## TEST DRIVE ar elephairi.

Elephant Floppy Disks are the perfect vehicle for storing and protecting data. Because Elephant never forgets. You'll get high performance that's 100\% guaranteed for a lifetime of heavy use. So take them for a test drive. They re available now at your local computer showroom. And there's no waiting for delivery. For the Elephant dealer nearest you, call 1-800-343-8413. In Massachusetts, call collect |617) 769-8150.

## ELEPHANT WEVER FORGETS.

# You bought a computer to cultivate your kids' minds. Make suire it's bearing fruit, not growing vegetables. 

## Introducing a whole crop of Learning

 Adventure games from Spinnaker.When it comes to cultivating adventurous young minds, the computer's potential is endless.
Unfortunately, the search for software that makes the most of that potential has been endless, too.
That is, until Spinnaker created the Learning Adventure Series. A unique collection of games that reward curiosity with

It's New! TRAINS. ${ }^{\text {TM }}$
You're in charge of an old-time railroad - and whether it turns into a bonanza or a bust depends on how well you run it. But either way you'll find that working on this railroad is a challenge-and a lot of fun! Ages 10-Adult.
hours of adventure and learning. So the time kids spend with our games will help them develop valuable skills. Instead of just tired thumbs.
But what really makes our Learning Adventure games unique-educational value aside - is how much fun they are. Which isn't too surprising when you consider you can do things like bargain with aliens, search a haunted house, or build your own railroad empire.

It's New!
ADVENTURE
CREATOR. ${ }^{\text {™ }}$
Design a challenging adventure game that you or a friend can tackle-or let the computer design one for you. It's complex, exciting-utterly addictive! Ages 12-Adult.

In fact, our games are so much fun, kids will really enjoy developing some very important skills. Deductive reasoning, note taking, and problem solving, for instance.

So, if you're in the market for software that will truly cultivate young minds. pick the Spinnaker Learning Adventure Series.

It's the best way to be sure your search will be fruitful.
Spinnaker Learning Adventure games are available
 computers.

IN SEARCH OF THE MOST AMAZING THING. It isn'teasy to find -even in your B-liner. But you'll have help from your Uncle Smoke Bailey as you search the universe to find the Most Amazing Thing. Ages 10-Adult.

We've cleverly disguised them as funny creatures from a computer game. But underneath the funny exterior is one of the most serious approaches to home education you've ever heard of.

INTRODUCING SPROUT ${ }^{\text {TM }}$ SOFTWARE.
GAMES THAT TEACH.

Your kid's new teachers are called Tink and Tonk. They come from Sprout. Software for kids 4 to 8 .

The beauty of Sprout software is how
entertainment is balanced with a healthy dose of education.

While kids are having fun at home, they're actually reinforcing what they've learned at school. Things like the alphabet, spelling, vocabulary, counting, adding, and pattern recognition.

You'll also like how Sprout prevents boredom. Our games grow up, instead of wear out. As kids get older, the game adjusts and gets harder. Because there are many

## la new breed of teachers.

variations and many decisions to make. Knowing how to do all this isn't something Sprout learned overnight.

You see, we've got a hundred years of experience to lean on. (Our parent company is SFN, the country's \#l textbook publisher for elementary and high schools.)

We've also got the expe-

rience of Mercer Mayer, who has written or illustrated 80 children's books. He dazzles kids with ideas and pictures that keep them coming back for more.

With TINK!TONK! ! ${ }^{\text {M }}$ software, kids see that learning can be more fun than destroying space creatures.
 Games that grow up. Instead of wear out.

Advanced spreadsheet
SynCalc ${ }^{\text {mim }}$

Database management
SynFile ${ }^{\text {m }}$

Graphing and statistics

## SynTrend ${ }^{\text {™ }}$

## Now your Atari computer

 gets down to business.If you're a serious home manager, a student, or run a small business at home, now you can get sophisticated, integrated software for your ATARI computer with the same features as the more expensive IBM and Apple packages.

## SynCalc <br> makes a spreadsheet more manageable.

First, there's SynCalc, the most advanced spreadsheet program ever created for ATARI Home Computers. Not only does SynCalc help you get all your numbers down easily, it also comes with a sorting feature, and the ability to label and name your formulas like "beginning inventory + goods purchased-goods sold $=$ inventory on hand," as well as standard entries. And SynCalc also comes with "expert" commands, to use once you've become more familiar with its procedures. Plus many other
features found in the more expensive programs.

## SynFile + keeps information more organized.

SynFile + can function as your database, your filing system. With SynFile+, you can reorganize and sort parts or whole files instantly. Not only can you enter text, you can calculate and update data as well. And files from both SynCalc and SynFile + can also be used by the ATARI word processor, AtariWriter, ${ }^{T M}$ for uses such as mail merge.

## SynTrend gives you a more graphic way to look at data.

Next, there's SynTrend, which can be the graphing and statistical arm of your operation. SynTrend allows you to visualize your data from SynCalc or SynFile + with either bar graphs, pie charts, line graphs or scatter plots. To do statistical analysis, you can quickly calcu-
late means and variances, standard deviations, or even linear and multiple regressions. It's pretty easy to understand, eh? And also pretty easy to operate because all three programs come replete with easy-to-understand "pop-up" menus, to take you through their paces step by step. And remember, all three programs can share data, which helps you get the job done even faster.

So get down to business with SynCalc, SynFile+, SynTrend, developed exclusively for ATARI by Synapse. And see for yourself why the cost of taking care of business doesn't have to put you out of it.
SynCalc. SynFile+, SynTrend are trademarks of Synapse Sottware. Synapse is a registered trademark of Synapse Software Corporation. IBM and Apple are respective trademarks of International Business Machines Corp., and Apple Computer.

We recently received a letter from a long-time subscriber that thoughtfully raises some concerns about the present composition of COMPUTE!. It is excerpted and addressed here.
"Dear Mr. Lock,
I felt compelled to write to you to express my feelings about the disappointing changes which have been coming over my once favorite magazine, COMPUTE!. I have been reading COMPUTE! since January 1981 and have a subscription which is paid through August 1985.

In recent months, since January 1984, you have been 'spread too thin' by attempting to cover so many types of computers that I feel none have been done adequately. The technical content of the magazine, for the Commodore computers, and computer use in the home, is what had interested me the most, and the quantity and the quality have dwindled so much . . .".

Our reader goes on to discuss concerns in specific about the breadth of our articles, and the size of our columns. We thought this presented a good opportunity to address these concerns and hopefully explain some of what we see happening from here, and where it will take us.

## The Case Of The Dwindling Magazine

In December of 1983, COMPUTE! had 392 pages. This issue, Septemper 1984, has 160 . The December issue had 215 pages of advertising; this issue has 60.5 . During the course of 1984, we've seen a massive shakeout, not unexpected of course, in the industry. Where there once was an advertiser base of thousands
of companies, there is now an advertiser base measured in the hundreds. All well and good, you may say, but is it really a problem or concern for you, the readers? In the sense that we must attend to some economic realities in planning and publishing our magazines, the answer is yes. Do we subjugate our concerns to formula? No, absolutely not.

A typical rule of thumb for the publishing business is a 50/50 advertising mix. As size increases, this ratio gives over to an increased percentage of advertising. In our case, the December 1983 issue of COMPUTE! was over 55 percent advertising. The September issue, by rule of thumb, should be at most 128 pages. Given the overhead we carry in fixed page content (i.e., everything from columns to MLX), this was not acceptable. The result is that our editorial percentage in this issue approaches 65 percent.

## The Future

Certainly all of this makes sense, but it still doesn't solve the problem/question at hand: more content. What else can we do? We're working on it. In our "fixed overhead" areas, we're whittling down column sizes. Were trying to expand the scope of some columns so they're more useful to more of you. And we're evaluating all of our columns with an eye toward further reductions.

One of your complaints, in essence, is that some of the "meat" of our content is diminished. Upon reflection, I think that's an offshoot of our at-
tempts to provide continued breadth. We probably have a tendency to run shorter articles to enhance variety. The unfortunate by-product of this is that some of the more technical, lengthy articles are bypassed. This we can address immediately, and we will begin to do so with our October issue. We would welcome some additional input from readers. One sagestion here has been that we start to run some of our "fixed" matrial on an every-other-issue basis. This would mean that "Beginner's Guide To Typing In Programs," for example, might appear on alternate months. We are open to your thoughts. Your comments?

Editor In Chief

## Neftrintorth

## Its only business is managing your home finances. No program does it more quickly, more easily, more directly.

Your Personal Net Worth systematizes the management of your household income, expenses, credit cards and check books using methods tested for accuracy by Touche Ross, one of the nation's leading accounting firms.

Your Personal Net Worth puts your computer to work, keeps your records straight, including your personal inventory of valuables and stock portfolio, tells you where and how you're spending your money or if you're making a shambles of your budget. And does it all
in less time than it takes you to balance your check book.

Nothing else - no other program at twice the price - makes handling your personal money matters simpler, faster and more direct than Your Personal Net Worth.

You'll find it at your favorite software retailer in the silver box with the real silver dollar on the front. It could be the single most valuable purchase you'll ever make.

Record all banking and any credit card transactions, reconcile bank statements instantly (up to 10 separate bank accounts can be handled), - print checks, too.

Set up a budget (as many as 350 categories) - and then compare your actual income and expenses to the budget.

Never forget a tax-deductible item. Today or at tax return time.

Display or print every financial report you'il everneed.

Space Battle Display

Hyperwarp Temporal Imbalance Sensor Grid

Galactic Starmap Display

## The sequel to JUPITER MISSION $1999^{\circ}$

When the government agents knocked on your door early one morning (at the beginning of JUPITER MISSION 1999) and rudely whisked you away in the starship Space Beagle, you had no idea of what was to follow. As the lone survivor of Jupiter Mission and the Earth's savior from an impending alien invasion, you unwittingly thought the worst was behind you. SLIM CHANCE! A mysterious beam has cast you into the nether reaches of space; cold, lifeless, forbidding. You long for the amenities of Mother Earth, which you had always taken for granted . . . until now!
THE QUEST OF THE SPACE BEAGLE: THREE ADVENTURES IN ONE!

- Befriended by the Faunians, a peaceful race being invaded by the evil Gentuzians, they have decided that YOU must launch a pre-emptive strike against the Gentuzian homeworld. You must command 10 Faunian robot fighters against the Gentuzian battle fleet which outnumbers you four to one! It won't be easy; you'll need the right tactics and all the skill and patience you can muster.
- Assuming you are successful and conquer the Gentuzians, they will want you to become their Emperor. The only thing you want is to repair the Space Beagle and get back home. But they are insistent creatures; refuse the crown, and you can forget leaving. Reluctantly you accept and, to prove your claim, they drop you into the Labyrinth of Kamerra! Find your way out, and they'll let you go home as Emperor of Gentuza. No problem, you think, until you soon realize that Kamerra is a cruel maze deficient of adequate food and oxygen, yet aplenty with dangerous pits and "Ardillian Whipstingers."
- SHOOT THE STARS! Fortunately, you are able to save your game in progress every step of the way in QUEST OF THE SPACE BEAGLE.

Your greatest challenge is about to begin. As you settle into the commander's chair of the Space Beagle, you set your sights for home! But which way? Before you spans $200,000,000$ light years of Superclusters. On board is an authentic matrix computer calibrated to simulate the actual dimensions of the universe. You must identify the one Supercluster containing Sol, and hyperwarp from one end of space to another. Once you lock into the right Supercluster, you must find the Milky Way Galaxy, your assurance that Mother Earth is within reach, and home sweet home!

THE QUEST OF THE SPACE BEAGLE is ready to run on your Atari® Home Computer with 48 K memory, one disk drive and joystick.

## Automatic Conversions?

Many of the programs you publish in COMPUTE! are for several different microcomputers. Do you have utilities that automatically convert a program to another type of computer? Are they available for sale?
J.B. Allen

We call the process of converting a computer program to another computer homogenization. Unfortunately, we do not have, nor have we seen, any utilities that will automatically homogenize a program.

We have a staff of talented programmers that manually goes through programs and homogenizes them. The process can be a laborious one, particularly with machine language programs which often require a byte-by-byte translation.

## Missing Commodore Ribbons

I am the owner of a Commodore MPS-801 printer. Until recently, I have had trouble finding a replacement ribbon. It seems that the dealers selling the printers are not able to get the ribbons.

I have some good news for you to pass on to your readers. You can find a replacement ribbon at your local Radio Shack store. It is the ribbon for the DMP-110 printer, part number 26-1283. This ribbon is identical to the one for the MPS801 printer.

Frank W. Fife
Many readers have mentioned difficulty locating replacement ribbons for the 801. Thanks for the tip.

## Atari Monitor Hookup

I have ordered a BMC monitor and an Atari 800XL. Very recently, I was told that the Atari is designed for use with a standard TV set. How can I make the Atari work with the BMC monitor. Will the monitor be totally useless?

Benedict V. Sulit
Although optimized for use with a television set, the Atari 800XL looks even better on a composite color monitor. You can also hook up a black-and-white (monochrome) monitor. You'll need a special cable
that plugs into the round, five-pin DIN plug on the back of your 800XL. For a color monitor, get a cable that feeds the chroma (composite video) signal into Video In on your monitor. For a monochrome screen, you'll get best results using the LUMA (luminance) signal. Some cables bring out all five pins to RCA phono jacks. With trial and error you can easily find which wire controls which signal. You can get a video cable at your local computer store or possibly a TV/video store.

## Musical Apples

I am an Apple IIe user and would like to know how to program my computer to make music. Can you do it in Applesoft BASIC or do you need another language?

Denny Hays

It's a fairly simple matter to make elementary sounds on the Apple in BASIC. You can tweak the speaker by accessing location -16336 (i.e., POKE $-16336,0$ ) or ring the bell by PRINTing CHR\$(7). But to do much more than this, you need a short machine language (ML) routine. Fortunately, this ML routine can be POKEd in from BASIC.

You can find such an ML routine in an article by Blaine Mathieu (COMPUTE!, October and November 1983). The tutorial explains both fundamental and complex Apple sound generation.

## More Open Commodore Files

The " 64 Explorer" by Larry Isaacs in the March 1984 issue concerning the maximum number of files which can be open at one time on the 1541 disk drive caught my interest. I have discovered some further information.

The number of sequential files opened for writing can be increased to three if the filename is prefixed with a 0 :. When this is not the case, the drive acts as Isaacs described.

Since the Disk Operating System was originally used on a dual disk drive, I always add the prefix 0 : to any disk operation to insure that it will work properly.

Mitchell S. Comstock
 see bow cerctive

## Autobooting Atari

Is there any way you can make a program run right after it has been loaded into your computer from tape or disk? This would prevent anyone from seeing the special codes in the program. Mark Zobel
We assume you are using a password or are disabling the break key and system reset. If the program didn't run automatically, anyone could LIST the program and remove the protection. Although you can't completely bar an experienced, enthusiastic invader, you can make a program run automatically from disk when you boot up your system. See "Automate Your Atari" in COMPUTE's Third Book of Atari.

Although it is possible to create a boot tape that does the same thing, we don't know of a specific program. There are techniques for making BASIC programs RUN automatically when LOADed on Commodore machines (for example, having the program load in memory low enough to change some vectors), but the technique is too involved to cover here. See "Commodore Autoboot" elsewhere in this issue.

## TI Memory Maps

I write this in reply to the letter from Davin A. Trulsen in the May issue of COMPUTE!. If he or any other TI user wants a comprehensive memory map for the TI, they should write to Miller Graphics, 1475 West Cypress Avenue, San Dimas, CA 91773. Miller Graphics offers a monthly newsletter, called The Smart Programmer, for $\$ 12.50$ a year. They have published four so far and I have found them quite useful.

Bill Grant

## Incomplełe NEXTs

I have a VIC-20 and I have a question about the NEXT statement. I've seen some programs that had a NEXT statement with nothing after the next. For example:

FOR A=1TO10:NEXT
Why doesn't it include the variable after the NEXT as in:

## FOR A=1TO10:NEXT A

Kevin Biebor
The NEXT statement increments or completes a loop that was started by a FOR statement. If a variable is placed after the NEXT, that loop is incremented. In the following example, the B loop will be incremented (and completed) ten times each time the A loop is incremented.

```
FOR A=1TO10
FOR B=1TO10
NEXT B
NEXT A
```

If the NEXT statement is not followed by a variable name, the loop completed will be the one most recently started. In the following example, the NEXT will complete the B loop even though the A loop was the first one started.

```
FOR A=1TO10
FOR B=1TO10
NEXT
```

Nested loops (loops within other loops) should be written with care. If they're programmed incorrectly, one or more of the loops may not be completed. For instance, the B loop in the following example will never be completed.

```
FOR A=1TO10
FOR B=1TO10
NEXTA
NEXTB
```

## Don't Blame The Hardware

I am having a problem reading arrays on the Atari. This simple program is an example:

```
10 DIM X(5)
20 FOR I=1 TO 5
30 READ X(I)
4 0 ~ P R I N T ~ X ( I ) ~
50 NEXT I
6 0 ~ D A T A ~ 3 , 5 , - 2 , 7 , 4
```

I always get an error in line 30. I wonder if my computer memory has gone bad.

Lloyd R. Holmes
When faced with a particularly stubborn bug, most programmers start to suspect the hardware-but it's almost never the culprit.

As a general programming rule, never assume the hardware is bad except as a last resort. Some program bugs are so obscure, so hard to track down, that it becomes pretty tempting to blame the hardware. Nevertheless, true hardware errors almost always exhibit outrageous behavior, such as lockups when you iurn the machine on, screens that suddenly go haywire, an eerie, inexplicable hum when you use SOUND, etc. Hardware errors are obvious, except when just a few bytes of RAM go bad. You can buy memory test programs, but it would probably be an unnecessary investment.

The specific problem you're having here is syntactic. On the Atari, you cannot READ a data item directly into an array. READ X(I) is just as illegal as INPUT X(I). It's a lamentable eccentricity, but it is easy to get around. Just read the item into a temporary variable, then assign that variable to $\mathrm{X}(\mathrm{I})$. To wit: READ $\mathrm{T}: \mathrm{X}(\mathrm{I})=T$.

# Go for higher Scholastic Aptitude Test scores in math and English with Micro Learn's teach-and-test instructional programs. 

Learn more and learn faster. Other tutorials just test you; Micro Learn's teach-and-test SAT programs explain why your answers are right or wrong.
They're the next best thing to having a personal tutor. With three separate programs for math and three for English, you can really be ready for your exam!
In the tutorial mode, a wrong answer triggers help screens and extra practice. (If you answer correctly, you can still ask for this extra help.) The test mode asks questions without giving help. Then the questions you missed are given again with help.

Micro Learn's SAT programs are a great learning aid - and, at only $\$ 30$ each, a great value. You'll be making a smart move by getting them today!

For Commodore 64, Apple II \& IIe, IBM PC \& jr, Atari 800, Adam. Suggested retail \$30 each.

## aricroleapa"

Math SAT increases understanding of arithmetic, algebra, geometry, ratios, probabilities, exponents, square roots, fractions, quantitative comparisons, negative numbers, least common multipliers, graphs.

## THE REAL TRICK IS GETTING OUT.

Expect the unexpected the first time you experience Infocom's interactive fiction. Because you won't be booting up a computer game. You'll be stepping into a story.

You'll find yourself at the center of an exciting world that continually challenges you with surprising twists, unique characters (many of whom possess ex-
 traordinarily developed personalities) and original, logical, often hilarious puzzles.

Communication is carried on just as it is in a book-in prose. And interaction is easy-you type in full English sentences.

But if you think getting inside a
 story is a pretty neat trick, just try getting out.

The most remarkable thing about Infocom's interactive fiction is that you become almost inextricably involved with it. That's not our opinion-it's the testimony of our customers. They tell us their pulse rates have skyrocketed and their palms have sweated as they've $=$ striven to solve the mysteries of our tales. And even when they've paused in the course of their adventures to attend to their everyday lives, their minds have continued to

hundreds, even thousands of alternatives at every step. In fact, an Infocom interactive story is roughly the

वlength of a short novel in content, but because you take an active role in the plot, your adventure can last for weeks and months. (Or longer. Frankly, some folks find being inside our stories so fascinating, they just don't seem to want to get out.)

As hard as getting out may be, though, we've made it easy for everyone to get into Infocom's interactive fiction.

 churn away at what the next step should be, how to alter strategy, where the ultimate solution lies.

Obsessions? Yes, but magnificent ones. For the first time, you can be more than a passive reader-you can become the story's main character and driving force. You can shape its
 course of events by what you choose to do. And you enjoy enormous freedom in your choice of actions-you have

We write everything from
fantasy to mystery to science fiction to high adventure, for everyone from the first-time adventurer to the most experienced veteran of our interactive stories.

So find out what it's like to get Inside a story. Get one from

TInfocom. Because with Infocom's interactive fiction, there's room for you on every disk.

## Ease into interactive fiction

 with our Can't-Lose Sampler Offer! Watch for Infocom's new sampler disk at your favorite dealer-and get your first taste of interactive fiction for just $\$ 7.95$ (suggested retail price). You've got nothing to lose (in fact, you can make a shiny new nickel in the bargain) because your Infocom sampler disk even comeswith a coupon entitling you to $\$ 8$ off the purchase of your first complete Infocom story, plus coupons for other exciting bonuses!

## InFOCOM

55 Wheeler St., Cambridge, MA 02138 For your: Apple II, Macintosh, Atari, Commodore 64, CP/M 8 " DECmate, DEC Rainbow, DEC RT-11, HP $150 \& 110$, IBM PC*
$\&$ PCjr, KAYPRO II, MS-DOS $2.0^{*}$, NEC APC, NEC PC-8000, Osborne, TRS-80 Color Computer, Tandy 2000, TI Professional, TI 99/4A, TRS-80 Models I \& III.
*Use the IBM PC version for your Compaq and the MS-DOS 2.0 version for your Wang, Mindset, Data General System 10, GRiD version for your
and many others.

And remember The Programmer's Debugging Rule: Hardware problems are as obvious as they are rare.

## Commodore Plus/4

Since you published the article on the new Commodore computers (COMPUTE!, April 1984), I have been giving serious thought to purchasing one. I will be enrolling in college, and feel that the new Commodore 264 would be a good choice for my major: electronics. However, I have a number of questions about the 264.

1. I know that the 1541 disk drive works with the Commodore 64 and the VIC-20, but will it also be compatible with the 264 ? 2. How far can I expand the RAM or ROM memory in the 264 ?
2. Can I buy an Eprom burner for the 264?
3. Is there any software available for the new 264 ?
4. Is it possible to increase the baud rate of the 1541 disk drive?

Don Maxwell
The new Commodore Plus/4 (renamed from the 264) has not been released for sale as of this writing. It is, however, expected to hit the retail shelves sometime this fall.

About the same time, Commodore is planning to market a new disk drive, the SFS-481. SF stands for super fast because it has an advertised baud rate of 1675. However, a 1541 disk drive will be compatible with the new Plus $/ 4$ as well.

Although the Plus / 4 will support (memory) bank switching, Commodore has not announced any memory expansion for the Plus/4. However, thirdparty companies might eventually offer something.

Regarding EPROM burners, again Commodore has no current market plans, but undoubtedly thirdparty manufacturers will offer this peripheral. Also, there will be software available for the Plus/4. There already exists a considerable amount of both application and entertainment software.

As to the baud rate change on the 1541 disk drive, a Commodore representative said that the baud rate (the speed that information is transmitted to or from the disk drive) on the 1541 cannot be changed on the drive as is. The current baud rate is dictated by the serial port interface on the computer. In other words, no matter how you modify the disk drive, the computer will only be able to receive data at its preprogrammed rate.

The 1541's rate can be increased by converting it to a parallel interface. But this is a major engineering project, and might prove to be both impractical and costly.

## Buying The Right Modem

I am thinking of buying a modem. Do I need a rotary-dial phone, or will modems work with a Touch-Tone system?

## Steve Milewski

Most modems will work with both the Touch-Tone and the older rotary phones. Some modems, in fact, work on Touch-Tone phones by emulating the rotary system. The Commodore 1650 auto-dial modem is one.

Before buying, however, it's always best to ask your dealer, or call the modem manufacturer for further information.

## Commodore Service

I am an electronics repair technician, and own a Commodore 64. I cannot find anyone in my area who can repair my computer.

Where can I obtain the technical information to service my Commodore computer, and all of its related peripheral equipment?

Gordon Bates
The addresses and phone numbers of the Commodore service centers are as follows:
1200 Wilson Drive
West Chester, PA 19380
(215) 431-9105

2246 North Palmer Drive
Schaumburg, Il 60195
(312) 397-0075

4350 Beltwood Parkway South
Dallas, TX 75234
(214) 458-1000

3330 Scott Blvd.
Santa Clara, CA 95051
(408) 727-1130

Technical information on some of Commodore's products is also available. They offer packages which include schematics, technical information, troubleshooting instructions, etc. For price and availability information, contact the parts department at the West Chester, PA, address listed above.

## Cassette Filenames And Built-In BASIC

I own an Atari 400 computer. Can you specify a filename for the 410 program recorder? Also, how do you run a program that asks you to remove the BASIC cartridge on the 600XL? Since BASIC is built-in, it seems like it might be impossible.

Doug Stevens
The tape operating system could have been written to allow filenames, but since tape access is sequen-

Get the jump on the weatherman by accurately forecasting the local weather yourself!

The beautiful princess is held captive by deadly dragons. Only a knight in shining armor can save her now!

A time-saving organizer for coupons, receipts and more.

A scientifically proven way to develop an awesome memory.

Cut your energy costs by monitoring your phone, electric and gas bills.

School-age and pre-school children are rewarded for right answers, corrected on their wrong ones.

You are trapped in a fivestory, 125 -room structure made entirely of ice. Find the exit before you freeze!

Computerize car maintenance to improve auto performance, economy and resale value.

A real brainflexer. Deflect random balls into targets on a constantly changing playfield.

Take control of your personal finances in less than one hour a month.

Create multi-colored bar graphs with a surprisingly small amount of memory.

A fun way to dramatically increase typing speed and accuracy.

## Get up to 30 new programs and games for less than 15 cents each every month in COMPUTE!

Every month, COMPUTE! readers enjoy up to 30 brand new, ready-to-run computer programs, even arcade quality games.

And when you subscribe to COMPUTE! at up to 40\% off the newsstand price, you'll get them all for less than 15 cents each!

You'll find programs to help you conserve time, energy and money. Programs like Cash Flow Manager. Retirement Planner. Coupon Filer. Dynamic Bookkeeping.

You'll enjoy games like Air Defense, Boggler, Slalom and High Speed Mazer.

Your children will find learning fast and fun with First Math, Guess That Animal and Mystery Spell.

Looking for a challenge? You can write your own games. Customize BASIC programs. Even make beautiful computer music and pictures.

It's all in COMPUTE! All ready to type in and run on your Atari, Apple, Commodore, PET/CBM, TI 99/4A, Radio Shack Color Computer, IBM PC or IBM PCjr.

What's more, you get information-packed articles, product reviews, ideas and advice that add power and excitement to all your home computing.

And when it's time to shop for peripherals or hardware, check COMPUTE! first. Our product evaluations can save you money and costly mistakes. We'll even help you decide what to buy: Dot-matrix or daisy-wheel printer? Tape storage or disk drive? What about modems? Memory expansion kits? What's new in joysticks, paddles and track balls?

tial and so slow compared to a disk drive, filenames are not especially useful. You can instead use the tape counter to find and position programs. Be sure to leave plenty of space between programs, since the tape counter is not precise, and you could inadvertently write over a program.

Some programs require $48 \mathrm{~K}, 8 \mathrm{~K}$ of which is not available with a cartridge plugged in. These programs check for a cartridge and ask you to remove it before the program will run. The 600XL has only 16 K , though, so this shouldn't be a problem. In any case, you can effectively remove (disable) the builtin BASIC by holding down the OPTION key while you turn on the computer.

## 6502/65 10 Differences

I am a relatively new computer owner and I want to learn machine language programming. As far as I can tell, my Commodore 64 contains a 6510 chip rather than the more common 6502.

A phone call to Commodore's corporate offices revealed that the machine language for the two chips is not compatible. The Programmer's Reference Guide directs all its instructions to the 6502 processor.

I am unable to find anything in print on machine language programming using the 6510 . I would appreciate it if you could help me out. Are the two chips incompatible? If so, can you tell me how and where I might learn machine language for the 6510 ?

Dean Lind
Unfortunately, the representative you talked to at Commodore was misinformed. The 6502 and the 6510 microprocessors are compatible. Both use the same instruction set (LDA, STA, etc.) and addressing format (low byte, high byte). Books on programming the 6502 also apply to the 6510 .

The only major differences between the two processors are bytes one and two of the 6510. The 6510 allows you to bank switch memory.

The Commodore 64 has 20K of ROM, including the BASIC interpreter, Kernal, and Input/Output control programs. There is also 20K of usable RAM memory "underneath" this ROM memory. You can switch out the ROM and switch in the RAM memory by bank selecting blocks of memory. If you wished, you could turn your 64 into a computer with 64 K of usable RAM memory by switching out all of the ROMs. However, you would have to supply your own BASIC interpreter, operating system, and I/O control programs. Without these, the computer would simply freeze, and you wouldn't be able to write or run BASIC or machine language programs. For more information on bank selection, refer to your Programmer's Reference Guide.

The VIC-20, which is equipped with the 6502 microprocessor, does not support bank selection of ROM/RAM memory.

A book on 6502 machine language programming will apply to the 6510. You might also want to take a look at the "Machine Language for Beginners" column in COMPUTE!'s GAZETTE, our sister publication.

## Printer Device Number Changes

Is it possible to change the device numbers of a printer? I want to buy a second printer for my computer, but am unsure if I can use both printers at the same time.

Jacques Poulet
Usually the device number cannot be altered. It depends on the brand of printer, but most printers have no significant internal "intelligence" (no computer assistance inside). You could change the device number of a disk drive because it can be programmed from the computer; it is an intelligent device.

However, some models of printers do allow you to change device numbers via a switch on the printer itself. The new Commodore MPS 801, for example, has a three-position switch that allows you to choose between device numbers 4, 5, and 6. And some few printers can be software assigned.

## DIM On Commodore

What happens to the data when it enters a DIM statement (array) from an INPUT statement or a sequential file?

I teach computer programming part-time at Tulsa Junior College. This is my first semester with micros. I have a Commodore 64 and a VIC 1541 disk drive. In advanced BASIC, sequential files are common, and are usually used for search and sort routines. When the data is read from DATA statements into the arrays, there is no problem. The sort or search never stops, but when that same data is brought into the arrays from a sequential file, the sort or processing stops many times, making a 16 to 30 minute program run for hours.

I have written my own sequential file program, and later discovered and used the one off the demonstration disk that came with the VIC 1541 disk drive. Both have these stops. I have tried about everything. If you could give me a clue, I would appreciate it.

Darrel Henry
The pauses you see in the program are the result of a process called "garbage collection." It's caused by moving strings around.

## DRACOIRIDERS OF PERT. FIY HLE UNFRIENDYSKIES.

Shooting down the menacing and constantly multiplying Threads isn't easy, but it's only one of the challenges in this official computer game version of Anne McCaffrey's famous book series.

Your strategy will be put to the test as you try to negotiate alliances with Pern's Lord Holders in an attempt to form the most powerful Weyr on the planet. Should you take a firm stance or compromise? Will asking a Craftmaster for assistance increase your chances for success? Maybe you should invite prospective allies to a Wedding or even a Dragon Hatching. Remember to check the Lord Holders personality traits
first. It may be critical to your success.
Numerous screens combine to create truly unique and challenging game play. There's even a practice screen to sharpen your Thread Fighting skills.

If you liked the books, you'll love the game. After all, how often do you get the chance to actually fly a dragon?

One to four players, joystick and keyboard controlled.

## Strategy Games for the Action-Game Player

Here's what happens: As new strings are created, the old ones are not thrown away; they lie dead in memory. Eventually, memory fills up and the computer has to stop and collect the strings that are still live. This takes time; the pauses are quite noticeable and can be time-consuming.

Strings that are completely defined within a program-from DATA statements or from an assignment statement such as $\mathrm{X} \$=$ "HELLO"-are used straight out of the program where they lie. These strings don't need to be collected; as you have noted, there's no garbage collection delay when you use these.

For your type of program-sorting and search-ing-there are two rules that will be very helpful in eliminating delays:

1. Don't move strings. Instead of sorting by moving them around from one part of the array to another-which creates garbage-use an "index" to keep track of where a string belongs within a certain sequence. (More on this in a moment.)
2. When you have finished with a string, set it to a null string, for example, $A \$(21)=$ '"'. When you have disposed of almost all strings this way, and are ready to read in another set of strings from disk or tape, force a collection by using the FRE function, for example, code $X=F R E(0)$. Garbage collection will run quickly if you have very few strings left. When you read in the next group of strings, they will come into the newly liberated memory space.

To illustrate point 1: Here's a program to sort an array of strings. It's a bubble sort, which is not very efficient. The point is this: After the strings are created, they are never moved. Only the index ( $A \%$ ) values move, and they are numbers, not strings, so there won't be any garbage.

```
90 REM BUBBLE SORT - INDEX DEMO
100 N = 30:DIM A$(100)
200 REM CREATE RANDOM STRINGS
210 FOR J=1 TO N
220 A$(J)= CHR$(RND(1)*26+65)+CHR$
    (RND(1)*26+65)
230 NEXT J
300 REM: CREATE INDEX
310 DIM A%(N)
320 FOR J=1 TO N
330 A %(J)=J
3 4 0 ~ N E X T ~ J ~
400 REM: SORT INDEX
4 1 0 \text { FOR J=N-1 TO 1 STEP -1}
420 FOR K=1 TO J
430 REM: GET INDEX FOR K, K +1
440 X=A%(K) :Y=A %(K+1)
450 REM: FLIP IF OUT OF ORDER
460 IF A$(X)>A$(Y) THEN A %(K+1)=X:A %(K)=Y
4 7 0 ~ N E X T ~ K , J ~
500 REM: PRINT RESULTS
510 FOR J=1 TO N
5 2 0 ~ P R I N T ~ A \$ ( A ~ \% ( J ) ) ,
5 3 0 ~ N E X T ~ J ~
```

Study this program to see how the strings are sorted, but not moved.

There are other rules on how to handle garbage collection; the ones above will do the job for your application.

## TI CALL KEY

I recently acquired a TI-99/4A and wondered if you would explain the use of the CALL KEY command?

David Stinchcomb
The CALL KEY statement has caused confusion for many TI users. The KEY subprogram, designed to return a single keystroke value, requires three parameters: a key unit, a return variable, and a status variable. The statement takes the format:

CALL KEY ( $\mathbf{n}, \mathrm{K}, \mathrm{ST}$ )
where $n$ is the key unit, $K$ is the return variable, and ST is the status variable.

The key unit used in the CALL KEY statement determines the keyboard configuration assumed by the computer. Six key unit values (0-5), or keyboard configurations, are available on the TI-99/4A. The three key units generally used are 0, 1, and 2. A key unit of 0 refers to the console keyboard. Key units 1 and 2 map the console keyboard as split keyboards (a value of 1 to read the left side of the keyboard, a value of 2 to read the right), or read the fire buttons on joystick 1 and 2, respectively.

When a CALL KEY statement is executed with a key pressed, some value will be assigned to $K$ (in our example above). The value given to $K$ will depend on the key pressed and the key unit used in the CALL KEY statement. If you use a key unit of zero, $K$ will correspond to the ASCII value of the key being pressed. For other keyboard configurations, the value of $K$ will vary as noted in the TI U'ser's Reference Guide (pp. II-87 to II-89). Eighteen in $K$ signifies that the fire button was pressed.

The final parameter used in the CALL KEY statement is the status variable (ST). A nonzero value returned for ST indicates that a key was being pressed when the CALL KEY statement was executed.

CALL KEY can be used to get a desired response from the program user. If you want to test for any keystroke (with key unit 0), you would use the following two lines:

## 10 CALL KEY(0,K,ST)

20 IF ST $=0$ THEN 10
The program repeatedly loops back to line 10 until some key is pressed.

If you want the program to accept only a specific response from the user, such as $Y$ for "yes," you could add these lines:

## 5 PRINT "TYPE THE Y KEY" <br> 30 IF K<>89 THEN 10

Until the $Y$ key is pressed, the program will loop back to 10.

# THANKS TO COMPUSERVES CB SIMULATOR, "Digital Fox"Accessed"Data Hari"And Proceeded To An "Altared" State. 

The CB Simulator, where CompuServe Subscribers can Access Friends and Influence People on 72 Different Channels.

Just pick your handle and get on line. From math to matrimony, there's always someone out there who speaks your language. Friends from all over the U.S. and Canada are at it 24 hours a day. Talking tech or just having fun. And if you've got a secret, just use the CB Scrambler.

That'll fool the "lurkers", those CB "see it alls" who get their kicks by watching. Or you can always use the private talk mode for guaranteed one-to-one conversation.

The CB Simulator is just one of CompuServe's many electronic communications options that include a National Bulletin Board, Professional Forums and Electronic Mail. Plus, there's a world of on-line information and entertainment all for the price of a local phone call plus connect time.

You can access CompuServe with almost any computer and modem, terminal or communicating word processor.

To receive your illustrated guide to the CompuServe Information Service and learn how to subscribe, call or contact:

## Commodore Machine Language Clear

I have been trying to develop a monitor program for the VIC-20 and am having a difficult time creating a routine to clear the screen. Is there any way to clear the screen without getting the READY prompt?

There are several ways to clear the screen from machine language. The easiest way is to assemble the following:

## LDA \#\$93 ;the equivalent of CHR\$(147) <br> JSR \$FFD2 ;print it

This routine will work on both the VIC and 64. Incidentally, you can also use it to home the cursor. Just replace the $\$ 93$ with $\$ 13$. The hex number 93 is the same as the character that clears the screen in BASIC and $\$ 13$ is the same as CHR\$(19) which homes the cursor.

Another way to accomplish the same result is to assemble the following:

JSR \$E55F ;clear the screen and home the cursor On the 64 the routine is located at a different location, thus the coding is different:

JSR \$E544 ; clear and home If you just wanted to home the cursor on either machine you could JSR to \$E581 on the VIC or \$E566 on the 64. Although these are two quick, easy ways
to clear the screen, there is yet another. You could write your own routine to clear the screen. The routine would need to store a $\$ 20$ at every screen location. $\$ 20$ is the number for a blank character.

## Commodore 1541 Drive Grounding Error

In your May issue you printed a letter from Jay Elmore regarding read errors on the 1541 disk drive. After buying a drive for my Commodore 64, I discovered that it was giving me error 23 and 27. Both are read errors. I returned the drive to the dealer and he tested it on a 64 and discovered no problems with it. I took the drive back home and carefully read the manual that comes with it and discovered that errors 23 and 27 can be caused by grounding problems. I checked the electrical outlet where the drive was plugged in and discovered that the ground plug was not properly connected. After fixing this, I haven't had any problems with my drive.

Ron Restivo

COMPUTE! welcomes questions, comments, or solutions to issues raised in this column. Write to: Readers' Feedback, COMPUTE! Magazine, P.O. Box 5406, Greensboro, NC 27403. COMPUTE! reserves the right to edit or abridge published letters.

# Dual Personality: 

## Meet the Axiom GP-550. The First Real Personal Printer for Home and Business - Just \$299!

- Dual-Mode Printing:

Choose the higher-speed draft mode or the beautiful Near-Letter-Quality printout. - Multiple Fonts: Include pica, elite, condensed, proportional, italic, sub-script, super-script, boldface and underline.

- Super-Quiet: Quiet operation is essential whether for home or business and the GP-550 is quieter than most.

Imagine doing all your word processing, data processing, graphics and documentation on a printer that sells for only $\$ 299$. You can stop imagining! The Axiom GP-550 which offers both draft mode and Near-Letter-Quality printing - is here.

## IBM-PC Compatible:

The GP-550 is available with control codes and character set that match with IBM-PC and all of its "Look Alikes." This means that your software, including Lotus 1-2-3,
will work with our GP-550 PC model.

## Direct-Connect to Atari, Apple, Commodore

 and T.I.:More good news. Axiom has additional models of the GP- 550 which include built-in interfaces for the most popular personal computers. These "Direct-Connect" ${ }^{\text {ти }}$ versions of the GP-550 will work with your computer without additional interface or cable. Just plug our printer into your computer and start printing. Priced from $\$ 319$, including interface.

GP-550AT for All Atari

GP-550TI for 99/4A

## Computers And Society

# Discovery-Based Learning And Teenagers 

On the Saturday before the Summer Consumer Electronics Show in Chicago, I was speaking at a Logo workshop in northern California. Much of the emphasis in one of my talks was on the importance of discovery-based learning for all ages, not just for the child in elementary school. While I have been emphasizing this topic in my talks for several months, most people seem content to let Logo be a tool for the younger computer user.

## Educational Software

As I drove to the airport to catch my plane to Chicago, I wondered if this reluctance to bring the power of educational environments like Logo to older students was also evident in other educational software. After all, the mention of educational software usually conjures up visions of activities for the younger child. Whether these activities are drills associated with a specific subject or are open-ended activities designed to teach problem-solving skills, the fact remains that only 2 percent of the current educational software appears to be directed to teenagers. Some people might argue that, once a child has entered the teenage years, educational software isn't needed. If a teenager wants to use a computer, why not just let him or her write programs.

In fact, there are several reasons why teenagers should have access to good educational

David Thornburg is an author and speaker who has been heavily involved with the personal computer field since 1978. His main interest is in making computers responsive to people's needs. He is the inventor of the KoalaPad graphics tablet and is the author of nine books about programming including Computer Art and Animation: A User's Guide to Atari Logo, The KoalaPad Book, and Exploring Logo Without a Computer (AddisonWesley). His 101 Ways to Use a Macintosh will appear soon from Random House. He has been called "an enthusiastic advocate for a humanistic computer revolution," and his editorial opinions have appeared in COMPUTE! since its inception.
software:

1. Teenagers are in the process of forming career decisions. Controlled exposure to computer environments can demonstrate the richness of this field in a way that transcends purely recreational applications of computers.
2. For those students who are already interested in computers, computer-based instruction in problem-solving methods and the development of programming style can help these students use computers more effectively in their jobs.
3. Students of all ages benefit from becoming better problem solvers. So much of our focus has been on problem-solving software for the young (including such excellent programs as The Factory by Sunburst) that we can easily lose sight of the fact that the acquisition of problem-solving skills is important for learners of all ages.
To see what can happen to educational software for teenagers, we should first look at the other two areas where these children use computersat home and at the arcade.

## Interactive TV

As I look at popular computer activities in homes and arcades, there seems to be a major distinction emerging between the two. Arcade software has continued its focus on coordination and skill games. As the technology has advanced, these games have become more sophisticated. For example, several popular games use computercontrolled video disks. Except for advances in technology, however, these games seem to be stuck in a niche that one might characterize as interactive television.

Popular home software has taken a different approach. The home user is not able to run out and buy new technology every three months or so, and the challenge has thus been to make the existing technology become ever more useful

Here's a series of seven easy-to-use Management Information Re ports flexibly designed to accommodate all small and medium size business accounting requirements for Commodore $64^{*}$ computers.

Inventory Management / Sales Analysis Management/ Accounts Receivable Management and Invoicing / Accounts Payable Management and Checkwriting / Payroll Management / Cash Flow Management / General Ledger

## General Overview

Each system includes:
A Menu-driven progrom, sophisticated enough to provide complete Management and Product information, yet requires no prior computer or accounting knowledge to operate.

A unique method of creating your own, unlimited array of reports - easily and quickly. YOU select the information you want, and YOU determine the sequence of the report column headings.

A program which can be used by itself (standalone), or can be interfaced, one at a time, with
other TIMEWORKS MANAGEMENT INFORMATION programs into a fully integrated accounting system.

A Manual written in easy-tounderstand, people-friendly English, abundantly illustrated to provide further clarity and eliminate guesswork. Password Protection, to prevent unauthorized access to confidential data. Suggested Retail List at \$59.95 each.

## Customer Support Plan

Timeworks Telephone Consulting Service is available to all users at no charge to support your installation and ongoing operations.

For further details, contact your local Dealer or Timeworks, Inc. Choose from a host of Commodore 64 programs. Now at your favorite dealer. Or, contact Timeworks, P.O. Box 321, Deerfield, IL 60015. 312-948-9200.

SOFTWARE WITH SUBSTANCE -FOR EVERYONE.

## THE FIRST FAMILY

Introducing the home productivity software Commodore ${ }^{\text {TM }}$ IBM $^{\text {TM }}$ and Apple $^{\text {TM }}$ owners have been waiting for. Three easy to use, powerful programs

from Creative Software.
Now you can run low cost, full-featured software that performs the most sought after functions.

Creative Writer. ${ }^{\text {TM }}$ Creative Filer. ${ }^{T M}$ And Creative Calc. ${ }^{\text {m }}$ Each developed by Creative Software and designed to give you the most for your software dollar.

## ht

## HASSLE-FREE WORD PROCESSING.

Finally there's Creative Writer. A simple word processing program anyone can start using in just fifteen minutes. With Creative Writer, editing functions similar to the ones found in more expensive programs are at your fingertips.

And best of all, you won't have to relearn your computer's keyboard because all cursor control keys work similar to your computer's standard editing mode. You'll even be able to use the function keys to perform more advanced process-

## PUT YOUR FILING CABINET ON DISK.

Store your collection of index cards and faded notes in the attic where they belong. Now there's Creative Filer-the simplest way to organize and access all your files.

Imagine, names and addresses, home and auto

records, club memberships and inventories, all on a computer disk and automatically filed in alphabetical order for instant access.

Isn't that one of the reasons you bought your computer?
each program is full-featured with integrated capabilities. COMMODORE 64, IBM PC, PCjr. AND APPLE VERSIONS AVAILABLE.

## A SPREADSHEET PROGRAM THAT REALIY ADDS UP.

Analyze your household expenditures. Plan investments. Even keep track of business and taxable expenses, all on Creative Calc. Just enter your numbers and totals are automatically calculated and transposed onto a spreadsheet format. Review your document and print out any or all of your financial statement.

But the real number crunching power is demonstrated when you update figures. Enter changes and Creative Calc will recalculate all related numbers,
re-entering them into your spreadsheet format.

Keep your financial matters in the black with Creative Calc.

## ALL THREE PROGRAMS ARE INTEGRATED FOR MORE COMPUTING POWER.

Creative Filer and Creative Calc work together with Creative Writer allowing you to customize documents combining text, data, and numeric tables.

Ask for the first family of productivity software for your writing, filing and calculating.

New from Creative Software.

- Limited time only.

COMMODORE 64, IBM, IBM PC, PCj, AND APPLE ARE TRADEMARKS OF COMMODORE ELECTRONICS, LTD. BM AND APPLE COMPUTER RESPECTIVELY.

with each new wave of products. While it is true that popular home titles continue to stress entertainment value, the most popular computer games appear to be those that let the player create his or her own levels or game fields. Anyone who doubts this need only look at the overwhelming popularity of Brøderbund's Lode Runner. Every Lode Runner enthusiast I know spends most of the game time creating new levels to play.

## The Fourth Generation

The popularity of construction set software is not new, as readers of this column know. Programs like Pinball Construction Set (Electronic Arts), Rocky's Boots (The Learning Company [TLC]), and Dancing Bear (Koala Technologies) have been popular largely because they allow the user to make unique creations within the context of a predefined activity. The task of creating new games in Lode Runner or Pinball Construction Set is, quite simply, the task of creating a computer program. Construction sets are examples of fourth generation programming languages, and the fact that these programs are so popular in the home market is quite heartening.

These programs are helping their users develop problem-solving strategies and other higher-order thinking skills. Since they can (and are) developing these skills at home, they should probably also be able to develop them at school as well. Unfortunately, some teachers can't see past the game aspects of these programs, and have thus banned them from the classroom. This makes as much sense as banning humorous literature from the English classroom. Teachers should look for the deeper significance in the newer computer games.

With this background in mind, I walked through the massive computer exhibits at the CES looking for some sign of educational software that would appeal to the entertainment and cognitive skill levels of the teenage user. Not surprisingly, I found the answer at the home of Rocky's Boots-TLC. Long known for their support of the young computer user, TLC decided to create a product for the older child. The result of their effort is Robot Odyssey I, an entertaining adventure game that is also a sophisticated programming language. As the first product in TLC's "DigiWorld" series, it represents a significant contribution to open-ended educational software geared to the teenage (and older) market.

Players begin by falling into Robotropolis, a futuristic underground city inhabited by robots. The object is to escape this world and return to civilization. This is accomplished by constructing robots that help the players work their way upward through several layers of this underground
city. Each layer has new obstacles and antagonists that require robots with different skills to help in the escape. As players get closer to the top, the challenge becomes more difficult.

## Complex Circuitry

What distinguishes Robot Odyssey I from other multilevel adventure games is that the player must construct robots that are programmed to display certain behaviors needed to avoid or neutralize obstacles. The task of creating these robots involves learning how to "wire" the robots to perform certain tasks. A special environment called the Innovation Lab lets the player work on robot design. There are three robots at the player's disposal. Each robot resembles a spaceship and has four thrusters to move it in four directions. The robot also has a claw that can be used to pick up things, and bumpers to tell when the robot has bounced against a wall or other obstacle. By interconnecting the bumpers with the appropriate thrusters, the player can create a robot that solves simple mazes.

More elaborate programs can be created with the aid of integrated circuit chips built from standard logic elements (AND, OR, XOR, etc.). Once an array of these elements has been interconnected and brought to the desired pins on the chip, the resultant circuit is burned into a final chip that can be carried inside a robot to be connected with the rest of the circuitry. Amazingly, a finished chip can be carried inside another chip, and this recursive nesting can take place up to 40 times. This allows the creation of quite complex circuits.

## Intelligent Robots

Each of the three robots becomes, in effect, a fully programmed entity. All three robots can carry out their tasks simultaneously. This is like having a word processor, a spreadsheet program, and a videogame running on your computer at the same time. But one of the neatest aspects of these robots is that they can send messages to one another using their antennae. For example, each robot could be programmed to look for fuel crystals. As soon as one robot finds a crystal, it can send a message to the other robots to stop looking for fuel and to find the first robot instead. This type of programming in which computational objects send messages to each other is reminiscent of the sorts of things one expects from Smalltalk, LISP, or Logo-not the sort of thing one expects from a videogame.

To properly explore Robot Odyssey I would take far more space than I have. Suffice it to say that if teenagers have only 2 percent of the educational software, this program shows that they won't need much more.

## Compumate 2100 from SWINTEC

# ITTL INTEREACE WITH YOUR COMPUTER AND YOUR BUDGET 

SWINTEC'S Compumate 2100 letter-quality copy printer has built-in parallel and serial interfaces that make it compatible with your computer . . . no matter whose computer you use. What's more, its very modest price tag of $\$ 649$ is no more than you'd pay for an inexpensive dot matrix printer.
It adds instant letter-quality word processing to your computer capabilities. It handles correspondence $\ldots$. prints out charts and financial projections . . . in fact, gives you a sharp, clear hard copy of anything in the computer.
Microprocessor-controlled Compumate has a logicseeking algorithm that skips over white space to print up to 20 characters a second. The 100-character daisy wheel print element is available in any one of the 10 most wanted type faces. More features: 10,12 and 15 pitch selections and a 256 -character buffer, plus LED
$\square$ Send me more information about the Compumate 2100
$\square$ Have a dealer contact me for a demonstration.

# Questions Beginners Ask 

#### Abstract

Are you thinking about buying a computer for the first time, but you don't know much about computers? Or maybe you just purchased a computer and are still a bit baffled. Each month in this column, COMPUTE! will answer some questions often asked by beginners.

QHow long does a floppy disk last? If I have some disks that are more than a year old, should I copy them onto new disks? How can you tell if a disk is wearing out?

AThe lifetime of a floppy disk largely depends on how heavily it is used and how carefully it is handled.

It's doubtful that you would actually wear out a disk with normal home use. One wellknown manufacturer of floppy disks (3M-Scotch) guarantees its products for 3.5 million passes per track. 3 M calculates that if you updated the disk (rewrote every track) once every hour, it would take more than 200 years to exceed 3.5 million passes. Not many home computer owners would use a disk that heavily. Some disk-intensive business programs which run 40 hours a week might approach that many passes in much less time than 200 years, in which case an alternative should be considered-perhaps a hard disk or a RAM disk. But the casual or moderate user has little to worry about. At COMPUTE! we have some disks that get fairly heavy use for storing word processing files, and after two years they're still going strong.

A floppy disk's lifetime can be drastically shortened, however, if it isn't handled and stored correctly. In careless hands a disk might not even last ten minutes. Disks are particularly vulnerable to magnetic fields from monitors and TV sets, spilled drinks, cigarette ashes, extremes of heat and cold, heavy weights, ballpoint pens used to mark on labels, and even chemical fumes.

Unfortunately, the first clue which indicates a disk is going bad probably will be a lost program or a lost file. One day you'll confidently slip the disk into the drive and discover that a certain file won't load. That's why you should always keep at least one backup copy of important
files on another disk or tape.
There is one clue you can watch for, thoughif you regularly clean your disk drive's read/ write head and notice one day that it's much dirtier than usual, it could mean that the magnetic coating on one of your disks is starting to flake off. It could also mean that you bought some poor quality disks.

> QOn my Commodore 64, when using the command PRINT 7 $\uparrow 2$, the computer will come up with the answer 49.0000001 . Is this a bug in the computer?

ANot really. It's a rounding error caused by the way the Commodore 64 calculates exponentiation. When you ask the computer to figure $7^{2}$, it doesn't actually multiply $7^{*} 7$. Instead, it uses logarithmic tables. Rather than engaging in a long discussion of higher mathematics, let's just say that these tables sometimes lead the computer to an answer which is slightly off. If 49.0000001 isn't accurate enough for your purposes, you can either PRINT 7*7 or PRINT INT(7ヶ2), which extracts the integer from the result.

The Commodore 64 isn't the only microcomputer which suffers from this problem by any means. Certain math operations will result in very small rounding errors on anything from an Atari to an IBM PC. On an Atari with the BASIC cartridge, for example, PRINT 2^2 (equivalent to PRINT $2 \uparrow 2$ on a Commodore) comes out to 3.99999996, while PRINT 2*2 yields the correct 4. The problem was fixed with the BASIC built into the Atari 600 XL and 800 XL .

The quirk which leads to this kind of problem is that computers perform all of their math in binary. When floating-point (moving decimal point) numbers are converted to binary and then back to decimal, small errors can accumulate.

QI recently found several old 60 -minute cassette tapes. Are the 60 - and $30-\mathrm{minute}$ cassette tapes acceptable for program recording? Is there any command or program which can be used to erase these tapes? They contain music and talk.

## ATARISOFT. All the hits your computer is missing.

It's showtime.
Time for ATARISOFT" to show you six exciting, brand new games that are destined for stardom.
Games that can be played on your Commodore 64, IBM PC and Apple II. (Some titles available on IBM PC jr. and VIC 20*)

First, there's Gremlins', based on the characters from the original film presented by Steven Spielberg. Then there's Crystal Castles" where Bentley Bear ${ }^{\text {t" }}$ journeys through all sorts of tantalizingly difficult paths and ramps in his endless quest for gems. In Donkey Kong Jr. ${ }^{\text { }}$ by Nintendo; Junior tries to rescue his father against immense odds. And speaking of Donkey Kong, there's also Mario Brothers ${ }^{\text {s }}$ by Nintendo: This time, Mario and his brother Luigi battle creatures on four levels of floors, encountering all sorts of treacherous enemies.

In Track And Field ${ }^{\text {y }}$ you can compete by yourself or
head-to-head with another player. But each player must beat qualifying times, heights and distances before they can compete in each of the gruelling six events.

Typo Attack is the muchacclaimed, fun-filled program that

allows you to enjoy developing your typing skills at any level.

And still playing to the de-
 light of audiences everywhere are Pac-Man, Ms. Pac-Man, Jungle Hunt, ${ }^{5}$ Battlezone,', Donkey Kong, by Nintendo, ${ }^{2}$ Centipede ${ }^{\text {ma }}$ and Pole Position?

So, if you've been searching for ways to entertain your Commodore, Apple or IBM, treat it to one of the best shows in town, one of the hits from ATARISOFT.
And don't forget the popcorn.

ATARISOFT products are manufactured by Atari, Inc. for use with various computers and video game consoles. ATARISOFT products are not made, licensed or approved by the manufacturer(s) of those computers and video game consoles.
*Titles available on IBM PC jr. are Ms. Pac-Man, Centipede, Donkey Kong, Moon Patrol ${ }^{7}$ and Typo Attack. Available on the VIC 20 is Typo Attack.

ATheoretically，longer tapes are thinner and thus more susceptible to stretching and print－through（signals leaking through the tape and imprinting on adjacent layers of tape）．But we＇ve never had any problems saving programs on 30 －or 60 －minute cassettes．If they are good－ quality tapes，they should work as well as the 10－or 20－minute cassettes generally sold for data recording．However，the longer tapes could be slightly less convenient if you store many pro－ grams on the same cassette．You＇d have to wind the tape further to locate the program you want to load．But even this is a negligible problem if you jot down the tape counter numbers．

It isn＇t really necessary to erase the old ma－ terial on the tape before recording your pro－ grams．The recorder＇s erase head will wipe it out as you record．However，your letter indicates you have an Atari 400 computer．The Atari Program Recorder has a stereo read／write head because the Atari can accommodate an audio track that plays through the TV speaker．When you load your program，you＇ll hear the old audio material along with the bleeps of the data．By typing POKE 65,0 before loading the tape，the bleeps will be silenced and you＇ll hear the audio only．

However，if you do want to erase a tape before using it，the best method is to use a bulk tape eraser（available at electronic supply stores）．

Another way is to insert the tape into an audio cassette recorder，press the record button，and disable the microphone by switching it off or sticking a null plug into the microphone jack．If the recorder has level controls，turn them all the way down．

With an Atari Program Recorder，you can erase tapes by pressing the record and play but－ tons and typing POKE 54018，52．This switches on the cassette motor from the computer．You can turn off the motor by typing POKE 54018，60．

## COMMDDDRE OWNERS：

＂Finally，A Universal Graphics Interface！＇
The ALL NEW＂MICROGRAFIX＂parallel interface by Micro World Electronix Inc．，is a complete switch selectable interface with full graphic capabilities for the VIC $20^{\mathrm{TM}}$ and Commodore $64^{\mathrm{TM}}$ ．It＇s truly the most universal of Interfaces with the capacity to print the Commodore ${ }^{8}$ graphics set，since it is switch selectable for virtually all centronics compatible parallel printers including Daisy wheel printers．
1）Fully intelligent Interface that plugs into the Standard Com－ modore ${ }^{\text {e }}$ printer socket．
2）Complete graphics capability that will allow popular matrix printers to fully pass the Commodore ${ }^{\bullet}$ Printer test（including Inverse text，tabbing，cursor up／down，etc．）．
3）Works with virtually all software，since it provides emula－ tion of the Standard Commodore ${ }^{\bullet}$ Printer．
4）Optional user installed 4 K buffer to speed up graphics and text printing．
5）Complete built－in status and self－test report．
6）Switch Selectable Commodore ${ }^{\bullet}$ graphics mode for most popular printers（Epson，Star Micronics，C．Itoh，Prowriter Okidata，Seikosha，NEC，Riteman，Banana，BMC Panasonic，Mannesman Talley and others）plus a Univer－ sal Switch mode for letter quality printers．
7）Complete with emulate mode，transparent mode，total text mode，ASCII conversion modes that will insure virtually total compatibility with popular Software．
No more ROM changes or extra shelf space taken up．The Micrografix Interface is easier to stock since one interface will support virtually all printers．

# ROM And RAM 

Every group has its lingo. When you first start to get used to computers, there are a few words to learn, a bit of computerese. Two of the simplest, yet most misunderstood, of these terms are ROM (Read Only Memory) and RAM (Random Access Memory).

## Absent-Minded Compułer

Read only memory is called that way because it is a kind of memory in each computer which can only be read. No matter how many times you try, you may never write in ROM. Computers come equipped with ROM because they need to have instructions that tell them how to perform certain functions such as adding or subtracting or even how to send things to disk drives or printers. The ROM memory stores these vital instructions in chips that can't be erased by writing to them or by turning off the computer. Without ROM your computer would be useful only as a doorstop. Just imagine turning your computer off and having it forget how to work the next time you turned it on.

BASIC is usually a set of machine language routines stored in several ROM chips in each computer. Another set of important ROM routines are the input and output routines. These routines instruct your computer on how to communicate with external devices such as disk drives, cassette recorders, and printers. ROMs obviously contain important routines that are needed for doing any kind of work with your computer.

## Extra ROM

Another useful and popular form of ROM is the game cartridge. Yes, those small black boxes that provide you with so many hours of fun are just preprogrammed read only memories. These ROMs in cartridge form are perhaps the fastest way to load a program into your computer. The reason they are so fast is that usually there is no
loading taking place. You plug in the cartridge, and it immediately becomes a part of the computer. The computer has immediate access to the programs and data stored on the cartridge.

RAM memory, although not as intrinsically important to the computer as ROM, serves important functions in the computer. It is the area of memory where user programs are typed in and run. RAM is also used by all the commercial software that comes on disk or cassette. The routines that are located in ROM often have to rely on pointers in RAM to function correctly. Without RAM memory, the computer might not have a screen display, and it would have no such thing as a keyboard buffer to hold extra keypresses. Graphics would not be available either.

## Empty Boxes

All memory in the computer can be described as a series of boxes that can hold something. Let's say that you have 1024 different boxes in which to put things. You could choose to place objects in these boxes sequentially from box 0 on up to box 1023, or you could just decide to place objects into boxes in any haphazard way that you yourself could understand. RAM memory is just like a series of empty boxes that allow you to place numbers into them. The only restriction that these boxes impose on you is that you must never place a number over 256 into any one box. If you have a section of memory that has 1024 spaces, you can claim to have 1 K of RAM memory. The difference between RAM and ROM when compared to boxes is that ROM memory is like a series of boxes that already have objects in them. Even more important, the boxes can't be emptied or altered by the user. The user can only look into the box to see what's in it. ROM could thus be compared to glass boxes. You can see in but can't remove anything without breaking something.

Any programs that run in RAM memory can
SOURINONGEST WORD

## ENTER THE EXCITING HAYDEN NATIONAL WORD CHALLENGE' CONTEST.

## IF YOU'VE GOT A WINNING WAY WITH WORDS, THIS IS YOUR GAME.

Word Challenge. The mindboggling game in which you compete head to head against LEX, the mighty Wizard of Words.
Select the size of your playing square, pick from 26 skill levels, set a time limit, and choose from 5 scoring methods. Then see how you stack up against the Wizard and his 90,000 word lexicon. It's a race against the clock.
You and LEX compete to form words by connecting randomly generated letters. Words are legal if their letters touch in sequence on any side or corner. The more words you find, the better your chances of beating LEX.

When your time's up, LEX displays the words you found and the words he found. You score points for every word you made that he didn't. Word Challenge keeps the score.

Word Challenge is based on Proximity linguistic technology. It operates on Apple ${ }^{\text {ITI }}$ II + , IIe, IIc, IBM PC, ${ }^{\text {M }}$ PC jr. ${ }^{\text {n. }}$ and popular compatibles. Available soon for Macintosh ${ }^{\text {™ }}$ and Commodore 64..

Play Word Challenge alone or with a group. See if your family or friends together are wordy enough to bring LEX to his knees.

## TO WIN OUR CONTEST, GIVE US THE GOOD WORD.

It's easy to play. First buy Word Challenge. Then follow the rules as described on the official Entry Form available only inside specially marked Word Challenge packages. Fill in the letters on the official contest grid to construct the longest possible word. Show your word to LEX. If he has it in his vocabulary, send it in.

First prize for the longest word is $\$ 10,000$ cash.

Second prize is $\$ 3,000$ cash.

Be one of the first 5,000 to buy Word Challenge and enter the contest, and we ll send you a free Word Challenge T-shirt.

Enter now. The contest expires October 31, 1984. Purchase of Word Challenge is required. Contest void where prohibited.

## JOIN OUR WORD ASSOCIATION. THE RIGHT WORD COULD BE WORTH $\$ 10,000$.

To purchase your copy of Word Challenge, see your local software dealer, or contact Hayden Software, 600 Suffolk Street, Lowell, MA 01854, or phone toll-free 800-343-1218.

Word Challenge is a registered trademark of Hayden Software Company, Inc.
Apple and Macintosh are registered trademarks of Apple Computer Inc. IBM PC and PC jr., are registered trademarks of International Business Machines, Inc. Commodore 64 is a registered trademark of Commodore Business Machines.

## HAYDEN. AMERICA'S FIRST FAMILY OF SOFTWARE.

be modified. For example, if you wrote a program in BASIC and then decided that you wanted to modify something in it, you could easily do so. One peculiarity of BASIC programs is that the RAM in which they are located must be continuous. If there were a gap of any sort, like a missing box, the program would not work properly.

## Screen RAM

Perhaps one of the most interesting sections of RAM memory is the screen. It is one of the few RAM locations that are shared by both the central processing unit and the video chip in all computers. What this means is that there is a section of RAM-let's say a 1024 box sectionthat both the computer's main processing chip and the chip that produces the colorful TV image can look at. The reason it is shared is that you must be able to change the screen either by POKEing values into the screen RAM or by PRINTing values onto it. For you to be able to do this, the central processing unit must have access to it. The video chip needs to have access to the RAM because it needs to know what to display on the TV set. The video chip essentially scans screen RAM and evaluates what is stored there. Once it knows what is in the screen memory, it can reproduce an image of it on your TV.

One useful feature that many home computers come equipped with is that more RAM and ROM can usually be added by just plugging a cartridge into the side or back of the computer. In some computers you have to plug the RAM into the inside expansion areas, but this is usually an easy procedure. The reason expandability is such a desirable feature is that it enables the user to program or use larger programs with more functions and commands and that it facilitates the use of alternate computer languages or BASIC enhancements.

## Memory Limiłations

There is one limitation to the use of both RAM and ROM. Each microprocessor, the brain chip of each computer, can access only a predetermined amount of memory at any one time. For example, the popular 6502 processor found in the Apple, Atari, and Commodore computers can directly access only 64 K of memory. The 8088 microprocessor found in the IBM PC and PCjr can access a little over one million bytes. There are other limitations that manufacturers either impose on their machines or are forced to adhere to. For example, Microsoft BASIC will only accept a program up to 64 K long. An example of a self-imposed limitation is that IBM restricted the memory limits of the PCjr to 128 K .

# The Educational Software Explosion 

Kathy Yakal, Editorial Assistant

Even if you didn't buy your home computer as an educational tool, you've probably learned a lot from your interaction with it. Games, home productivity packages, and other computer programs can. teach, but recently there's been a proliferation of dedicated educational software. Software developers and publishers are vying for top positions in educational software, potentially a billion-dollar business.

Experts have said that it was pretty easy to predict who the first 6 percent of computer owners would be, says Marilyn Rosenblum, vice president for product development at CBS Software. They're the same people who have expensive hi-fi systems and Sony Walkmans, people who like new technology.
"The important issue for us and for the future of this industry is who the next 6 percent will be," she says. "The thing that's going to determine that is how truly useful we can make computers."

Software publishing firms have been scrambling over the last few years to figure out how they can influence the next 6 percent to buy. The bets right now are on education. "There's been a tremendous proliferation of manufacturers into the educa-
tional software market," says Jordan Levy, vice president of marketing at Software Distribution Services.

Levy and many others in the industry who attended last summer's Consumer Electronics Show are overwhelmed by the number of publishers who have either entered the market or added educational software to their already existing line. Future Computing predicts that consumers and schools will purchase $6,787,000$ units of educational software this year.

## Bringing School Home

"I think you can trace the recent popularity of educational software to penetration of the home computer," says Richard Khaleel, president of Scholastic, Inc.'s Software Group. Game software was popular initially, he says, due to the popularity of the VCS. "And with the penetration of the personal computer into the business market, we saw the explosion of business software."

Further, home computer sales took off partly because children were using them in schools. "The use of computers in schools is probably one of the main reasons for the popularity of home computers," says Khaleel. Market analysts at the Minnesota Educational Computing Consortium (MECC) agree.

And as more school districts make computer literacy an important part of the daily curriculum, children are exposed in ever-increasing numbers.

## Not Just A Shooting Star

In the rush to find uses for this newly installed base of home computers, a lot of potential applications and inappropriate game ideas have come and gone. With them have gone a lot of software companies. But the concept of education is no fad. "Everyone latched onto education because education doesn't change that much," says Marilyn Rosenblum. "The need to teach children to read and write well will always exist."

Marilyn Rosenblum, vice president for product development at CBS Software.

# Today's most innovative educational software began here 60 years ago. 

At Scholastic, we have something no other educational software company has: 60 years' experience making learning fun for kids.
We began in the schoolrooms of the 20's with the first national news magazine written especially for young people, The Scholastic. Since then, our one magazine has grown into 37 , and we've become the largest educational publisher of books and magazines in the English-speaking world.
Now we've put everything we've learned from five generations of school children into the most innovative family of educational software available today. Scholastic Wizware. ${ }^{\text {TM }}$
Our experience makes Wizware different from all other educational software. It turns learning subjects like geography, writing and spelling into exciting adventures for your children. And because every Wizware game is interactive, kids become deeply involved in what they're learning.
What's more, our experience has taught us the importance of teaching things most other educational software leaves out. Like teamwork, imagination, critical thinking and problem solving. You'll find them all in Wizware.
But by far the most important result of our experience is that your children will thoroughly enjoy learning with Wizware.

There are now Wizware programs for teaching everything from creative writing to computer programming. Here are a few of the ways we bring learning into the Computer Age.
Spelldiver. ${ }^{\text {TM }}$
It's the most ingenious way ever devised for teaching spelling and improving reading skills. Deep beneath the sea lie giant words covered by a strange seaweed called lettermoss. Kids must face ferocious sharks and pesky flippernippers to remove the lettermoss and decipher the words.
Agent U.S.A ${ }^{\text {TM }}{ }^{\text {a }}$
Agent U.S.A. turns geography into an exciting race to save the nation from the ruthless Fuzzbomb. Along with learning geography, children hone their problem-solving and reasoning abilities.
Story Tree ${ }^{\mathrm{TM}}$
Story Tree can bring out the Mark Twain in every child. Budding

Spelldiver, Agent U.S.A. and Bannercatch designed and developed by Tom Snyder Productions, Inc. Story Tree designed and developed by George Brackett. • Agent U.S.A. and Bannercatch available in Atari, Commodore, Apple and IBM versions. - Spelldiver available in Atari, Commodore and Apple versions. $\cdot$ Story Tree available for Apple.
authors create their own mystery and adventure stories. A remarkable feature lets them weave alternate choices into every turn of the plot, and challenges their imaginations to the maximum.

## Bannercatch ${ }^{\text {TM }}$

Based on the classic game of Capture-the-Flag, this is the most sophisticated and fun strategy game for kids available today. Not only do players learn how to devise complex strategies, they also learn how to work together to solve difficult problems.
Scholastic Wizware. Our experience makes all the difference.
Look for Wizware at your local computer store. Or contact Scholastic Inc., 730 Broadway, New York, NY 10003, 212-505-3000.

## LScholastic Software

The most trusted name in learning.

Having worked in educational publishing for a number of years before coming to CBS, Rosenblum's perspective of this "explosion" is different. In educational book publishing, it wasn't so much an explosion as an ongoing event. Educational publishers began to add microcomputer software to their existing lines of books and audiovisual materials.
"What we're seeing here is that a lot of the stuff that's been used in the schools is perfectly appropriate for the home," she says. "A lot of the explosion is just recognizing a new market.'

## Pulling Away From The Pack

Jordan Levy thinks that many software companies sang a swan song at last summer's Consumer Electronics Show. "There will be a lot of people who won't be at the next CES," he says. "A lot of people are going to fall by the wayside, mostly entertainment."

The same thing is bound to happen with educational software over the next few years, say software publishers. But in 1989, consumers will buy about five times as much educational software as they're buying this year, says Future Computing. They predict that $35,072,000$ units will be sold in that year.

Whose name is going to be on those packages? Those companies that have experience working with children, says Scholastic's Richard Khaleel. "People who have experience knowing how people learn have the best chance of creating software that is not really state of the art, but state of the mind," he says. "No new software publisher that does not have a consumer franchise in another market has been able to spend the kind of money yet to be able to establish a basis for consumer trust."
"It's very important for
people who know children, who have traditionally been selling educational materials to children, to get into the business," says Weekly Reader Software Manager Fritz Luecke. "You're going to find fewer unknowns entering the market," he says.

Though parents may feel comforted by familiar names, market analysts at MECC predict that the competitive situation in the educational software market will eliminate those without educational strength and technical skill, as well as adequate marketing ability. "The next 18 months will hold some very hard lessons for those publishers who think the educational buyer is an easy sell," says MECC's Ron Barnes.

## No Fun

In all of the brouhaha over which educational software publishers will emerge as leaders, there's a basic problem that everyone's trying to solve: Who deems a program educational? How do you decide when the educational benefits balance the enjoyment?

The argument seems to focus on just how much emphasis there should be on the entertainment aspects of an educational program, if any. There aren't any real rules yet, though educators try to quantify and set standards, and software designers and publishers try to develop formats that they hope will please parents, teachers, and students.

Those formats vary tremendously. "My belief is that educational software should manifest itself in some kind of discernible change in behavior, like grades," says Thomas Garsh, president of American Educational Computer, Inc. "You don't get through high school by being a good games player or having superior cognitive skills. You get through high school by having good grades. And you do not get accepted

Thomas Garsh, president of American Educational Computer, Inc.
into college with superior kinds of thinking skills. You get into college by passing the SAT and having good high school grades.
'So what we've done is almost totally related our software to curriculum, by grade and subject," he says. "We've given up a few whistles and bangs, which may initially be a disadvantage because it doesn't look as flashy, but the subject is there. I'm not defending that. I'm just saying that is reality. That's our position. In this rush to the market, I don't see many companies taking that position."

## Pupils Of Pac-Man?

Software developer Tom Snyder says it's too early to judge, that it's dangerous to impose restrictions or define too concretely right now. "Even Pac-Man would be educational if you could freeze the action," he says.
"If you freeze Pac-Man or any other game, a couple of things happen," he says. "You get to use your head instead of just knee-jerk reactions. You start verbalizing to yourself what the alternatives are and formalizing them a bit instead of having them remain in sort of an intuitive, physical reaction.
"Beyond that, it really opens the experience up to more even if you've never flown before. When you think you're ready, you can play the World War I Ace aerial battle game. Fight Simulator II features include I animated color 3D graphics a day, dusk, and night flying modes -over 80 airports in four scenery areas: New York, Chicago, Los Angeles, Seattle, with additional scenery areas available r user-variable weather, from clear blue skies to grey cloudy conditions a complete flight instrumentation IVOR, ILS, ADF, and DME radio equipped navigation facilities and course plotting e World War I Ace aerial battle game I complete information manual and flight handbook.

Software developer Tom Snyder.
than one person. If you slow it down, everyone gathers around and you get five people talking to each other about what a decent strategy might be, and introducing the whole social element into it. That kind of interaction multiplies the learning instantly."

## Keeping The Scales Steady

Somewhere between those two opposing viewpoints lie hundreds of software styles, with varying degrees of entertainment and learning. MECC Deputy Executive Director Ron Barnes contends that the learning objective of any piece of software should come first, with the game aspects then designed to increase the child's motivation to learn. Often, he says, educational software is developed the other way around.

DLM Teaching Resources publishes software which is designed to supplement curriculum as first priority. But, they say, what makes their software sell to both schools and homes is that it does not ignore the element of fun. "I think that what software producers are looking for is a correct combination of ingredients to combine into their instructional courses, to keep the interest and focus," says Jim

Hafer, product evaluation supervisor for MicroD.
"There seems to be a bit of a gray line there," he says. "Some have a theory that seems to be working, and that is to make education fun. But there's only so much that can be learned from a simple game as opposed to an in-depth program.'

Richard Khaleel believes that we will see more segmentation between software that makes learning fun and software that is just drill and practice. "It all depends on the age," he says. "In grade school, homework is fun. It's only when things outside of school get more important that schoolwork competes with other interests.
There's always room for both.'

## Pinning Down The Beast

 In the meantime, educators and parents puzzle over how to decide. Not just on what kind of software or computer, but something more basic: whether or not the microcomputer can be used effectively as a teaching tool.And they can be fooled, says Tom Snyder. "There is an erroneous promise, an implication that you're going to be able to do quantifiable things with it, testing how the education is," he says. "Therefore, it's excited educators and educational consultants who say finally, we can start pinning down this educational beast in general."

## The Latest In Learning:

## New Trends In Educational Computing

The House That Jill Built lets youngsters design, build, and animate a variety of houses. Developed by Joyce Hakansson Associates for CBS Software.

## Selby Bateman, Features Editor

Construction sets, interactivity, networking-these are some of the trends in the quickly evolving educational software market. A swarm of new companies have entered the competition, and a variety of different educational approaches are being tried.

Few subjects will generate arguments faster in the microcomputer industry than what makes good educational software.

Interest in computer-based learning programs has never been greater, nor the debate over future directions more vocal. Parents and teachers are requesting more and better packages. Computer companies are courting software firms that specialize in educational products.

Educational Software

And greater numbers of educators are getting involved in the production and distribution of these programs.

Increased competition in this growing field is creating several important trends that will directly affect both the quality and the kind of future computer learning programs.

## Challenging The Technology

Even staunch supporters admit that educational computer programs generally have a long way to go to reach their potential, but the software is evolving rapidly.

There's now "some clarity about what educational software is," says Marilyn Rosenblum, vice president of product development for CBS Software, a company that produces several lines of educational programs with such developers as Joyce Hakansson Associates and the CTW Software Group from Children's Television Workshop.
"I also think the technology is being challenged much more than it was a year ago. Things that would have been acceptable then are no longer acceptable," she says.
"We're getting away from a lot of drill and practice," adds Marge Kosel, director of microcomputer courseware for Sunburst Communications, a company that produces educational software. "Designwise, drill and practice is the easiest [to produce]. Now, there are a lot more simulations and problem-solving. The technical quality of software has really improved."

## Design Your Own Robots

Greater emphasis is being placed on the amount of interaction that occurs between the student and the computer in several of the newer educational packages. And a higher level of sophistication has been built
into other programs, as some software developers reach for an older, teen-oriented educational market.

Take, for example, The Learning Company's new Robot Odyssey I (Apple II family, $\$ 49.95$ ). Inspired by the company's earlier, Rocky's Boots, the new package is both a game and an educational tool. It's one of a growing number of products called construction sets, or builders-a programming style made popular by Bill Budge's Pinball Construction Set.

Programs written in this style are highly interactive and allow the player to control

In Robot Odyssey I, players must build robots to escape from Robotropolis, a futuristic underground city inhabited by robots. Marketed by The Learning Company, Robot Odyssey I is the first program in their new DigiWorld series, which is aimed at the teenage market.
many aspects of the game environment. In Robot Odyssey I, for instance, the player actually designs robots and builds computer chips, which are later used to help the player escape from a futuristic robot-run city, Robotropolis. The program features built-in tutorials to teach the basics of digital logic and an Innovation Lab in which players design and test chips and robots.

## Atari's Futuremakers And Milestone

New programs from Atari, Inc., also reflect the trend toward
greater sophistication. The company's Milestone Series from Atari Learning Systems and its Futuremakers simulation programs are quite interactive and feature a hands-on approach to learning. The AtariLab science packages, part of the Milestone Series, let youngsters simulate more than 100 different experiments using the computer and a laboratory kit.

## Socrates On A Chip

The freedom to move almost anywhere within an educational program is an important aspect of the Arrakis Advantage, a family of educational software marketed by Prentice-Hall for Apple, Atari, Commodore, and IBM PC and PCjr computers.

Directed at students in grades 7 through 12, the Arrakis Advantage series is based on the Socrates Learning Environ-ment-a dialectical teaching technique borrowed from the Greek philosopher, notes Charles de Martigny, managing director of Arrakis Systems.
"Where other programs operate in only one direction, Socrates [the system] can move in any direction the user wishes," he says. "Students can interrupt, ask questions, test themselves, review and explore other subjects and, in effect, talk directly to Socrates as naturally as they would converse with a teacher."

## Learning Is Parallel, Not Serial

Students need that kind of flexibility since learning is not strictly linear, with one event following another in a predictable chain. Instead, information arrives in a parallel fashion, with information coming from a variety of complementary sources, points out Emiliano De Laurentiis, director of advanced research and development for Arrakis.
"People should start looking for software that's more intelligent; software that allows

you to interact on a normal level, to type in a sentence, to ask questions," he says. "The technology exists now. There's no reason why it shouldn't be implemented."

The Arrakis Advantage series, available this fall, will initially include home programs that complement school curricula in algebra, geometry, biology, chemistry, physics, and statistics.

## The Hakansson Touch

Another proponent of the construction set approach is Joyce Hakansson, whose independent software development firm has already produced 19 "playful educational" packages for CBS Software, Simon \& Schuster, Spinnaker Software, and Milton Bradley.
"We like to build exploratory worlds for children to investigate-worlds full of sparkling graphics and music and a good measure of giggles," she says. "I want every aspect of a program, even the most subtle, to serve an educational purpose. If a child builds words, then building words should be a powerful tool to make something happen so that the reward is inherent in the activity. We feel a program should validate and support a child's natural intuition and enthusiasm for discovery."

Among the newer programs developed by Joyce Hakansson Associates is The House That Jill Built (CBS Software), available now on disk for the Commodore 64 and this fall for the Apple II family.

## Build If Your Way

Created for children five years of age and older, the program lets the player design and build a house from the ground up. Youngsters furnish, decorate, and animate the environments simply and easily, but the program also can be used by older children and even adults in
more complex ways.
Working from electronic blueprints, you choose one of a variety of four-story houses to build. Doors, windows, and stairways must be placed throughout the house. Exterior styles must be selected (Victorian, modern, or colonial). And once the outside of the house is complete, you then design, decorate, and furnish the interior. Tips on design and notes on architecture are included in the manual.

As the installed base of computers has increased, some software producers who previously concentrated their attentions on a school-based market

Youngsters count as many crops as they can before the sun sets in DLM's Number Farm.
are coming into the home with programs to supplement their curricular packages.

## It's "Arcademic"

DLM Teaching Resources of Allen, Texas, currently offers hundreds of educational materials for schools. DLM has made the transition into the home software market as well with its Arcademic Skill Builders series in math, language arts, and other areas.

Educational software companies with strength both in the school and in the home will have the best chance of survival, says DLM's Karen McGraw, project editor for microcomputer software and a
former teacher. DLM emphasizes content in its packages, she adds, but with a presentation that is also fun for the user and with programs that fully use the capabilities of the computer.
"But we don't want a product just because it is an innovative use of technology, if it's not married to educational validity. We don't build software and then make it fit the child.'

## Sunup, Sundown

In one of DLM's preschool educational games, for example, a timer is included to let the child know how much time is left in the program. Rather than using a clock, which might have no relevance to a four-year-old who can't yet tell time, the program employs a day-to-night cycle to accomplish the same thing.

At the start of the game, the sun comes up. As the game progresses, the sun crosses the sky and then starts to come down as the game draws to a close. When the sun sets and night comes onto the screen, the game is over.
"We use real-world things that are important to a child, that a child can understand," says McGraw. "Unless you really know about education, unless you really understand the mind of a child, you would never think of it." Drawing on its experiences as a curriculumbased, educational-software producer, American Educational Computer (AEC) is also among those school-oriented software companies which have entered the home market.

## "Tested And Tried"

An educational program in the home can be much more effective if it's first been shown to be successful in the schools, argues AEC president, Thomas B. Garsh. "It's been tested and tried and is based on sound educational pedagogy," he says.

# ONLY NRI GIVES YOU TOTAL COMPUTER SYSTEM TRAINING <br> More practical experience as you 

## COMPUTER • MONITOR•DISC DRIVE - PRINTER • AND SOFTWARE...

## It's all included with NRI at-home

 training in Microcomputers and Microprocessors. And only with NRI training.If you really want to learn how to work on computers, you have to learn how to work on computer systems. Only NRI includes a complete system with your training...total training that gives you hands-on experience with computers, peripherals, and software.

## Get Inside the Famous TRS-80

 Model 4 ComputerYou'll work with one of the most popułar computers ever designed. Learn programming techniques for troubleshooting . . .go inside to expand its RAM from 16 K to a powerful 64 K . . . even install a double density floppy disc drive.

You'll become familiar with computer languages...run software that demonstrates computer operation . . .even become proficient at modifying programs to fit your business or family computing needs.
Add High Performance Peripheral Printer

Only NRI gives you total system training with the flexible Gemini 10X printer as part of your hands-on learning. Working with it, you'll get practical experience in adding peripherals, learn maintenance and servicing operations. And you'll use it for hard copies of important programs, business records, and word processing.

## Understanding Built On Experience

You start with the basics, rapidly build
on the fundamentals of electronics with bite-size lessons to master advanced concepts like digital logic, microprocessors, and computer memories.

You'll use the exclusive NRI Discovery Lab ${ }^{\circledR}$ to see what makes transistors tick build and test working electronic circuits that duplicate key computer circuitry, construct digital logic circuits that demonstrate computer performance. And, you'll probe into the very heart of your computer using the Discovery Lab and professional digital multimeter included in your training program.

Do It at Home in Your Spare Time
NRI trains you in your own home at your convenience. You learn at your own pace, backed at all times by your own NRI instructor and the entire NRI staff of educators and engineers. They're always ready to answer questions and help you over the rough spots to keep you moving toward your goal.

## Free Catalog Tells Much More . .

 Send TodaySee all the interactive training equipment you get in this state-of-the-art course in today's technology. Look over the lesson outlines and descriptions of the exciting experiments you'll perform. And look at other high-tech career fields like Robotics, TV/Videol Audio Servicing and Data Communications.

Mail the coupon today to see how NRI can give you the skills and confidence you need to start a good-paying career as a microcomputer technician.

"We know that if a parent buys it for a fifth-grade student and he or she gets better grades, then the parent comes back, says it worked, and buys it for the sixth-grade child."

The movement of software from the school to the home is accelerating. Control Data Corporation, developers of the widely used Plato system of educational software, now has more than 12,000 hours of courses that include everything from instruction in basic skills and computer literacy to educational games and advanced calculus. And the company is in the process of converting many of its packages for use on personal computers like the Apple II family, Atari, IBM, and Texas Instruments.

## The More The Merrier

A related trend over the last year or so is the entry of large corporations, especially established educational publishers, into the home software field. Companies like Random House, Prentice-Hall (Arrakis Systems), SFN Companies (Mindscape), Xerox (Weekly Reader Software), Scholastic, Simon \& Schuster, and Fisher-Price are bringing their talent, marketing muscle, and reputations into the computer learning field.
"And that's very good," says Fritz Luecke, manager of computer software for Weekly Reader Software. "Most of them bring something to the business that other traditional software companies might not bring, and that is a different kind of marketing expertise.
"They also bring, in many cases, a new way of packaging, a new way of adding things to a program to make it a total program, which is what we feel we have done with our products," he adds.

## What Children And Parents Want

Giving children items with

# Choosing The Best Educational Software 

Selby Bateman, Features Editor<br>Sharon Darling, Research Assistant

Of the thousands of educational software programs available, which ones are worth your time and money? Here's a short lesson from the experts.
"One recommendation I always make to parents-one that not enough people are making-is that you should really begin to look for educational software for your three- or fouryear old child," says William Bowman, chairman of Spinnaker Software.
"That's the time to begin thinking about buying a home computer and getting educational software. It's going to be easier for you to find things that are generally applicable to the learning skill areas of young children than it will be to find the more specific software for older kids," he adds.

## Getting Involved

Spinnaker's educational software lines include the new Fisher-Price Learning Software for children from three to twelve years of age, as well as such best-selling programs as Kindercomp, Alphabet Zoo, In Search of the Most Amazing Thing, and Kids On Keys.
"The next real criterion is that the software's got to be fun," says Bowman. "If it's not fun to use, kids won't use it no matter what their ages are-and that's where an awful lot of educational software falls down. The next thing for a parent to do is to consider how much he or she is going to be involved with the child. A little involvement is always required. But some software, like Spinnaker's, really expects the parent to be more involved," he adds. "The software is a little bit deeper, it's a little more advanced in terms of what you can do with it."

## Trying if On For Size

Getting educators and software developers to agree on a set of specific guidelines would be almost impossible, given the many conflicting views which abound in the computer-based learning field. But there are a few fundamental pieces of advice for anyone buying educational software. The following tips from educators, software houses, and leading independent program developers may be of help as you wade through the flood of educational software packages:

- Shop at a software store that allows you to run some programs prior to purchase, or that lets you buy packages on approval. Such stores may not be easy to find right now, but retailers are discovering that an increasing number of customers are demanding more than just the promises on the outside of a package to buy an educational software product.

Now, you can introduce your Commodore $64^{\text {TM }}$ to the Work Force: affordable, easy-touse software and hardware that will unleash the power you always expected from your Commodore $64^{\text {TM }}$, but thought you might never see.

## PaperClip ${ }^{\text {Tu }}$

is simply the best word processing program of its kind-loaded with advanced features, yet so easy to use even a novice can get professional results. With SpelliPack ${ }^{\text {n"w }}$, it even corrects your spelling! Once you've tried it, you'll never use a typewriter again.

## The Consultant ${ }^{\text {iu }}$ <br> (formerly Delphi's Oracle)

 is like a computerized filing cabinet with a brain. Organize files for recipes, albums, or the membership of your service club. Then search, sort, arrange and analyze your information with speed and flexibility that's simply astounding.
## SpellPack"

teaches your 64 to spell. It checks an entire document in 2 to 4 minutes against a dictionary of over 20,000 words. And you can add up to 5,000 of your own specialized terms. Type letter perfect every time!

## BusCard II ${ }^{\text {tu }}$

is a magic box that lets you transform your humble home computer into a powerful business machine. It gives you the added power of BASIC 4.0, and lets you add IEEE disk drives, hard disk, virtually any parallel printer, and other peripherals without extra interfaces. Completely software invisible.

## B.I. $-80^{\text {m }}$ Column Adaptor gives you crystal clear 80 column display. Using the highest quality

 hardware, we've eliminated the problems of snow, fuzziness and interference. Basic 4.0 commands greatly simplify disk drive access. Switches easily from 40 to 80 column display. Discover the true power of your Commodore $64^{\text {m }}$. Ask your dealer about the Commodore $64^{\text {M }}$ Work Force, from Batteries Included-the company that doesn't leave anything out when it comes to making things simple for you.which they are familiar-books, stickers, posters-in addition to the software package makes it easier for the youngsters to relate to the product, Luecke says.

While numerous educational software companies are expanding their operations from school orientation to include the home market, the growth is very much a two-way street. Other companies, which have previously sold software strictly to the home, are approaching schools with their products. And the success which some microcomputer hardware manufacturersespecially Apple Computerhave had in donating products to school systems, is now spurring more software companies to try similar tactics.

Using the slogan, "Be a hero, software your school," Scarborough Systems of Tarrytown, New York, is embarking on a major schooldonation project this fall.

Those who purchase Scarborough educational programs between September 15 and December 15 will find a coupon in each package enabling them to donate a piece of educational software to the school and teacher of their choice. The donated program does not have to be the same one purchased.

The purchaser sends the coupon and $\$ 3.50$ for postage and handling to Scarborough. The company will then donate the software to the school. A gift card telling the name of the donor and the name of the dealer where the software was purchased will be included in the donation.
"We think it's a unique program, and it may provide up to $\$ 4$ million in the value of computer software-that's 125,000 programs," says Sanford K. Bain, vice president of marketing for Scarborough Systems. The company has computer software for four machines-the Apple II family, Commodore 64, IBM PC/XT/jr, and the Atari
"Buying blind" is the way Dr. Sam Barkliss, chief executive officer of Computerose, Inc., an educational software firm, describes the predicament most parents and some teachers find themselves in when purchasing educational packages. They should be offered the opportunity to test the educational value of software before a purchase.

## But What Does It Really Do?

- Determine what age and learning levels the software is designed for. Once that is established, find out exactly what the program intends to teach, says Leigh Mosley, an educational consultant at Peachtree Software. "A parent should ask, 'Is my son or daughter going to learn from it?'

Some companies are better than others at telling you who the target audience is, what level of learning is required, and what the goals of the packages are. Always keep in mind the software user-the child's age, learning level, interests, and dislikes.

- Be aware that the nature of "educational content" is often difficult to assess-and usually the subject of much debate among educators and software houses. Many educators and software producers believe that specific learning objectives are crucial in producing good computer-based educational products. Others stress the validity of programs which invite youngsters to explore and "play" in a less structured learning environment.

## The General And The Specific

For example, software that stimulates a student's creativity might be more useful than a program that deals with a specific learning problem in school, notes Kent Kehrberg, director of software for the Minnesota Educational Computing Consortium.
"It may be difficult for a parent to match up a very specific program with a problem a child is having in, say, algebra," he says. "In a case like that, it's very difficult for someone besides the teacher to pinpoint [the problem]."

- Read published reviews and other articles about software packages and the goals of various software companies. The more knowledgeable you are about manufacturers and their products, the easier your task when picking out new software.

## Tutorials, Simulations, And Drill-And-Practice

For example, when shopping for software, parents should know the three basic types of educational programs-tutorials, drill-and-practice, and simulations, notes Sherwin A. Steffin, vice president for research and development at Eduware Services, Inc.
"Tutorials help you attain a new skill or understanding," he says. "They generally ask the question, 'How to?' With drill-and-practice, you already know how, but want to know better, so you need repetitive exercises." Simulations can offer examples of the way things work in just about any field.

- Consider how much replay value, or depth, a product has. Will the child use the package a few times and tire of it, or is there enough variety and challenge to offer a stimulating environment?

## The Making of ALegend.

Both tractor \& friction feed are

Prints a crisp
original, plus up to three copies.

Up to 142 columns in compressed printing mode.

Centronics parallel interface standard; RS232C optional.

Serial impact dot matrix in two models: $80 \& 100$ cps.

New square dot technology for higher resolution \& near letter-quality print (Model 800).

Bit image graphics add to legend's versatility:

Bi- directional logic seeking for fast. output:

Features like these make our new dot matrix impact printer a Legend. While a low price makes it a near miracle! Imagine, all this and more for less than $\$ 350$. That puts you into our 80 -cps Legend 800 model. And if you're looking for something even faster, look into our 100-cps Legend 1000.

See them both at a dealer near you. Or drop us a line for facts by mail: CAL-ABCO PERIPHIERALS DIVISION, 14722 Oxnard Street, Van Nuys, CA 91401. Telephone (818) 994.0909. Toll free 1-800-321-4484. Telex 662436. Dealer inquities invited.
family.
"Obviously, we're doing it because we think it reflects a favorable image for the company," Bain says. "We strongly believe the validity for these programs has to come from the schools. And our donation program allows schools to sample software without great expense on their part."

## To Network Or Not To Network?

One school-based trend that disturbs DLM President Andrew W. Bingham is the tendency for schools to network their computers, which Bingham says can work against innovative use of the computers.
"It almost scares me, because I think the evolution may ultimately lead us to miss the revolutionary potential of software," he says. "When there are just two or three computers in a school, teachers will use them flexibly and individually.
"When the school gets more computers, they bring them all together into one room, because it's easier to control, easier to administer. Then they want a networking system," says Bingham. "What you get is students being marched to the computer for their 20 minutes of instruction and marched back to their seats."

Bingham urges parents and teachers to explore innovative uses of the computer rather than trying to emphasize convenience of management.

No matter what the area of computer-based educational programs, software companies and educators all agree that the field is still in its infancy in many ways. And expectations for the future are bright. "I think we're going to see an explosion in the next couple of years," says Sam Barkliss, chairman of Computerose, Inc., an educational software company. "I think we're going to see some astonishing things."

As William Bowman puts it, "Does the software provide multiple paths to creativity, and does it accept multiple paces from different children?"

## The Price Tag For Learning

- Price and future availability of software from the same company can be important factors. Depending on the needs of the student and the goals of a company's software line, you may wish to purchase an entire series of complementary programs over time. How much this will cost you and its effects on the student's learning goals then become very important.
"A lot of people out there are getting too great a price for what they're selling, and for what the market will support," says George Esbensen, national sales coordinator for MicroEd, a Minnesota-based company which produces educational software. "A lot of what's being passed off as educational software is not."
- Take your child to the store when selecting software. This can be especially helpful-and save you later dis-appointments-if the child can actually see the program working in the store. If that's not possible, at least you can get a better idea of some of the likes and dislikes of the youngster for whom you're purchasing the program.

## Sophistication, Power, And Interaction

- How flexible is the software program? Are there built-in options which allow a variety of challenges and motivational changes as the user works with the program? As computers become more powerful and software becomes more sophisticated, the level of interactivity between user and program is increasing dramatically. The best educational software takes advantage of that power and sophistication.
- Is the software both easy to use and error-free? Educational programs which freeze up or frustrate a user can immediately discourage users, especially younger children. Be aware of both potential problems as you evaluate software you see or that you've purchased.

Fritz Luecke, manager of computer software for Weekly Reader Software, suggests that you determine how easy and helpful the program guide booklet is that comes with the package. Many parents, teachers, and students want to be able to insert a program into the computer and use it without having to use a guide, particularly if that guide is confusing or incomplete.

## NEA Teacher Certified

Finally, you might want to look at the NEA catalog of educational software. With the proliferation of educational software packages, the job of separating the good from the mediocre gets tougher every day. For more than a year now, the National Education Association (NEA) has been trying to give some guidance in this area. Approximately 50 NEA reviewers have been testing educational programs submitted by software authors and publishers. Those which meet the NEA's stiff requirements are given an "NEA Teacher Certified" stamp of approval, and are included in a catalog of approved software.

# The Tester 

Joseph Kattan

Multiple-choice tests have been standard for years. Now anyone who wants to create a multiple-choice test on his home computer can easily do so. Tests can be devised to teach youngsters anything from history to sports trivia. Just fill in the DATA statements with the questions and answers and the program will do the rest. Versions that work on the Commodore 64, VIC-20, PETs, Apples, Radio Shack Color Computer, Coleco Adam, IBMs and TI-99/4A are included.

One of the most frequently cited reasons for purchasing a personal computer is its great potential as an educational tool. The home computer is widely used to teach children to spell or perform simple arithmetic calculations and to drill adults on anything from foreign languages to organic chemistry. A well-designed instructional program can produce spectacular results in improving a student's command of a subject. A poorly designed program, on the other hand, will frustrate, rather than teach.

Computers, for better or worse, cannot yet think. If the programmer tells the computer that Washington is the capital of the United States, the program will be less than kind to the hapless user who responds that Washington, D.C., is the capital. If the programmer tells the computer that avoir means "to have," pity the French student who answers "to possess." These are, of course, soluble problems, but they illustrate one weakness in computerized instruction. No matter how well designed the program, there will always exist a correct answer to some question that the program will not recognize. You can instruct a program to accept Washington, Washington, D.C., and Washington, DC, as the answer to the capital question, but how do you cover all of the synonyms of a word like fantastic in a foreign language translation program?

## No Ambiguity

There is one kind of testing that a computer handles exceptionally well, because it is not required to reason: multiple-choice. It takes little
effort to insure that the answers to a multiplechoice test are free of ambiguity, which is why all of the standardized testing in our schools tends to be multiple-choice. These tests, moreover, require less effort on the part of the user than answer-oriented tests, and can be used together with the more rigorous answer-oriented tests to form a very effective instructional package.

## Remembering To Answer

Designing an effective program for a multiplechoice test is no easy matter, however. A simple and commonly used algorithm selects a question from DATA statements at random and then reads four or five different answers from the DATA statement, together with a code that identifies the correct answer.

There are several deficiencies to this solution. For one, it consumes tremendous amounts of memory, as it gobbles up bytes both for the correct answer and for the dummy answers that have no use other than to serve as the incorrect choices. In addition, the program user is always presented with the same set of choices, and in the same order, for each question. The user may well get into the habit of remembering that the answer to a question is C without learning the answer itself.

A more elegant solution should present truly random choices for each question. The user should rarely, if ever, encounter the same choices for a given question. The program, moreover, will be more compact because every answer in its DATA statements will be a correct answer to some question. With this method, the program will select a question from a DATA statement at random, will read the answer to that question from the same DATA statement, and then read four more answers at random to present as false choices. This method insures that the same answer is not presented as two separate choices (since random selection could cause that result) and arranges the order of the answers at random. The U.S. capital may be $C$ on one run of the test, but A or B or D on another.

## YOU'VE JUST FOUND SIX OF THE BEST.

OBECTIVE: KURSK" is the grand-tactical simulation of the southern half of the Battle of Kursk - the largest tank battle of World War II. Consider its scope: 12 German divisions and 9 Soviet corps - a sum total of more than 4000 tanks! It is the first computer game ever to resolve such a massive battle down to every tank, every gun, every infantry squad! $\$ 39.95$.

REFORGER '88". Once every year, NATO embarks on "Reforger," a military exercise that tests its ability to transport American reinforcements from the U.S. to Frankfurt during a simulated Soviet strike of West Germany. Now, REFORGER ' 88 makes thé simulation available to every ardent wargamer. The Fulda Gap is chosen as the focal point of the Russian attack in this grand-tactical wargame. \$59.95.

All games are on 48 K disk except for 50 MISSION CRUSH (40K disk).
ATAR ${ }^{\circ}$ is a registered trademark of Atari, Inc.

COMPUTER AMBUSH* is a gut-wrenching simulation of man-to-man combat in the middle of a half-ruined French town during World War II. You play a squad sergeant (U.S. or German) in command of nine other infantrymen. Each man has a name, individual combat skills, even a personal background! The fighting is so fast, so real and intense, you'll experience the sweat and death of war! \$59.95.

COMPUTER BASEBALL". Voted "1982 BEST COMPUTER SPORTS GAME" by Electronic Games Magazine, Computer Baseball" lets you manage any NL or AL team of past and present. All the options of a real manager are at your disposal. You can even make up your own imaginary teams! \$39.95.

50 MISSION CRUSH:. As the pilot of a World War II B-17 bomber in this roleplaying game, can you survive 50 dangerous but exciting raids over France and Germany to earn the crushed cap of a true veteran? Find out as you travel back to 1942 as part of the 8th Air Force Bomber Group. \$39.95.

GALACTIC ADVENTURES", a science-fiction role-playing, tactical combat, adventure game, will transport you literally out of this world - to a spaceport of a strange planet. You must acquire combat experience and advanced skills before you can fly off to different worlds in search of treasures and to do battle against alien monsters. You can even create your very own adventures. \$59.95.

Look for these games at your local computer/software or game store today!

## STRATEGIC SIMULATIONS INC

If there are no convenient stores near you, VISA \& MC holders can order direct by calling 800-227-1617, ext 335 toll free. (800-772-3545, ext. 335 in California.) To order by mail, send your check to: Strategic Simulations Inc, 883

Stierlin Road, Bldg. A-200, Mountain View, CA 94043 . Please include $\$ 2.00$ for shipping \& handling. (California residents, add $6.5 \%$ sales tax.) All SSI games carry a 14 -day "satisfaction or your money back" guarantee.

## Cowruilys Second Book of Commodore 64 Games

Sixteen outstanding games, from detalled simulations to fast-paced machine language arcade games. Run for president in "Campaign Manager," defend yoursell agalnst sharks and acld raln in "The Frantic Fisherman," or defend a world in "AstroPANICI" Photograph the loch Ness monster, baitle in an arena, or establlish trade routes to incla. The best games from COMPUIF and COMPUIE's Gazelte, and some appearing here for the first time anywhere. Articles show you how to design a videogame and explaln the Intricacles of writing your own text adventure.
$\$ 12.95$
ISBN 0-942386-64-7

## Cowpuret's Mochine Language Rouitines For the Commodore 64

Somelimes BASIC is just nol fast enough, or versatile enough, for programming on the Commodore 64. Machine language (ML) is. But creating ML routines can be dilificulif for the beginning or Intermediate programmer. This collection offers ready-to-use ML routines that can be easily inserted into BASIC programs, as well as stand-alone routines that make the 64 even more powertul. Valuable programming aids such as one-key commands, automailic line numbering, and program searches are here. Roulines useful in games and graphic design are also included. There are even complete machine language programs to help in the crealion of custom characters and sprites.

## Compuril's quide to II Sound \& Graphics

Using dozens of examples and clear, nontechnical explanations, COMPUTEIS Gulde to 11 Sound and Graphlos introduces you to the tremendous sound and graphics capabilifies of your It home computer. This book includes exciling arcadestyle games, challenging educalional programs, a ver salile sprite editor and many more useful ready-to-type-in programs. Whether you're a beginning II user or an experienced programmer, this is a book youll refer to again and again

II owners who want to put their computers to work will appreciale the many useful programs: soriling routine, checkbook adder, data manager, spreadsheet program. electronic card file, appoint: ment calendar, and more. The home applications are supplemented by a clearily written introductory chapter that explains the many features of 11 Exiended BASIC.

[^3]
## Segregated Data

Even this method, however, has a potential pitfall, and the solution discussed here resolves it. Let's take a U.S. history test as an example. The answers to such a test may be George Washington, or Philadelphia, or 1776. Obviously, it would be quite absurd to present Philadelphia or 1776 as possible answers to a question calling for the name of the first president. The solution to this problem is to segregate the DATA statements containing the questions and answers into different areas of the program and to select answers to each question only from a valid area. For example, DATA statements between 1000 and 1999 could contain questions concerning names of persons; DATA statements between 2000 and 2999 could contain questions concerning places; and so forth. The program chooses an area at random and then stays in that area to present the incorrect answers. If the answer to the question selected is George Washington, the four incorrect answers will always be names of persons.

This solution has an added advantage. It allows for the inclusion of diverse subjects on a single test, with the testing either confined to a subject chosen by the user or mixed at random by the computer. This program is intended primarily for single-subject tests that require the segregation of answers by types, as in the U.S. history example above.

## How It Works

The program relies on two arrays- $Q$, which stores the number of questions in each category, and $T$, which selects the answers at random. The variable N is used to store the group of questions and answers to be called. The question and answer are selected by the computer at line 300. Since answer groups are stored in DATA statements beginning with 1001, 2001, and so forth, the program adds that number to a random number from 1 to the number of questions for the appropriate group, as indicated in the $Q$ array. For example, if the question and answer are to come from group 1, for which questions and answers are stored in lines 1001 through 1011, the program looks to the variable $Q(1)$ to ascertain the range of random numbers to generate.

Once a question and answer have been read, the program uses the same random number formula to look up the incorrect answers. It stores the random numbers (data line numbers) in a $T$ array (line 330) and makes sure that none of the numbers in that array is equal to the line number of the correct answer or to the number of another element in the array (line 335). At line 340, the program chooses where to place the correct answer, which can be any choice from one to
five, and then proceeds to place all of the choices on the monitor or television screen. Once an answer is entered, the program indicates whether or not it was correct. In the case of a correct answer, the program waits for two seconds (lines 400 and 410) and then constructs a new screen. If the answer entered is incorrect, the program waits for the RETURN key to be pressed before moving on to the next screen.

## Screening Keys

One other matter is the little subroutine beginning at line 800 . The entire subroutine could be replaced with a single INPUT statement. The advantage of the subroutine is that it screens out unwanted keys (in this case, anything but a number) and maintains the integrity of the screen display. In addition, the subroutine does not attach a question mark to a prompt, allowing you to insert it where it is appropriate and omit it where it is not. Study the DATA statements beginning at line 1001 and you can see the flexibility afforded by the subroutine.

This program is obviously meant to be modified. When modifying it for your own use, pay special attention to the $Q$ array. The array should be DIMensioned to the number of answer categories in the program. The same number should be placed in the variable SUBJ. The elements of the $Q$ array should be equated to one more than the number of questions in the appropriate category. Finally, the questions and answers should be placed on the same DATA statement, and the DATA statements should be arranged in increments of one beginning with a line number of $\mathrm{N}^{*} 1000+1, \mathrm{~N}$ being the number of the group. Make sure that neither the questions nor the answers contain any commas, since the BASIC interpreter will take the commas to indicate the end of a string.

## Microsoft And TI－99／4A Version Notes

## Jeff Hamdani，Editorial Programmer

The Microsoft version of＂The Tester＂（Pro－ gram 2）runs on the Commodore 64，the VIC－20，all PETs，the Apple II + ，IIc，and IIe，the Radio Shack Color Computer，the Coleco Adam，and the IBM PC and PCjr．If you have a VIC without memory expansion， remove all REMs and spaces when typing in the program．With an IBM PC or PCjr，make the following minor changes：
Add line 100 ：
100 RANDOMIZE（0）
Change line 220 to：
220 PRINT：PRINT＂YOUR CHOICE：＂；
Add line 225：
225 Z\＄＝INKEY\＄：RD＝RND：N＝VAL（Z\＄）：IF $\mathrm{Z} \$=\cdots \prime \prime \prime$ OR（ $\mathrm{N}<1$ AND $\mathrm{N}>4$ ）THEN 225 ELSE PRINT N

Last，in Program 2，line 930 contains a statement to clear the screen．Replace this with the appropriate statement for your computer．For instance，on the Apple，line 930 would read：

## 930 HOME：RETURN

The TI－99／4A version of The Tester （Program 3）will run in either Console or Extended BASIC．

AP 815 IF $Y>1$ THEN $Y=Y-1: ? " \quad " ;$ NUM $\$$ $=$ NUM $\$(1, Y)$

# A Beginner's Guide To Typing In Programs 

## What Is A Program?

A computer cannot perform any task by itself. Like a car without gas, a computer has potential, but without a program, it isn't going anywhere. Most of the programs published in COMPUTE! are written in a computer language called BASIC. BASIC is easy to learn and is built into most computers (on some computers, you have to purchase an optional BASIC cartridge).

## BASIC Programs

Each month, COMPUTE! publishes programs for many machines. To start out, type in only programs written for your machine, e.g., "TI Version" if you have a TI-99/4. Later, when you gain experience with your computer's BASIC, you can try typing in and converting certain programs from one computer to yours.

Computers can be picky. Unlike the English language, which is full of ambiguities, BASIC usually has only one "right way" of stating something. Every letter, character, or number is significant. A common mistake is substituting a letter such as O for the numeral 0 , a lowercase 1 for the numeral 1, or an uppercase B for the numeral 8. Also, you must enter all punctuation such as colons and commas just as they appear in the magazine. Spacing can be important. To be safe, type in the listings exactly as they appear.

## Braces And Special Characters

The exception to this typing rule is when you see the braces, such as \{DOWN\}. Anything within a set of braces is a special character or characters that cannot easily be listed in a printer. When you come across such a special statement, refer to the appropriate key for your computer. For example, if you have an Atari, refer to the "Atari" section in "How To Type COMPUTE!'s Programs."

## About DATA Statements

Some programs contain a section or sections of DATA statements. These lines provide information needed by the program. Some DATA statements contain actual programs (called machine language); others contain graphics codes. These lines are especially sensitive to errors.

If a single number in any one DATA statement is mistyped, your machine could "lock up," or "crash." The keyboard, break key, and RESET (or STOP) keys may all seem "dead," and the screen
may go blank. Don't panic - no damage is done. To regain control, you have to turn off your computer, then turn it back on. This will erase whatever program was in memory, so always SAVE a copy of your program before you RUN it. If your computer crashes, you can LOAD the program and look for your mistake.

Sometimes a mistyped DATA statement will cause an error message when the program is RUN. The error message may refer to the program line that READs the data. The error is still in the DATA statements, though.

## Get To Know Your Machine

You should familiarize yourself with your computer before attempting to type in a program. Learn the statements you use to store and retrieve programs from tape or disk. You'll want to save a copy of your program, so that you won't have to type it in every time you want to use it. Learn to use your machine's editing functions. How do you change a line if you made a mistake? You can always retype the line, but you at least need to know how to backspace. Do you know how to enter inverse video, lowercase, and control characters? It's all explained in your computer's manuals.

## A Quick Review

1. Type in the program a line at a time, in order. Press RETURN or ENTER at the end of each line. Use backspace or the back arrow to correct mistakes.
2. Check the line you've typed against the line in the magazine. You can check the entire program again if you get an error when you RUN the program.
3. Make sure you've entered statements in braces as the appropriate control key (see "How To Type COMPUTE!'s Programs" elsewhere in the magazine).

We regret that we are no longer able to respond to individual inquiries about programs, products, or services appearing in COMPUTE! due to increasing publication activity. On those infrequent occasions when a published program contains a typo, the correction will appear on the CAPUTE! page, usually within eight weeks. If you have specific questions about items or programs which you've seen in COMPUTE!, please send them to Readers' Feedback, P.O. Box 5406, Greensboro, NC 27403.

## How To Type COMPUTE!'s Programs

Many of the programs which are listed in COMPUTE! contain special control characters (cursor control, color keys, inverse video, etc.). To make it easy to tell exactly what to type when entering one of these programs into your computer, we have established the following listing conventions. There is a separate key for each computer. Refer to the appropriate tables when you come across an unusual symbol in a program listing. If you are unsure how to actually enter a control character, consult your computer's manuals.

## Atari 400/800

Characters in inverse video will appear like: memaramberec Enter these characters with the Atari logo key, $\{\boldsymbol{A}\}$.

TYpe
ESC SHIFT <
ESC CTRL $=$
ESC CTRL $=$
ESC CTRL +
ESC CTRL
ESC DELETE
ESC CTRL DELETE
ESC CTRL INSERT
ESC SHIFT DELETE
ESC SHIFT INSERT
ESC TAB
ESC CTRL TAB
ESC SHIFT TAB
ESC CTRL 2
ESC ESC

Graphics characters, such as CTRL-T, the ball character will appear as the "normal" letter enclosed in braces, e.g. \{T].

A series of identical control characters, such as 10 spaces, three cursor-lefts, or 20 CTRL-R's, will appear as $\{10$ SPACES $\}$, 3 LEFT \}, 120 R \}, etc. If the character in braces is in inverse video, that character or characters should be entered with the Atari logo key. For example, $\{\mathrm{m}]$ means to enter a reverse-field heart with CTRL-comma, $\{5 \mathbf{m} \mid\}$ means to enter five inverse-video CTRL-U's.

## Commodore PET/CBM/VIC/64

Generally, any PET/CBM/VIC/64 program listings will contain words within braces which spell out any special characters: (DOWN) would mean to press the cursor down key. 15 SPACES ) would mean to press the space bar five times.

To indicate that a key should be shifted (hold down the SHIFT key while pressing the other key), the key would be underlined in our listings. For example, $\underline{S}$ would mean to type the $S$ key while holding the shift key. If you find an underlined key enclosed in braces (e.g., $\{10 \mathrm{~N}\}$ ), you should type the key as many times as indicated (in our example, you would enter ten shifted $N$ 's). Some graphics characters are inaccessible from the keyboard on CBM Business models (32N, 8032).

For the VIC and 64, if a key is enclosed in special brackets, $K \geqslant$, you should hold down the Commodore key while pressing the key inside the special brackets. (The Commodore key is the key in the lower left corner of the keyboard.) Again, if the key is preceded by a number, you should press the key as many times as indicated.

Rarely, you'll see in a Commodore 64 program a solitary letter of the alphabet enclosed in braces. These characters can be entered by holding down the CTRL key while typing the letter in the braces. For example, $\{A\}$ would indicate that you should press CTRL-A.

About the quote mode: you know that you can move the cursor around the screen with the CRSR keys. Sometimes a programmer will want to move the cursor under program control. That's why you see all the fLEFT\}'s, \{HOME\}'s, and \{BLU\}'s in our programs. The only way the computer
can tell the difference between direct and programmed cursor control is the quote mode.

Once you press the quote (the double quote, SHIFT-2), you are in the quote mode. If you type something and then try to change it by moving the cursor left, you'll only get a bunch of reverse-video lines. These are the symbols for cursor left. The only editing key that isn't programmable is the DEL key; you can still use DEL to back up and edit the line. Once you type another quote, you are out of quote mode.

You also go into quote mode when you INSerT spaces into a line. In any case, the easiest way to get out of quote mode is to just press RETURN. You'll then be out of quote mode and you can cursor up to the mistyped line and fix it.

Use the following tables when entering special characters:

## VIC And 64

## All Commodore Machines

ClearScreen \{CLR\}
Home Cursor ( HOME \}
Cursor Up \{UP\}
Cursor Down \{ DOWN \}
Cursor Right $\{$ RIG HT $\}$

Cursor Left \{LEFT\}
Insert Character \{INST\}
Delete Character \{DEL\}
Reverse Field On \{RVS \}
Reverse Field Off $\{O F F\}$

## Apple II / Apple II Plus

All programs are in Applesoft BASIC, unless otherwise stated. Control characters are printed as the "normal" character enclosed in braces, such as (D) for CTRL-D. Hold down CTRL while pressing the control key. You will not see the special character on the screen.

## Texas Instruments 99/4

The only special characters used are in PRINT statements to indicate where two or more spaces should be left between words. For example, ENERGY \{10 SPACES\} MANAGEMENT means that ten spaces should be left between the words ENERGY and MANAGEMENT. Do not type in the braces or the words 10 SPACES. Enter all programs with the ALPHA LOCK on (in the down position). Release the ALPHA LOCK to enter lowercase text.

# The Automatic Proofreader For VIC, 64, And Atari 

Charles Brannon, Program Editor

#### Abstract

At last there's a way for your computer to help you check your typing. "The Automatic Proofreader" will make entering programs faster, easier, and more accurate.

The strong point of computers is that they excel at tedious, exacting tasks. So why not get your computer to check your typing for you?

With "The Automatic Proofreader" nestled in your VIC-20, Commodore 64, or Atari computer, every line you type in will be verified. It displays a special code, called a checksum, at the top of the screen. The checksum, either a number (VIC/64) or a pair of letters (Atari), corresponds to the line you've just typed. It represents every character in the line summed together. A matching code in the program listing lets you compare it to the checksum which the Proofreader displays. A glance is all it takes to confirm that you've typed the line correctly.

## Entering The Automatic Proofreader

Commodore (VIC/64) owners should type in Program 1. Program 2 is for Atari users. Since the Proofreader is a machine language program, be especially diligent. Watch out for typing extra commas, or a letter O for a zero, and check every number carefully. If you make a mistake when typing in the DATA statements, you'll get the message "Error in DATA statements" when you RUN the program. Check your typing and try again.

When you've typed in The Automatic Proofreader, SAVE it to tape or disk at least twice before running it for the first time. If you mistype the Proofreader, it may cause a system crash when you first run it. By SAVEing a copy beforehand, you can reLOAD it and hunt for your error. Also, you'll want a backup copy of the Proofreader because you'll use it again and againevery time you enter a program from COMPUTE!.

When you RUN the Proofreader, the program will be POKEd safely into memory, then it will activate itself. If you ever need to reactivate it (RUN/STOP-RESTORE or SYSTEM RESET will disable it), just enter the command SYS 886 (VIC/64) or PRINT USR(1536) for the Atari.

## Using The Proofreader

Now, let's see how it works. LIST the Proofreader program, move the cursor up to one of the lines, and press RETURN. If you've entered the Proofreader correctly, a checksum will appear in the top-left corner of your screen.

Try making a change in the line and hit RETURN. Notice that the checksum has changed. All VIC and 64 listings in COMPUTE! now have a number appended to the end of each line, for example, :rem 123. Don't
enter this statement. It is just for your information. The rem is used to make the number harmless if someone does type it in. It will, however, use up memory if you enter it, and it will cause the checksum displayed at the top of the screen to be different, even if you entered the rest of the line correctly.

The Atari checksum is found immediately to the left of each line number. This makes it impossible to type in the checksum accidentally, since a program line must start with a number.

Just type in each line (without the printed checksum), and check the checksum displayed at the top of the screen against the checksum in the listing. If they match, go on to the next line. If they don't, there's a mistake. You can correct the line immediately, instead of waiting to find the error when you RUN the program.

The Proofreader is not picky with spaces. It will not notice extra spaces or missing ones. This is for your convenience, since spacing is generally not important. Occasionally proper spacing is important, but the article describing the program will warn you to be careful in these cases.

## Nobody's Perfect

Although the Proofreader is an important aid, there are a few things to watch out for. If you enter a line by using abbreviations for commands, the checksum will not match up. This is because the Proofreader is very literal: It looks at the individual letters in a line, not at tokens such as PRINT. There is a way to make the Proofreader check such a line. After entering the line, LIST it. This makes the computer spell out the abbreviations. Then move the cursor up to the line and press RETURN. It should now match the checksum. You can check whole groups of lines this way. Atari users should beware of using ? as an abbreviation for PRINTthey're not the same thing in the Proofreader's eyes.

The checksum is a sum of the ASCII values of the characters in a line. VIC and 64 owners may wonder why the numbers are so small, never exceeding 255. This is because the addition is done only in eight bits. A result over 255 will roll over past zero, like an odometer past 99999 . On the Atari, the number is turned into two letters, both for increased convenience and to make the Proofreader shorter. For the curious, the letters correspond to the values of the left and right nybbles added to 33 (to offset them into the alphabet). This number is then stored directly into screen memory.

Due to the nature of a checksum, the Proofreader will not catch all errors. Since $1+3+5=3+1+5$, the Proofreader cannot catch errors of transposition. In fact, you could type in the line in any order, and the Proofreader wouldn't notice. Anytime the Proofreader
seems to act strange，keep this in mind．Since the ASCII values of the number $18(49+56)$ and $63(54+51)$ both equal 105，these numbers are equal according to the Proofreader．There really is no simple way to catch these kinds of errors．Fortunately，the Proofreader will catch the majority of the typing mistakes most people make．

If you want the Proofreader out of your way，just press SYSTEM RESET or RUN／STOP－RESTORE．If you need it again，enter SYS 828 （VIC／64）or PRINT USR（1536）（Atari）．You must disable the Proofreader before doing any tape operations on the VIC or 64.

## Hidden Perils

The Proofreader＇s home in the VIC and 64 is not a very safe haven．Since the cassette buffer is wiped out during tape operations，you need to disable the Proofreader with RUN／STOP－RESTORE before you SAVE your program．This applies only to tape use．Disk users or Atari owners have nothing to worry about．

Not so for VIC and 64 owners with tape drives． What if you type in a program in several sittings？The next day，you come to your computer，LOAD and RUN the Proofreader，then try to LOAD the partially completed program so you can add to it．But since the Proofreader is trying to hide in the cassette buffer，it is wiped out！

What you need is a way to LOAD the Proofreader after you＇ve LOADed the partial program．The problem is，a tape load to the buffer destroys what it＇s supposed to load．

After you＇ve typed in and RUN the Proofreader， enter the following lines in direct mode（without line numbers）exactly as shown：

A\＄＝＂PROOFREADER．T＂：BS＝＂\｛1ø SPACES\}": FOR $X=1$ TO 4：AS＝AS＋BS：NEXTX

FOR $X=886$ TO $1018: A \$=A \$+C H R \$(\operatorname{PEEK}(X)):$ NEXTX
OPEN 1，1，1，AS：CLOSE1
After you enter the last line，you will be asked to press record and play on your cassette recorder．Put this program at the beginning of a new tape．This gives you a new way to load the Proofreader．Anytime you want to bring the Proofreader into memory without disturbing anything else，put the cassette in the tape drive，rewind，and enter：

## OPEN1：CLOSE1

You can now start the Proofreader by typing SYS 886．To test this，PRINT PEEK（886）should return the number 173．If it does not，repeat the steps above， making sure that A\＄（＂PROOFREADER．T＂）contains 13 characters and that $B \$$ contains 10 spaces．

You can now reload the Proofreader into memory whenever LOAD or SAVE destroys it，restoring your personal typing helper．

Incidentally，you can protect the cassette buffer on the Commodore 64 with POKE 178，251．This POKE should work on the VIC，but it has caused numerous problems，probably due to a bug in the VIC operating system．With this POKE，the 64 will not wipe out the cassette buffer during tape LOADs and SAVEs．

# Missile Math 

Garry S. Wick

#### Abstract

Educational programs are usually designed to reward correct answers. "Missile Math" does this, but also gives extra points for speed. Here's an entertaining way for young students to learn their math. Versions for the Atari, Commodore VIC-20 and 64, the TI-99/4A, Apple, and IBM PC/PCjr.

"Missile Math" starts with an animated introduction screen, then a joystick-controlled menu appears on the screen. You have a choice of addition and subtraction or multiplication and division at a slow or fast speed. Using the joystick to select the menu item eliminates possible errors from incorrect typing. The joystick does not give any unacceptable entries when the fire button is pressed to start the game.

## Different Difficulty Levels

After a short pause for the initialization of the player/missile figures, the player sees a screen that displays ENTERING LEVEL 1. As you advance from one level to the next, the math problems become increasingly difficult.

The problem appears at the top of the screen. On the bottom there are five possible answers, together with a missile gun which you control with the joystick. The object is to position the gun over the correct answer and launch a missile so that it destroys an enemy spaceship as it traverses the screen. On the upper left corner of the screen are spades representing the number of remaining guns. You begin with three guns. The score is displayed in the upper right corner of the screen.

A special kind of problem appears in random locations. For example, you could see $3+4=$ ? or $3+?=7$ or $?+4=7$. Addition and subtraction are combined. It is similar for multiplication and division. The correct answer randomly appears in one of five possible locations, so the player never knows in advance where to position the gun. The values of the incorrect answers are chosen so that the correct answer is not obvious. This discourages guessing.

## A Feisty UFO

The UFO moves across the screen at three different heights. The first height is near the top of the screen, and on the two successive flights, the

UFO moves closer to the position of the gun. Of course, if the player destroys the UFO on the first pass, it does not appear at the lower altitudes. Instead a new problem appears, and the UFO starts again at the highest position.

It is most difficult to destroy the UFO at the highest altitude because there is less time to calculate the correct answer and to fire the missile at the right time to hit the UFO. Destroying the UFO at the middle altitude is easier, and at the lowest altitude, it is easiest. Thus the player gets 25 points for a correct hit on the first pass, 10 points for the second pass, and 5 points for the third pass. When the gun is positioned over the correct answer and scores a hit, the UFO explodes with sound effects, disappears, and the number of points earned appears in its place. Then a new problem appears on the screen.

If you score a direct hit on the UFO, but have the gun over an incorrect answer, the UFO briefly changes colors, makes a funny sound and continues on its way. You must then try again on the next pass of the UFO. Three consecutive misses or incorrect answers and the UFO destroys the gun and one of the spades disappears. Sound effects accompany the disappearance of the spade and the correct answer blinks on and off as an encouraging message flies onto the screen. The game ends when all three guns have been destroyed.

To advance to the next level, you must score 50 points. If the present level is too easy, you can enter the next level by solving as few as two problems, receiving 25 points for each correct answer. If you only succeed in destroying the UFO on its third pass each time, then you will have to solve ten problems before moving to the next level. Thus you get more practice on problems that stretch your abilities. You can quickly pass by the problems that you find easy.

## Bonus Points

You can earn the 50 points necessary to advance to higher levels with any combination of 5,10 , or 25 points, but you can earn bonus points for speed and accuracy. If the average score for the problems solved in a level is 25 , the player receives 50 bonus points. The only way to get 50 bonus points is to score correct hits on the first two problems in a level during the first pass of

the UFO. If you average ten points or better per problem (but less than 25), you will earn 25 bonus points. There are no bonus points if you average less than ten points per problem. Bonus points are displayed with suitable fanfare.

There are a few features of Program 1 that require special mention. The joystick-controlled menu appears in Program 1 at lines 5000 through 5230. It uses screen memory locations to identify the choices available so that it is impossible to make an incorrect entry and cause an error.

## Player/Missile Machine Language

The UFO is Atari Player 1 and the explosion character is Player 3. In order to rapidly exchange them when a correct hit has occurred, it is necessary that the two players always be at the same vertical position. (Then it is easy to POKE the UFO horizontally off the screen and to POKE the explosion at the former position of the UFO.)

BASIC was too slow to move both players vertically. A machine language program to move two players vertically lower on the screen is in lines 4000-4060. The parameters for the current location and length of the players are set by the subroutine at line 3500 .

It is a little tricky and not at all obvious how to determine when the gun is over the correct answer. The playfield characters (the answers) and the players use different coordinate systems. It is necessary to establish an equation that maps one coordinate system to the other. The appropriate equations are:

$$
\begin{aligned}
& X(P / M)=4^{*} X(\text { Playfield })+45 \\
& Y(P / M)=4^{*} Y(\text { Playfield })+17
\end{aligned}
$$

where X and Y are the horizontal and vertical coordinates respectively. The $X$ equation is used in line 2510 to determine whether the gun is over the correct answer, and the $Y$ equation is used in line 3025 to position the number of points earned at the same height as the explosion of the UFO.

## 80 COLUMN PRINTER SALE-\$149.00*

## - 15 Day Free Trial-180 Day Immediate Replacement Warranty

- Lowest Priced, Best Quality, Tractor-Friction Printers in the U.S.A.
- Fast $80-120-160$ Characters Per Second - 40, 46, 66, 80, 96, 132 Characters Per Line Spacing
- Word Processing - Print Labels, Letters, Graphs and Tables - List Your Programs
- Print Out Data from Modem Services - "The Most Important Accessory for Your Computer"

## *STX-80 COLUMN PRINTER-\$149.00

Prints full 80 columns. Super silent operation, 60 CPS , prints Hi-resolution graphics and block graphics, expanded character set, exceptionally clear characters, fantastic print quality, uses inexpensive thermal paper! Best thermal printer in the U.S.A.! (Centronics Parallel Interface).

## **DELUXE COMSTAR T/F <br> $\mathbf{8 0}$ CPS PRINTER-\$179.00

The COMSTAR T/F (Tractor Friction) PRINTER is exceptionally versatile. It prints $8 \frac{1}{2 \prime \prime} \times 11^{\prime \prime}$ standard size single sheet stationary or continuous feed computer paper. Bi-directional, impact dot matrix, 80 CPS, 224 characters. (Centronics Parallel Interface).

## Premium Quality-120 CPS <br> COMSTAR T/F SUPER-10X <br> PRINTER—\$289.00

COMSTAR T/F (Tractor Friction) SUPER10X PRINTER gives you all the features of the COMSTAR T/F PRINTER plus a $10^{\prime \prime}$ carriage, $120 \mathrm{CPS}, 9 \times 9$ dot matrix with double strike capability for $18 \times 18$ dot matrix (near letter quality), high resolution bit image ( $120 \times 144$ dot matrix), underlining, back spacing, left and right margin settings, true lower decenders with super and subscripts, prints standard, italic, block graphics
and special characters, plus 2 K of user definable characters! The COMSTAR T/F SUPER-10X PRINTER was Rated No. 1 by "Popular Science Magazine." It gives you print quality and features found on printers costing twice as much!! (Centronics Parallel Interface) (Better than Epson FX 80).

## Premium Quality-120 CPS <br> COMSTAR T/F SUPER-151/2" PRINTER-\$379.00

COMSTAR T/F SUPER $151 / 2^{\prime \prime}$ PRINTER has all the features of the COMSTAR T/F SUPER-10X PRINTER plus a $151 / h^{\prime \prime}$ carriage and more powerful electronics components to handle large ledger business forms! (Better than Epson FX 100).

## Superior Quality SUPER HIGH SPEED-160 CPS COMSTAR T/F 10" <br> PRINTER-\$399.00

SUPER HIGH SPEED COMSTAR T/F (Tractor Friction) PRINTER has all the features of the COMSTAR SUPER-10X PRINTER plus SUPER HIGH SPEED PRINTING-160 CPS, $100 \%$ duty cycle, 8 K buffer, diverse character fonts, special symbols and true decenders, vertical and horizontal tabs. RED HOT BUSINESS PRINTER at an unbelievable Iow price!! (Serial or Centronics Parallel Interface)

## Superior Quality SUPER HIGH SPEED-160 CPS COMSTAR T/F $151 / 2$ " <br> PRINTER—\$529.00

SUPER HIGH SPEED COMSTAR T/F $151 / 2$ " PRINTER has all the features of the SUPER HIGH SPEED COMSTAR T/F 10" PRINTER plus a $151 / 2^{\prime \prime}$ carriage and more powerful electronics to handle larger ledger business forms! Exclusive bottom paper feed!!

## PARALLEL INTERFACES

For VIC-20 and COM-64- $\$ 69.00$
For Apple Computers $\mathbf{\$ 7 9 . 0 0}$
NOTE: Other printer interfaces are available at computer stores!

## Double Immediate Replacement Warranty

We have doubled the normal 90 day warranty to 180 days. Therefore if your printer fails within " 180 days" from the date of purchase you simply send your printer to us via United Parcel Service, prepaid. We will IMMEDIATELY send you a replacement printer at no charge, prepaid. This warranty, once again, proves that WE LOVE OUR CUSTOMERS!

## World's Finest Computer Printer

List Price \$699

SALE \$399

- Daisywheel printer, bidirectional with special print enhancements.
- Print speed up to 20 characters per second.
- 10,12 , and 15 characters per inch.
- 256 character print buffer.
- $14.4^{\prime \prime}$ forms width.
- Print line width: 115,138 , and 172 characters.
- Serial RS-232-C and parallel Centronics interface ports built-in.
- Built-in bidirectional forms tractor.
- Operating status control panel.

## World's Finest

## "Combination"

List Price $\$ 799$

## Printer/Typewriter SALE \$489

- Superb computer printer combined with world's finest electronic typewriter!
- Better than IBM selectric - used by world's largest corporations!
- Two machines in one - just a flick of the switch!
- Superb letter quality correspondence - home, office, word processing!
- Extra large carriage - allows 14-1/8" paper usage!
- Drop in cassette ribbon - express lift off correction or eraser up to 46 characters!
- Precision daisy wheel printing - many type styles!
- Pitch selector - 10, 12, 15 CPS, Automatic relocate key!
- Automatic margin control and setting! Key in buffer!
- Electronic reliability, built in diagnostic test!
- Centronics parallel interface built-in

## 15 Day Free Trial - 90 Day Immediate Replacement Warranty

Add $\$ 17.50$ for shipping, handling and insurance. Illinois residents please add $6 \%$ tax. Add $\$ 35.00$ for CANADA, PUERTO RICO, HAWAII, ALASKA, APA-FPO orders. Canadian orders must be in U.S. dollars. WE DO NOT EXPORT TO OTHER COUNTRIES.
Enclose Cashiers Check, Money Order or Personal Check. Allow 14 days delivery, 2 to 7 days for phone orders, 1 day express mail!

## Programmer's Notes: VIC Version

The VIC-20 version of "Missile Math" requires at least an 8 K expander. To make it easier to enter this version, the machine language portion of the program has been listed in MLX format. To enter Missile Math, you must enter Program 2 using the VIC MLX Program elsewhere in this issue. The starting address is 12288 and the ending address is 13295. After you have entered and saved Program 2, enter Program 3 as you would a normal BASIC program and save it to tape or disk.

To run Missile Math, you must first enter these POKEs.
POKE 43,1:POKE 44,24:POKE 641,0:POKE 642,24:POKE 6144,0
Type NEW and load Program 2, bypassing the normal relocator by adding, 1 to the LOAD command. Here's how your LOAD command should look:
From tape:
LOAD "filename" ,1,1
From disk:
LOAD "filename" , 8,1
Now type NEW, then load and run Program 3.

## Program 4: 64 Missile Math

Refer to the "Automatic Proofreader" article before typing this program in.

Notes On The
Commodore 64, TI, Apple, And IBM PC/PCjr Versions
Instructions for all these versions are included within the programs themselves. The 64 version (Program 4) requires a joystick in port 2. The TI-99/4A version (Program 5) requires Extended BASIC and may be played with either a joystick or the keyboard. The Apple version (Program 6) requires a paddle controller. The IBM PC/PCjr version (Program 7) is controlled from the keyboard.

## STOP PLAYING GAME

－Calculate odds on HORSE RACES with ANY COMPUTER using BASIC．
－SCIENTIFICALLY DERIVED SYSTEM really works．TV Station WLKY of Louisville，Kentucky used this system to predict the odds of the 1980 Kentucky Derby．See Popular Computing（February，1984）for a review of this popgram．This system was written and used by program．This system was written and used by computer experts and is now being made available to home computer owners．This method is based on storing data from a large number of races on a high speed，large scale computer． 23 factors taken from the＂Dally Racing Form＂were then analyzed by the computer to see how they influenced race results．From these 23 tacts，ten were found to be the most vital in determining winners．NUMERICAL PROBABILITIES of each of these 10 factors were then computed and this forms the basis of this REVOLUTIONARY NEW PROGRAM．
－SIMPLE TO USE：Obtain＂Daily Racing Form＂the day betore the races and answer the 10 questions about each horse．Run the program and your computer will print out the odds for all horses in each race．COMPUTER POWER gives you the advantage！
－YOU GET：
1）Program on cassette or disk
2）Listing of BASIC programs for use with any computer．
3）Instructions on how to get the needed data from the＂Daily Racing Form．
4）Tips on using the odds generated by the program．
5）Sample form to simplify entering data for each race．

# Lightsaver 

Jon Rhees

The world is depending on you to save its supply of light bulbs. A quick eye and an even faster hand are the only two things that will help you. This arcadestyle action game uses machine language for fast action. Versions are included for the Commodore 64 and VIC-20, the Atari home computers, and the IBM PC/PCjr.

Technology has backfired again! A dangerous power surge has transformed the light fixture in your room into a devilish lamp, which is trying to rid the world of light bulbs by tossing them to the ground. Only you can stop the lamp from carrying out its horrid plan. You must catch the bulbs in your baskets before they hit the ground and break. The more bulbs you save, the more angry the lamp will become, and the faster it will drop bulbs. How long can you survive the wrath of the lamp?
"Lightsaver" is a fast-action, arcade-style game which utilizes many of the capabilities of the Commodore 64. Most of the action in this game is written in machine language for speed, while the scoring and setup routines are written in BASIC. The game requires a set of paddle controllers, which should be plugged into port 1.

The object of the game is simple: catch as many light bulbs as you can without missing or dropping any. You must catch each bulb in your baskets. At the beginning of a game you start out with three baskets, stacked atop each other. You position the baskets by turning the paddle controller. Each time you miss a bulb, you lose a basket, and are set back one level. Each consecutive level has more bulbs to catch and faster action. Bonus baskets are awarded every 2000 points, but you can have only three baskets at a time. Also, the higher the level you are on, the more points each bulb you catch is worth.

There are 16 skill levels in Lightsaver and two basket sizes. The higher the skill level you choose, the faster the game. Bulbs are easier to catch with a large basket than with a small one. A large basket is twice as wide as a small one. You can change the basket size during the game by pressing the f1 key. Press the paddle fire button to start a new round.

Lightsaver takes advantage of the sprite, redefined character, color, and sound capabilities of the 64 . It contains two separate machine language routines-one for the game action, and another to quickly copy the character ROM into RAM for programmable characters. A demo mode is also included. The computer plays a game against itself if left alone. All eight sprites are used, as well as a redefined character set. The first two voices of the SID (Sound Interface Device) chip are used for sound effects, and the third voice is used as a random number generator for the machine language routine.

If you'd rather not type in the program, you can obtain tape or disk copies ( 64 version only). Send an SASE, a disk or tape, and $\$ 3$ to:

Jon Rhees

## Notes For VIC-20, Atari, And IBM PC/PCjr Versions

In "Lightsaver," you must catch light bulbs that fall from a lamp at the top of the screen.

## The VIC Version

Program 2, for the unexpanded VIC-20, is written entirely in machine language and offers five levels of play. The level selected affects the speed of the falling bulbs at the beginning of play. The speed increases when a light bulb is caught in your basket and decreases when light bulbs crash to the bottom of the screen. The game ends when three bulbs have been missed.

You move your baskets under the falling bulbs by using a paddle plugged into the control port.

Since the VIC version is written in machine language, you must use a special technique to enter the program. You must first type in the "Tiny MLX" program found elsewhere in this issue, and then use this program to type VIC Lightsaver. Be sure you read and understand the Tiny MLX article before you begin typing Lightsaver. Also, remove or disable any memory expanders. Once you have typed in Lightsaver, and saved it to tape or disk using MLX, you can load and run the program just as you would a BASIC program.

## The Atari Version

To catch bulbs in the Atari version of Lightsaver, you must move your basket with the paddle controller and touch the bulbs before they hit the bottom of the screen. If a light bulb reaches the bottom of the screen, it will break and you will lose one of your three baskets. The number of points awarded for catching a bulb is equal to the current level. For instance, on the fourth level, every bulb that you catch is worth four points. You are given an additional basket every 2000 points. Each time you complete five levels, the speed of the light bulbs increases.

Atari Lightsaver has been split into two programs so it will work on 16 K computers with DOS. Load and run Program 3. This program loads two machine language subroutines and the redefined character set. When finished, this program will load and run Program 4. Program 4 (the main program) contains the player missile graphics and the main game loop. Since Program 3 loads and runs Program 4, disk users must save both programs on the
same disk. Program 4 must be saved with filename LIGHTSAVER.

Cassette users must change line 1046 in Program 3 to:
1046 READ A: IF A= -1 THEN PRINT "HIT RETURN TO LOAD LIGHTSAVER": RUN "C:"
Next, rewind a tape to a blank section, press the PLAY and RECORD buttons, and enter SAVE "C:" to store Program 3. When the cassette is finished, type in Program 4. Save Program 4 immediately following Program 3 by once again entering SAVE " C :". To load and run the two programs, rewind the tape to the start of Program 3 and type RUN " $\mathrm{C}:$ ".

## The IBM Version

In the IBM version of Lightsaver (Program 5), you must catch bulbs before they fall below basket level. The IBM version has only one difficulty level and a constant basket size. Game play consists of several rounds, each consisting of a barrage of dropping bulbs. Between 10 and 20 bulbs are dropped before the round ends. Each additional round increases the motion of the lamp which drops the bulbs and increases the number of points awarded. The formula is simple: The number of points awarded equals the number of bulbs caught, multiplied by the difficulty level.

You can catch a bulb only if it drops into the basket from above. It is possible to break a bulb by hitting it with the rim of your basket. If you let a bulb break, the round ends and the difficulty level decreases by one.

IBM Lightsaver will run on PCs with Advanced BASIC (BASICA) and PCjrs with DOS and Cartridge BASIC. A Color/Graphics Monitor Adapter card is needed on PCs. A joystick is required to control the left-right movement of the baskets.

Since the video display processor of the IBM PC may refresh the screen while we are using the PUT statement to place graphics on the screen, a short machine language routine has been included to synchronize PUT with the vertical retrace interval.

MOV DX,3DAh
CHECKPORT IN AX,DX
AND $A X, 8$

## JZ CHECKPORT <br> RETF

This machine language routine reduces flicker when the baskets are moved around the screen.

## THE WORLD INSIDE THE COMPUTER

## Build A Computer In Your Mind <br> Fred D'lgnazio, Associate Editor

In my recent column, "The Morning After," in the May and June 1984 issues of СОмPUTE!, I wrote about a new kind of programming that I believe people are beginning to do on their computer. I called this "neoprogramming" to distinguish it from traditional programming in BASIC or Pascal and from "no programming" in which people treat the computer as a thinking machine and let it do their thinking for them.

In this month's column I'd like to explore neoprogramming and see how it can be related to computer activities that will help people develop thinking, learning, and communication skills that they can practice and refine using the computer, and that they can also take away from the computer and use, on their own, in all areas of their lives.

## Neoprogramming

Neoprogramming can be defined as borrowing the most powerful ideas from programming languages and turning them into thinking skills that people can use, inside their head, in their daily life.

Another way to look at neoprogramming is as a toolbox that has three kinds of tools inside:

Fred D'Ignazio is a computer enthusiast and author of several books on computers for young people. His books include Katie and the Computer (Creative Computing), Chip Mitchell: The Case of the Stolen Computer Brains (Dutton/Lodestar), The Star Wars Question and Answer Book About Computers (Random House), and How To Get Intimate With Your Computer (A 10-Step Plan To Conquer Computer Anxiety) (McGraw-Hill).

As the father of two young children, Fred has become concerned with introducing the computer to children as a wonderful tool rather than as a forbidding electronic device. His column appears monthly in COMPUTE!.

$\square$ Tools to Help You Learn
$\square$ Tools to Help You Communicate
These are practical tools that will be valuable no matter what people's goals are. Mastering these tools is more worthwhile than simply learning how to operate a computer.

Thinking, learning, and communication tools can be found in many places-in textbooks, in courses, in jobs, etc. But they can also be found, in a concentrated form, in the computer. And through extensive use and familiarity with these tools on a computer, people can learn how to use the tools to think better without the computer.

## How Not To Use A Computer

Learning how to operate a computer, on its own, will not automatically guarantee people a successful career, help them learn how to use more advanced computers of the future, or give them thinking skills they can apply to other areas of their lives.

Also, it is possible to have a relationship with computers that actually deadens or stifles the ability to think. Many people, for example, use computers mechanically and passively. They spend their time in front of a computer entering information, making trivial, routine queries, or typing other people's documents.

## The Thinking Appliance

There is a strong assumption in many people's minds that computers are labor-saving appliances. People ask, "What can I do on a computer?" But what they mean is, "What can the computer do for me?'" The labor that many people hope computers will save is not mechanical labor but thinking labor. For most of us, thinking is work-work that we would avoid if we had the chance.

Many people would be happy (though few would admit it) if computers would do their thinking for them. In the near future, with the
advent of expert systems and friendlier computers, there is a great risk that computers will take over more and more of the thinking that people do. As a result, people and organizations will become increasingly dependent on computers.

## Dumbo's Feather

For adults at work and at home, and for children in school, there is the risk that computers will become super calculators. When they want to do real work or thinking, they will, by habit, turn to the computer. The computer will become an adjunct to the person's mind. The computer will be like Dumbo's feather. Dumbo the elephant could fly because of his big ears, but he thought it was because of his magic feather. If he didn't hold on tight to his feather, he was afraid he couldn't fly. People may come to feel incapable of thought unless they do it using their computer.

## The Computer Crutch

There is a real risk that many people will use computers as a crutch. They will expect computers to do their thinking for them, or they will be afraid that they cannot think without the aid of the computer. Either way, they will be tied to computers to help them carry on their daily affairs.

Also, if people use computers (or anticipate using computers) as a crutch, they will not get the most out of them. They will be using computers' powerful computational, communications, and information handling functions sloppily, indiscriminately, and inefficiently.

## The Computer Lever

In fact, the computer is not a thinking machine, a magic feather, or a crutch. It is a complex lever. It amplifies our abilities to move information around, but we must position and guide it to get what we want.

In addition, we don't need to tie ourselves to the computer to use its lever. We can build the lever inside our head. The lever is, in fact, just an assortment of thinking skills embedded in generalpurpose (BASIC, Logo, Pascal, Assembler, etc.) procedural languages and special-purpose (word processing, spreadsheet, file handling) builder kit languages. Once we have acquired these skills, we can employ them on the computer, or we can use them inside our heads. If we recognize and master these skills, we can get more out of using the computer, and we can become less dependent on it and more skilled, on our own, to think, learn, and communicate.

## Building A Computer Inside Your Head

Burrell Smith, Apple's hardware wizard who
helped create the Macintosh, has written that he never just goes into a workshop and builds a new computer. Instead he first spends considerable time building mental prototypes inside his head. Burrell's prototypes are like a writer's rough drafts. Using mental prototypes, he takes a rough, simple idea and turns it into a cluster of complex ideas, and eventually into an advanced concept or design. Then he begins building the computer.

Burrell can create mental prototypes because he has a computer inside his head. Burrell has built this computer from an array of thinking skills he has learned from programming real computers and from his other experiences in life. These skills aren't mysterious, nor are they Burrell's alone. They can be mastered by anyone.

## Environments For Thinking

Programming languages offer an environment for thinking-a place in which these skills can be learned, practiced, mastered, and then used. Learning a programming language offers an opportunity to explore new avenues of thought.

For example, if taught properly, BASIC, Pascal, Logo, and other languages can help people learn algorithmic thinking, how to break complex problems into smaller, simpler problems, and how to organize large quantities of information.

A word processing program can give people a feeling for the fluidity and mobility of words, ideas, thoughts, and knowledge. It can help them learn how to create several rough drafts, in quick succession, that sharpen an image, refine a concept, or lead to new ideas.

A spreadsheet program can help break a complex situation down into lists and arrays of smaller parts. It can display the whole forest and the individual trees in the forest, all at the same time. It can also reveal the relationships between all the parts.

A file-handling (data base) program can teach how to organize thoughts, feelings, experiences, and information. It can show how to group facts according to categories of likeness, how to sort and prioritize, and how to cross-reference facts that have certain traits in common.

Graphing languages, word processing languages, and telecommunications languages, singly or together, can teach how to better communicate feelings, ideas, and desires. They can teach how to use visual images and symbols, page layout and design, and grammar and style to communicate more effectively.

## Magnets For Thinking, Learning, And Communication

Computers, like other media, can have a pushpull effect, depending on how people use them.

If computers are used inefficiently or inappropriately, they have to be pushed just to get meager, mediocre results.

On the other hand, computers can also exert a powerful pulling effect. They can be so attractive, so elegant that they will pull at the mind, like a magnet. They can almost seduce a person into performing a task or solving a problem.

## Magnets And Road Maps

Computer tools can pull you like a magnet to the computer, but they can also become magnets inside your head that draw related information and ideas toward them. They can help you make sense out of chaos. They can let you mentally map out individual facts in some kind of logical, coherent, and practical order.

For example, what happens if you think about two things: a paper route and a spreadsheet? What kind of associations can you make? How might you map the paper route onto a spreadsheet?

You don't need to use a computer to do this exercise. Instead, you can perform what Albert Einstein called a thought experiment. You can build a mental prototype of a paper-route spreadsheet inside your head.

Associating spreadsheets and paper routes is not a dull, artificial, or mechanical activity. If you have the proper image, appreciation, and passion for using spreadsheets as a thinking skill, you start mapping the paper route onto the spreadsheet even before you know it. The spreadsheet, as a thinking tool, or metaphor, will draw your thoughts playfully and automatically. When you begin thinking about the paper route, your mind will unconsciously make an association with spreadsheets and figure out how the two are related.

For example, you might start thinking of the different houses on the paper route as columns. You might think of the people's names, addresses, telephone numbers, amounts owed, and your last collection date as rows in the spreadsheet.

You might also think of mapping the spreadsheeted paper route into a data base in which you could quickly determine who owes you for the papers, who is the most overdue, and what might be the most effective collection route for you to follow on your bicycle or in your car.

In fact, you might never put all this information onto the computer. It might be too much trouble entering the information and keeping it up-to-date. But this doesn't matter as long as you have a model of the spreadsheet or the data base inside your head.

For many, many applications in life, building a mental prototype inside your head is enough.

It's not practical to go any further. The value of the computer skills is not that you use them on the computer, but that you can organize information, perform tasks, and solve problems better inside your head. This helps you become a better thinker, learner, and communicator on your own. You don't need a real computer around. You can carry one inside your head.

## Learning Through Play

One of our greatest joys in life comes when we play-or when we feel we are playing. We might be working, but if it feels like play, we will be more motivated, more intense, and do a better job.

Passion and joy are not attributes of work but of love. And when we love what we are doing, it is never work. No matter how difficult the activity is, it feels like play.

I think that people can use computers to think playfully, learn playfully, and communicate playfully. The real joy of computing doesn't come from getting a job done faster, easier, or cheaper; it comes from making the job more challenging and more fun while you're doing it.

## Are You A Neoprogrammer?

How is your relationship with your computer? Does your computer challenge you to think, learn, and communicate better? Does it make work more fun and interesting? Have you been able to take your computer skills with you when you leave the computer? Can you think on your own when your computer is turned off?

If you can, congratulations. Maybe you are a neoprogrammer and you don't even know it.

Whether you think you are a neoprogrammer or not, I'd like to hear your thoughts. What do you think about building a computer inside your head? Please write to me:

# Exodus: Ulitima III For Commodore 64 Davik R Peacek 

Exodus: Ultima III ushers in an exciting new era of fantasy role playing. The combination of superb graphics, music, and excellent playability makes Exodus a modern-day masterpiece. The game presents challenges requiring clear, creative thinking plus the patience and determination to thwart hundreds of monsters during a quest to defeat the ultimate foe: Exodus.

## An Adventure In The Box

Just opening the box is an adventure. Inside, you discover such magical items as a book of wizard spells, another full of incantations, a comprehensive playbook along with a quick reference guide, and a colorful cloth map of the realm to be explored. Also included is a key in the form of a black disk which, once booted, opens the way to the universe of Sosaria, where your dreams and fears materialize and your wits are your only hope.

After making a copy of the master side of the disk, you are ready to begin your journey. First you must create several characters to do your bidding. Up to 20 characters may reside per disk, and up to 4 may travel together at one time. Each character has a name, sex, race, profession, and the four attributes of strength, dexterity, intelligence, and wisdom. Take your time and choose wisely among the five possible races and eleven professions. Also, consider which attributes are important for different characters while using up as few points as pos-
sible. Because there are so many options and tradeoffs involved, don't be surprised if some of your characters just don't cut it and you have to create new ones. The opportunity for multiple characters, with varying personalities and abilities, enhances the playing environment over the single character allowed in Ultima II.

## Sosaria Awaits You

Once your party is formed, the quest begins. The disk spins for a moment, and you find yourself in the magical realm of Sosaria where the waves lap the shores and banners atop towns flap in the breeze. Walking along, you notice open grassy plains, tall mountains, and dark forests. Your ears are treated to enchanting medieval tunes throughout. Suddenly, a band of nasty orcs appear heading straight for you. You duck behind a range of hills where the monsters can't find you.

Now is the time to seek a town and outfit your party with much-needed supplies such as weapons and armor. Even though all your characters begin with cloth armor and a dagger apiece, better equipment could be a lifesaver. Remember, at the beginning, your characters are weak in every respect and must be nurtured until they have grown strong in body and mind and have gained knowledge along with experience. Until then, on to the safety of a town.

## Weapon Trading

When you enter a town you'll
find many citizens roaming the streets. These people are worth getting to know, for only by speaking to everyone will you learn secrets to help guide you along. Also, clues can be found only with extensive exploration.

One major improvement of Ultima III upon its precursor concerns the weapons and armor shops. In Ultima II, you were limited to buying; now, in this game, you can buy and sell. The variety of weapons and armor is better than ever. In fact, there's a rumor that some weapons are effective over a great distance-that might be worth even a steep price.

As in Ultima II, there are places to buy food and several pubs whose bartenders hear tales and could give you a tip or two. There are also stables with sturdy horses. Occasionally your party will come across an oracle, a man of wisdom and divine insight who might impart some of his knowledge for part of your gold. Two new and useful places to visit are the thieves ${ }^{\prime}$ guild shops and the houses of healing. You'll find this and more in towns, not to mention a couple of castles and enough dungeons to make your head spin.

Dungeons. The word conjures up images of dark, twisting passages, sounds of funeral organ music, and thoughts of impending doom. This is the mood of the endless dungeons of Ultima III. These 3-D dungeons represent a significant improvement over the simple underground mazes in Ultima II. Exploring your first dungeon is thrilling as you attempt to overcome pesky gremlins, howling winds, foul traps, dozens of monster groups, and enough twists and turns to make getting lost no problem at all.

Reaching the lower depthswhere the goodies are-requires careful planning and a working knowledge of the layout of each level. Once the treasures are lo-

cated, it will take cunning to get your party back out alive. If all the treasures had been packed into one or two dungeons, the game would have been almost perfect. Instead, vital things were spread out among many dungeons, decreasing the enjoyment of each one. After you've conquered one dungeon, the rest can become tedious. Of course, a true dungeon lover might see things differently.

A Four-Player Battlefield A new combat routine has been implemented to accommodate up to four players. When a monster group is encountered, the scene shifts to a battlefield where all the monsters and all the players can be seen. Each player gets a turn in which he may reposition himself, attack an oncoming monster, or cast a spell. Then each of the monsters performs a similar act. The battle

## Monkey Wrencin II

Cut your programming time from hours to seconds, and have 33 direct mode commands and functions. All at your fingertips and all made easy by the MONKEY WRENCH II.
The MONKEY WRENCH II plugs easily into your ATARI and works with the ATARI BASIC. Order your MONKEY WRENCH II today and enjoy the conveniences of these 33 features:

- Line numbering
- Deletion of line numbers
- String exchange
- Move lines
- Copy lines
- Disk directory display
- Margins change
- Home key functions
- Cursor exchange
- Upper case lock
- Hex conversion
- Decimal conversion
- DOS functions
- Renumbering basic line numbers
- Machine language monitor
- Function keys
- Variable and current value display
- Location of every string occurrence
- Up and down scrolling of basic programs

The MONKEY WRENCH II also contains a machine language monitor with 16 commands that can be used to interact with the powerful features of the 6502 microprocessor.

## cin? Rabbit"

 for your VIC 20 or CBM 64If you own a VIC 20 or CBM 64 and have been concerned about the high cost of a disk to store your programs on. worry yourself no longer. Now there's the RABBIT. The RABBIT comes in a cartridge and at a much, much lower price than the average disk. And speed ... this is one fast RABBIT. With the RABBIT you can load and store on your CBM datasette an 8 K program in almost 30 seconds compared to the current 3 minutes of a VIC 20 or CBM 64, almost as fast as the 1541 disk drive. The RABBIT is easy to install. allows one to Append Basic Programs, works with or without Expansion Memory, and provides two data file modes. The RABBIT is not only fast but reliable.
(The Rabbit for the VIC 20 contains an expansion con. nector so you can simultaneously use your memory board, etc.)

# MAE THE BEST FOR LESS 

Please for your own protection consider the MAE first before you buy that other assembler. We've had numerous customers who wasted their money on some cheaper off brand assembler tell us how much better the MAE is The most powerful Macro Assembler/Editor available for the Commodore 64 and other CBM/PET computers, and also for the ATARI 800/XL and Apple IIIIIE.
MAE includes an Assembler, Editor, Word Processor. Relocating loader, and more all for just $\$ 59.95$.
We could go on and describe the MAE but we thought you would like to read our customers' comments. The following are actual unedited comments from correspondence about the MAE:
"Excellent Development Package."
"Compares to DEC and INTEL."
"My Compliments to Carl Moser and EHS." "It is a superb program."
\$59.95

rages on, turn by turn, round by round-gone are the days of instant destruction.

Though the combat sequence is well conceived, it is simply too slow considering the number of monster groups which must be dealt with. Granted, the pace does quicken once the characters' attributes have been raised, but most of the game is spent slugging it out. Then, for the effort, your party garners a single chest containing barely enough gold to sustain everyone. On rare occasions, a small weapon or cheap armor may be locked inside. If more items were found more of the time, agonizing money problems would diminish and the party could proceed with more interesting tasks.

## Wizards And Clerics

One of the best aspects of Ultima III involves the extensive use of magic. Now wizards and clerics can demonstrate their true value as they cleverly choose just the right spell to save the party from a slew of poisonous balrons. At first, your spell casters will be limited and somewhat ineffective, but as time passes and they grow smarter and wiser, they will become indispensable. The wizards' spells mainly center on harming evil creatures, while the clerical spells are good for healing and resurrection. Both sets include very handy spells for maneuvering in dungeons. The two books of magic provide wonderful insights into the workings of each spell, making the game even more bewitching. Overall, the use of magic in Ultima III is well integrated with the obstacles to be overcome.

## Moon Gates

Time affects many aspects of the game. If, for example, a member of the party is poisoned, the passage of time slowly brings about his death. Otherwise, wounds heal with time and spell points increase to their
maximum. Also, if your party has fought pirates and gained control of their ship, only time will allow the winds to shift in your favor so that you may explore new lands. Perhaps the most important effect of time concerns the ever-present moons, Trammel and Felucca. As they pass through their cycles, strange events take place. Warps in space, called moon gates, appear only at certain times. Somehow, the moons and gates are thought to be connected, hence the name. There is a rumor of a city hidden in a vast forest. Not only hidden, but also not always there. Time, moons, cities, gates-all interwoven to challenge the best adventurers. Such is the spell Exodus weaves about its players.

Game designer Lord British has outdone himself with his latest work of art. Ultima II was a fantastic game, but Exodus: Ultima III makes it seem like child's play in comparison. Exodus has achieved an unparalleled blend of setting, multicharacter development, magic, plus a strongly integrated plot. The animated graphics sparkle with speed and color, and the sound effects achieve nothing less than a complete, evocative sound track. Except for a few places that tend to drag, Exodus is a delight to play, and I eagerly await the perils and pleasures of the fourth installment in the ultimate series.

known. Imagine, then, what it must have felt like to be with Pizarro, Cortez, Ponce de León, or Columbus and to sail away from the familiarity of Spain in search of discovery, gold, and fame.

The ocean was wide and uncharted, and the lands were filled with strangely painted natives who were often hostile. The storms were fierce and could easily blow the ship far off course. Starvation and a slow and painful death would follow if land was not sighted. Yet even in the face of such obstacles, the conquistadors were lured by the promise of gold and treasure. The ship's captain just had to be brave, smart, and lucky enough to discover a new world.

## Gold For Spain

One after one, the would-be explorers visited the court and on bended knees requested a grant to buy ships and hire men. In return they promised to establish missions for the church, forts to prove Spain's sovereignty, and gold to fill Spain's coffers.

Now you can experience the thrill of sighting land after a long, arduous sea voyage. You can also experience the pride in returning to Spain after having explored the Mayan Peninsula and discovered rich and fertile lands; or the shame of returning home after having lost most of your crew, several ships, and having no gold to show for your efforts.

## Graphics And Strategy

Ozark Softscape, in conjunction with Electronic Arts, has produced a riveting new adventure game entitled The Seven Cities of Gold that places you at the helm of a fleet of ships and allows you to venture forth from Spain in search of a new world, wealth, and fame.

As in their award-winning game M.U.L.E., the Bunten brothers have designed a graph-
ically enhanced strategy game that challenges and educates as well as entertains. Upon booting The Seven Cities of Gold, the player finds himself in front of a palace in Spain. He has just been given a commission by the Spanish court; and as captain of a fleet of four newly outfitted ships, he is ready for his first voyage.

## Leaving The Old World

After scrolling past a pub, his home, and an outfitters building (all important places when returning home from an expedition), the player leaves the Old World and ventures forth in search of the new. Sailing is controlled by the joystick, as are all actions and options. While at sea, the player may navigate the ship, view the map, and keep track of how many days have elapsed. The latter is especially important for several reasons. For one thing, your food supply isn't unlimited.

Eventually you will sight land. At this point, you will have to decide how much of the on-board supplies, goods, and men you want to take to explore the uncharted mass into which you have just bumped. Now the real fun begins. There will be lush jungles, fertile plains, intimidating mountain ranges, dangerous swamps, major rivers, and natives.

## Jungles And Swamps

Accomplishing all your objectives is no easy task. Ambushes in the thick jungles will take their toll as will sickness in the swamps. Food is a constant source of worry; men won't travel on an empty stomach, let alone fight on one. And as the land grows cold with the approach of winter, food becomes scarcer.

Once you decide that it is time to return home (a decision often made easy by the loss of men, goods, etc.), you must navigate back to Spain. Assuming that you make it back,
thwarting the best efforts of nature's storms, a trip to your home will provide you with a tally of what areas you have discovered, what forts and missions have been established, and how much wealth has been obtained. A trip to the court will give you a rating based upon your successes or failures. More gold, a promotion, or chastisement awaits you in the court. Finally, a trip to the pub allows you to record (save to disk) maps for future voyages. The outfitter? Most assuredly, it will be your first stop before weighing anchor for the next excursion. There you will buy food and goods, hire more men, and perhaps even purchase more ships.

## Historical Accuracy

The mechanics of The Seven Cities of Gold are easily implemented and well-done. All movement, both on land or at sea, is handled by use of the joystick, as are all option selections and even combat. The graphics are well-done, and Cities contains over 2800 screens that represent the lands you will explore. The computer literally draws the map as you move about North, South, and Central America, all accurately depicted.

Your expedition is represented by an arrow moving over a variety of easily identified terrain. Symbols are used in various places to represent hundreds of different types of settlements, ranging from farmers and hunters to wealthy Aztec strongholds. It is upon entering one of these settlements that another of Seven Cities' delights is discovered.

Once the player has moved the arrow onto a settlement symbol, the screen symbol begins to magnify, increasing in size until it is replaced by a detailed graphic screen. The arrow is replaced by a conquistador who represents the expedition, and you find yourself in the middle of the settlement, rapidly
surrounded by natives. Find their chief and begin trading, or draw your sword.

## An Enchanting Challenge

There are many more surprises in The Seven Cities of Gold. The program both challenges and enchants. It forces you to consider various strategies: What is the best way to outfit an expedition? Do you have enough men to establish forts? When should you return home for more supplies? Even the time of year can be an important factor.

And what happens after the player discovers the Mississippi or the Amazon, gold mines, the Fountain of Youth, and all the mysteries of the Americas? Is the game over? Not a chance. Aside from the fact that the game could be played again using different strategies and achieving higher rankings, Seven Cities of Gold provides a utility that randomly generates entire continents; no two are ever the same. Furthermore, all games can be played at one of three levels: novice, journeyman, or master.

ics and sound to reinforce learning, but uses them in a way that's both new and refreshing.

Word Flyer was developed by ChildWare, a programming group within Electronic Arts. Typically, ChildWare programs combine proven educational psychology with captivating programming, and Word Flyer is no exception.

The object of the game is straightforward: Use your joystick to maneuver word flyers and match zooming letters or words. It's a challenging and exciting game for young children. But there's learning amidst the laughter. Without realizing it, players are practicing valuable reading and vocabulary-building skills. On lower levels, the emphasis is on recognizing the letters of the alphabet; that makes the program valuable even for children who have not yet learned to read. Higher levels introduce words chosen from a built-in list of over 2000 entries. The approach is both original and nonviolent.

## Booting The Birds

Two towers-built of the word towers-dominate the screen, one on the left and one on the right. Atop each tower sits a remarkably realistic-looking bird. A control panel runs across the bottom of the screen; it consists of flight level and speed indicators, a score bar, a timer, and a number-of-players indicator. On higher levels an alphabet bar appears too.

Play starts on flight 1 , where emphasis is on the alphabet and on two-letter words. Flight 2 comes next, giving you the chance to match three-letter flyers. Subsequent flights introduce you to three- and fourletter flyers and faster speeds.

On flights 2 and above, you also gain access to the "alphabet bar." That allows you to select the first letter of your flyers. On levels 4 and 5 you can also change the color of your flyer to
match the color of various zooming words.

If you're playing a twoplayer game, the hourglass timer will clock each player's turn. Need to take a break? At any time, on any level, you can move your flyer to the "rest nest" (an unmistakable mass of sticks and twigs) and press the joystick button to stop the timer. Also, at the beginning of each game (and at any point during play), you have the option of entering the "control panel" and changing any of the game parameters.

Although it takes a few minutes to get the hang of it, game play is fundamentally simple. Use your joystick to select a word from either word tower-the chosen word will be highlighted for you-and then press the button to send the chosen word flyer soaring into the air. Move it into position to match one of the soaring words, and press the joystick button again. If the match is correct, one of the birds will nod approval. If your match is incorrect, the bird will pronounce the avian equivalent of "uh-oh!"

## Cooperative Scoring

In either case, your score will change appropriately. The score is increased when a player matches the flyer with the correct letter or word. On higher levels, additional points are awarded if the words' colors match too. Incorrect matches lower the score slightly and return you to the word tower. In two-player games, an incorrect match ends that player's turn.

Many parents will be pleased with this departure from the winner/loser approach of other multiplayer games. Word Flyer emphasizes constructive cooperation instead of conflict and destruction. The total score increases whenever either player correctly matches a letter or word. By working together, two players can move through the different levels more quickly
than either could alone.
Parent and child can play together, working toward a common goal, and the child will learn to recognize letters, words, and colors. But he or she can learn the importance of cooperation too.

## Where's The Word?

Word Flyer's graphics and sound are effective without being overpowering. Joystick control is responsive. The constantly changing list of letters or words holds interest, assuring many hours of satisfying and challenging play.

However, after several sessions, one odd quirk does become evident. In some cases, while exuberantly chasing down a zoomer, the flyer would fly off the top edge of the playing field. However, you can move the joystick to maneuver the flyer back onto the screen. Bothersome? A little, at first, and it might confuse very young children.

Also, at several points in the otherwise excellent manual, the reader is told that something will be described under a subsequent heading. It is mildly confusing (and occasionally annoying) to have to skip ahead to figure something out; in the case of instructions, at least, necessary redundancy is a feature that many software manuals still lack.

But once you figure it outand it won't take long-control is simple and straightforward. Selecting flyers, colors, levels, and speeds quickly becomes second nature, allowing players to concentrate on the game itself. The educational goals underlying this game are pleasantly and effectively achieved. All in all, a deft piece of work.

## BIG NAME, NO NAME DISKETTES: <br> the best buy YOU CAN FIND!

 Amaray Media-Mate 50 disk storage unit. Extremely well designed with grooves for stacking. Normally $\$ 14.95$. When ordered with 50 BIG
NAME, NO NAME diskettes, you can get one for \$9.99 (Shipping Included).

WELL, OUR SEARCH OF MORE THAN A YEAR HAS PAID OFF.

We found a diskette that you've used a hundred times...but have never heard of. It's the one used by a ot of major software houses for their copy-protected originals..

These BIG NAME, NO NAME diskettes exceed all ANSI and IBM standards. They are individually tested track by track, sector by sector and certified $100 \%$ error-free.

Moreover, the company that makes them has thei own proprietary coating formulation which results in a super-smooth, anti-static surface

In short, these are good diskettes.
If they weren't, we wouldn't be selling them
LIFETIME WARRANTY!
As with every diskette we sell, BIG NAME, NO NAME diskettes are covered by a LIFETIME WAR. RANTY by us and the manufacturer.

If you have any problems with them at any time because of materials or workmanship, just call us to arrange a return

DON'T SAY NO!
Sure, you've never heard of BIG NAME, NO NAME diskettes.

But a lot of software manufacturers who use hun dreds of thousands of diskettes for their copyprotected originals have... and a lot of them use BIG NAME, NO NAME diskettes.
DISKETTE HEAVEN GUARANTEED!
Order your supply of BIG NAME, NO NAME disk ettes today.
If you re not totally happy with them at the end of 30 days, we'll give you a refund, credit or exchange

That's contidence.

# Lightning Sort <br> Russ Gaspard 

#### Abstract

Last September COMPUTE! published "Ultrasort," and we called it the fastest sorting program ever published for any home computer. It would sort a 1000-element array in less than eight seconds.

It's been improved. Here's "Lightning Sort." It does the same thing in a breathtaking 2.1 seconds. Add this extraordinarily powerful subroutine to any of your BASIC programs where you need to alphabetize something. For the VIC, 64, and PC/PCjr. Atari users should refer to the accompanying. sidebar and program "Bulldozer Sort."

The "Ultrasort" routine for Commodore computers (COMPUTE!, September 1983, p. 194) isn't as fast as it could be. After disassembling the code to study the algorithm, I found several opportunities to compact the code (mainly to reduce disk loading time) and to speed up the execution time. Using the "Sort Test" program from the original article as a benchmark, my "Lightning Sort" routine sorts a 1000 -element array in an average of 2.1 seconds, versus 7.8 seconds for Ultrasort. That few seconds savings isn't much. But when I tried it on random 4000element arrays the routine took an average of 10 seconds, versus 40 seconds for Ultrasort. A 400 percent speedup in execution time can be significant in applications where the sort routine is called repeatedly, or in sorting very large arrays.

The time for this type of algorithm to sort an N -element array is $\mathrm{T}^{*} \mathrm{~N}^{*} \log _{2} \mathrm{~N}$ on the average, where T is about .21 milliseconds for the modified routine and .8 milliseconds for the original. Actual running time depends on the starting order of the array. Interestingly, whereas many sort algorithms run fastest when the original array is already in order, Hoare's Quicksort runs fastest on randomly ordered data. If you try it on an array which is already in correct order you'll find that it takes much longer (proportional to $\mathrm{N}^{2}$ ).

Besides speeding up the execution, I was also able to reduce the amount of RAM needed from 908 bytes to 418 bytes. By storing the variables in RAM space above the actual sorting routine rather than within the routine, the actual program storage needed on disk is only 338 bytes. This means the saved program uses only two disk blocks, rather than the four required for the original.

Program 1 is a BASIC program which loads the machine language Lightning Sort routine for the Commodore 64. The routine is loaded into RAM from $\$$ C000 to $\$ \mathrm{C} 152$ (decimal 49152 to 49490), and writes variable data up to \$C1A2 (decimal 49570). It is used in exactly the same way as Ultrasort. However, I prefer to define the call address 49152 as variable QS (either within the BASIC program or in direct mode) and then call the routine with:

SYS QS,N,AA\$(K)
where K and N are the first element and the number of elements to sort, and AA\$ is the array variable name, as in the Ultrasort article.

Program 2 is a BASIC loader for the VIC version of Lightning Sort. It automatically relocates the machine language to the top of available memory, regardless of the amount of expansion installed, and protects the sort routine from BASIC. The program also tells you the proper SYS to use to start the sorting.

Although Program 2 will run on an unexpanded VIC, we recommend that at least 8 K expansion be used. With less than this, only a very few items can be sorted.

Program 3, the Sort Test program from the original Ultrasort article, can be used as a demonstration of Lightning Sort. The program creates an array, AA $\$$, of 1000 random elements, then sorts them into order. If you are using a VIC with limited memory, you'll need to reduce the number of elements.

## Program 1: Lightning Sort Loader For The 64

## Atari Bubble And Bulldozer Sorting <br> <br> Chisine C. Genei

 <br> <br> Chisine C. Genei}While machine language data sorting is extremely fast, there still may be times you will want to insert a simple BASIC sorting routine into a program. When the list to be sorted is small, bubble sorting is a good method to use. For larger lists, a technique called bulldozer sorting may be better.

## Using The Bulldozer Sort Program

The program is a demonstration of the bulldozer sort. It asks how many numbers you want to sort and the value of the highest number in the list. It then generates random numbers in the desired range. When finished sorting, it prints all nonzero values to the screen.

To use the bulldozer sort as a subroutine, delete lines 70 through 85 and add a line to the beginning of the program defining the number of data elements (RN) and the maximum value of the data (MV). Also, change line 111 so that it will input the data in the way that is needed for your program. For example, to input data from the keyboard, change the line to read:

111 INPUT DT:IF DT $>$ MV THEN 111
If you would like the sorted list printed to the screen as part of your subroutine, change line 550 to read:

550 RETURN
If you don't want a screen print, delete lines 500 through 550 and add the following line:

200 RETURN

## How Bubble Sorting Works

The bubble sort is a commonly used method of sorting small lists of data into numerical or alphabetical order. While bubble sorts are easy to understand and use in programs, they are often too slow to use for large sorting tasks-bubble sorting requires many comparisons.

A bubble sort compares each item against the other unsorted items. If the item tested is larger than the one it is tested against, their positions are switched. This way, after all of the values have been tested once, the first position in the array contains the lowest number in the list.

## Sorting A Stack Of Cards

Suppose we have a small stack of index
cards that are out of order. We have four cards (numbered 1 through 4) to sort, and they are in the following order: $3,2,4,1$. To begin, we compare the first card (3) with the second (2). Since 2 is less than 3 , we swap the cards and the order becomes: $2,3,4,1$.

Next we compare the first and third cards in the deck, and since 2 is less than 4 , no swap occurs. Comparing the first and fourth cards, we see that they should be swapped (since 2 is greater than 1) and our stack of cards reads $1,3,4,2$.

Now we have placed the lowest card in the first position, so we can start our second series of comparisons with the second card in the deck. We compare the second and third cards ( 3 and 4) and make no swap, then compare the second and fourth cards, swapping 3 with 2 . At this point, the first two positions in the deck are set and the order is $1,2,4,3$. Testing the third card is easy, since there is only one comparison left, and we switch the positions of 4 and 3 to finish our bubble sort with the array filled as follows: $1,2,3,4$.

Our mental sort took only six comparisons, and was pretty quick. But with longer lists, bubble sorting slows down greatly. The reason for this is that in any array with N elements, the number of comparisons required will be $N(N-1) / 2$. This means that while a bubble sort of 20 items will require 190 comparisons, a list only four times as long ( 80 items) will require over 16 times as many comparisons (3160). In order to speed things up, we need to reduce the number of comparisons as much as possible.

## A Faster Sort

An alternative is bulldozer sorting, first described by Isaac and Singleton, in JACM 3 (1956): 169-174. Bulldozer sorting uses address calculation to roughly position items in the array before sorting them. We bulldozer sort every time we use an index card filewe look for the correct section of files first, then sort the card into the specific place it belongs. On a computer, this sort works well for up to around 500 items and is faster than bubble sorting, although it uses more memory for the array.

Another feature of the bulldozer sort that makes it faster than the bubble sort is
that the bulldozer sort arranges the items one by one as the data is input－there is no long wait for the sort to finish after all of the data has been entered．

## Address Calculation

To successfully predict where the data should be placed in the array before sorting， keep two requirements in mind：

1．The array used for sorting and stor－ age of the data should be about 1.4 times as large as the data list，and
2．The formula for calculating the es－ timated address should be chosen to al－ low empty array spaces above，below， and between the sorted data elements．
The first requirement is easy to handle；just DIMension the data storage array to a value 1.4 times greater than the size of the data list．

## Borrowing An Equation

To satisfy the second requirement－leaving extra space in the array－we need an equa－ tion that predicts a position for the lowest data element about 10 percent of the way into the array，and estimates the highest data element＇s position to be about 10 per－ cent from the end of the array．Since the ac－ curacy of the predicting equation is not critical，we＇ll use a simple one borrowed from geometry－the equation for a line－to put the data in the correct general area of the array．Then we＇ll sort the data into the exact location．

For example，if we had 200 job num－ bers（or other data elements）ranging in value from 0 to 500 ，we would DIMension the array to 280 ．We would also want the lowest value to be placed by the equation in the 28th array position and the highest value to be sent to the 252 nd position．

The general equation for a line is $y=m x+b$ ，where $m$ is the slope and $b$ is the place where the line crosses the $y$－axis．The slope of a line is the rise（change in the value of $y$ ）divided by the run（change in the value of x ）．We want predicted points to be in the middle 80 percent of the array，so we multiply m in the above equation by 0.8 ． For the value of $b$ ，simply use 10 percent of the array size（28）．The estimated array position for $x=250$ would be：

$$
y=m x+b=0.8(280 / 500) x+28=0.448(250)+28=140
$$

Note that of the 281 array positions created by DIMensioning，position 140 is very near
the center．Using the same equation to pre－ dict a position for $\mathrm{x}=251$ ，though，yields a value of 140.448 ，which rounds to 140 ．

Obviously one array element can hold only one data value，and this is where sorting becomes necessary．When an array location is already being used，the bulldozer sort compares the two values and rearranges the list．It is this readjusting feature of the bulldozer sort that requires the 40 percent extra array storage．The program slows down as it sorts near the end of the data list because more of the predicted locations are filled and more sorting is necessary．

## Program 3: Sort Test

## Programmer's Notes: PC And PCji Version

Tim Victor, Editorial Programmer

## The PC and PCjr version of "Lightning

 Sort" (Program 4) is based on the same algorithm as the version for Commodore computers, but runs in about one-third the time, due to the greater speed and power of the 8088 microprocessor used in the IBM computers. There are a couple of differences in the way that this program is loaded and used.The BASIC loader program calculates a checksum from the DATA statements to help identify typing errors, then creates a disk file named "LSORT.BAS", containing the ML routine in binary form. The demonstration (Program 5) loads this file into memory using BLOAD and sets LSORT to the address of the sort routine. This variable is needed because IBM BASIC's CALL statement will only accept a variable name for the address of an ML routine.

Lightning Sort uses the first parameter in the CALL statement to find the array that it will sort. This is actually the address of the first string in the array, $\mathrm{AA} \$(1)$ in the demonstration program, not the address of the array itself. The second parameter, $\mathrm{N} \%$, tells Lightning Sort how many strings are in the array. Variable names also have to be used for parameters, which is the reason for using N\% instead of just plain 1000, and this version expects the length parameter to be an integer variable (a variable whose name ends with a percent sign).

Lightning Sort is loaded at address hex FF00 in BASIC's default segment. During a sort, the 256 bytes starting at hex FE00 are also used. To protect this memory, both programs start with the instruction CLEAR,\&HFE00, which sets the top of BASIC's workspace to hex FE00.

## Notes For Apple Version Of Lightning Sort

## Tim Victor, Editorial Programmer

The Apple version of "Lightning Sort," shown in Programs 6 and 7, requires an Apple II with at least 48 K of random access memory and one disk drive. It has been tested on an Apple II Plus under DOS 3.3 and on an Apple IIc under ProDOS as well as DOS 3.3. The Applesoft demonstration program in Program 7 uses the BLOAD command to load the file LIGHTNING.SORT. This is a binary file containing the Lightning Sort program that is entered from Program 6 using the Apple II's built-in ML monitor.

Boot your computer, then type "CALL-151" to use the monitor. When you hit RETURN, the Applesoft input prompt will be replaced by an asterisk ("*"), the monitor's prompt. To enter a line from the listing, replace the hyphen after the first four-digit hexadecimal number with a colon. The first line in the listing would be entered as

9400: 20 B1 002005 E1 A5 A0
Since no checksums are used in the listing, it's a good idea to make sure that the program in memory is correct. You can ask the monitor to display the contents of any memory location by typing its address as a hexadecimal number and hitting return. To examine a range of memory locations, type the address of the first location in the range, a period ("."), and then the address of the last location in the range. For example, Program 6 was made simply by entering " 9400.9551 " in response to the asterisk prompt.

When you're sure that the program is entered correctly, save it to disk using the BSAVE command. All DOS commands work in exactly the same way when entered from the monitor as when they are used in Applesoft. You can CATALOG, BLOAD, BSAVE, DELETE, and even LOAD and SAVE BASIC programs. To save the program you just entered, type "BSAVE LIGHTNING.SORT,A\$9400,L\$152" and hit RETURN. DOS will create a binary file named "LIGHTNING.SORT" and store in it $\$ 152$ (338 in decimal notation) bytes beginning at memory location $\$ 9400$ (decimal 37888).

## Program 6: Lightning Sort For The Apple

```

\section*{For the}

Commodore 64

SuperTerm - the only software that communicates with them all! Information networks such as CompuServe; business and university mainframes; free hobby bulletin boards.

Professionals and students: SuperTerm's VT102 emulation gets you on-line in style. Advanced video features, graphics, full-screen editing, 80/132 column through sidescrolling. extended keyboard - perfect for EDT, DECMail, etc. Even download your workfiles and edit off-line! Full printer and editor support; other emulations available.
Researchers and writers: SuperTerm's built-in text editor helps you create, edit, print, save, send and receive text files - articles, stories, reports, inventories, bibliographies - in short, it's your information work station. Access CompuServe, Dow Jones Information Network, Dialog/Knowledge Index, Western Union's Easylink, The Source, and many more. Optional Sprinter accessory saves printing time and \(s\) (see below).

Computer hobbyists: Join in the fun of accessing hundreds of free bulletin board systems (BBS) for Commodore, Apple, TRS-80, etc. Text mode with all BBS systems; up/downloading with Commodore BBS systems (Punter protocol). Special protocol for up/downloading with other SuperTerm owners. Popular "redial-if-busy" feature for use with automodems.

Get the information you need, for business or for fun, with the software that communicates with them all!

Requires: Commodore 64, disk drive, and suitable manual- or auto-modem. Printer optional. Software on disk w/free backup copy. Extensive manual in deluxe binder.

\section*{SuperTerm's}

\section*{SPRINTER Accessory}

With the Sprinter accessory, SuperTerm can perform concurrent printing - as text appears on your screen, it's simultaneously printed on your printer. Includes all necessary hardware for connecting your parallel printer and computer via the cartridge port. Simply plug-in and go. Free utility software for printing and listing as a stand-alone interface.

Requires: parallel printer such as Epson, Gemini, Microline, C.Itoh. (Min. speed 35 cps.)

Commodore 64 is a trademark of Commodore Electronics, Ltd.

\title{
Aids For The Blind
}

Computers provide new and powerful aids for blind people. With special input and output devices and programs, computers enable blind people to more effectively substitute hearing and touch for sight and to use books, magazines, and newspapers that would otherwise be inaccessible to them. Computers can help blind people enjoy new opportunities for education, employment, social interaction, and recreation.

Much of this information about aids for the blind has been provided by the staff of the Sensory Aids Foundation of Palo Alto, California. They train blind people in job skills and help them find suitable jobs. They receive support from some of the major computer and electronics companies in Silicon Valley, and have placed workers at these companies. Other information has been provided by Telesensory Systems, Inc., the developers of Optacon and VersaBraille.

\section*{Computer Speech Synthesis}

Speech synthesizers and text-to-speech conversion programs make it possible for computers to pronounce any word. The speech is not perfect, but people understand it easily after they get accustomed to it. During a visit to the Sensory Aids Foundation, I watched a demonstration of a talking terminal-a computer terminal combined with a speech synthesizer.

The blind user of the talking terminal has a control that lets him move a pointer to any line on the display screen. He can have the computer

\footnotetext{
Dr. Glenn M. Kleiman is an educational psychologist and software developer. He is the author of Brave New
Schools: How Computers Can Change Education (Reston/Prentice-Hall) and the designer of Square Pairs, an educational game program (Scholastic, Inc.).
}
announce what line the pointer is on and speak the words on that line. He can have it repeat any words or read letter by letter. He can use the keyboard to edit the line.

Talking terminals make almost all the capabilities of a computer accessible to blind people. At Sensory Aids, blind people learn to use talking terminals for data entry, information retrieval, word processing, and programming.

Many educational programs could be used by blind people if the computer spoke what appears on the display screen. Staff members at Sensory Aids are revising some popular programs so that blind people can use them. During my visit, I saw a version of MasterType that was adapted for the blind. In the MasterType program, letters and words "attack" a central station. The user defends the station by typing the letters and words before they reach the station. In the adapted version of this program, the computer says the letters and words to be typed, and announces whether they have been typed correctly and quickly enough to defend the station.

\section*{Large Print Displays}

Many people with impaired vision cannot read normal print, but can read large, high-contrast print. There are several ways to create large letters on the computer screen with standard equipment. One is to simply use a television or video monitor with a large display screen. Another is to use the computer's graphics capability to create large letters. In addition, many computer printers can produce large type on paper. With a suitable printer, any information stored in the computer can be printed in large letters.

A special large-print display processor, manufactured by Visualtek, magnifies letters on personal computer screens up to 16 times their
usual size. A control panel lets the user set the scanning rate at which the letters move across the display screen.

\section*{Tactile Forms}

Many people cannot see any letters, no matter how large. But these people can read when the letters are converted to a tactile form. One device which does that, Optacon, is already used by many blind people.

Optacon consists of a small camera, an electronics unit, and a stimulator array. The array is composed of 144 miniature rods. The electronics unit interprets the light pattern received by the camera and sends signals that cause certain rods to vibrate, thereby producing a tactile analogue to the light pattern. Some training is necessary to learn to read the vibrating patterns, but once this is mastered the blind person has access to all printed materials. Special adapters are available so that Optacon can be used to read computer screens and calculator displays.

Other devices use Braille, a system of writing in which each letter is represented by a pattern of raised dots in a \(2 \times 3\) grid. Blind people read by feeling the dot patterns.

Although widely used, Braille has several disadvantages. Braille books are extremely bulky: A standard student dictionary fills a three-footsquare box. Braille typewriters are noisy and slow. Errors in Braille type cannot be corrected, since the raised dots cannot be erased. Braille books are therefore expensive, and most books, newspapers, and magazines are never made available in Braille.

\section*{Braille Word Processing}

Special Braille printers can be interfaced to computers so that any information in the computer can be transformed to Braille. This provides a remedy for the problem of Braille not being correctable. A word processing program can be used to produce a Braille text after all corrections have been made on the computer screen.

Other Braille output devices can be interfaced to computers. One example is a device that contains sets of pins arranged in the \(2 \times 3\) Braille grid. Each pin can be raised or lowered, thereby providing a mechanical Braille display. This device can be controlled by computer programs to produce instant Braille for a blind computer user.

A special device called VersaBraille incorporates recent advances in computer technology. VersaBraille is composed of a mechanical Braille display, a cassette information storage component, and a specially designed Braille keyboard, all under the control of a built-in computer.
Information can be entered from the keyboard,
revised and corrected (editing capabilities are built-in), stored on cassette, and transformed to Braille whenever needed.

VersaBraille provides a solution to the bulkiness of Braille. It is a self-contained unit that is easy to carry and can store 400 pages of Braille on a standard cassette tape.

A major advantage of VersaBraille is that it can be linked to a computer via a standard serial interface. A blind person can connect VersaBraille to a computer and quickly transfer information from the computer to VersaBraille's cassette storage system. The VersaBraille can then be taken away from the computer and read where and when convenient. A VersaBraille user can also take notes during class lectures, write reports, or enter any other information. He or she can then connect VersaBraille to a computer, transfer the information to the computer's memory, and use the computer to print the information, store it, or send it to others via an electronic mail system.

\section*{Computerized Letter Recognition}

Speech synthesizers and text-to-speech programs can convert any words stored in a computer to speech. Other devices can convert information stored in a computer to large letter displays or to Braille or other tactile signals. However, much of the information people need is in books, not computers. To fully use the capability of computers to convert text to speech, Braille, or large print, we need efficient ways of transferring text from books to computers.

Special cameras and pattern recognition programs have been used for some time to recognize specially designed letters and numbers, such as the account numbers on checks. The camera converts the pattern of each letter into a binary code. A computer is programmed to process the binary code and determine which letter it represents.

In the last few years, devices and programs have been developed which make it possible for computers to recognize most typewritten characters and to adjust automatically for different type styles and sizes. In the next few years, this technology is likely to be perfected and become more widely available. (Only very limited success can be expected with handwritten letters, due to the large variations found in even one person's handwriting.)

Letter-recognition devices can be combined with appropriate output devices to produce large size displays, speech or Braille. Letter-recognition devices can also be combined with Braille printers to expedite the production of Braille books.

\section*{Converting Print To Speech}

One impressive example of technology which serves the visually handicapped is the Kurzweil

Reading Machine that converts print to speech. This machine combines sophisticated pattern recognition, speech synthesis, and text-to-speech conversion capabilities. It lets blind users control how the material is read. They can set the speed of reading and adjust the tonality of the voice. They can stop the reading at any time, have the last few words or lines repeated, request the machine to spell out words or announce punctuation and capitalization, and mark certain words or phrases for later reference. This reading machine is currently a very expensive device. But as the technology advances and prices decrease, machines with these capabilities should become available to all blind people.

\section*{Technology For The Blind}

Of 51 blind people who were assisted by the Sensory Aids Foundation during a one-year period, fifteen are now programmers, computer operators, or systems analysts. Other occupations include design engineer, word processor, medical transcriber, account clerk, attorney, cashier, clerktypist, physicist, and college professor. Their employers include Apple, Hewlett-Packard, Pacific Telephone, Stanford Linear Accelerator, Department of Immigration, Internal Revenue Service, and other businesses, educational institutions, and government agencies.

Current technological aids include Optacon, VersaBraille, talking terminals, talking calculators, and closed circuit television systems that produce enlarged images of print on a television screen. These devices, and others now in development, can dramatically increase the opportunities available to blind people.

Call Toll Free: 800-421-7731

\section*{In California: 800-421-7748}

1 JASON-RANHEIM
580 Parrott St., San Jose, CA 95112

Last month we discussed how to make programs designed for the Atari 400 and 800 load and run automatically on the new XL series without having to hold the option key down. We also looked at a way to make patches into Atari DOS 2.0 s to enable it to work with the new enhanced density 1050 disk drive. The procedure is easy, but requires two disk drives. Just type in the source code (the portion printed last month and the continuation found in this issue) using an assembler capable of placing its object code directly in memory. Assemble it after LISTing or SAVEing the source code to disk. After assembling it once, change line number 1000 to read:

1000 .OPT NOLIST,OBJ
and assemble the code once more.
DOS should now be patched. Hit the SYSTEM RESET key and give the DOS command from your assembler. You should now be in the DOS menu (if you're not, something has gone wrong). Format a new disk using option I and then write the DOS files using option H. This will insure that everything is right and will give
you a safe copy of your newly patched DOS.

\section*{The Tricky Part}

There's one more step necessary to finish the procedure. Turn off your computer, put your BASIC (or BASIC XL) cartridge into your machine, and turn the power back on, thus booting the disk that was just formatted. Place a blank diskette into the 1050 drive that you are using as drive 2 and, from BASIC, type the following command:
```

XIO 254,\#1,0,34,"D2:"

```

Drive 2 should now contain an enhanced-density diskette. Now hit the SYSTEM RESET key so that DOS will recognize the new density. Finally, go into DOS and write the DOS files to the new diskette (D2), using option H from the menu.

If everything has been done properly, drive 2 should now have an enhanced-density diskette containing the patched DOS. Once you have this master completed, creating others is simple and can be done with the I and H options in the DOS menu.

Patches To Atari DOS 2.0s

ØD7D
128 COMPUTE September 1984

\title{
Commodore Autoboot
}

David W. Martin

This utility makes loading and running programs quick and easy, and can also be used as a form of copy protection. For the VIC-20 and Commodore 64 with a disk drive.

Have you ever wondered how some commercial programs run automatically after they're loaded? "Autoboot" enables you to add this convenient feature to your own programs.

Type in and SAVE Autoboot. VIC users should substitute the following for lines 481 and 491 before saving:
```

481 DATA 165,175,133,46,165,174,133,45,32
,89,198,32 :rem 234
4 9 1 ~ D A T A ~ 1 4 2 , 1 9 8 , 7 6 , 1 7 4 , 1 9 9 ~ : r e m ~ 7 7 ~

```

To use Autoboot, first load the BASIC program that you want to make bootable. Then enter POKE 43,0:POKE 44,1 and SAVE the program using a different filename. This version of the program will be used by Autoboot. Now load and run Autoboot and enter the name of the modified version when prompted. Autoboot will then turn it into an autoboot program by directly changing certain disk sectors. The sector numbers are displayed on the screen as Autoboot runs.

Since the VIC and 64 automatically relocate programs when loading, all autobooted programs must be loaded using a nonrelocatable load as follows:

\section*{LOAD "filename",8,1}

Of course, any BASIC program can be made to load and run from disk just by typing:

LOAD "filename",8:
and pressing SHIFT-RUN/STOP instead of RETURN. But the power of Autoboot lies in the copy protection it provides. To copy protect your autorun programs, add POKE 808,100 (VIC), or

POKE 808,234 (64) as the first line in your program before saving the modified version to be used by Autoboot. This will disable the RUN/ STOP key, the RESTORE key, and the LIST command as soon as the program runs. Since the autobooted program will run as soon as it's loaded, the user won't be able to break out of the program to SAVE it.

\section*{Autoboot}

Refer to the "Automatic Proofreader" article before typing this program in.

\section*{ATTENTION COMMODORE 64 OWNERS: "Is THE CLONE MACHINE really dead?"}

Yes, there comes a time when a product grows old and isn't the latest state of the art. Thank goodness we understand that here at Micro-W. Our all new version (known as SUPER CLONE) will surely prove that we are still number one in the back-up business. You'll still get the old reliable Clone Machine but we've added the following: 1) A fast clone copy (approx. 14 minutes) that's simple to use 2) A Super Unguard utilility that quickly handles errors 20 thru 29 (and you don't even have to disassemble your drive like some of our competitors suggest) 3) A new unique way to back-up formerty uncopyable software.
Don't worry if you are a registered owner of our earlier version, we've got you on file and this upgrade will only cost you \(\$ 10\) plus shipping and handling. Dealers, call us for stock balancing on old merchandise.
STILI ONLY \$49.95*

Should've made back-ups with Super Clone

\title{
Atari Paddle Fixer
}

\author{
William Griner
}

Here's a quick fix for the Atari paddle jitters that still preserves the paddles' range.

The Atari paddles are so sensitive that the heat of a hand or any jarring can change their value. Some paddle-based games don't take the sensitivity into account, causing their characters to flicker annoyingly. Try this:

\footnotetext{
KN 1 ø日ø REM get the paddle value 16101ø PV=PADDLE(PN): IF ABS (PV-OPV ) >1 THẸN OPV=PV: RETURN
LF 1ø2め PV=OPV: RETURN
where:
PN is the paddle number \((0-7)\)
PV is the value read from the paddle
OPV is the old paddle value (initialized to whatever value you wish)
}

\section*{Centered Values}

The above subroutine keeps the paddle centered between the adjacent values. It takes a difference of two steps or more to change the paddle value. This is not to say that the paddle will use only all even or all odd values. For example, if the paddle is at value 77, it will not be allowed to move directly to 76 or 78 . If you want to move from 77 to 78 , you will have to move to 80 or 75 , then to 78.

\section*{Better Than Brackets}

This method is better than dividing the paddle range by a number since doing so creates fixed brackets of possible values and does nothing to keep the paddle value from straddling the bracket boundaries. This method could also be used to keep the paddle in a wide bracket, allowing only for coarse movement, yet giving access to the entire range of the paddle's values.

\title{
Apple Editing Hints
}

\author{
Patrick Moyer
}

\begin{abstract}
Most computer owners develop a love-hate relationship with at least one feature of their machines. For Apple owners, this feature is often the editing functions. Here is a review of Apple editing controls and protocols and some tips on making the process easier and more effective.
\end{abstract}

The Apple uses a combination of screen editing and line editing. Changes are made by moving the cursor to a particular line which has been listed on the screen and retyping that line. This retyping is usually accomplished with the right arrow key. As the right arrow is pressed, the cursor moves to the right, reentering all it passes over. A change is made by typing over what is already there, or by inserting the correction through a combination of cursor moves.

\section*{Physical, Logical}

Therefore, to make a change, we must specify the line to be changed. In this case, we are talking about a line of BASIC, not a line displayed on the screen. The BASIC line is called a logical line, as opposed to the physical line that is displayed on the screen. A logical line may contain multiple BASIC commands and may be up to 255 characters long. The physical display line is the 40 -letter width of the screen.

Before a BASIC line can be changed, it must be listed. It is best to clear the screen with the HOME command initially. This eliminates confusion about what was changed and what wasn't.

When a line is listed, the computer puts one space between words or variables, two spaces after the line number, seven spaces at the end of the first physical line, and five spaces on the right and left sides of the remaining physical lines.

Most of the time, these extra spaces and lines are of little consequence. One can just merrily right-arrow over them with no harm. The one exception occurs in string information (characters in quotes). This causes a problem. If a string is broken between two or more physical lines during the listing process, and you rightarrow to retype, 12 additional spaces will be inserted between the last character on the first line and the first character on the next line. Certainly not what's wanted. The common solution is to
avoid the right arrow and use the cursor with the \(<\mathrm{ESC}>\mathrm{K}\) sequence instead.

\section*{Simplified Cursor Control}

There's an even simpler solution. Let's edit a line step by step to demonstrate this technique (<ESC> is the ESC KEY, <RET> is the RETURN KEY):
Here's the line as originally typed:

\section*{10PRINT"THIS IS A LONG LINE OF STRING DATA" \(<\) RET>}

List the line. It looks like this:

\section*{LIST10<RET>}

10 PRINT "THIS IS A LONG LINE OF STR ING DATA"

We then type \(<\) ESC \(>\) I, repeating the I key until the cursor is over the second digit of the line number; J is pressed to move the cursor one space to the left. (This J keypress is important. If you forget it and continue the editing process, you will gain a line in your program. Line 0 will be created, but more about that later.)

Once you've moved left, leave <ESC> mode. This is done by pressing any key not having meaning in <ESC> mode. Because some keys not normally used for cursor movement do have special meaning, it's best to press the space bar. Remember, this will not move the cursor.

We can now use the right arrow to "retype" the line to the place of the change. The repeat key can be used to speed this process. Let's say you've used the right arrow until it appears after the last quote. The line on the screen looks no \({ }^{\circ}\) different. However, if we LIST the line, we now see this:

\section*{10 PRINT "THIS IS A LONG LINE OF STR ING DATA"}

If we type RUN we get:

\section*{RUN<RET>}

THIS IS A LONG LINE OF STR ING DAT A

\section*{Eliminating Problem Margins}

The common solution, again, is to right-arrow to the R in STR, then type <ESC> and press K repeatedly to move the cursor until you reach the I in ING. Anyone who has done this often will know how easy it is to forget \(<\mathrm{ESC}>\mathrm{K}\), and end up with a string of K's.

The solution is simply to eliminate those extra margins unless you need them. Let's start
with the same original line: 10PRINT"THIS IS A LONG LINE OF STRING DATA" \(<\) RET \(>\)
To edit the line we type: HOME:POKE33,30:LIST10<RET>
The HOME gives us a clean screen to work with; the LIST puts the line to be edited on the screen. A POKE instruction places a single number into an "address" in the computer's memory. Address 33 controls the width of the screen display. Placing the number 30 in it reduces the size of the screen to 30 characters wide rather than 40.

Caution: The POKE must be done before the LIST for this method to work. The HOME is optional, but prevents a very confusing screen. (Try it. You'll see what I mean.) The screen will erase and display:

\section*{10 PRINT"THIS IS A LONG LINE OF S TRING DATA"}

As you can see, the line is 30 characters wide without the extra margin spaces. Move the cursor to the line number as usual. The right arrow may be used without ill effect. It will go directly from the \(S\) on the first display line to the \(T\) on the second line without inserting any blanks. This eliminates the need to use the <ESC> K sequence.

Once you have finished editing, you will need to type TEXT. This command will return you to normal 40-character screen mode.

\section*{Duplicating Lines}

One strength of Apple II editing is the ability to duplicate lines. Let's try an example:

\section*{HOME: POKE33,30:LIST10<RET> 10 PRINT"THIS IS A LINE TO BE DUPLICATED"}

Next move the cursor up to the line using the normal \(<\mathrm{ESC}>\mathrm{I}\). When the cursor arrives over the number, move it left until it is over the first digit of the number. Then press the space bar as before; but prior to using the right arrow, retype the line number, say, 20 . Then use the right arrow to "retype" the line as described above until you reach the end of the logical line. At this point, press RETURN. If you LIST the program, you'll see:

\section*{HOME:POKE33,30:LIST<ret> \\ 10 PRINT"THIS IS A LINE TO BE \\ DUPLICATED" \\ 20 PRINT" \({ }^{\prime}\) THIS IS A LINE TO BE DUPLICATED"}

Once you have moved your cursor up to the number and changed it, you do not have to reuse the entire line. You can treat it like any line to be edited further if necessary.

\section*{Easy Program Merge}

This technique can also be used on a limited scale to merge two programs. Let's say you have a favorite subroutine of three or four lines which you wish to add to a program. You could use the merge function of the Renumber program on the Systems Master, or the program that is part of the Programmer's Toolkit. If you don't have these programs or you don't have them handy, here is a simple procedure:
1. Save the program you are working on.
2. Load the program which contains the lines to be copied to your new program.
3. Clear the screen, change width, and list lines (using HOME:POKE33,30:LIST statements).
4. Now, load the program the lines are to be added to.
5. Using the normal \(<\mathrm{ESC}>\) and right-arrow commands, edit each line without changes. It's best to edit the last line first and work up the screen, entering each line one at a time. This is because when multiple lines are listed and edited, once \(<\) RET \(>\) is pressed, the line number below it is partially destroyed and has to be retyped by hand. There's nothing wrong with changing the line numbers to fit your new program if the current line numbers are a problem.
6. Once all lines are edited, save the program. If you list it, you'll find the lines are now part of your program.
Finally, if you want to cancel a particular change as long as you have not pressed \(<\) RET \(>\) yet, cancel the editing of the line by typing <CTL> X. Be sure that you press the <CTL> key first, then \(X\). The machine will answer with a backward slash. If you list the line, it will be unchanged.

\title{
Math And Tables
}

I'm frequently asked for addresses within ROM that do certain operations, usually mathematical functions. I do my best to talk programmers out of this approach if possible.

For one thing, the addresses of the ROM routines vary from machine to machine. I'd prefer to see a programmer borrow the code from the ROMs and include it in the program. At least that way, transportability is not a problem.

Using ROM math routines is often awkward. They often call for one or more values to be placed into floating point accumulators before calling, and return values in the same areas. A floating point number is often an inconvenient format and takes a fair-sized conversion routine to bring back to the more convenient "fixed point" notation used by most machine language programmers. The total effort can turn out to be greater than programming it yourself.

But the main reason that I try to discourage use of these routines is this: They are designed for a certain number of digits of accuracy, and your program usually wants either greater or less accuracy. If you need less, you're wasting processor time working out the extra places. If you need more, the built-in routine will not do the job for you.

\section*{A Question}

I was recently asked by a user to supply the address of the logarithm routine within a certain computer. It would have been easy to just answer the question, but I balked. I asked the user to define his objective.

This makes an interesting case history, since the objectives were changed partway through the exercise. We have a chance to see a couple of approaches to avoiding the built-in routines.

My first thought was to replace the ROM log routine with a streamlined machine language version. There are several efficient ways of calculating a logarithm; any book on numerical analysis (or an encyclopedia) will supply information on this.

\section*{First Approach}

After questioning the user closely, the objective appeared to be this: An eight-bit reading was being taken from a remote device. He desired to convert this reading to a base ten logarithm (with appropriate scaling) for display purposes, and the accuracy of the result was to be 16 bits.

My concept of the approach changed. The magic words, "eight bits," had been spoken. The objectives were still a bit fuzzy, since it's hard to get a full 16 bits of useful data when your original data was only 8 bits accurate; but not to worry on that score for the moment.

Here's the pitch: If you have an eight-bit value to work through any mathematical function, use a table. There are only 256 possible values to be worked out, 256 questions and 256 corresponding answers.

We'll need to have two tables-one for the low part of the answer and one for the high part-but that's no problem: 512 bytes of storage is usually not hard to come by.

Looking up things in a table of 256 values is the ultimate in simplicity. It's sometimes called a "list type lookup," and the principle is very simple. Put the original value into an index register, and read out the indexed answer. Our code might read something like the following:
```

LDX -input register-
LDA LOWTABLE,X
STA LOWRESULT
LDA HIGHTABLE,X
STA HIGHRESULT

```

No loops, no math, no complexity: Five instructions and it's done. We must be sure to prepare the table in advance, but that's a one-shot task. In fact, BASIC could do the job for us and POKE the values into the table.

\section*{Second Approach}

When the requirement was examined more closely, the rules changed and the problem was inverted: Given a 16 -bit reading, compute the base ten logarithm to 8 bits of accuracy. The eight bits, by the way, were to be used to draw a high-resolution graph; 256 points were quite sufficient for the resolution required.

This requirement makes a little more sense: Converting 16 bits into 8 involves a loss of accuracy, but that was compatible with the display objective.

We still have the magic words "eight bits" embedded in the problem, but this time they describe the result. We can still use our table approach if we invert the way we use the table.

Let's build our table this way: For each of the 256 entries, we'll put the corresponding "anti logarithm" in the table. When we search the table to find the closest match to our original value, the answer will turn out to be the number of the table entry.

An example might illustrate what I mean here. Suppose the 16 -bit input number has a value of 2000. The desired result, allowing for the scale, will be 165 . In slot 165 of the tables (high and low), I'll find a value that's quite close to 2000. My task: search the table to find the closest value.

\section*{Binary Splitting}

This isn't hard to do. Most of us have learned to search a table by using a "binary split" method, splitting the table in half again and again until we find the value we want. And on a table of size 256 , a computer can do a very efficient job of binary splitting. Eight comparisons and it's all over.

The code would follow these lines:
LDA \#\$80
STA MASK

This says, "we're going to split the table into chunks of 128 (hex 80) this time around."
```

LDX \#\$00
STX POINTER

```

We'll kick off starting at position zero in the table. Here comes the loop:

\section*{LOOP LDA POINTER ORA MASK TAX}

We've added our offset of 128 to the starting position of zero, so our first comparison will be at the midpoint of the 256 table.

\section*{COMPARE .....}

Let's fudge the COMPARE coding for the moment. We'll need to load our high and low bytes into A, compare to the table high and low (indexed, of course) and decide whether our value is higher or lower than the table entry. If our value is LOW, we'll branch ahead to LOW; otherwise, we continue with HIGH:

\section*{HIGH STX POINTER}

If our value is high, we store the index. If not, we skip this instruction and continue with the old value in POINTER.

\section*{LOW LSR MASK}

Our mask contained 128 , the size of the "split." Now we are dividing it by two so that it becomes 64 , and 32 the next time, followed by 16, and so on. Eventually, we'll end up with zero as the bit rolls out of the end of the byte.

BNE LOOP
We go back to do another comparison. Let's see what has happened. POINTER started at zero. If our input value is lower than table item 128 , POINTER will stay at zero and the next comparison will be with item 64 . On the other hand, if our input value is higher than table entry 128 , POINTER will be changed to 128 , and the next comparison will be with item 192. In other words, we'll split the upper half or the lower half depending on how the previous comparison went.

It's not hard to see how the program zeros in on the answer after eight comparisons. Finally, MASK becomes zero, the program stops looping, and the answer may be found in POINTER.

The user started out looking for a logarithm routine in ROM, and ended up with something much better: faster, more compact, and wellsuited to the application.

And there was a free bonus. After looking at this approach, the user discovered that he could do something he had previously thought impractical: switch to a new display scale-linear, split scale, or whatever-with no difficulty. It was just a matter of turning the tables.

\title{
Commodore Disk Pattern Matching Part 1
}

Jim Butterfield, Associate Editor

The flexible Commodore DOS allows the user to LOAD, Scratch, and obtain a directory of files using the symbols * and ? as pattern matchers. The quirks of these two symbols can, however, cause problems. For one thing, you might accidentally erase an entire diskette.

Commodore disk drives are versatile; sometimes we don't realize how versatile they are. In this article, we'll discuss pattern matching: how it works, and how to use it to get rid of an annoying "comma" file that sometimes appears on your disk directory.

First, a recommendation: Unless you have 4.0 BASIC (in the PET/CBM series of computers), learn how to use the Wedge or DOS Wedge utility program. It's a great convenience. We'll refer to wedge commands within this article. The DOS Wedge has many handy features, but the two most important are these: You can find out about a disk error at any time by typing the @ key followed by a RETURN; and you can examine a disk directory without disturbing the program within your computer's memory by typing @\$ followed by RETURN.

\section*{Pattern Matching}

It's possible to identify one or more programs on disk without specifying their full names. Match the missing part of the filename by using a pattern. The two characters used for this are:

\footnotetext{
? - to match any single character;
* - to match any following characters.
}

If I have two files, one named DIG and the other, DOG, I can specify a name which matches both files with D ?G-the question mark matches any character. If I have files named HOUSE, HO, HOTDOG, and HORRIBLE, I can match them all with \(\mathrm{HO}^{*}\) - the asterisk matches any group of characters, including no character.

This is good if you can't remember a filename exactly. If you have a file that might be called CATFOOD or might be called CAT FOOD, but you can't remember which, you can load it regardless of name with LOAD "CAT*",8. The first file whose name begins with CAT will be loaded. Unfortunately, you might discover that instead of the program you wanted, you have loaded something else, such as CATCH-MICE. The first name in the directory that matches will be the one loaded.

We can use pattern matching to get around this problem. If you load the directory using pattern matching, you'll see all programs that fit the pattern. To examine CAT programs, type:
```

LOAD " $\$ 0:$ CAT" $^{*}, 8$

```
or, with the wedge program:

\section*{@\$0:CAT*}

You'll see a list of all programs (if any) whose names begin with the characters CAT, which allows you to select the one you want.

\section*{Command Variations}

Note that LOAD picks the first program that matches, but the directory picks all programs that match.

It's probably obvious that SAVE must not al-
low pattern matching. You must save a real name, not an approximation. Thus, SAVE "CAT"", 8 will produce a syntax error from the disk.

The Scratch command does accept pattern matching; all files that match will be removed from the disk. Use pattern matching with great care when using Scratch; you could remove more files than you planned.

To scratch all files from a disk that begin with the letter M , you would type the following:

OPEN 15,8,15
PRINT\#15,"S0:M*"
or, using the wedge:

\section*{@S0:M*}

Be careful. There might be more files starting with M than you expected. Take a directory listing first (using pattern matching, of course).

Here's another example. Suppose you've been writing a BASIC program called DIS. As you write code, you save the program from time to time, creating DIS1 and DIS2. Then you start testing and correcting, saving new versions as you go, and create DIS3, DIS4, and DIS5. Finally, you're satisfied, and you save your final version as DISK/EDIT. How can you get rid of your five development programs, named DIS1 to DIS5? Easy. Scratch pattern DIS? and they will all go. DISK/EDIT will stay, since the ? character matches only a single character. Do not scratch pattern DIS* since that would definitely clobber DISK/EDIT.

But be careful. Just before you give the command to scratch pattern DIS?, take a directory with the same pattern. You might have other files called DISK or DISH that match the same pattern. So you might code:

> LOAD "\$0:DIS?"
> LIST
or, with the wedge:
@\$0:DIS?
You'll see the programs that match the name pattern. If they are exactly the ones you want, type the Scratch command; or with the wedge, you can go back and type over the dollar sign with the letter S; pressing RETURN will scratch these files.

\section*{New Pafterns}

There are other patterns that are less wellknown. For example, a filename is a pattern; it must be matched exactly. Thus, if I have a file named HOG and I want to see that it is in the directory, and perhaps check the number of blocks, I can type:

\section*{LOAD "\$0:HOG",8 \\ LIST}
or,
@\$0:HOG
The only item in the directory will be file HOG (if it exists).

Let's take this a step further. Suppose I don't want to see any file details. All I need is the title of the disk, its ID, and the number of blocks free. That's easy: Just specify a file that does not exist on the disk. The directory will then consist of the title line and the blocks free information. I often ask for a directory using a filename such as \(0: \# \$ \&!\%\). This isn't an expletive; it's just a name that I know doesn't exist on the disk so that I'll get the blocks free count.

\section*{The Lone Asterisk}

You would think that a pattern consisting of only a single asterisk would mean "any file." Thus, a command such as LOAD "*", 8 would bring in the first file since anything will match. That's not quite correct: The asterisk often has a special meaning.

The single asterisk sometimes means "same name as last time." It may have been Commodore's intention to allow a user to load a program, and later save it with the same name with SAVE "*", 8 , the asterisk meaning "same name as before." This was never implemented fully, but you can see traces of this idea in the dual disk copy command. If you have a dual disk, type:
@C1:*=0:PROGNAME
We can see that this command asks to copy a file called PROGNAME to drive 1; but what name will the new file be given? The destination name is *-which in this case means "same name.' Thus, the new file will be named PROGNAME, too. It seems that it was originally Commodore's intention to allow copying to take place with pattern matching, so that \(\mathrm{C} 1: *=0: \mathrm{RA}^{*}\) would copy all files whose names started with RA from drive 0 to drive 1 with the same name. If you have a dual drive, try it; it almost works correctly.

So it turns out that LOAD "*", 8 does not always load the first file on the disk. Sometimes it loads the same file that was previously loaded.

\section*{Specifying Type}

You may specify a file type by adding an equals sign to the pattern followed by the file designation: S for Sequential, P for Program, U for User, and R for Relative types. You may also type the three-letter designation such as SEQ or PRG if you wish. Thus, \(0:^{*}=S\) will reference all sequential files, \(0: B^{*}=P\) will reference all programs whose names start with \(B\), and \(0: ?=P\) will reference all programs with one-letter names.

Next month we'll look at a common disk error and a way to fix it.

\title{
Writing An Educational Program
}

I'm sure you already know or have read what a "good" educational program should contain. I'd like to discuss how you actually program an educational program. I decided that the best way I could describe the process was to write a program, then provide a step-by-step explanation of what I did.

The hardest part of writing any program is deciding the topic and the type of program-drill and practice, tutorial, simulation, game, etc. I picked a very popular topic for computer programs, the Morse code, and decided to do a drill-and-practice program. Quite a few readers have requested programs for secondary school students, so next month I'll present a tutorial on a high school subject.

\section*{Memorization Quiz}

A drill-and-practice program is useful for any subject that requires memorization. The usual procedure is to ask a question, then have the student input an answer. If you can avoid INPUT and use CALL KEY instead, there will be much less chance for errors or "crashing" the program. In the "Morse Code" program, the quiz will be to press the letter or number after the computer displays a code.

I decided to use the numbers from 0 to 9 and the whole alphabet in the quiz. Since each number and letter corresponds to a code, I set up the array \(\mathrm{M} \$\) to contain the codes. \(\mathrm{M} \$(0)\) through \(\mathrm{M} \$(9)\) will hold the codes for the numbers in order from 0 through 9 . The alphabet will be in \(\mathrm{M} \$(10)\) through \(\mathrm{M} \$(35)\). Since we need 36 elements for the array, line 160 dimensions M\$. Lines \(170-190\) READ the codes for \(\mathrm{M} \$\) from data in lines 200-250. The data items are in orderfirst the numbers then the alphabet-each item separated by a comma.

\section*{Dots And Dashes}

I started out using periods for dots and minus
is \&\&\&) if the symbol is \&. I put a space after the dot or dash to separate them slightly on the screen. You could use CALL HCHAR instead if you wish, but I used PRINT. By printing with semicolons, everything will stay on the same line and be printed right after the previous printing.

\section*{Making Some Noise}

Since the TI has sound, we can use sound in our Morse code program. Besides that, real Morse code transmission is by sounds. Line 390 plays a sound for a dash, and line 420 plays a different sound for a dot. I used a sound duration of 300 for the dash and 60 for the dot. As you learn the Morse code, you'll probably want to shorten those durations. You should also try different frequencies instead of the one I chose (131) or combinations of frequencies and noise numbers to get a sound you like. Line 440 stops the sound so that dots and dashes are distinct. If you don't have this statement, dashes would run together and you wouldn't be able to tell how many dashes there should be.

Line 450 forces the loop to go to the next symbol in the code. Line 460 PRINTs to get off the present line (colon means "go to the next line \({ }^{\prime \prime}\) in printing) and add an extra line between codes. Line 470 returns program execution from this subroutine.

\section*{Returning To The Menu}

I thought it would be nice to review the numbers and letters before having to take the quiz, so there are three sections: Numbers, Alphabet, and Press a Key. Numbers will print each number and show the corresponding Morse code. Alphabet will go through the whole alphabet in order and print each letter with its code. In Press a Key the student can press any number or letter, and the computer will print the code. In any of these sections the student can at any time press ENTER, and the demonstration will stop and the program will return to the main menu screen.

The procedure to see the codes for the numbers is in lines \(560-670\). Line 570 begins the FOR-NEXT loop with the counter I varying from 0 to 9 for the numbers. The number is printed (by printing I), then the subroutine at 360 is called which deciphers the code \(\mathrm{M} \$(\mathrm{I})\) into the dots and dashes and prints the code on the screen while playing the tones. Line 600 calls, subroutine 480 , which is simply a delay loop to create a slight pause between numbers. Lines \(520-530\) check to see if the student has pressed ENTER to return to the main menu screen and stop the numbers section.

The Alphabet section, lines \(680-790\) is similar to the Numbers section. This time the loop
counter I varies from 10 to 35 , and the codes will go in order from \(\mathrm{M} \$(10)\) to \(\mathrm{M} \$(35)\), which are the letters from A to Z . To print the letters with the codes, line 700 uses the CHR\$ function. The ASCII codes of the letters are from 65 to 90.
Since the loop counter I varies from 10 to 35 , the ASCII codes for CHR\$ are \(55+\) I.

In the Press a Key section, the student may press a letter or number and the computer will display the code. This section could be used as a quick review for students who want to study certain letters. The student may also spell words and phrases one letter at a time to see and hear the Morse code equivalent. Lines 840-920 detect which key is pressed. If the ENTER key ( \(\mathrm{K}=13\) ) is pressed, the program branches back to the main menu screen. The IF-THEN statements make sure that only a number or a letter is pressed; all other keys are ignored. The variable K holds the ASCII value of the key pressed, and lines 900 and 930 relate K to the variable I which is used to print the code \(\mathrm{M} \$(\mathrm{I})\).

The instructions are in lines 970-1040, and the quiz is contained in lines \(1050-1490\). The quiz consists of all ten numbers and 26 letters. An array \(N()\) is set up so each of the 36 elements from 0 to 35 is equal to 1 . This is in lines 1050-1070. Later as one of the numbers or letters is answered correctly, \(\mathrm{N}(\mathrm{I})\) will be set to zero so it cannot be chosen again. Line 1080 initializes the number of guesses \(G\) to zero for the scoring.

The quiz loop first chooses a random number (I) from 0 to 35 (line 1140). If the number has previously been answered correctly, N(I) will be zero and another number I is chosen. Lines 1160-1190 determine the correct answer L for the number I, which will be the ASCII code of the number or letter chosen. Line 1200 calls the subroutine to print and sound out the code chosen, and line 1210 increments the number of guesses.

Lines 1220-1290 detect the key the student presses; makes sure it is ENTER, a number, or a letter; and then prints the key pressed. If the key pressed is ENTER, the program branches back to the main menu and the quiz ends. Lines 1300-1390 determine if the key pressed is the correct answer. If the answer is incorrect, an "uhoh" sound is played and the program branches back to line 1200 to display and sound the code again and wait for another answer. If the answer is correct, an arpeggio is played. After the code is answered correctly, line 1400 sets \(\mathrm{N}(\mathrm{I})\) to zero so that code cannot be chosen again, and line 1410 goes to the next problem. The student must get the right answer to continue the quiz.

\section*{Quiz Variations}

You can change the program to give the right
answer if the student misses．Instead of lines 1330 and 1340，print CHR\＄（L）or CALL HCHAR or CALL VCHAR and put L on the screen，then branch to line 1400 ．In this case you might want to keep a score of number correct and number incorrect．You might want to allow that missed letter or number to be shown again．Branch to line 1410 instead of 1400 ，and before you branch set \(Z=Z-1\) ．Another way would be to GOTO 1140 instead of changing the loop counter Z and going to the NEXT Z ．

If you prefer to let the student guess two or three times before the correct answer is given，set up a flag（ \(\mathrm{FLAG}=0\) ）at line 1155 then at line 1340 increment the flag（FLAG＝FLAG＋1）．You could then branch，depending on the value of FLAG，either back for another guess or to give the answer and branch to the next problem．

You might prefer to have a quiz of a certain number of codes，say 10 ，rather than all 10 num－ bers and 26 letters．Change line 1130 to FOR \(\mathrm{Z}=1 \mathrm{TO} 10\) ．Using lines 1150 and 1400 will still prevent the quiz from choosing the same number or letter more than once．

Another idea would be to have an infinite quiz．Take off the FOR－NEXT loop，lines 1130 and 1410．Also，you won＇t need lines 1150 and 1400 （and 1050－1070）because the numbers and letters can keep being chosen．Now the quiz keeps going until the student presses ENTER to return to the main menu screen．

In this type of quiz you may want to make sure the code is not the same as the previous one．We can use a variable PI for previous I cho－ sen，and add these two lines：
```

1150 IF PI=I THEN 1140
1155 FI=I

```

You can change the Numbers and Alphabet sections to fit your needs also．To change the de－ lay time between codes，change the upper limit in line 480．Instead of 200，put your own num－ ber；a larger number will be a longer delay．In－ stead of using a delay between numbers and letters，you can have the student press any key to continue，or press the appropriate number or letter．You can change the following lines：
```

65@ IF K<>I +48 THEN S10
655 NEXT I
770 IF K<>I+55 THEN 73@
775 NEXT I

```

The program is flexible enough that you can change it to do exactly what you want it to do． You can even change the graphics and make it a quiz to learn Braille，or sign language，or some other type of code．You can use words instead of the alphabet and make a quiz for reviewing a foreign language，or perhaps vocabulary words．

\section*{Structuring Your Programs}

A couple of readers have suggested that I include flowcharts with my programs．My secret is that I haven＇t touched a flowchart since it was required in my college FORTRAN class years ago．In an－ swer to your questions of how I plan a program， I just sit down at the computer and start typing． With this program，I got to line 350 and typed
 め，ちの曰め
then worked on a section at a time，not necessar－ ily in order．The Numbers section started with line 1000，Alphabet with line 2000，Press a Key with line 3000，the quiz with line 4000 ，and 5000 was END．

As I realized I needed subroutines，I num－ bered them 400,600 ，and 700 ，making sure I didn＇t get to line 1000．On the TI it doesn＇t really matter where you put the subroutines；you can put them all at the end if you prefer．Anyway， after everything was running properly and each section was tested，I used the RES command to get all the line numbers to look nice．Each pro－ grammer has his or her own way of planning， and there＇s really no right way or wrong way．I say if it works，you＇re successful．

If you wish to save typing effort，you may obtain a copy of Morse Code by sending \＄3，a blank cassette or disk，and a stamped，self－ addressed mailer to：

\section*{C．Regena}

P．O．Box 1502
Cedar City，UT 84720
Be sure to specify the title and that you need the TI version．

\section*{64 EXPLORER}

This month let's discuss a few more things concerning the line-drawing and characterdrawing routines presented in the last couple of columns. Some of you may have noted that the character-drawing routines did not support the multicolor mode. This could be done with some additional time and effort. However, because of the increased complexities of handling multicolor mode, there probably won't be room for the routines in the \(\$\) C000 to \(\$\) C7FF region of RAM where the other routines were located.

\section*{Multiuse Vector Bytes}

There were some other things which were not implemented as well. First, vector byte strings were provided only for the uppercase character set. The remaining characters weren't implemented due to the space they would require. You could implement the remaining characters yourself, or even create an entire character set of your own design. Also, you are not restricted to drawing characters. The vector byte strings could be used to draw almost any design.

If you have studied the machine language listing for the character-drawing routines, you may have noticed there was some provision made for additional special function vector bytes. One I had in mind, but didn't get around to implementing, was a "clear character cell" special function code. This would clear a character cell of a specified size. The function would be useful if you wanted to draw characters on top of some other design. Another useful function would be contour fill function-that is, fill the area inside a boundary. With this, large solid characters could be made much more easily. Unfortunately, I doubt there is enough room in the code to have such a routine. Perhaps we can discuss contour filling in a future article.

As you might guess, there are lots of other things which could be implemented. Unfortunately, there isn't enough room to implement them all. This is where the machine language source code listing should come in handy. You can combine routines from various sources to construct the set of routines you require.

\section*{Easy To Understand}

I hope the comments provided in the source code are sufficient to make most of the routines understandable. The thoroughness of the comments is not consistent throughout the source code. The variation is largely due to an effort to keep the source code from growing too large.

Having good comments in a program can be extremely useful. Unfortunately, there are a couple of factors which tend to discourage commenting. The first factor is that it makes the source code longer. With the speed of the 1541 disk drive, the extra size can noticeably affect the length of time it takes to edit or assemble the source file. The second factor is that it takes extra time to write the comments. Usually, writing the comments will be less interesting than writing the program.

However, if the machine language you plan to write will be of some importance, I highly recommend thoroughly commenting the program. You can use comments to understand how the program was intended to work after you've forgotten. You'd be surprised how fast you can forget.

\section*{Comment Fields}

There are two basic places to put your comments. One is to the side of the machine language instructions, on the same line as the instructions. The other is between routines, where the comments would document the routine which follows. It is here that the extra effort commenting pays off the best. Ideally, the comments should include a description of what the routine is supposed to do, plus the entry and exit conditions that apply. This would allow you to use the routine, once it is written, without having to study the routine itself to determine what it does. In the long run, such comments can actually save a lot of time. Especially if someone else has to make use of your source code. In the source code I've provided so far, most of the time I've included the entry and exit conditions, but have omitted the description to conserve space.

Program 2 and Program 3 which follow are continuations of last month's column on drawing characters to the bitmap. They facilitate the drawing of letters to a hi-res screen.

Refer to the "Automatic Proofreader" article before typing these programs in.

\title{
SYSound
}

Mike Steed

The Commodore 64 has an amazing sound chip, and anyone who has heard it knows this. However, anyone who has tried to program it may have been surprised or discouraged, because everything had to be done with POKEs. That is, until now. "SYSound" will make creating sounds much easier, using absolutely no POKEs at all. Also included is an example program to show how easy programming 64 music can be.

Type in Program 1 and be sure to save a copy before running it. Program 1 loads in SYSound, which is a machine language program, and one typing mistake can crash SYSound when you use it. You may wish to save a copy of just the machine language once it's loaded, if you have a machine language monitor. Program 1 will specify the start and end addresses.

To use SYSound, all you need to do is type SYS 49152 followed by any of several possible parameters, each separated by a comma. The

The ADSR Envelope

number 49152 could (and probably should) be put into a variable, such as \(S\) or SOUND.

A list of possible parameters for the SYS statement and their meanings follows:
- \(\mathrm{V} x\), where \(x\) is the voice number used for the note (one, two, or three). More than one voice may be used at the same time.
- A \(x\), where \(x\) is the attack rate of the note. This is the time it takes the sound to reach its highest volume. The value of \(x\) must be between 0 and 15 ; the larger the number, the more time it takes. (See the figure for a further description of attack, decay, sustain, and release.)
- \(\mathrm{D} x\), where \(x\) is the decay rate of the note ( \(0-15\) ). This is the time it takes the sound to soften to the sustain volume.
- \(\mathrm{S} x\), where \(x\) is the sustain level of the note ( \(0-15\) ). The sound remains at this volume until the release starts.
- \(\mathrm{R} x\), where \(x\) is the release rate of the note \((0-15)\). The release rate is the time it takes the sound to drop from the sustain volume to silence.
- Wy[x], where \(y\) is a letter representing the waveform used for the sound. This can be N (noise), S (sawtooth), T (triangle), or P (pulse). If the pulse waveform is chosen, then a pulse rate \(x\) ( \(0-4095\) ) must be entered after the waveform letter, such as WP2048 for a square wave.
- F \(x\), where \(x\) is the frequency of the note (0-65535). Higher frequencies will produce higher notes.
- \(\mathrm{L} x\), where \(x\) is the volume (loudness) of the note ( \(0-15\) ). Note that this is the overall volume, so all the voices will be affected by this setting.
- C clears the sound chip. This is equivalent to the following in BASIC:
\(10 \mathrm{~S}=54272:\) FOR I \(=0\) TO 24:POKE S + I, 0:NEXT
Once a parameter has been entered, it need
not be entered the next time the routine is used. For example, if all your sound effects are going to be done with voice 1 , at volume 15 , with the sawtooth waveform, attack 0 , decay 9 , and sustain and release 0 , you could set all these at the beginning of your program:

10 S = 49152:SYS S,C,V1,L15,WS,D9
(All parameters default to zero initially, so A, S, and \(R\) needn't be entered.) Then all that would need to be done to play a note would be:

20 SYS S,F5000
(Any valid numeric expression may be used after the parameter letter.) Also, if a parameter is entered more than once, only the last case will be considered. For example, SYS S,WS,WT,A0,A6 is effectively the same as SYS S,WT,A6.

Program 2 provides an example of SYSound in action, and shows how much simpler music programming can be accomplished.

If you would rather not type all those DATA statements, I will send you a copy of the program. Send a stamped, self-addressed mailer, a blank tape or disk (1540/1541), and \(\$ 3\) to:

Mike Steed

\title{
Musical TI Keyboard
}

Randal J. Reifsnider

The TI music chip has long been regarded as an excellent sound chip, but few programs have yet demonstrated its capabilities. "Musical TI Keyboard" changes all that by turning your TI's keys into simulated piano keys.

In the book Beginner's BASIC that comes with the TI-99/4A computer, there is a short demonstration program illustrating how you can use the computer's keyboard to make musical tones. When you run this program and press the A key, the musical tone A will sound. The tone will continue as long as you hold down the key, with a slight gap of silence between repetitions of the tone. This sounds like a musical machine gun. It is an interesting program, but very limited. Since it uses only seven letters of the alphabet to represent musical notes, you could play only seven notes on the computer in this fashion (A
through G, with no sharps or flats).
Also, if you play the piano and are familiar with its keyboard arrangement, you'll find that looking for letters feels unnatural and difficult. Hence, "Musical TI Keyboard," which makes the computer's keyboard more closely resemble that of a piano.

This program first READs frequency values from DATA statements into an array, then mathematically converts the ASCII code returned by the CALL KEY statement, and uses that value in the CALL SOUND statement to locate the corresponding frequency value within the array. The figure shows the arrangement of the keyboard. Since not all the keys are used, the program includes a check to silence any unwanted keys. ASCII code numbers of silenced keys which fall within the array are assigned a DATA value of 1 as a filler. This allows the array to be easily filled and insures that the ASCII code for a given key corresponds to the proper frequency.

\section*{Program Variations}

One variation of this program you may want to try would be:

\author{
90 CALL SOUND (100,NOTE(Q),1,1.26*NOTE(Q),5, 1.5*NOTE(Q),5)
}

This would produce a major chord for each key pressed. To create minor chords, try:

\section*{90 CALL SOUND (100, NOTE(Q),1,1.19*NOTE(Q),5, 1.5*NOTE(Q),5)}

If you change the duration from 100 to -150 , the computer will play continuous tones. A value for a noise ( -1 through -8 ) could be added to the CALL SOUND statement for an interesting effect. The space bar could be assigned a noise value for use as percussion. Since this program requires that the ALPHA LOCK be on, additional tones or noises could be assigned to what would be the lowercase letters.

Even though we do have a piano, our four-year-old daughter would rather play the computer. However, you can take the program further. You could include a routine within the program to print out the duration, frequency, and sequence of the notes you play on the computer's keyboard. This could be extremely helpful when tackling the laborious task of transposing sheet music so that it can be played by the computer. You could also try creating a routine that would play back any song played on the computer.

To make playing your computer/piano keyboard easier, you might want to buy two different colors of small gummed labels, like those sold in office supply stores. These may be placed on the computer keys to distinguish the white keys from the black keys. Novice musicians may
also wish to write the name of the note on the label as an aid to playing. These labels can be easily removed when you are ready to let the computer go back to its regular keyboard functions.

CAPUTE！
}

Modifications Or Corrections To Previous Articles

\section*{64 Jackpot}

The 64 version of this game from the August issue（Program 3，p．89）requires the following two lines，which were accidentally omitted from the original listing：

5 PRINT＂\｛CLR\}"; :POKE51, \(\varnothing:\) POKE55，\(\varnothing:\) POKE52， 48 ：POKE \(56,48:\) CLR：GOSUB \(6 \varnothing\)
：rem 61
\(1 \varnothing \mathrm{TT}=5 \emptyset: \mathrm{S}=54272:\) FORL＝STOS＋24：POKEL，\(\varnothing:\) NEX T ：rem 135

\section*{IBM PC／PCjr Blueberries}

The IBM version（Program 3，p．88）of this game in the July issue should work as published，but reader Michael Saletnik points out that the pro－ grammer used the VARPTR statement incorrectly in line 5000．VARPTR returns the starting ad－ dress for the descriptor of the specified string variable．The descriptor is three bytes of data；the first byte tells the length of the string，and the other two hold the starting address within the current segment of memory where the characters that make up the string are stored．Thus，if you use a statement like \(\mathrm{V}=\operatorname{VARPTR}(\mathrm{ML} \$)\) ，then PRINT PEEK（V）will show the length of ML\＄， and PRINT PEEK \((\mathrm{V}+1)+256\)＊PEEK \((\mathrm{V}+2)\) will give the starting address of the characters in ML\＄．

In line 5000，the calculated address ZZ does not point to the start of ML\＄as intended，but rather off into some other part of the variable area．＂Blueberries＂works as printed because the
programmer uses the computed address to POKE the machine language directly into memory in line 5010．A more standard way of transferring the machine language from DATA statements into ML\＄would have been：
READ A: ML\$=ML\$+CHR\$(A)

If the technique used in line 5010 had not been used，then the program would not have per－ formed correctly．To place the machine language data properly into ML\＄，line 5000 should be changed to read：
```

5øø\emptyset DEF SEG:ML$=SPACE$(48):V=VARPTR(ML\$)
:ZZ=PEEK(V+1)+256*PEEK(V+2)

```

\section*{Bunny Hop For The 64}

Characters were omitted in two lines of the Com－ modore 64 version（Program 1，p．74）of this game from the July issue．The final number in line 35 should be 208 instead of just 2，and the final number in line 200 should be 33 instead of 3 ．The corrected lines should read as follows：

35 DATA \(40,169,32,145,253,96,160,41,177,25\) 3，136，145，253，2ø0，2ø0，192，81，2ø8
2øø POKEP，32：POKE37154，127：Y＝PEEK（56320）A \(\operatorname{NDPEEK}(Q Q): I F(\) YAND8 \()=\emptyset\) THENP \(=P+1: D=33\)

\section*{VIC Olympiad}

There is an error in one of the PRINT statements which defines the arena in the VIC version（Pro－ gram 2，p．56）of this game from the June issue． Ed Eyerman notes that there should be two spaces following the five SHIFTed spaces in line 3080．The line should read as follows：
```

3ø8\emptyset PRINT"-{2 SHIFT-SPACE}{5 SPACES}U\&W习
{2 SPA\overline{CES } KQ彐I{{5 SHIFT-SPACE }}
{2 SPACES}二";

```

Also，line 1045 in the VIC version is an uninten－ tional carryover from the original Commodore 64 version，and can be deleted．

\title{
Tiny MLX Mastine lannuage Entry Program
}

\begin{abstract}
MLX is a labor－saving utility that allows almost fail－safe entry of machine language programs published in COM－ PUTE！．You need to know nothing about machine lan－ guage to use MLX－it was designed for everyone．＂Tiny MLX＂is a special version for the unexpanded VIC．
\end{abstract}

MLX is a new way to enter long machine language （ML）programs with a minimum of fuss．MLX lets you enter the numbers from a special list that looks similar to BASIC DATA statements．It checks your typing on a line－by－line basis．It won＇t let you enter illegal characters when you should be typing numbers．It won＇t let you enter numbers greater than 255 （forbid－ den in ML）．It won＇t let you enter the wrong numbers on the wrong line．In addition，MLX creates a ready－ to－use tape or disk file．

\section*{Using MLX}

Type in and save＂Tiny MLX＂（you＇ll want to use it in the future）．When you＇re ready to type in an ML pro－ gram，run Tiny MLX．Unlike regular MLX，Tiny MLX does not ask for the starting and ending address of the program to be entered．Instead，this information must be included in line 210 ．The values currently shown in line 210 are for the＂Lightsaver＂program in this issue．

You＇ll see a prompt corresponding to the starting address．The prompt is the current line you are enter－ ing from the listing．It increases by six each time you enter a line．That＇s because each line has seven num－ bers－six actual data numbers plus a checksum num－ ber．The checksum verifies that you typed the previous six numbers correctly．If you enter any of the six numbers wrong，or enter the checksum wrong，the computer rings a buzzer and prompts you to reenter the line．If you enter it correctly，a bell tone sounds and you continue to the next line．

MLX accepts only numbers as input．If you make a typing error，press the INST／DEL key；the entire number is deleted．You can press it as many times as necessary back to the start of the line．If you enter three－digit numbers as listed，the computer automati－ cally prints the comma and goes on to accept the next number．If you enter less than three digits，you can press either the comma，space bar，or RETURN key to advance to the next number．The checksum automati－ cally appears in reverse video for emphasis．

\section*{MLX Commands}

When you finish typing an ML listing，you can then save the completed program on tape or disk．Follow the screen instructions．If you get any errors while saving，you probably have a bad disk，or the disk is full，or you made a typo when entering the MLX pro－ gram itself．

Since Tiny MLX has no provisions for reloading a partially completed program，you must enter the ML program all in one sitting．

\title{
1. Machine Language Entry Program For VIC-20
}

MLX is a labor-saving utility that allows almost fail-safe entry of machine language programs published in COMPUTE: You need to know nothing about machine language to use MLX-it was designed for everyone.

MLX is a new way to enter long machine language (ML) programs with a minimum of fuss. MLX lets you enter the numbers from a special list that looks similar to BASIC DATA statements. It checks your typing on a line-by-line basis. It won't let you enter illegal characters when you should be typing numbers. It won't let you enter numbers greater than 255 (forbidden in ML). It won't let you enter the wrong numbers on the wrong line. In addition, MLX creates a ready-to-use tape or disk file. You can then use the LOAD command to read the program into the computer:
\[
\begin{array}{ll}
\text { LOAD "filename", } 1,1 & \text { (for tape) } \\
\text { LOAD "filename", } 8,1 & \text { (for disk) }
\end{array}
\]

To start the program, you enter a SYS command that transfers control from BASIC to machine language. The starting SYS number appears in the article.

\section*{Using MLX}

Type in and save MLX for your 64 (you'll want to use it in the future). When you're ready to type in an ML program, run MLX. MLX asks you for two numbers: the starting address and the ending address. These numbers are given in the article accompanying the ML program.

You'll see a prompt corresponding to the starting address. The prompt is the current line you are entering from the listing. It increases by six each time you enter a line. That's because each line has seven numbers-six actual data numbers plus a checksum number. The checksum verifies that you typed the previous six numbers correctly. If you enter any of the six numbers wrong, or enter the checksum wrong, the computer rings a buzzer and prompts you to reenter the line. If you enter it correctly, a bell tone sounds and you continue to the next line.

MLX accepts only numbers as input. If you make a typing error, press the INST/DEL key; the entire number is deleted. You can press it as many times as necessary back to the start of the line. If you enter three-digit numbers as listed, the computer automatically prints the comma and goes on to accept the next number. If you enter less than three digits, you can press either the SPACE bar, or RETURN key to advance to the next number. The checksum automatically appears in inverse video for emphasis.

To simplify your typing, MLX redefines part of the keyboard as a numeric keypad (lines 581-584):
\begin{tabular}{llllllll} 
& U & I & O & & 7 & 8 & 9 \\
H & K & L & become & 0 & 4 & 5 & 6 \\
M & & & & 1 & 2 & 3
\end{tabular}

\section*{MLX Commands}

When you finish typing an ML listing (assuming you type it all in one session), you can then save the completed program on tape or disk. Follow the screen instructions. If you get any errors while saving, you probably have a bad disk, or the disk is full, or you've made a typo when entering the MLX program itself.

You don't have to enter the whole ML program in one sitting. MLX lets you enter as much as you want, save it, and then reload the file from tape or disk later. MLX recognizes these commands:

\section*{SHIFT-S: Save \\ SHIFT-L: Load \\ SHIFT-N: New Address \\ SHIFT-D: Display}

When you enter a command, MLX jumps out of the line you've been typing, so we recommend you do it at a new prompt. Use the Save command to save what you've been working on. It will save on tape or disk as if you've finished, but the tape or disk won't work, of course, until you finish the typing. Remember what address you stop at. The next time you run MLX, answer all the prompts as you did before, then insert the disk or tape. When you get to the entry prompt, press SHIFT-L to reload the partly completed file into memory. Then use the New Address command to resume typing.

To use the New Address command, press SHIFT-N and enter the address where you previously stopped. The prompt will change, and you can then continue typing. Always enter a New Address that matches up with one of the line numbers in the special listing, or else the checksum won't work. The Display command lets you display a section of your typing. After you press SHIFT-D, enter two addresses within the line number range of the listing. You can abort the listing by pressing any key.

What if you forgot where you stopped typing? Use the Display command to scan memory from the beginning to the end of the program. When you reach the end of your typing, the lines will contain a random pattern of numbers. When you see the end of your typing, press any key to stop the listing. Use the New Address command to continue typing from the proper location.

\section*{There is a road.}

\section*{Many cancer patients need transportation to and from treatments. That's why the} American Cancer Society has formed groups of volunteers across the United States who give a few hours of their time each month to drive them. The road to recovery can be a long and difficult one, but it can be that much easier when there are friends who can help along the way.

First you need the right input.
Like \$219. That's what the Commodore \(64^{\mathrm{mm}}\) costs. It's about one third the price of the Apple \(\mathrm{Il}^{T M}\) or the \(\mathrm{IBM}^{\circledR} \mathrm{PCjr}^{\mathrm{mM}}\)

And 64 K . That's how much memory the Commodore 64 has. It's also how much memory Apple Ile and the IBM PCjr have.

This computer lesson is brought to you as a public service by Commodore (certainly not by Apple or IBM), the only computer company that can afford to show you a chart like the one above.

But what you can't see above are the

thousands of software programs that make the Commodore 64 fully capable of doing anything any "triple the price" computer can do; for fun or profit, for every member of the family; anything from soccer to spread sheets to space exploration.

Because the Commodore is so affordable, you can load up on Commodore peripherals. Like a disk drive, a printer or a telephone modem. All together they cost just a tad more than an IBM PCjr by itself. With no peripherals.

No wonder Commodore sells more computers than Apple and IBM combined. IT'S NOT HOW LITLE TT COSTS, I'S HOW MUCH YOU GET.```
