Commodore 64 3-D Animated Graphics Simple Commands To Create And Move Your Own Shapes

Apple Program Protector Shield Your Programs From Prying Eyes

Atari REMover Automatically Delete REMs From BASIC

A message from a leading software publisher.

## Why Electronic Arts

"The Amiga will revolutionize the home computer industry. It's the first home machine that has everything you want and need for all the major uses of a home computer, including entertainment, education and productivity. The software we're developing for the Amiga will blow your socks off. We think the Amiga, with it's incomparable power, sound and graphics, will give Electronic Arts and the entire industry a very bright future."
Trip Hawkins
President, Electronic Arts

## IS COMMITTED TO THE AMIGA.

In our first two years, Electronic Arts has emerged as a leader of the home software business. We have won the most product quality awards-over 60 . We have placed the most Billboard Top 20 titles -12 . We have also been consistently profitable in an industry beset by losses and disappointments.

Why, then, is Electronic Arts banking its hard won gains on an unproven new computer like the Amiga?

## The Vision of Electronic Arts.

We believe that one day soon the home computer will be as important as radio, stereo and television are today.
These electronic marvels are significant because they bring faraway places and experiences right into your home. Today, from your living room you can watch a championship basketball game, see Christopher Columbus sail to the New World, or watch a futuristic spaceship battle.

The computer promises to let you do much more. Because it is interactive you get to participate. For example, you can play in that basketball game instead of just watching. You can actually be Christopher Columbus and feel firsthand what he felt when he sighted the New World. And you can step inside the cockpit of your own spaceship.
But so far, the computer's promise has been hard to see. Software
has been severely limited by the abstract, blocky shapes and rinkydink sound reproduction of most home computers. Only a handful of pioneers have been able to appreciate the possibilities. But then, popular opinion once held that television was only useful for civil defense communications.

## A Promise of Artistry.

The Amiga is advancing our medium on all fronts. For the first time, a personal computer is providing the visual and aural quality our sophisticated eyes and ears demand. Compared to the Amiga, using some other home computers is like watching black and white television with the sound turned off.
The first Amiga software products from Electronic Arts are near completion. We suspect you'll be hearing a lot about them. Some of them are games like you've never seen before, that get more out of a computer than other games ever have. Others are harder to categorize, and we like that.
For the first time, software developers have the tools they need to fulfill the promise of home computing.
Two years ago, we said, "We See Farther." Now Farther is here.

ELECTRONIC ARTS ${ }^{\text {T }}$

Dr J and Larry Bird Go One-On-One The number one software sports game of all time. Shoot as accurately as Larry Bird, slam durk like the Doctor, while
you're cheered on by the victory chants of the Boston Garden crowd.

Deluxe Video Construction Set ${ }^{\text {tM }}$ Be your own video director for business presentations or just for fun. Set up special effects, animated computer graphics, sound effects and titles - even record them to videotape for use with a VCR.

Skyfox ${ }^{\text {Tw }}$
Get in the spaceship and fly. Out your window or on your radar screen you have but split-seconds to appreciate the fierce beauty of enerny jets and tanks.

Arcticfox ${ }^{\text {Tw }}$
You command the advanced and deadly tank of the future - the Arcticfox. A first person tank combat game with all the sturning graphics and sound of the best 3-D simulations.

Seven Cities of Gold ${ }^{\text {w }}$
Be Christopher Columbus and discover the New World. Learn history and geography or generate your own random new worlds to explore.

Return to Adantis ${ }^{\text {T" }}$
Play Indiana Cousteau, oceanic hero, in this three dimensional simulation under the seven seas.

Archon
A new kind of computerized board game, like chess with wizards and dragons for pieces. But when one lands on another, they have to fight a white-knuckled action battle.

Marble Madness ${ }^{\text {™ }}$
For the first time, the home version of a coin-op arcade game is just as good as the original. Same graphics. Same sound. And you can play it in your bathrobe.

## Left Brain.

Rational. Functional. Precise.
Introducing the OKIDATA 120, the logical printer for your Commodore ${ }^{*}$ computer.

Get results fast. With a utility mode that zips through letters and reports at twice the speed of any Commodore printer.
Switch to the enhanced mode. And print your most important ideas with typewriter clarity. Or illustrate your rationale with the 120 's bit image graphics for high resolution charts, graphs and drawings.

Stay on target. With a self-inking "Clean Hands" ribbon cartridge. And Okidata's famous full year warranty on parts, labor and printhead.
The OKIDATA 120. At $\$ 269^{*}$, it's the only Commodorecompatible printer that makes sense.
For more information, call 1-800-OKIDATA (in New Jersey 609-235-2600). Mt. Laurel, NJ 08054.

## Right Brain.

Effervescent. Colorful. Outrageous.
Meet the OKIMATE 10, the $\$ 208^{*}$ color printer that takes your Atari ${ }^{\circ}$ or Commodore ${ }^{*}$ computer over the rainbow!

Dazzle 'em. With brilliant printing in over 36 eye-tickling colors. Reds, greens, golds and blues that breathe life into everything: from charts and graphs to original drawings and overhead transparencies.
And when you're forced to work in black and white, the OKIMATE 10 prints crisp, clean reports and papers-at 240 words per minute. You can even add spice with wide, bold and fine print.

Everything you need for color printing comes with the OKIMATE 10 and its Plug 'n Print package. Including a data cable, Learn to Print and Color Screen Print software diskettes, a color ribbon cartridge, a black ribbon cartridge and paper.

So c'mon, print on the wild side. With the OKIMATE 10 Personal Color Printer from Okidata.

For more information, call 1-800-OKIDATA (in New Jersey 609-235-2600). Mt. Laurel, NJ 08054.

# IF YOU CAN FIND A BETTER PROGRAM WE'LL BUY IT FOR YOU! 

WORD WRITER "cheiker
Now with 85,000 word Spelling Checker

- An efficient, 80-column professional word processing system which includes a spelling checker and built-in calculator.
- Contains all the features you'll need for everyday word processing, plus most of the sophisticated features found in more expensive programs: document chaining, form letter printout, page separations, horizontal and vertical scrolling, and more.

## With Timeworks you get more power for your dollar

You can use each program alone. Or interface this trio - one at a time if you like - into a completely integrated productivity system that delivers all the power and features most of you will ever need ... at a cost that lets you enjoy their use.

Look for these and other Timeworks programs at your favorite dealer. Or contact Timeworks, 444 Lake Cook Road, Deerfield, IL 60015. Phone: (312) 948-9200.

## DATA MANAGER 2

Faster, more efficient, more versatile

- A complete general information storage and retrieval system with report-writing, graphics, statistics, and label-making capabilities.
- Exclusive X-SEARCH, X-SORT, and X-CHART features allow you to crosssearch any category of information; sort items alphabetically, numerically, or by date; break down statistical information into categories; and graphically view your results.

## With Timeworks you get more than software

## You Get Our Customer Technical Support Team

At the other end of our toll-free hotine, you'll find our fulltime Customer Technical Support Team. Free of charge to all registered users.

## You Get Our Liberal Trade-Up Policy

You'll find the details inside each package.

## SWIFTCALC with SIDEWAYS

New easy-to-use spreadsheet for home and small business use

- The SIDEWAYS option lets you print all your columns on one, continuous sheet . . . sideways.
- 250 rows and up to 250 columns ( 128 K version) provide up to 62,500 cells (locations on the spreadsheet) in which to place information.
- Performs mathematical functions up to 17 digits. Allows the use of minimum and maximum values, averages, sums, integers, absolute values and exponential notation.

## *With Timeworks you gef our Money Back Guaranfee

If you can find anything that works better for you, simply send us your Timeworks program, your paid receipt, and the name of the program you want, along with your check or credit card number for any retail price difference. If it's available, we'll buy it for you."

## For Apple, IBM,

 Commodore 128 (128K) \& Commodore 64 Computers

More power for your dollar.

## Editor's Notes

This month's Editor's Notes are written by Richard Mansfield, senior editor. We suggest that he does not mean to imply that "mouseketeers" are mousy; perhaps a rebuttal in the months ahead?
-Robert C. Lock, Editor in Chief

Ever since the Macintosh was introduce, the computing community has been debating about ease of learning versus ease of use: mice, menus, and icons are easy to learn, but typewriter keys, written commands, and control codes are often easier to use in the long run.

These two philosophies are represente rather neatly by two manufacturing giants, IBM and Apple. When you turn on an IBM, you are in the DOS environment. It's much like a programming language. There are dozens of words you can type which control the computer's behavior. Type DIR and you see a list of all the files on a disk. TIME will give you the time of day. CLS clears the screen. Beyond this, you can combine some of the commands: DIR > FILE sends a copy of the directory into a file named FILE. DIRISORT will print a sorted directory. Essentially, you are given a rich language with which to communicate your particular instructrons to your machine. But you pay a price for this richness-it takes longer to learn how to work with PC-DOS than it does to learn to use menu-driven systems like the Macintosh.

You may have seen the ads. A formidable tome crashes down next to a PC, graphically illustrating that runring PC-DOS is a complicated affair. Then the Macintosh manual, light as a leaf, softly settles next to Apple's menudriven computer. They're right, of course. You can be mousing around with the Macintosh within minutes, effortlessly deleting files, sorting directories, and activating applications programs.

Atari has chosen to configure its new ST computer quite like the Marintosh. The familiar elements are all in place. The ST displays icons (pictorial representations) so you can tell at a glance when something's a data file. It
will look like a tablet with the edges of the pages turned up. On an IBM, by contrast, you must learn that filename extensions like .EXE or .COM signify a program that can be run. Extensions like .DOC indicate a data or text file.

On the IBM, you delete a file by typing DEL NAME. On the ST, it's a bit difficult to describe. You use the mouse controller to move a pointer on the screen to open a disk directory. Then you move the mouse to the target filename and click the mouse, highlighting the name. Then you click the mouse again and drag a picture of the filename until it's on top of a picture of a trash can. A warning window opens and asks you if you, in fact, do want to delete the file. You must either click the mouse in a box labeled CANCEL or in another box labeled OK. During this process, you must be able to see the filename and the trash can. Thus, if something is covered up, you must move it to some available space on the screen before you can access it. This can add steps to the above process. You might need to make some windows smaller or move them to a different part of the screen.

It sounds pretty intimidating, but skilled mouseketeers can fly around the screen, popping windows open and closed at quite a clip. You do need a fair amount of clear desk space to the side of the computer where you might otherwise have a book. But, one of the ideas behind windows, icons, and mice is that you won't need a book. Everything is on screen: windows covering older windows, menus popping out of other menus, "dialog" boxes appearing on top of menus. Your desktop is clean (for the mouse), but your screen can get pretty busy.

Although early STs are currently being shipped without software or documentation offering an alternative to the mouse environment, there is a commend program which allows you to talk to the ST directly in the IBM style. In this mode, you can list a directory with the simple command LS. And you can quickly see everything in any data file via TYPE NAME. It's too early to tell whether or not this facility will be made part of the ultimate ST package. But that is the solution to the debate: offer both styles. For people who prefer not
to type, offer mice. For people who don't like mice, offer command control. For people who prefer words like DEL, offer text-only screens. For people who prefer pictures, offer the trash can illustration.

Similarly, when you go to buy a word processor, one of the major factors in your decision will be whether you want a menu-driven or control-code-driven package. For example, some software pops up with a menu every time you want to change the margin: 1. Indent? 2. Flush right? 3. Single line? and you type the number signifying your choice. Additional menus might then appear asking how much you want to indent. Conversely, control-code style software requires that you memorize a pattern. To indent ten spaces, you might type CONTROLI 10. This is a lot faster than responding to menus, but it is harder to learn and remember. If you indent often and are a good typist, however, you will likely prefer the efficiency of control codes. For one thing, your fingers don't leave the keyboard so commands to the word processor don't require that you look at the keys.

The best software offers the user a choice of either menus or control codes. Perhaps the best computers will offer optional mice, windows, and icons, but will provide a command-driven mode as well. When both styles are available, we can have the best of worlds.

#### Abstract

If you have any questions, comments, or suggestions you would like to see addressed in this column, write to "Readers' Feedback," COMPUTE!, P.O. Box 5406, Greensboro, NC 27403. Due to the volume of mail we receive, we regret that we cannot provide personal answers to technical questions.

## Falling Through Trapdoors

I have a question about the placement of NEXT in a program. After typing in "Devastator" (COMPUTE!, August 1984) I made a few changes. In lines 1293-1294 (shown here) I tried moving the NEXT from line 1294 to the end of 1293. But now the program doesn't erase text the way it should. I thought it wouldn't make any difference which line the NEXT was on. Can you explain?

> 1293 FORT=1Ø24TO14øø: IF PEEK(T ) <16ØTHEN POKE T, 32
> 1294 NEXT:GOSUB13øØ

## Alfred Glasser, Jr.

The answer to your question applies to virtually every computer with BASIC. When the computer finds an IF statement, it immediately tests the expression after IF to determine whether it's true or false. If the expression is true, the computer performs whatever comes after THEN on that line. If the expression is false, the computer ignores everything after THEN and goes directly to the next program line. When an IF test proves false, it's as though a trapdoor opens at THEN. The computer immediately falls through (proceeds) to the next program line and performs what it finds there.

The lines shown here test screen memory locations 1024-1400. In plain English the part before GOSUB 1300 means "Check every location from 1024 to 1400. If a location doesn't contain a reverse space character (160), replace it with a blank (32). Otherwise ignore it." If the expression $\operatorname{PEEK}(T)<160$ is true, the computer executes POKE T, 32 before going to NEXT in line 1294. If the expression is false-if the location contains a reverse space-the computer skips the part after THEN and immediately falls through to 1294. Note that NEXT is always performed whether the IF statement is true or
false. Moving NEXT to the end of 1293 causes it to be executed only when the IF test is true-clearly not what the programmer intended.

Because the computer falls through an IF-THEN statement when the test proves false, be careful what you add to IF lines. Don't add statements to the end of the line unless you want them to be performed only when the IF test is true. For similar reasons you shouldn't put anything on the same line after a GOTO statement (which immediately sends the computer somewhere else in the program). These two lines demonstrate the error: The GOTO in line 10 prevents NEVER from being printed.

```
10 GOTO 2ø:PRINT "NEVER"
2\emptyset PRINT "ALWAYS"
```

## Atari Disk Speedup

I have a solution for Duyen Nguyen, who asked for a way to speed up his Atari disk drive ("Readers' Feedback," July 1985). Enter POKE 1913,80 to disable the verify function. Your drive will run faster.

> Jim Noland

Thanks for pointing this out. This POKE dramatically speeds up write operations and has been widely used by Atari owners for years. In fact, some Disk Operating Systems, such as OS/A+ and DOS XL, incorporate this modification by default. The POKE works by modifying DOS to turn off the write-with-verify function. Normally, location 1913 contains the value 87, which tells DOS to verify each sector as it is written. This assures an error-free SAVE but also slows things down considerably. Disabling this function with POKE 1913,80 can make a noticeable difference. Although you might expect the modification to increase the likelihood of errors, in practice this is extremely rare. Atari programmers at COMPUTE! have been using this technique for many years without problems.

To save yourself the trouble of performing this POKE each time you boot your system, you can save the modified DOS on disk. After entering the POKE, type DOS. When the DOS menu appears, select option H, "Write DOS Files."

The new Atari DOS 2.5 disables
write-with-verify by default. It also lets you change this function without making any POKEs. Simply run the DOS 2.5 utility file SETUP.COM and select the option "Change System Configuration." This is safer than POKEing around in DOS, because a mistyped POKE command could mess up something.

## ProDOS Date And Time

I have numerous books covering my Apple IIc and the ProDOS operating system, but nowhere have I been able to find out how to set the ProDOS date and time. Can you help me with this?

## Stanley Moody

ProDOS keeps information about the current date and time in its System Global Page, a 256-byte block of memory starting at location 48896 (\$BFOO). On an Apple IIe this information can be updated by a clock card. The Apple IIe User's Disk also has a utility to let you set these locations. The following program permits you to set date and time on the IIC.

[^3]
## Youve Stumbled Into AnUnknown ComputerSystem. <br> NowWhat?

## WelcomeTo The Next Generation Of Home Computer Software.

"Plunge into every hacker's dream."

-Rick Manning/Louisville Times

".. the most mysterious game ever." -Rawson Stovall"The Vid Kid"
"An open screen says 'logon please.' That's it, no instructions." -Technology Notebook/Gannett News Service
'Just like in real life, there are no rules, no clues, no instructions."
-David Greising/Technology Memo
What more can we say? Well, someone as clever and smart as you certainly wouldn't want any hints, right? So all we'll say is it was created by legendary designer, Steve Cartwright.

## Just tell your friends youre going on a very long trip.

Kiss your earthbound buddies good bye and travel the solar system in the most exciting space program ever envisioned.

The Halley Project: A Mission In Our Solar System ${ }^{\text {TV }}$ is history's first real-time space simulation. Its challenge provides out-of-this-world stimulation.

Lightweight space jockeys need not apply, this one's for qualified star pilots. A rigorous ten-mission training program will test your knowledge and skill as you navigate

Hi-Res Characters On The 64
I have written a program that draws charts and graphs on the Commodore 64's high-resolution screen, but have trouble putting numbers and letters on the screen. Plotting every character pixel by pixel takes much too long. Is there any easy way to do this? Sean Wood
One solution is to copy the character definitions directly from the ROM (Read Only Memory) character set into the bitmap. The following program demonstrates the technique. Lines 10-30 enter hi-res mode, lines 100-180 contain the character plotting routine, and line 40 shows how to call the routine. Define the message you want to print as A\$. Variables X and Y determine the row and column where printing begins. Keep X within the range 0-39 and $Y$ in the range $0-24$. DX controls the direction of printing. If $D X=1$, the string prints from left to right; if $D X=40$, it prints from top to bottom. Other values can be used to print diagonally, from bottom to top, and so on. BK and CH set the background color and character color, respectively. After these variables are defined, GOSUB 100 puts the string on the screen.

Another solution is to look up the article " 64 Multicolor Graphics Made Easy" in the October issue of COMPUTE!. It includes a program called "Color Plotter 64" that adds 14 commands to Commodore BASIC for drawing multicolor hi-res graphics and text.

## Commodore Screen Splitting

Is there any way to split the Commodore 64's screen between multicolor bitmapping on the top and uppercase text on the bottom?

Brian Sullivan

The picture on your TV or monitor is composed of many horizontal lines called raster lines. The 64 permits you to set up an interrupt at any raster line. When the computer reaches that line, it stops what it's doing and performs a special machine language routine (which you must have prepared in advance). This technique, known as raster interrupt programming, is covered thoroughly in COMPUTE!'s First Book Of Commodore 64 and Mapping The 64. Here's a program that puts a multicolor bitmap display at the top of the screen and uppercase text at the bottom. POKE location 2 with the number of the raster line where you want the change to occur (only lines 50-249 are visible on the screen).

10 FORA $=828 \mathrm{TO} 913$ : READB: POKEA, B : $\mathrm{C}=\mathrm{C}+\mathrm{B}:$ NEXT $:$ IFC < > 9673 THENPR INT"\{CLR\}DATA ERROR": STOP

## Commodore Countdown

I am writing a Commodore program and want to add a timer that counts down in minutes and seconds. My problem is that when the timer reaches 0 it flips to 99 instead of 59. Can you help?

> Chaiyos Gosolsatit

In many cases it's easiest to treat time as seconds rather than minutes and seconds. Then you have only one number to worry about. When you need to display the time, convert the number of seconds into appropriate minute and second. values. For instance, if TM represents the number of seconds, the statements $M N=I N T$ (TM/60) and $S E=T M-60^{*} I N T(T M / 60)$ calculate the minutes and seconds, respectively.

The following routine demonstrates a simple countdown timer that should work on any Commodore computer. Line 10 sets the computer's internal clock to 000000. The reserved variable TI\$ returns the time (in hours/minutes/seconds format) elapsed since reset. As shown, the example provides a countdown of three minutes ( 180 seconds). To modify this, change the value of SS (line 10) to the desired number of seconds.

10 TIS="øøøøø日":SS=18ø
$2 \varnothing \mathrm{~T} \$=\mathrm{TI} \$: T M=\mathrm{SS}-$ (VAL (MID\$ (T\$, 3 ,2)) *6ø+VAL(MID\$(T\$,5,2)))
$3 \varnothing \mathrm{MN}=\mathrm{INT}(\mathrm{TM} / 6 \varnothing): \mathrm{SE}=\mathrm{TM}-\mathrm{MN}^{*} 6 \varnothing$
$4 \varnothing$ PRINT" $\{$ HOME $\}$ "MN" $\{$ LEFT $\}$ "SE" \{LEFT\} ": GOTO2ø

## Atari Cartridge Dilemma Solved

Like many other Atari owners, after suffering from the bugs in revision B BASIC, I ordered the new revision C BASIC cartridge for my 800 XL . However, with the BASIC cartridge in place I can't use the Monkey Wrench II cartridge (a useful BASIC editing aid). My solution is this program, which copies the old BASIC from ROM into underlying RAM with a fast machine language routine, then changes rev B into rev C (only 12 bytes are different). This program runs so fast that it's almost as convenient as plugging in a cartridge, and now I can use my editing cartridge along with the new BASIC. Pressing RESET switches ROM BASIC back in; enter POKE 54017, 255 to go back to rev C BASIC in RAM.
1 FOR I=ø TO 43:READ A:PO KE $16384+\mathrm{I}, \mathrm{A}:$ NEXT I:A=U SR(16384)
2 DATA $194,169,9,133,2 ø 3$, $169,169,133,264,162,32$, 169, $6,177,293,72$
3 DATA 169,255,141,1,211, $104,145,203,169,253,141$ ,1,211,136,2ø8,237
4 DATA 23ø,2ø4,2ø2,48,6,2 Ф8,239,169, $0,208,226,96$
5 FOR J=1 TO 13:READ A, B: POKE A,B:NEXT J
6 DATA 54ø17,255,43231,23 4,43232,24ø,43233,17
7 DATA 43234,234,47913, $\varnothing$, 49139, ø, 4914ø, ø,49141, ø
8 DATA 49142, $, 49143, \emptyset, 49$ 144, $\varnothing, 49145, \varnothing$
9 PRINT "BASIC VERSION C ACTIVATED": PRINT "POKE 54ø17,255 TO REACTIVATE

Gregory Latta
Thanks for the program, which should prove useful to Atari owners who wish to use other cartridges with the new BASIC. The revision B bugs, found in the BASIC built into the 600 XL and 800 XL , are familiar to many Atari users by now. See Bill Wilkinson's "INSIGHT: Atari" column in June 1985 COMPUTE! for a demonstration of the bug that mangles strings. To demonstrate the bug that adds 16 bytes to a program when you load it, run the program above, then enter POKE 54017,253 (or press RESET) to switch the ROM BASIC back in. Now type in and run the following program (a disk drive is required):

[^4] (ø)

The idea behind choosing a computerized SAT program over a manual is to save you from piles of paperwork. But surprisingly, two of the best-known programs come with big, fat manuals and only 2 or 3 double-sided disks.

When that much information is put into the manual, what's left to put into the computer?

Why not buy a computer program that's really a computer program? Buy The Perfect Score from Mindscape for just \$69.95.*

It has 6 double-sided disks and a real skinny manual. It even has printout capability and a continuous on-screen clock. All this makes The Perfect Score more computerized
 than those others.

Now, if this cold logic fails to convince you, perhaps an emotional appeal to your sense of patriotism and social consciousness will. Your choice is this. Either you buy their SAT, which kills innocent trees to make all that paper. Or you buy our SAT with 6 disks and Save America's Trees.

2 SAVE "D: EXPANDER": IF PE EK (53279) < > 6 THEN RUN " D: EXPANDER"
The program saves, reloads and runs itself over and over, growing 16 bytes longer every timie when rev B BASIC is present. Press the START key when you've seen enough. Now enter POKE 54017,255 (to switch in rev C BASIC), then run it again to confirm that it saves and reloads without changing in size.

## Atari ML Addresses

I own an Atari 800XL and was interested in the "Commodore ML Addresses" program in "Readers' Feedback," September 1985. Do you have a program for Atari computers that finds the starting and ending addresses of machine language programs on disk and tape?

Adam Mercadante
This program prints the starting and ending addresses of most machine language files. Be sure to include the C: prefix (for tape) or D: prefix (for disk) when entering the filename.

```
1\emptyset DIM A$(14)
2\emptyset PRINT "ENTER FILENAME
    (INCLUDE C: OR D:)":IN
    PUT A$
3ø OPEN #1,4, ø,A$:GET #1,
    A:GET #1,A
4\emptyset GET #1,SLB:GET #1,SHB
5\emptyset GET #1,ELB:GET #1, EHB
6\emptyset PRINT "START ADDRESS =
    ";SLB+256尔SHB
7\emptyset PRINT " END ADDRESS =
    ";ELB+256㑑EHB
8\emptyset CLOSE #1
```

## IBM Compatible Coverage

Now that the PCjr has died, I begin to worry anew about what little support and information has been forthcoming for the IBM-compatible home computers. (I define that as an MS-DOS-based 8088 chip computer which can be purchased for less than an Apple IIe system.) So far I have been able to run all the PCjr programs in COMPUTE! on my Tandy 1000. And all the programs in your book Easy BASIC Programs for the IBM PC and PCjr run beautifully on my Tandy. I recently bought your machine language book for the PCjr and have not run into problems yet. But now I fear for the future of those books; you might be tempted to pull them off the shelves before they even become available. Please don't. I appeal to your business sense to broaden the spectrum of your coverage and pay some attention to the market so strikingly similar to the IBM market you already cover. Why not change your PCjr coverage into PC/MS-DOS coverage? This surely requires only a minimum of effort and I
think it will pay off Christopher L. Herd Our home-oriented IBM coverage in COMPUTE! already is directed toward compatibles as well as both the PC and PCjr. If your "IBM-compatible" computer is truly compatible, it should run the programs we publish for the PC and PCjr without mod-ifications-as your experience with the Tandy 1000 bears out. The Tandy has proven to be highly compatible with IBM computers. But not all so-called compatibles are created equal. If a program doesn't run, there's almost certainly a slight compatibility problem with your computer, BASIC, or DOS. Since there are dozens of IBM compatibles on the market, it isn't practical for us to test every program on every system. Instead, we design the programs to work on what is considered the common denominator in the IBM-compatible world-the IBM PC itself.

## Commodore ML Keyboard Input

I'm writing a Commodore 64 machine language program that requires input from the keyboard to be printed on the screen. Neither the CHRIN routine (\$FFCF) nor GETIN (\$FFE4) seem to work properly, and after several weeks of work I'm stumped. The bug in question occurs only when I call the CHROUT routine with JSR SFFD2. When I JSR to \$F1CA (the address \$FFD2 jumps to), my program works fine. What's the difference between calling CHROUT at \$F1CA instead of \$FFD2?

Jerry Ford
Under normal circumstances it makes no difference which address you use. Since the Kernal call at \$FFD2 simply performs $J M P(\$ 0326)$ to get to \$F1CA, the result is the same unless you've disturbed the vector at \$0326-0327. We can't debug your program without seeing the code, but you should know that CHRIN and GETIN handle keyboard input quite differently. Here are two brief examples that do the job you describe and show how the two routines differ. You'll need a machine language assembler to type them in (the comments are optional).

| LINE | LDX \#0 | ;Set counter ;at zero. |
| :---: | :---: | :---: |
|  | STX TEMP |  |
|  | JSR \$FFCF |  |
|  | CMP \#13 | ;RETURN character |
|  | BEQ EXIT | ;terminates. |
| STORE | LDX TEMP | ;Get counter. |
|  | STA BUFFER, $X$ | ;Store char. |
|  | INC TEMP | ;Bump counter. |
|  | BNE LINE | ;Always branch. |
| EXIT | RTS |  |
| TEMP | .BYTE 0 |  |
| BUFFER | R |  |

This routine puts the input string in memory starting at BUFFER and records its length in the variable TEMP. The code may look confusing unless you understand that CHRIN performs two different functions depending on when it's called. The first time you call CHRIN, the computer simply lets you enter a logical line (up to two screen lines). It displays a blinking cursor and allows you to type on the screen, waiting until you press RETURN. When CHRIN terminates, the accumulator holds the first character from the input line. At this point, the routine falls through to STORE to put the first character in BUFFER. BNE LINE goes back to do another JSR \$FFCF, but this time CHRIN doesn't input a line. Instead it puts the second character in the accumulator. Subsequent calls to CHRIN retrieve the remaining characters, so the routine keeps storing and branching back until a carriage return appears. Calling CHRIN after the whole input line has been retrieved starts the process over again.

## LDX \#0 <br> STX TEMP

GETIT JSR \$FFE4
;Get character. BEQ GETIT ;Ignore nulls. CMP \#13 BEQ EXIT
JSR \$FFD2
LDX TEMP
STA BUF-
FER, $X$
INC TEMP
BNE GETIT
EXIT RTS
TEMP .BYTE 0
BUFFER $=$ *
GETIN does nothing but pull a character from the keyboard buffer and return it in the accumulator. Thus, if you want a cursor or editing keys, your program must provide them (we don't have space for a complete example here).

At first, CHRIN seems more useful than GETIN because it provides so many features (cursor, editing keys, etc.) automatically. But you pay a price for all that convenience. The first call to CHRIN traps you in the ROM routine until RETURN is pressed. If you type only what the program expects, all is well. But there's nothing to prevent a user from moving the cursor to the wrong line, clearing or scrolling the screen, typing graphics garbage rather than letters, or wreaking other sorts of havoc. To avoid such problems, it's often preferable to write a custom input routine with GETIN, adding code to handle editing keys, screening out unwanted characters, and displaying a cursor. The commented source code in SpeedScript: The Word Processor for the Commodore 64 and VIC-20 (published by COMPUTE! Books) includes two fairly elaborate keyboard routines built around GETIN.

## comi

Give a gift subscription to Compute! and you'll be giving a lot more than just another computer magazine. That's because Compute! comes complete with over 20 FREE programs in each big issue.

Send Compute! today and your gift recipient can depend on a steady supply of high quality fun-filled programs like Cash Flow Manager, Speed Ski, Turtle Pilot, Boggler, Text Plot, Retirement Planner and hundreds of other educational, home finance, and game programs the entire family can use all year long.

The free programs alone are worth much more than the low holiday gift subscription price. But there's much more to Compute! than just free programs.

Compute!'s superb editorial delivers the latest inside word on everything from printers

And our up-to-the-minute software reviews are "must reading" for any home user.

So whether that "certain someone" is a novice or an experienced user, Compute! makes a great stocking stuffer. Especially when you can give twelve big issues for just $\$ 18 . .$. that's $25 \%$ off the regular subscription rate... less than $8 \&$ per program.

Compute! It's the perfect holiday gift. Give a subscription today by returning the attached subscription card... or by calling 1-800-247-GIFT.

## COMPUTE!

MAGAZINE

If you're a telecomputing enthusiast, how would you like to dial all the long-distance calls you want for only a modest monthly fee? Or access an online information service with color graphics for pennies a day? These and similar experiments may soon boost personal telecomputing to new heights of popularity.

## Selby Bateman, Features Editor

Many companies are betting that telecommunications holds the key to the future of personal computing. Some of these companies are now experimenting with innovative ideas and lower prices.

For example, when you log onto an electronic bulletin board or online information service, minutes have traditionally been measured in dollars and cents. In effect, a meter is running for every moment you spend on the long-distance telephone line or carrier systems such as Telenet, Tymnet, and Uninet.

But now one of those carriers, GTE Telenet, is experimenting in a dozen major cities with a system that could drastically change the telecomputing landscape. For the first time, people in those cities will be able to call bulletin boards, other computer users, and noncommercial databases over the Telenet system for a flat monthly fee of $\$ 25$. Without flat-rate billing, many telecomputing fans can amass $\$ 25$ in charges in just one evening. The new service is called PC Pursuit.

There are limits to this experiment, however. PC Pursuit is available only during evenings and weekends, and cannot be used to access the commercial online services which have direct links with Telenet, such as CompuServe, The Source, Dow Jones, and others. Those systems have their own hourly rates which include access through Telenet and other longdistance carriers.

Still, PC Pursuit is a significant development for those who frequently call local bulletin boards and fellow computerists. The experiment is now under way in

Atlanta, Boston, Chicago, Dallas, Denver, Detroit, Houston, Los Angeles, New York, Philadelphia, San Francisco, and Washington, D.C. Whether or not PC Pursuit expands into a national service depends on how much interest is generated.

## Measuring Demand

"We've seen this as a need, but whether the potential market is great enough, we weren't sure-we still aren't totally sure," says Claudia Houston, a GTE Telenet spokesperson. "We're the first ones to have done this, so there's no proof.'

Telenet's primary business is not the evening and weekend access which it makes available to consumers, Houston says. "The reason we're able to offer a rate like this is because we have the Telenet data network in place, a major val-ue-added network service supplying business customers during the day. We're able to handle a billion packets of data a month, equivalent to about 28 million typed pages. So when business closes up at the end of the day, there's plenty of room for other uses."

To use PC Pursuit, you first call the local Telenet number, then enter your name and phone number. Next you enter the name of the city you're calling and the phone number, then hang up. PC Pursuit makes the contacts and calls you back with the connection already established. The service prevents illegal use of the long-distance network for voice connection. Each month, PC Pursuit customers are billed automatically on their Visa or MasterCard accounts.

GTE Telenet is eager to hear
from people who are interested in PC Pursuit, even if you don't live in one of the 12 cities involved in the experiment. A toll-free bulletin board has been set up to distribute more information, and you can also leave a private message about PC Pursuit for Telenet's ongoing market research. The bulletin board number is $1-800-835-3001$. For voice phone inquiries between 8 a.m. and 5 p.m. Eastern time, call 1-800-368-4215.

If PC Pursuit catches on, it can be easily extended to other metropolitan areas, Houston adds. In one form or another, the idea behind PC Pursuit will eventually be established, agree observers: easier, cheaper access for nonbusiness personal telecomputing.

## The Quantum Connection

People who use computers at home are beginning to wake up to the possibilities of telecommunications, says Owen Davies, co-editor of The Omni Online Database Directory, an annual compendium of more than a thousand electronic databases. Business people may now make up the bulk of the traffic, but individuals are finding new applications almost every day. Davies, who closely watches the telecomputing field, has seen plenty of growth during the past year: new online databases in many different areas of interest, easier access for home users, and telecomputing software that's simpler to learn.

Another innovative experiment is QuantumLink, a new telecommunications network to be operated jointly by Commodore International and Control Video Corporation. The official launch date for QuantumLink was scheduled for October 1, although testing has been going on for several months.
"What we'll be doing, initially for the Commodore 64 and 128 , is offering a set of services, mostly on a flat-fee basis for $\$ 9.95$ a month," says Stephen Case, vice president of marketing for Quantum Computer Services. QuantumLink's offerings will include previews of commercial software that can be downloaded, bulletin boards, a computer information center, news, teleshopping, and interactive telegaming with full-color graphics, says Case. "The $\$ 9.95$ a month includes communications charges for some of the services-like the encyclopedia, for example. You can use it [Grolier's American Academic Encyclopedia] all you want and there's no extra charge."

Some services, such as software downloading and the Chat feature-an interactive online con-versation-cost an extra six cents a minute. QuantumLink can be accessed through the Uninet carrier network.

Computer owners who register for QuantumLink before the end of 1985 will get Quantum's special terminal software without charge plus a free month of access. After January 1, the signup fee will be $\$ 25$, says Case. The special software is necessary because QuantumLink has a graphics interface similar to that of the Macintosh, and telegames such as chess, backgammon, and hangman-which feature full-color graphics and sound-are stored on the disk. (To register online for a free trial, call 1-800-833-9400.)

## Online Previews

Commercial programs are not the only products that can now be previewed online. On CompuServe, science fiction fans can read chapters from new books published by

Baen Books. There's no charge other than the usual CompuServe connect fees. CompuServe subscribers can reach the Science Fiction and Fantasy Forum by typing GO HOM 29. Baen Books is currently in the forum's Data Library 3 (although that may change by the time you read this). To enter that library, type DL3 and hit RETURN or ENTER. Then type BRO to browse through the various filenames. Subcommands let you retrieve and read a file. You can even comment on what you've read by leaving a message for Baen Books via its CompuServe user number: 70307,541.

The Baen Books files can be read, copied, and distributed freely, as long as they aren't altered or sold. Local bulletin boards can retrieve the files from CompuServe and offer them to their members without charge.

These experiments and others are changing the ways in which people use their personal computers. In two particular areas-immediate acquisition of information and communication among like-minded individuals-telecomputing is becoming easier every day, says Matthew Lesko, an authority on the use of electronic databases and president of Information U.S.A., a database information company.
"Now I can hook up my computer terminal and be on the floor of the stock market even 5,000 miles away. That's a wonderful application."

Immediate communication among members of different professions has already become a commonplace event, reaping extraordinary results, Lesko adds. "It's like-minded people communicating, getting together and talking. It's how our society takes leaps and bounds."

Ben's Mom also bought Bowater's 500 sheet package of computer paper with a FREE Christmas Window Ornament that looks like stain glass. She knows Bowater gives her family MORE than just computer paper.
Ask for Bowater Computer Forms at your local office supply, computer dealer, discount or specialty department store. Or, call us and we'll help you locate the Bowater dealer nearest you.

Bowater Paper \& Files come in 500, 1000, and 2900 sheet packages in $91 / 2 \times 11$ - 20\# bond computer paper.
Bowater Better Image brand with Christmas Window Ornament comes in 500 and 1000 sheet packages of $91 / 2 \times 11$ 20\# bond computer paper.

## An Overview Of

## Telecommunications Software

The following chart contains information on a variety of telecommunications programs for several different computer systems. There are hundreds more available, but we have limited this guide to software in the under- $\$ 100$ price range.

Choose carefully when shopping for a terminal program. The most expensive, multifeatured modem is helpless without adequate software.

Data for this guide was supplied by .MENU-The International Software Database Corporation. For further information and ordering, contact .MENU, 1520 South College Avenue, Fort Collins, CO 80524. Call toll-free 1-800-THE-MENU or 303-482-5000 (in Colorado or outside the U.S.). Telex ISD 454590. When ordering, please use the International Standard Program Number (ISPN).

| Product | Price | ISPN | Publisher/ <br> Vendor | Systems | Description |

MacTalk: Telecomputing on the Macintosh
Sheldon Leemon Arlan Levitan
A complete guide to telecomputing on the Macintosh from choosing a modem and software to accessing information services and electronic bulletin boards.
\$14.95 ISBN 0-942386-85-X

COMPUTE!'s Telecomputing on the IBM
Arlan R. Levitan
Sheldon Leemon
The ins and outs of telecomputing on the IBM PC or PCjr, selecting a modem and evaluating terminal software, how to go online with the major information services. \$14.95 ISBN 0-942386-96-5

COMPUTE!'s Telecomputing on the Commodore 64 Edited
Introduces readers to telecommunications, with sections on buying and using modems, accessing information services and bulletin boards, and uploading and downloading files. There is also a disk available which includes the programs in the book.
\$12.95 ISBN 0-87455-009-2

Telecomputing lets you call up computers around the world through a network of telephone lines.
To get you started in telecomputing, COMPUTE! Books offers you five top-selling books. Written for the Apple II-series, Commodore 64, IBM PC and PCir, and Macintosh, the books give you all the information you need, from selecting software to dialing large databases.

To order your complete guide to telecomputing, give us a call. In the U.S., call toll free 800-334-0868 (North Carolina residents call 919-275-9809).

## COMPUTE!'s Personal Telecomputing

Don Stoner
This comprehensive general guide to the world of telecomputing shows how to access databases, receive software, and communicate with others using a personal computer.
\$12.95 ISBN 0-942386-47-7

## COMPUTE!'s Guide to

Telecomputing on the Apple
Thomas E. Enright
Joan Nickerson
Anne Wayman
An informative, easy-to-understand guide to telecomputing on the Apple: covers everything from selecting hardware and software to accessing large databases.
\$9.95 ISBN 0-942386-98-1

# Some Historic Breakthroughs Don’t Take As Much Explaining As CompuServe. 

#### Abstract

But then, some historic breakthroughs could only take you from the cave to the tar pits and back again.

CompuServe, on the other hand, makes a considerably more civilized contribution to your life.
It turns that marvel of the 20th century, the personal computer, into something useful.

Unlike most personal computer products you read about, CompuServe is an information service. It isn't software. It isn't
 hardware. And you don't even have to know a thing about programming to use it. You subscribe to CompuServe -and 24 hours a day, 7 days a week, it puts a universe of information, entertainment and communications right at your fingertips.

## A few of the hundreds of things you can do with CompuServe.

## COMMUNICATE

EasyPlex ${ }^{\text {TM }}$ Electronic Mail lets even beginners compose, edit, send and file messages the first time they get online. It puts friends, relatives and
business associates-anywhere in the country -in constant, convenient touch.
CB Simulator features 72 channels for "talking" with thousands of other enthusiastic subscribers throughout the country and Canada. The chatter is frequently hilarious, the "handles" unforgettable, and the friendships hard and fast.

More than 100 Forums welcome your participation in "discussions" on all sorts of topics. There are Forums for computer owners, gourmet cooks, veterinarians, pilots, golfers, musicians, you name it! Also, Electronic Conferencing lets businesses put heads together without anyone having to leave the shop.
Bulletin Boards let you "post" messages where thousands will see them. You can use our National Bulletin Board or the specialized Bulletin Boards found in just about every Forum.

## HAVE FUN

Our full range of games includes
"You Guessed It!", the first online TV-style game show you play for real prizes; and MegaWars III, offering the
ultimate in interactive excitement. And there are board, parlor, sports and educational games to play alone or against other subscribers throughout the country.
Movie Reviews keep that big night at the movies from being a five star mistake.

## SHOP

THE ELECTRONIC MALL" ${ }^{\text {m }}$ gives you convenient, 24 -hour-a-day, 7-day-a-week shopping for name brand goods and services at discount prices from nationally known stores and businesses.
 Travelshopper ${ }^{\text {sm }}$ lets you scan flight availabilities (on virtually any airline - worldwide), find airfare bargains and order tickets right on your computer.
Worldwide Exchange sets you up with the perfect yacht, condo, villa, or whatever it takes to make your next vacation a vacation.

A to Z Travel/News Service provides the latest travel news plus complete information on over 20,000 hotels worldwide.

MAKE PHI BETA KAPPA
Grolier's Academic American Encyclopedia's Electronic Edition delivers a complete set of encyclopedias right to your living room just in time for today's homework. It's continuously updated .. and doesn't take an inch of extra shelf space.
The College Board, operated by the College Entrance Examination Board, gives tips on preparing for the SAT, choosing a college and getting financial aid.

## KEEP HEALTHY

Healthnet will never replace a real, live doctor-but it is an excellent and readily available source of health and medical information for the public.
Human Sexuality gives the civilization that put a man on the moon an intelligent alternative to the daily "Advice to the Lovelorn" columns. Hundreds turn to it for real answers.

## BE INFORMED

## All the latest news is at your

 fingertips. Sources include the AP news wire (covering all 50 states plus national news), the Washington Post, USA TODAY Update, specialized business and trade publications and more. You can find out instantly what Congress did yesterday; who finally won the game; and what's happening back in Oskaloosa with the touch of a button. And our electronic clipping service lets you tell us what to watch for. We'll electronically find, clip and file news for you...to read whenever you'd like.

## INVEST WISELY

Comprehensive investment help just might tell you more about the stock you're looking at than the company's Chairman of the Board knows. (Don't know who he is? Chances are, we can fill you in on that,
 too.) CompuServe gives you complete statistics on over 10,000 NYSE, AMEX and OTC securities. Historic trading statistics on over 50,000
stocks, bonds, funds, issues and options. Five years of daily commodity quotes. Standard \& Poor's. Value Line. And more than a dozen other investment tools.

Site II facilitates business decisions by providing you with demographic and sales potential information by state, county and zip code for the entire country.

## National and Canadian business

wires provide continuously updated news and press releases on hundreds of companies worldwide.

## GET SPECIALIZED INFORMATION

Pilots get personalized flight plans, weather briefings, weather and radar maps, newsletters, etc.
Entrepreneurs use CompuServe too for complete step-by-step guidelines on how to incorporate the IBMs of tomorrow.
Lawyers, doctors, engineers, military veterans and businessmen of all types use similar specialized CompuServe resources pertinent to their unique needs.

## And now for the pleasant surprise.

Although CompuServe makes the most of any computer, it's a remarkable value. With CompuServe, you get low start-up costs, low usage charges and local phone-call access in most major metropolitan areas.

## Here's exactly how to use CompuServe.

First, relax.
There are no advanced computer skills required.
In fact, if you know how to buy breakfast, you already have the know-how you'll need to access any subject
 in our system. That's because it's "menu-driven," so beginners can simply read the menus (lists of options) that appear on their screens and then type in their selections.
Experts can skip the menus and just type in "GO" followed by the abbreviation for whatever topic they're after.

In case you ever get lost or confused, just type in " H " for help, and we'll immediately cut in with instructions that should save the day.

Besides, you can either ask questions online through our Feedback service or phone our Customer Service Department.

## How to subscribe.

To access CompuServe, you'll need a CompuServe Subscription Kit, a computer, a modem to connect your computer to your phone, and in some cases, easy-to-use communications software. (Check the information that comes with your modem.)

With your Subscription Kit, you'll receive:

- a $\$ 25$ usage credit.
- a complete hardcover Users Guide.
- your own exclusive user ID
number and preliminary password.
- a subscription to CompuServe's monthly magazine, Online Today.
Call 800-848-8199 (in Ohio, 614-457-0802) to order your Subscription Kit or to receive more information. Or mail this coupon.

Kits are also available in computer stores, electronic equipment outlets and household catalogs. You can also subscribe with materials you'll find packed right in with many computers and modems sold today.Please send me additional information.Please send me a CompuServe Subscription Kit I am enclosing my check for $\$ 39.95$, plus $\$ 2.50$ handling. (Add sales tax if delivered in Ohio.)
Please make check payable to CompuServe Information Services, Inc.Charge this to my VISA/MasterCard

# What's New Online? 

Kathy Yakal, Assistant Features Editor

The major telecommunications services have added several new features over the past year, and a few new services oriented toward personal computer users have come online. Here are the highlights.

## American People/Link

Last December, American Home Network premiered American People/Link, a telecommunications network focusing on family entertainment and online conversations. Electronic mail, a CB simulation, and a wide variety of telegames are its main features.

In mid-August, American People/Link started adding online clubs to its other services. Similar to special interest groups (SIGs) on other telecommunications net-
works, they provide an electronic forum for people with similar interests to share information. Initial clubs cater to such interests as sports, aviation, humor, women's issues, and health.

Subscriber fees are as follows: For the first three hours of nonprime-time use each month, the hourly charge is $\$ 4.78$ for 300 bps and $\$ 7.78$ for 1200 bps . Additional time costs $\$ 2.95 /$ hour for 300 bps and $\$ 5.95 /$ hour for 1200 bps . Prime-time access is $\$ 9.95$ for both 300 and 1200 bps ( $\$ 14.95$ in some cities).
For more information, contact: American Home Network, Inc., Arlington Ridge Office Center, 3215 N. Frontage Road, Suite 1505, Arlington Heights, IL 60004. 800-524-0100 (Illinois residents call 312-870-5200).

## CompuServe Information Service

CompuServe, the nation's largest consumer information service, experienced tremendous growth in 1985. Its subscriber base grew by more than 70 percent to nearly a quarter-million, and several new services were added.

Travelshopper gives subscribers access to Trans World Airlines' reservation system. You can find the lowest rates and most convenient flights, then make a reservation while online. Tickets can be sent to your home or to the airline ticket counter, or issued by a local travel agency.

The Executive Service Option (formerly called Executive Information Services) is a database of sophisticated financial information
which is now available to all subscribers. It offers a variety of tools for investment and financial planning, as well as special merchandise offers and discounts. There is a one-time charge of $\$ 10$ ( $\$ 5$ for new users) and a $\$ 10$ minimum monthly usage fee.

CompuServe has also upgraded and simplified its electronic mail service. Easyplex features different modes for different levels of expertise; online instructions; easy editing; and an "address book" which stores names and user IDs of up to 50 people.

Gannett Co., Inc., is now distributing USA TODAY Update through CompuServe. Hotlines, updated hourly from 8 a.m. to 11 p.m., offers business, financial, local, and international news, plus weather reports. Decisionlines, updated daily , is targeted to specific industries and professions such as travel, technology, law, and energy.

Since August 1983, the NCR Universal Credit Union has allowed its members to conduct transactions electronically from anywhere in the world through CompuServe's Companion at-Home. In the last year, three additional major credit unions have announced an intention to do the same: Northwest Orient Airlines Employee Credit Union, Pacific IBM Employees Credit Union, and Oak Ridge National Laboratories Employees Credit Union.
For more information, contact: CompuServe, P.O. Box 20212, Columbus, OH 43220. 800-848-8199.

## Delphi

Since June, Delphi has offered service at 2400 bps , for an additional $\$ 5$ an hour.

Two new areas of the service have also been developed. Subscribers can now get current news, sports, and financial information on Delphi through AP News Services. And owners of Commodore, Apple II-series, Macintosh, and Atari computers can share information and get technical help through several new online SIGs.
For more information, contact: Delphi, 3 Blackstone Ct., Cambridge, MA 02139. 800-544-4005.

## Dow Jones News/Retrieval

Dow Jones has added two new databases to its information service.

Peterson's College Selection Service has profiles on more than 3,000 two- and four-year colleges and universities. And a new medical and drug reference database addresses the diagnosis of hundreds of diseases and offers information on many pharmaceutical drugs.

American Express Advance lets cardholders look up previous statements on their accounts. American Express Shopping And Travel Service offers online shopping and travel information.

In June, Dow Jones' perminute fees for 300 bps changed to 90 cents (prime time) and 20 cents (nonprime time). The 1200 and 2400 bps rates are double the 300 bps rate. Certain business-related databases require an additional 30 cents (prime) and 60 cents (nonprime) per minute. In addition to the $\$ 75$ standard membership fee, there's also a $\$ 12$ annual service fee.
For more information, contact: Dow Jones News/Retrieval, P.O. Box 300, Princeton, NJ 08540. 800-257-5114.

## The Source

Over the past year, The Source simplified use of its telecommunications network. The updated menu incorporates a self-teaching design to help users find what they're looking for more quickly.

Online assistance has always been available on The Source, but now it's expanded and it's free. The tutorial includes four lessons of graduated difficulty to familiarize new users with the system. Unlimited free access to this assistance allows both new and experienced subscribers to explore areas of the system that they may not have known about before.

In August, officials at The Source announced that individual SIGs would soon be online. Though details have not been fully developed at this writing, the SIGs are expected to address the special interests of personal computer owners. An additional per-minute fee will be charged for this service.

In August, 2400 bps service began in ten major cities. Additional cities will soon be added via Uninet and Telenet. The base rate for prime-time 2400 bps service is 46 cents per minute; nonprime time is 20 cents per minute.

A new database contains updated listings for 14,000 domestic and 8,000 international hotels. Each listing contains the hotel's address and telephone number, as well as information on restaurants, convention facilities, sports and leisure services, and rates.
For more information, contact: The Source, 1616 Anderson Road, McLean, VA 22102. 800-336-3366.

## Viewtron

Viewtron is a new videotex service scheduled to begin this fall for Commodore, Apple, and IBM owners. Operated by Viewdata Corporation, a subsidiary of KnightRidder Newspapers, Inc., Viewtron was to start October 1 in most areas of the U.S. with access to a Telenet, Tymnet, or Uninet number, except Massachusetts, New Hampshire, Vermont, and Maine. Viewtron plans to offer news, weather, sports, and current stock prices; book, movie, and software reviews; communication with other subscribers through electronic mail and a $C B$ simulator; and online shopping and banking.

Viewtron is to be the first major news and information service in the U.S. to display color graphics, though only for Commodore users. Because of this feature, Commodore owners need special terminal software designed for the system. IBM and Apple owners can use any terminal software with VT-100 emulation (or Viewtron's package).

To subscribe, you must buy a Viewtron Software Starter Kit (\$9.95) which contains terminal software, one free hour of service, an ID and password, and a user manual. Rates after the first hour are nine cents a minute (after 6 p.m. weekdays, all day weekends) and 22 cents a minute (weekdays before 6). There is no monthly minimum and no extra charge for 1200 bps access.

Viewdata is offering free starter kits with the purchase of some Anchor Automation modems. A 300 bps Westridge 6420 modem with software is $\$ 49.95$; a 1200 bps Volksmodem 12 is $\$ 189.95$.
For more information, contact: Viewdata Corporation of America, Inc., 1111 Lincoln Road, 7th Floor, Miami Beach, FL 33139. 800-543-5500, Department 9401.

HOW TO GET
OVER \$2000 WORTH OF NEW CAPABILITIES

# Programming Languages Communicating With Your Computer 

BASIC, Logo, Pascal, FORTRAN, COBOL, Forththese and a hundred other odd-sounding names are the languages we use to communicate with computers. Since the beginning of the computer age, scientists and programmers have been striving to make this human-machine interaction easier, faster, and more powerful. Why are there so many languages? Which are best? And what will tomorrow's languages be like? The answers may help you decide which language is best for you.
magine that if every time you asked someone to do something, you had to tediously explain each step of the procedure. Outlining something as simple as taking out the garbage could take ten minutes:

Walk to the garbage can by placing one foot in front of the other and moving forward, Stop. Bend over at the waist, extending both arms out in front of your. Put your hands on either side of the garbage bag and grasp it by curling your fingers and applying pressure to get a good grip. Stand up straight again, holding the bag in front, of you. Turn around and face the opposite direction; still holding the bag. Walk toward the back door. Stop. Bend over again and release your grip on the bag. Stand up, extend your right arm, and grasp the doorknob. Apply pressure, twist, and pull until the door opens.... And so on.

Human beings don't need that kind of step-by-step instruction for most tasks. But computers require it for all tasks. Technically, the only way to make a computer do something is to rearrange its internal pathways of electricity by flipping the equivalent of thousands of microscopic on/off switches. By programming at the computer's most fundamental level, -a binary code of ones and zeros which controls those switches-programmers can instruct computers to carry out very simple tasks, like adding two numbers or storing a number in memory. When hundreds or even thousands of these simple commands are combined to form a program, computers can seem to handle tasks of great complexity.

But programming a computer in binary codes can be a daunting job. To make it easier and faster, computer scientists and engineers have spent the last four decades developing scores of programming languages as alternatives to communicating with computers on the binary level. Many of these languages are composed of familiar English words, and they serve as translators or interpreters between the language of the programmer and the language of the machine. For example, many of today's personal computers come with a language called BASIC, which stands for Beginner's All-purpose Symbolic Instruction Code. A typical Englishlike BASIC command is PRINT. When PRINT is followed by some text inside quotation marks, such as PRINT "HELLO", the computer prints the text on the monitor screen. To do the same thing directly in machine language, a programmer might have to write a halfdozen or more commands.

For this reason, languages such as BASIC are known as high-level languages-they are relatively far removed from the binary level of the machine. Programming in a high-level language versus programming in machine language is somewhat like the difference between saying "Please take out the garbage" or outlining the whole process step-by-step as shown above.

There are other reasons why high-level languages are continual-

Special programming jobs require
specialized tools; the language for writing
an accounting program might not be the best for writing an adventure game.
ly being developed, too. Different people have different programming styles, so more languages provide more choices. Also, special programming jobs require specialized tools; the language for writing an accounting program might not be the best for writing an adventure game.

The evolution of these languages, however, has distanced programmers from the inner workings of computers. High-level languages make it easier to write programs, but fewer and fewer people understand what's really happening inside the box-how the electrons are zipping in and out of logic gates. It's like driving a car without thinking about how the gas and air are exploding inside the cylinders, pushing the pistons up and down. Whether or not it's important to know these details is a matter of debate within the computing community.

Today, you can run a programon just about any personal computer without knowing anything about programming. Usually it's as simple as inserting a floppy disk or program cartridge, switching on the system, and perhaps typing a single command to get things started.

This is quite a jump from 40 years ago, when the first electronic digital computer, ENIAC, was built.

ENIAC (Electronic Numeric Integrator and Calculator) was a 30 -ton, 100 -foot-long machine which contained almost a hundred thousand vacuum tubes, resistors, and capacitors. ENIAC had to be programmed by hard-wiring-engineers rewired it for each new program they wanted to run. There was no memory inside the computer to store programs. And today's mass-storage devices, such as floppy disks and tapes, were not yet imagined. Hard-wiring ENIAC could take days as engineers prepared the monster to solve one type of complex calculation. Once programmed, ENIAC could solve the equations far faster than people. But if a different type of calculation was required, the hard-wiring had to start all over again.

The difficulty of programming a behemoth such as ENIAC meant that only a handful of scientists and engineers could really "talk" to the computer. And they had to communicate completely in the machine's own primitive language of wires and connections.

In addition to being enormously expensive to build and maintain, these early computers were expensive to use because hard-wiring took so much time-time that could be spent on calculations. So engineers borrowed an idea from computer pioneer John von Neu-mann-stored programs. Adding memory to a computer to temporarily store a program as it runs is much faster and easier than rewiring the hardware. You can change programs simply by replacing the program in memory with a new one.

By mid-1948, British computer scientists had completed the Mark I, commonly recognized as the first stored-program computer. By flipping switches on the front of the Mark I, engineers could enter short programs into the machine. This was a major improvement, but still clumsy. Reportedly, the codes had to be entered backward.

Next, a way had to be found to store programs between jobs; there isn't nearly enough memory in a computer to permanently keep all the possible programs that could be written. Also, many programs require data

You've just discovered the Eidolon-a curious 19th century machine whose inventor vanished without a trace. Only his journals and sketches remain.
They tell of an incredible magical realm-a maze of caverns populated by strange creatures noted as Greps, Biter Birds and Bottlenecks. And "intelligent" Guardian Dragons-who hurl colored fireballs of energy?
The machine itself belies its quaint Victorian charm. For the Eidolon glows with the power of enchanted energy. It awaits, pristine and gleaming-perfectly preserved for over a hundred years by the powerful forces that propelled it and its pilot to another dimension.
With the fascinating first-person point of view, you
can climb into the pilot's chair and fly this mysterious magical machine. And the haunting fractal graphics take you deeper and deeper into an endless maze of mystical caverns.

An adventure so real, it'll make you wonder: What ever happened to the Eidolon's mysterious inventor? Only the adventurous of spirit will know his fate. The Eidolonscientific curiosity, or passport to a magical dimension?

which changes from job to job and can't be stored as part of the program, such as the monthly electric bills of utility company customers.

This time, engineers borrowed a piece of nineteenth-century tech-nology-cardboard punch cards. This idea was originally developed by nineteenth-century mathematician Charles Babbage, who took the concept from an earlier system used by the French to control weaving looms. Punch cards had proven their worth in data processing during the 1890 U.S. census, when they were used to speed up tabulation on mechanical adding machines.

By adapting punch cards to computers, it became possible to write and store programs without tying up the machine itself. Programmers typed their programs on keypunch machines, then waited their turn to feed the stack of cards into the computer. After the results were printed out, the computer was prepared to accept another batch of cards. This system was called batch processing.

For the first time, programmers were physically separated from computers. There were software experts, who wrote programs on batches of cards, and hardware experts, who fed the cards into computers.

The first real software breakthrough was an assembler program. An assembler translates mnemonics like LD (load a number from memory) and ST (store a number in memory) into the binary ones and zeros the computer understands. Each assembler operation code (or opcode) corresponds directly to a machine language instruction.

Soon, programmers began collecting useful pieces of programs written with assemblers. For example, if someone needed a routine to calculate square roots, they could borrow one from another programmer who had already figured out the math, rather than waste time reinventing the wheel. Such a fill-in-the-blanks routine is called a macro-instruction, or macro for short.

A library of macros isn't quite a language, because it's not organized or standardized. But macros were the first step toward highlevel languages.

> As computer education began seeping downward from colleges, for the first time there was a need for languages tailored especially for young people.

0ne of the first high-level languages was FORTRAN (FORmula TRANslator), developed in 1954. Before FORTRAN, engineers and scientists who were unfamiliar with computers had to describe a problem to a computer programmer, who would then write a program to solve it. FORTRAN made it easier for scientists and engineers to write their own programs.

Just as FORTRAN was written for engineers, COBOL (COmmon Business Oriented Language) was created for accountants. Developed in the 1950s by U.S. Navy Captain Grace Hopper, COBOL is still one of the most popular languages for large business computers, and is often used to write payroll programs and other applications in large data processing departments.

In 1964, when FORTRAN and COBOL were the most popular programming languages, two Dartmouth University professors formulated a couple of important ideas. First, they suggested that instead of processing programs in batches, a single computer could be hooked up to several terminals, sharing its time among many users. A fast typist works at perhaps 100 words per minute, while a computer can accept keystrokes much faster-in millionths of a second. A time-sharing system of terminals would allow more than one person to use the computer simultaneously. Because the computer works so fast, each person could have the
illusion that he was the only one working with the machine.

Their second idea was a new language, BASIC, a general computing language which would be easier to learn than FORTRAN or COBOL and more flexible.

Dartmouth became the first university to make computer time generally available to undergraduates, thanks to time-sharing and BASIC. (The two professors, John Kemeny and Thomas Kurtz, recently released a new version of BASIC called True BASIC.)

With batch processing, programmers had to write a program by punching it onto cards, then submit it for processing, collect the results the next day, find out there was a bug, rewrite it, submit it again, and so on. Time-sharing allowed programmers to begin debugging a program immediately. It also made computers accessible to more people and paved the way for personal computing.

Soon after BASIC was developed, many more programming languages began appearing. Computers were being adapted to more applications, and more people began using computers, so demand grew for better and more specialized languages.

In the late 1960 s , a debate heated up within the academic and computer communities over structured programming. This is a method intended to keep programmers more organized and programs more readable and easily modified. The first language specifically designed to encourage structured programming was Pascal-invented by Niklaus Wirth in Switzerland and named after the French mathematician and logician, Blaise Pascal. Today, Pascal is popular in high schools and colleges because instructors say it teaches good programming style. It's also easier to follow the flow of a program written in Pascal.

Meanwhile, computer education began seeping downward from colleges into high schools, junior highs, and even elementary schools. For the first time, there was a need for languages tailored especially for young people. In the late 1960s, Seymour Papert of the Massachusetts Institute of Technology

It takes all kinds to make a galaxy interesting. Like you, a techno-scavenger. Your kind are out to get rich scavenging Ancient technology. And now you've found the fabled Koronis Rift-the weapons testing grounds of the Ancients. The chance of a lifetime awaits you.
Abandoned war hulks litter the Rift-crammed with exotic weapons and technology. The lifelike fractal graphics take you to this mythical land of the Ancients. The mind's-eye point of view puts you right in the driver's seat of a Surface Rover. A hulk looms before youyour mind races, feverishly planning a strategy. What weapons do you need to survive? What technology will fetch the highest price? If you can pack your battered Rover full-you'll be rich beyond your wildest dreams. But it won't be easy. The Guardians-genetically
engineered mutants-stand watch over their creators' technology. And they deal swiftly and ruthlessly with characters like techno-scavengers.

But you've got a plan. If you and your trusty Science Droid can scavenge the right combination of weapons and technology-and get off the planet alive-you'll make it big. Destroy the Guardian base and you'll even be a hero! The treasures of the Ancients are yours . . if you've got what it takes.

Strategy Games for the Action-Game Player ${ }^{*}$
developed Logo. Many of Logo's commands give directions to a turtle on the computer screen, a small object whose movements define and execute a graphics program. The onscreen turtle was adapted from Pa pert's original Logo, which attached the computer to an actual robotic turtle which children could program to draw designs on paper. Many elementary schools now teach Logo as the first programming language for young children.

New approaches to programming languages also were being explored. For example, Forth is an unusual language originally developed to control telescopes in observatories. It's roughly halfway between machine language and high-level languages like BASIC, and is extensible-you can define new functions and commands which then become part of the language. In a sense, it's a language that lets you create your own personal language. If you want, you can build up the language piece by piece, until you finally define a single word that runs the whole program.

Although there are hundreds of programming languages, most are not available for personal computers. Some languages were designed for large mainframe computers and cannot fit into small amounts of memory. Others are just too specialized for general use. If you'd like to explore the alternatives, here are some issues to consider:

- What types of programs will you be writing?

One language might offer lots of commands for handling files and variables, but very little in the way of graphics. Another might be strong in mathematical functions, but weak in handling strings and text. Look for a language that is suited for the kind of programs you want to write. There are always books and manuals which list the commands available in a language and describe what they do.

- How much control do you want over the hardware and software? Is the language high-level, low-level, or somewhere in between?

A low-level language like machine language puts you in direct control of the computer. Individual instructions do very simple things,

The commands in high-level
languages look more like words in a human language, so
they're easier to learn.
like fetching and storing numbers in memory, comparing two numbers, and basic addition and subtraction. To multiply two numbers, you might need several instructions. (However, on the newer chips, multiplication requires only a single instruction.)

High-level languages take you several steps away from machine language and the hardware. The commands look more like words in a human language, so they're easier to learn. Also, individual commands are usually broader, performing tasks which might require dozens of commands in machine language. But you pay a price: Direct control over the finer points of the computer may be more difficult, and the finished programs run more slowly and often consume more memory. Remember, the only language the computer really understands is machine lan-guage-at some stage, it has to translate programs written in another language into its native tongue.

## - How fast is the language?

Speed is important in some programs. A certain part of a program may take $1 / 20$ second to execute in one language and $1 / 2$ second in another, not a noticeable difference if it's used once or twice. But if it's executed several thousand times, the difference could become significant.

Machine language is the fastest, and most commercial software is written in machine language. (In fact, most high-level languages themselves are written in machine language.) Mid-level languages such as Forth and C, while not as fast as machine language, are generally quicker than higher-level languages.

Because the faster languages are usually low-level, they may be more difficult to learn and use. High-level languages are fine for many programs, and here's where you must strike a balance: Would you rather spend five hours working with a low-level language to write a program that runs in one minute, or spend one hour working with a highlevel language to write the same program that runs in 15 minutes? If you're going to run the program every day, you might choose to spend the extra time writing it with the faster language. But for an infrequently used program, you might prefer the language that's easier and slower.

In some cases, the speed of a language doesn't matter. If a printer seems to take forever to print reports or mailing labels, rewriting the program with a faster language may not help. The printer is probably the limiting factor on speed, not the language.

- What are the system requirements? And how much free memory for programs remains after the language is loaded into the computer?

You may find languages that require a certain operating system. C, for example, was originally written for the Unix operating system, although that has changed-other versions of $C$ are now available. On a Commodore 64, certain languages work only with the $\mathrm{CP} / \mathrm{M}$ cartridge. And some languages won't work without two disk drives.

Check the memory requirements. You may have to install additional memory boards or controller cards. Even if you have the minimum memory specified for a certain language, you may be left with very little space for your programs.

## - What programming style are you most comfortable with? Scientific and structured? Or creative and artistic?

Some people write programs methodically, step by step. They draw a flowchart on paper, diagramming the program in modules. They fully document each section, describing exactly what happens when. Not until they finish the preliminary planning and structuring do they enter the program into the computer. In business, the structured approach is preferable. If a programmer quits for

# ANNOUNCING THE FAMILY SOFTWARE SPECTACULAR: 

## BUY3, GET1FREE.

## CHOOSE FROM OVER 50 LEADING TITLES.

What do you call an offer that brings together, for the first time ever, five leading brands of home software?

The Family Software Spectacular!
And it's your opportunity to choose a free software program from the best titles on the market today. All you have to do is buy any combination of three titles from any participating brands during this special offer period. And we'll send you another one of your choice-free!

It's a one-of-a-kind value your family shouldn't miss.

## FISHER-PRICE. A NAME YOU CAN TRUST.

For years Fisher-Price has been known for helping children develop skills as they play. With Fisher-Price ${ }^{\text {t' }}$ Learning Software, your child can develop skills in five key areas: math, language, creativity, basic learning and computer literacy.

Your child will love developing and testing language skills with the help of PETER RABBIT READING, a program that uses voice to teach sound and letter recognition in words.

## WINDHAM CLASSICS.". CLASSIC NOVELS COME TO LIFE.

Pick up Windham Classics, graphicinteractive fiction based on some of the greatest adventures of all time.

## SPINNAKER. THE LEADER IN FAMILY LEARNING SOFTWARE.

From pre-school counting to high-school compositions, Spinnaker offers the high quality educational programs you have come to expect. For example, there's the HOMEWORK HELPER ${ }^{\text {Tw }}$ series which provides step-by-step methods for improving writing and math skills and helps kids tackle otherwise troublesome school assignments.

## TELARIUM." INTERACTIVE FICTION AT ITS BEST.

Here's graphic interactive fiction by famous writers of science fiction, fantasy, and mystery like Ray Bradbury, Arthur
C. Clarke and Erle Stanley Gardner. Each story unfolds with you in the center of the action-and completely in control. In PERRY MASON: THE CASE OF THE MANDARIN MURDER, ${ }^{\text {Tw }}$ you are the world famous criminal lawyer. Challenge the evidence. Cross-examine the witness. Only you can prove your client's innocence. And time is running out.

## A SOFTWARE OFFER FOR ALL AGES.

Any software offer including something for everyone in the family is certainly fantastic. But combine that with a free product offer and what you have is something spectacular. Look for the specially marked boxes of The Family Software Spectacular at your retailer.

some reason, the company needs to know how the programs are put together.

Others prefer a looser, more improvisational style. They type a few lines, run the program, make some changes, test it again, and so on. Then they write and test a new section. The programs are not necessarily unstructured or illogical; it's just that the program ideas are not written down. The program may change as it develops, evolving into something quite different from the original plan.

There are advantages and disadvantages to each style. Planning ahead takes a lot of time up front, before a single line is entered. And it locks you into a certain structure. But the programs are generally easy to follow and debug. When teams of programmers work together, they generally use the planned-out approach.

More casual programmers who work interactively with the computer can see immediate results, positive feedback that the program is progressing. There's also an element of creative experimentation: "I'll try this and if it doesn't work, I'll try something else." Less time is spent on planning, and more time on actual programming. The casual approach can be carried too far, however. If the program is written sloppily, even its author might not understand how it works if modifications are required a few months later.

- If you need to write fast programs, but don't want to use machine language, will a compiler do the job?

There are two general ways in which commands in higher-level languages are translated into the machine language that the computer can understand.

An interpreter language translates the commands as the program runs, on the fly. The BASICs built into personal computers are interpreters.

A compiler, on the other hand, translates all the high-level commands into machine language before running the program. This compilation step may take several minutes, but when it's done, the finished program usually runs much faster than an interpreted program (though not as fast as programs written directly in
machine language).
Some languages (including BASIC) are available as both interpreters and compilers. There are tradeoffs either way. Compiled programs run faster than interpreted programs, but usually require much more memory-sometimes too much for small computers. Interpreters are more interactive, because you can type in a few statements, quickly try them out, and continue. A compiler might take ten minutes to compile a program. The choice between an interpreter and a compiler depends a great deal on your personal programming style, the amount of memory in your computer, and your need for speed in the finished product.

Ultimately, the language you choose for communicating with your computer depends on a great number of things. After reviewing all the options, you may find it desirable to learn more than one language, especially if you plan to write different kinds of programs.

During recent years, computer scientists, programmers, and linguists have been working in the field of artificial intelligence to develop methods for computers to more closely mimic human thought. An important part of this work has been research into socalled natural languages-those languages which humans use. We may see a day when the perfect natural language interface is developed, and we need only tell the computer, in our own tongue, what we want it to do. The latest generation of personal computers-such as the Apple Macintosh, Atari 520ST, and Commodore Amigarepresent another small step in that direction.

For now, however, control over a computer means meeting the machine at least halfway-learning a language which gives the computer something intelligible to work with. No longer must people learn to program to use a computer enjoyably and productively. But for thousands of computer owners, learning to communicate with their machines in a common language opens up the world of computing in ways which are better experienced than explained.

Here's a game that tests your skill in pattern-matching and visualization. It runs on the Commodore 64; unexpanded VIC-20; Plus/4 and 16; IBM PC with color/graphics adapter and BASICA; PCjr with Cartridge BASIC; Apple II-series computers; TI-99/4A with Extended BASIC; and Atari 400/800, XL, and XE computers with at least 16 K RAM for tape or 24 K for disk. The Commodore 64 and Atari versions also require a joystick.

How good are you at recognizing patterns? Many intelligence tests measure this important conceptual skill. "Puzzler" challenges your ability to find matching patterns in a background of similar shapes. It displays two puzzle grids composed of multicolored blocks (see photos). Both grids contain exactly the same blocks, but those in the left grid have been scrambled. Your job is to rearrange the blocks in the left puzzle grid until they match those on the right. You must solve the puzzle before time runs out.

Because all versions of Puzzler are similar, we've printed general game instructions followed by specific notes for each computer. Read the general instructions as well as the section for your machine, then type in the program listed for your computer. Don't forget to save a copy of the game before you run it.

## Puzzle Building

Puzzler begins by letting you choose the size of the puzzle grid. Enter values for the number of rows and columns in the grid. The maximum puzzle size differs among the various versions. Of course, larger puzzles are more difficult to solve than small ones. Next, enter the number of colors the puzzle will use. Two-color puzzles are the easiest. The maximum number of colors depends on which version you're playing. The more colors you choose, the harder your job becomes.

Puzzler then spends a short time building the two grids. Since the blocks are arranged at random, each new puzzle is different from the last. While you try to solve the puzzle, the computer keeps track of the time and alerts you when the puzzle is solved or time runs out. The time limit depends on the size of the puzzle.

Puzzler allows three different operations. You can move within the puzzle grid from one block to another, pick up a block and move it to a new position, or rotate a block in its current position. Use the cursor keys (or joystick in some versions) to move around in the grid. Your position is indicated by a colored cursor (or index arrows in some versions). To pick up a block, press RETURN (or the joystick but-
ton) once. The cursor or arrow changes color to show that you're carrying the piece. Then move to the position where you want to place the block, and press RETURN (or the button) once. The block in the current position trades positions with the block you're carrying.

Each block consists of four colored squares. To rotate a block in its current position, press RETURN (or the joystick button) twice. The block rotates 90 degrees. You may rotate a block as many times as you want.

Continue moving and rotating blocks until both puzzle grids match. Every block must match in color and be turned in the right direction.

## Commodore 64 Version

Plug a joystick into port 2. The puzzle may contain as many as seven rows and columns, and up to 16 different colors. The box-shaped cursor shows your position on the puzzle grid. Press the joystick button twice without moving the joystick to rotate the block under the cursor. Press the button once to pick up the piece under the cursor: The cursor changes color to show that you're carrying the block. Now you may move to any other place in the grid. When you find the spot

## SCENERY DISKS for LIG H T SIMUSATOR II

SubLOGIC Scenery Disks expand the potential flying environment of Flight Simulator II and Microsoft Flight Simulator.
Twelve separate Scenery Disks cover the entire continental United States. Each disk covers a geographical region of the country, and includes the major airports, radio-nav aids, cities, highways, rivers, and lakes located in that region. Enough detail is available on each disk for either visual or instrument cross-country navigation.
A STAR Scenery Disk (available 4th quarter 1985) covers a smaller area with a relatively dense amount of scenery. STAR Scenery Disks are primarily intended for visual flight sight-seeing. They include buildings and landmarks, as well as detailed renditions of all major airports in the area.

Individual Scenery Disk price: \$19.95
Western U.S. (Disks 1-6): \$99.95 - Coming Soon Eastern U.S. (DIsks 7-12): \$99.95
See Your Dealer...
or write or call for more information. For direct orders please specify which disk or disk-set you want. Enclose the correct amount plus $\$ 2.00$ for shipping ( $\$ 6.00$ for the six-disk set) and specify UPS or first class mail delivery. Visa, MasterCard, American Express, and Diners Club cards accepted.

Commodore 64 is a trademark of Commodore Electronics Ltd. IBM is a registered trademark of international Business Machines Corp.

For the Commodore $64^{\text {TM }}$ and IBM PC ${ }^{\circledR}$

you want，press the button again to set down the block．It changes places with the block in that position．

## VIC－20 Version

VIC－20 Puzzler is played with the cursor keys．The maximum puzzle size is four columns by six rows， with up to six colors．Your position in the grid is shown by two index arrows，normally colored black． Press RETURN twice to rotate a block．Press RETURN once to pick up a block，then move it with the cursor keys and press RETURN to put it down．The arrows turn blue when RETURN is pressed once， and red when it is pressed a second time．

## Plus／4 And 16 Version

Puzzler for the Commodore Plus／4 and 16 permits up to seven rows and columns and seven different colors．It is played exactly like the VIC－20 version．

## Atari Version

Plug a joystick into port 1．Atari Puzzler lets you build puzzles with as many as eight rows and columns and up to four different colors．Ma－ nipulate the joystick as explained in the Commodore 64 instructions．

## IBM Version

IBM Puzzler allows grids as large as seven rows and columns with up to seven different colors．Index arrows indicate your position in the grid，as explained in the VIC－ 20 instruc－ tions．Use the cursor keys to move within the grid．Press Enter to move or rotate a block．

## TI－99／4A Version

You have the option of playing with either a joystick or keyboard controls．Puzzles can be as large as six rows and six columns with as many as six different colors．The box－shaped cursor shows your po－ sition in the puzzle grid and changes colors to indicate when you＇re carrying a block．When using the keyboard，make sure the Alpha Lock key is down．Move the cursor with the arrow keys and press Enter to rotate or move a block．

## Apple Version

Puzzler runs on any Apple II－series computer with either DOS 3.3 or ProDOS．Press the space bar to
move or rotate a block，and press I， J，K，and L to move up，left，down， and right，respectively．Your posi－ tion in the grid is indicated by small white highlights in the corners of the block．

## Give your 154r'Disk Brive a brain transplant!

Simply plug the STARDOS ROM Chip into the drive unit and insert the STARDOS cartridge. That's all you need to do to complete a transplant procedure that will give your Disk Drive and Computer higher intelligence.

Other Quick Loaders and Fast Loaders try to 'Patch' the DOS of the Disk Drive. This does not significantly speed up much of today's Software and sometimes it fails to load altogether.

But, STARDOS electronically replaces the entire DOS and KERNAL. This means STARDOS will speedup finding records in your Database, any changes you wish to make to your Spreadsheet and playing your favorite adventure or other Disk Intensive work with your C-64*.

The STARDOS transplant offers:
Speed. $\qquad$ for 'All Types' of Disk Access at an incredible 600\%-1000\% faster!
Reliability end overheating and"SAVE @ O:" woes!
Convenience.. with single key load, SAVE, and Directory Etc. Built in File and Disk Copiers!
Power. full Word Processor, M.L. Monitor and Sector Editor, Screen Dumps to Printer and lots more!

Compatibility. STARDOS works with virtually all C-64* Software and Hardware!

Guarantee. 120 day repair or replacement warranty. Your satisfaction guaranteed or your money is refunded!

The power of a Computer is a terrible thing to waste. Help your C-64* live up to its full potential...Transplant with the very best!...Transplant with STARDOS!

Personalize your C-64* for a $\$ 10$ (non-refundable) charge. We will include a 21 character power-on message with your favorite screen, border and text colors. Example:

| Background $\quad$ BLACK |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Border GREEN Text RED |

Write or phone for additional information.

## Program 3: Puzzler For Commodore Plus/4 And 16

Version by Patrick Parrish, Programming Supervisor
For instructions on entering this listing, please refer to "COMPUTEI's Guide to Typing In Programs" published bimonthly in cOMPUTE.
$1 \varnothing \mathrm{X} \$="\{$ RVS $\}\{O F F\} ": C O(\varnothing)=1: C O$ ( 1 ) $=7$ : С $\mathrm{CO}(2)=3:$ DN $\$=$ " $\{$ HOME $\}$ \{22 DOWN\}":COLORø, 2:COLOR4, 2
 16) "PUZZLER": PRINT" $\{3$ DOWN $\}$ way to back up your most protected software. It encompasses all the latest advances in software, as well as a highly sophisticated piece of hardware. This is absolutely the best utility availabie today. You may not even need updates, but if you do, the Shadow's unique design allows for updates to be available for a nominal fee.

By the time you place your order we expect the Shadow to back up 100\% - that's right, 100\% of all software available for the C-64.

Order by phone 24 hrs: $/ 7$ days or send cashier's check/money order payable to Megasoft. Visa. MasterCard include card \# and exp. date. Add \$3.50 shipping/ handling for continental U.S.. \$5.50 for UPS air. CODs add \$7.50 Canada add $\$ 10.00$ Other foreign orders add $\$ 15.00$ and remit certified U.S. funds only. Distributors invited and supported.

# SOLO FMCHTT 

"The only Flight Simulator that gives you the real feel and thrill of Primary Flight Training with the FUN, Ease of Use and challenge even for the best fighter pilot!'"

Major Bill 3,000 Flying Hours

## NOW INCLUDES:

## MAIL PILOT MISSION

Brave the wind, weather, and mechanical failures in an exciting and increasingly challenging race to deliver the mail to 21 different airports from Kansas to Colorado!
INSTRUCTOR PILOT OPTION
On screen guidance from a real instructor pilot to help you make your first Solo!

## CESSNA and MICRO PROSE

## present the

Great American

## LEARN TO FLY A REAL AIRPLANE

 Contest
## \$30 OFF COUIPON AND FREE FLYING LESSONS!!!

You get a coupon worth up to $\$ 30$ towards a Cessna
"Discovery Flight" in every flying simulation product box Plus you can win a complete flight training course from Cessna. Details in every box, or see your local dealer.

A Truly Unique Flying Experience Solo Flight is an exciting and sophisticated Primary Flight Training Simulator that makes learning to fly Fun and Easy! Designed by a real fighter pilot, who taught more than 200 Air Force Lieutenants how to fly, Solo Flight takes you from your first taxi to take-off; through your first solo; and all the way up to the challenge of the Mail Pilot Mission! Solo Flight features full instrumentation, multiple air navigation maps, emergency procedure practice, the unique "in-the-slot" 3 Dimensional flight perspective, and fun and challenge for pilots of all ages!

LSA TODAY - SOLO FLIGHT
.. there's a revised pecking order in the air... easier to master (than another famous flight simulator) (Solo Flight) ... loses none of the subtlety of flight, even when you've logged dozens of hours." Marc Randolph
CREATIVE COMPUTING - SOLO FLIGHT
.. is a flight simulator designed with fun in mind... it's easier to fly than Sublogic's Flight Simulator and...it is more fun to play." John Anderson COMPUTE!'s GAZETTE - SOLO FLIGHT
"... The word that best describes Solo Flight is Fun... it's (for those who) don't wish to spend a lot of time reading, but would rather be flying."

David Florance

Solo Flight is available for Commodore 64/128, Apple II Family, IBM PC/Jr., and Atari XL/XE and Macintosh computers. Suggested retail is only $\$ 34.95$. For Macintosh only - $\$ 39.95$. Call or write for more information or MC/VISA orders.

The Thrilling Submarine Simulation

Challenging and Exciting Air Combat from the Modern Electronic Cockpit!

You are in Command -D-Day to the Battle of the Bulge!

# MacOffice: Using the Macintosh for Everything 

Sharon Aker Paul Freiberger Arlan Levitan Selby Bateman Vahé Guzelimian Dan McNeill Charles Brannon
This newest release from COMPUTE! Books shows you how to get the most out of your Macintosh and software. Practical demonstrations teach you how to fully utilize several commercially available programs, such as Microsoft's Word, Chart, File, and Multiplan, Apple's MacTerminal, and others. You'll see how to:

- Create form letters with Word,
- Use Multiplan for your accounting,
- Share information between offices with MacTerminal.

Here are the ins and outs, hints and tips on how to use each program most efficiently, and previously undocumented techniques.

Extensively illustrated with actual Macintosh-created documents and graphics, MacOffice shows you how you can integrate programs, let them share information, making it even easier to manage your business with a computer. You'll also learn about networks-where computers, printers, and other devices are connected to create an office-wide working environment-with details on how to create a network, and what to look for in network software.

# personal computer 

Inside information, practical opplcartons, and hints and tips on the Mocintosh show you how to use
Microsott" Whord. Flie. Chart, Multlplane. and MocTerminal'to tur your office into a more efficient workplace.
Edted by Grego Kezar
A Computel sooks Publcation $\$ 18.9$
\$18.95 ISBN 0-87455-006-8

## Look for these new titles at your local book or computer stores or order directly from COMPUTE! Books.

COMPUTE! Books are available in the U.K., Europe, the Middle East, and Africa from Holt Saunders, Ltd., 1 St. Anne's Road, Eastbourne, East Sussex BN 21 UUN England.

## COMPUTE!'s Second Book of Apple

Edited
With over 30 programs, this collection for Apple II + , Ile, and IIc owners contains arcade-style games, games of logic and education, applications, graphics generators, and programming utilities. Compiled from the most recent issues of COMPUTE! magazine and COMPUTE's Apple Applications Issue, these programs include dazzling graphics, high-speed game play, and valuable programming techniques. All the programs are ready to type in.

Applications calculate your financial situation and turn your computer into a remote terminal for accessing sophisticated databases. Action games put you in a jet fighter and in a bowling alley. Educational games range from a five-level chess game to a program which lets you write quizzes on any subject. Graphics and programming utilities help you design custom graphics or put a RAM disk in your Ilc.

## \$12.95 ISBN 0-87455-008-4

There is also a disk available which includes the programs in the book. You can order this disk directly from COMPUTE! for only $\$ 12.95$ plus $\$ 2.00$ shipping charges.

To order, call toll-free 800-334-0868 (in NC 919-275-9809) or mail your payment (including $\$ 2.00$ shipping charges) to COMPUTE! Books, P.O. Box 5058, Greensboro, NC 27403.

# A SPECIAL OFFER from COMPUTE! Books 

## for Owners and Users of Commodore Computers

Buy any 2 of these books and receive a $15 \%$ Discount. You pay $\$ 22.00$ and save $\$ 3.90$ !
Buy all 3 books and get a $\mathbf{2 5 \%}$ Discount. You pay only $\$ 29.00$, a savings of $\$ 9.85$ !

An excellent resource for users of the 64, with something for everyone: BASIC programming techniques, a memory map. a machine language monitor, and information about writing games and using peripherals. This 264-page, spiral-bound book includes many ready-to-type-in programs and games. $\$ 12.95$

Continues in the tradition of the First Book of Commodore 64 in presenting some of the best programs and articles from COMPUTE! Publications, many revised or never before published. There's something for almost any Commodore 64 user in this 289-page book: arcade and text adventure games in BASIC and machine language, a commercial software-quality word processor, a program which adds 41 new commands to BASIC, an electronic spreadsheet, tutorials about programming sound and graphics, and utilities for saving, copying, and retrieving files. \$12.95

## Buy Now—This Offer Expires December 15, 1985.

A collection of outstanding games, applications, tutorials, and utilities from the most recent issues of COMPUTE! magazine and COMPUTE!'s Gazette, including several programs never before published. Commodore 64 users of all ages and experience will find this book informative, entertaining, and educational. Create an 80 -column display, play educational and arcade-quality games, compose music, move sprites easily and quickly. and see how to program more efficiently and effectively. \$12.95

"If you know BASIC and want to learn machine language, this is the place to start . . . . Building on your experience as a BASIC programmer, Mansfield very gently takes you through the fundamentals of machine language."
-Whole Earth Software Catalog

## COMPUTEI Books'

## Best-selling Machine Language Books

## "Understandable"-The New York Times

"Presents the machine language novice with a very good tutorial in simple, understandable terms."
-Antic
"I highly recommend Machine Language for Beginners as your first introduction to the world of machine language."
-Commodore Power/Play

## The LADS Disk

LADS, the assembler used in The Second Book of Machine Language, is available on disk for only $\$ 12.95$. This is a great accompaniment to the book, saving you hours of typing time by providing the complete source and object programs for all versions of the assembler, and more. And LADS disks are specific to your Apple, Atari, or Commodore computers.

## Machine Language for Beginners

Richard Mansfield
Most commercial software is written in machine language because it's far faster and more versatile than BASIC. Machine Language for Beginners is a step-by-step introduction. Includes a simple assembler, a disassembler, and utilities, to help beginners write programs more quickly and easily. \$14.95
ISBN 0-942386-11-6

Machine Language for Beginners and The Second Book of Machine Language everything you need to learn machine language programming
on your Apple, Atari, and Commodore personal computers.

The Second Book of
Machine Language
Richard Mansfield
The follow-up to the best-selling Machine Language for Beginners, this book leads the programmer deeper into the most powerful and efficient programming techniques available for personal computers. Fully tutorial, with easy step-by-step explanations, the book shows how to construct significant, effective machine language programs. Included is a highspeed, professional-quality, la-bel-based assembler. Everything that's needed for optimized programming on the Commodore 64, Apple, Atari, VIC-20, and PET/CBM computers. \$14.95

## THE ULTIMATE DISK UTILITIES FOR YOUR 64

## MORE

 FANTASTICThis fall COMPUTE! Books brings you the best in games, utilities, graphics, music generators, applications, and programming tutorials for your Commodore, Atari, Apple, and IBM PC personal computers.

# FALL titles <br> <br> from COMPUTE! BOOKS 

 <br> <br> from COMPUTE! BOOKS}

COMPUTE!'s Atari Collection, Vol. 2 Edited
More than 30 never before published programs and articles make COMPUTE!'s Atari Collection, Vol. 2 an outstanding value and an excellent addition to any software library. Packed full of games like "Speedway," "Electronic Football," "Termite," and "Granite Cracker," applications such as "Personal Net Worth Statements," and numerous tutorials and utilities, this book brings you the variety and value you've come to expect from COMPUTE! Publications. A disk is also available for $\$ 12.95$ which includes programs in the book.

## Advanced Macintosh BASIC Programming Philip Calippe

The Macintosh is an exciting machine-and Microsoft BASIC 2.0 lets you put it to work for you. This tutorial and reference guide to Microsoft BASIC 2.0 shows you how to use the computer's advanced features to create impressive programs of your own. You'll quickly learn how to access everything from keyboard input and graphics to the Macintosh's sophisticated ROM routines. Sample programs are built one piece at a time, and individual subroutines will easily find their way into your own programs. Macintosh-specific features, like creating pull-down menus, windows, and dialog boxes, are explained. You'll build a set of software tools, which will aid in developing such working applications, as a mailing list and business graphics. You'll even write an arcadestyle game on the Macintosh. Everything you need to become a proficient Macintosh programmer is here, ready for you to explore.

William B. Sanders
This friendly, easy-to-use guide to the Atari
ST will step you through the process of connecting your computer, loading programs, creating graphics and music, and writing your own programs. Written by the author of the bestselling The Elementary Commodore 64, The Elementary Atari ST contains lots of helpful information for both the novice computer user and the seasoned programmer.

This unique program, written by a planetarium director, presents the sky as it can be viewed at any date and time from the year 1977 onwardincluding zodiac constellations and all the visible planets. It also calculates planet tables, positions of the sun, and phases of the moon for any date and time from 1977 into the future. As an extra (and timely) bonus, it can even display Halley's Comet, due to become visible in late 1985 and early 1986. "Skyscape" is both educational and entertaining. The original version is for the Commodore 64, and we've written additional versions for Apple II-series computers with DOS 3.3 or ProDOS; the TI-99/4A with Extended BASIC; the IBM PC with color/graphics adapter; the PCjr with Cartridge BASIC; and Atari 400/800, XL, and XE computers with at least 24 K RAM for tape or 32 K for disk.

For thousands of years the sun, moon, and planets in our solar system have excited human imagination. In ancient times they were regarded as gods whose distant motions influenced the course of earthly events. Though we now understand more about the true nature of celestial objects, many facts remain unknown, and a brilliant nighttime sky still presents an inspiring spectacle.

Whether you're seriously interested in the sky or just casually curious, "Skyscape" is a convenient tool for extending your knowledge. It opens a movable window on the heavens, displaying the position of our sun, moon, and neighboring planets from almost any location on Earth, at any point in time from 1977 into the distant future. Since it performs all the necessary calculations, you can enjoy and learn from this program even if you're not an expert in astronomy. In addition to providing data about the position of celestial objects, it draws a sky map on the screen, showing each object as it would appear to you at the chosen location and time.

To get started, type in the appropriate version of Skyscape for your computer and save a copy before running it.
Past, Present, Or Future
Skyscape begins by asking you to answer several questions. Enter the year, choosing any year from 1977 forward. In some ways this is the most important input of all, since objects in our solar system move significantly from one year to the next. After you choose the year, Skyscape allows you to enter the month and day.

Next you must enter the latitude (north/south position on Earth) from which you wish to view
the sky. Latitude 0 places you, the observer, at the equator. Latitudes $1-90$ place you in the northern hemisphere (north of the equator). To choose a southern latitude (south of the equator), enter a negative number from -1 to -90 . Skyscape generally represents southerly locations with negative values.

Whenever Skyscape asks for information, it checks your entry to make sure it's in the acceptable range. If you enter an illegal value, the program displays an error message and gives you another chance.
The Sun And Moon
Though very different in size and composition, the sun and moon are alike in being the largest celestial objects visible from Earth. After you enter the date and latitude, Skyscape displays a table of data for the sun and moon. In addition to the date, day of the year, and latitude north or south, you'll see the following information:

- Sun's geocentric angle. This figure represents the sun's position as a number of degrees relative to the vernal equinox. The vernal equinox is where the sun is located when spring begins in the northern hemisphere (the same time that autumn begins in the southern hemisphere). Easy Company of the First Infantry Division - into eight historical battles.

Dividing your company into fireteam units of six men, you'll engage in such exciting combat as a night raid in North Africa, the storming of Omaha Beach on D-Day, or a defensive delaying action in the Battle of the Bulge - all against German forces controlled by your cunning computer.

Special attention has been paid to the Hi-Res graphics and lively sound effects. Realistic rules cover every aspect of the fighting: Line-of-sight, hidden movement, weapons ratings. Bven your soldiers' abilities will improve through time.

To experience the heart-pounding thrill of commanding these heroic men, run to your nearest game or computer/software store today!

If there are no convenient stores near you, VISA and $\mathrm{M} / \mathrm{C}$ holders can order this $\$ 39.95$ game direct by calling 800-227-1617, ext. 335 (toll free). In California, call 800-772-3545, ext. 335. Please specify computer format and add $\$ 2.00$ for shipping and handling.

To order by mail, send your check to: STRATEGIC SIMULATIONS, INC., 883 Stierlin Road, Bldg. A-200, Mountain View, CA 94043. (California residents, add 7\% sales tax.) All our games carry a "14-day satisfaction or your money back" guarantee.

## THE \#1 BACKUP COPY SYSTEM IS NOW BETTER THAN EVER!

- The LATEST breakthrough in copy technology!
- Copies NEW custom G.C.R. code protection
- Accesses \& copies NEW no-sync data blocks!
- Now includes NEW long data-block logic
- Copies normal \& PROTECTED data up to track 40
- 3 New IMPROVED copiers! Includes FAST Copier, VARI-SECTOR Copier, and AUTO-LOGIC NIbbler
- Actually copies a FULL disk in only 2.75 minutes!
- Includes one FREE Masterkey Module!
- Inexpensive MODULE releases keep you up-to-date
- MODULES available individually or by subscription
- Works with DiskMaker TOOLKIT and FAT-TRACK Kit
- Requires standard 1541 disk drive or SX-64
- Special version available for INDUS GT drive!
- PRODUCT SUPPORT tel. \# \& future module updates
- You've tried the rest, now get the BESTI!

THE FASTEST NIBBLE COPIER YOU CAN BUY!
ONLY
$\$ 49.95$
for copier system

Technical line 805-682-4000 ext. 55

[^6]- Sun's declination. The number of degrees north or south of the equator. Negative values indicate a southerly location.
- Sun's altitude at noon. The location of the sun in degrees from the northern or southern horizon at noon.
- Sun's right ascension. Just as longitude and latitude indicate locations on the Earth, right ascension and declination are used to pinpoint locations in the sky. For this purpose the sky is visualized as a gigantic sphere surrounding the Earth. Declination locates a point vertically in the celestial sphere and right ascension locates it horizontally. Right ascension values are given in hours and minutes in the range 0:00-23:59. Right ascension 0:00 is exactly at the vernal equinox. Larger right ascension values lie to the east of smaller ones.
- Right ascension at 9 p.m. The right ascension which would be on the meridian at 9 p.m. This coordinate system would be found on star charts. By comparing this number with those charts, you can tell what stars and constellations would be visible at that time.
- Moon's age. The number of days since the last new moon.
- Moon's elongation. The location of the moon in degrees east or west of the sun.
- Moon's phase. The phase of the moon on this particular day.

## The Planet Table

After viewing the sun and moon display, press $P$ to continue to the next display screen, which contains the planet table. (Press D if you wish to enter a new date.) The planet table shows vital information about the visible planets (through Uranus, which is at the limit of our visibility). The table shows the position of each planet in right ascension and degrees east or west of the sun. It also shows the distance of each planet from Earth in millions of miles.

If you'd rather see the distance in kilometers, modify the program to change the value of $\mathrm{ES}=93$ to $E S=149.6$ (the program line which defines the value of ES varies with the version of Skyscape: Commodore 64-line 220; Atari-line 190; IBM-line 130; Apple-line 80;

TI-line 150).
Some planets have an asterisk to the left of the right ascension figure. This signifies that they are visible at 9 o'clock this evening. For reference, the planet table also includes the sun's present right ascension and its right ascension at 9 p.m. Press D to input a new date or S to view a graphics display of the sky at any time in the current day.

## The Visible Skyscape

After selecting the sky display, you must enter the hour when you wish to view the sky. The hour value should be a whole number from 0-23 (enter 22 for 10 p.m., etc.). You'll also need to enter the minutes ( $0-59$ ). Skyscape then displays the time and offers you a chance to enter different values. Press RETURN or Enter when you're satisfied with the time.

Skyscape now displays the sky as it would appear at the chosen latitude, date, and time. Since the sky looks very different from different places on Earth, the latitude affects the display considerably. If your latitude is in the range 24-90 degrees north or south, the sky shows a dashed line representing the position of the celestial equator, along with symbols representing the sun, moon, and planets visible at that time. If your latitude is in the tropical region-from $23^{1 / 2}$ degrees north to $231 / 2$ degrees south-the dashed line indicates a position directly overhead.

If you're viewing in the northern hemisphere, north is above the dashed line and south is below it. In the southern hemisphere these directions are reversed. Below the sky display is a key that interprets the symbols used to represent celestial objects. If more than one object is positioned at the same spot, the symbols are displayed above each other.

At the bottom of the sky you may see two-letter abbreviations. These represent zodiac constellations that would be visible from your chosen vantage point. Skyscape uses the abbreviations AR (Aries), PI (Pisces), AQ (Aquarius), CP (Capricorn), SA (Sagittarius), SC (Scorpio), LI (Libra), VI (Virgo), LE (Leo), CA (Cancer), GE (Gemini) and TA (Taurus). Each constellation is located above the spot where its
abbreviation appears. In northern latitudes, the border of each constellation's zone begins at its abbreviation and extends left. In southern latitudes, the constellation extends right from the position of its abbreviation.

Daytime skies are shown in blue and nighttime skies in black. Skyscape does not calculate the actual rising or setting time of the sun. Average rising and setting times of 6 a.m. and 6 p.m. are used in every case. You may obtain exact rising and setting times from local newspapers. However, keep in mind that there is usually about an hour of twilight before sunrise and after sunset.

## Halley's Comet

In addition to permanent objects, Skyscape's graphics display includes Halley's Comet, which should be visible during late 1985 and early 1986. If you choose a date from November 1, 1985 to May 29, 1986, Skyscape calculates the position of Halley's Comet and includes it in the graphics display (if it would be visible at the place and time you select). The comet's position is based on the best predictions available at the time of this writing (summer 1985). These positions may differ slightly from the comet's actual position when it finally makes its appearance.

While Skyscape is generally accurate, it bases most position calculations on circular orbits. This introduces a certain element of error, since no object in our solar system has a perfectly circular orbit. The position error is most pronounced for Mercury and Mars (whose orbits are quite elliptical), but does not significantly affect other objects. I've found Skyscape accurate enough for my own purposes, which include planning astronomy classes and planetarium displays.

For instructions on entering these listings, please refer to "COMPUTEI's Guide to Typing In Programs" published bimonthly in COMPUTEI.

## It's easy to make copy. It's quick. It's illegal. It's wrong. <br> It's hard to believe.

People who wouldn't think of shoplifting a software product on their lunch hour don't think twice about going back to the office and making several illegal copies of the same software.

Making unauthorized copies of software is a violation of U.S Copyright Law. Yet, the problem has reached epidemic proportions because many people are unaware, or simply choose to ignore the law. The software industry is urging decision-makers and software users to take steps to stop software piracy in their organizations. In the meantime, the industry has been forced to prosecute willful copyright violators.

There are legal, moral and economic imperatives forbidding theft of copyrighted software.

There is a free pamphlet on the subject. Call or write for a copy. A copy. A copy. A copy for everyone you know. Please ask for Priscilla.

# Crossword Magic 

Karen McCullough

Requirements: Apple II-series computer with at least 48 K RAM (or Apple III in emulation mode); Apple Macintosh; Commodore 64/128; IBM PC/PCjr with at least 128K RAM; or an Atari 400/800, XL, or XE (memory requirements not available at presstime). All versions require a disk drive, and a printer is recommended. The Apple II version was reviewed; other versions are similar.

Crossword Magic does for the process of creating crossword puzzles what a word processor does for writing. It can't replace the thinking, planning, and research needed to create a satisfying puzzle, but it does simplify the process of organizing and moving the material from brain to paper. Crossword Magic lets you create a puzzle on the screen, edit it in various ways, play it, and print it out. The program's authors have provided ways to do everything you can think of with a crossword puzzle.

The program comes on a two-sided disk. One side is called the Maker Disk, and the other the Player Disk. The Maker disk contains the options for creating, editing, printing, deleting, and moving puzzles. The Player disk lets you play a previously created puzzle, or create a new storage disk.

When you start to create a new puzzle, the program first asks if you want automatic sizing. If you answer no, you must enter the size of the grid you desire. However, automatic sizing provides more flexibility, since it allows the grid to grow from its initial size as needed.

Each word you enter is placed in a suitable position on the display grid, highlighted so you always know which word was placed last. Words that don't fit into the grid are added to a list of unused words. If adding a word later allows any unused word to fit into the puzzle, that word is placed on the display and highlighted along with the word just entered. If you don't like where the program placed your word,
you can press a key to make the program search for another suitable place, or press another key to remove it.

## Menus And Help Screens

A group of special functions also are available at the touch of a key. You can save a partial or complete puzzle; gain access to a help screen that explains your options; return to the main menu (you lose whatever work you've just done on the screen if you don't save it first, however); look at the list of unused words; start entering clues; or go into manual mode. Manual mode lets you add, remove, or change letters in the puzzle.

Crossword Magic comes with a 23page manual, well-written but not as well organized. Each menu function has its own section in the manual, with clear, comprehensive explanations and directions-until you get to the explanation of the special functions. At that point, each section merely gives you a list of the functions and refers you to a separate section of the manual that explains them in greater detail. The manual would be easier to use if the special functions were explained at the end of each section, even at the expense of some duplication. Also, the special function section begins in the middle of a page, making it difficult to find without referring to the index.

Aside from this, Crossword Magic deserves top marks for ease of use, smooth functioning, and good errorhandling. It works quickly, finding places for words in seconds, even on large grids. Everything works exactly as described, and the program never failed; it resolutely ignores inappropriate actions. After only a few minutes with the manual, I pulled out a review list of basic Spanish vocabulary words and created a puzzle. However, it's a good idea to read the list of helpful hints in the back of the manual before creating a puzzle; there's a lot of valuable information there.

Crossword Magic is ideal for schools. It's an excellent tool for testing and reinforcing vocabulary in subjects such as English, foreign languages, and science. And anyone who enjoys working with crossword puzzles will find the program a pleasant pastime.

## Colorasaurus

## Steve Hudson

Requirements: Commodore 64 with a disk drive and a joystick; or an Atari 400/800, XL, or XE computer with at least 48 K RAM, a disk drive, and a joystick. The Atari version was reviewed.

If you ask a child what makes a good computer game, the answer will probably be that it has to be fun. Ask a parent the same question, and you'll hear words like "enriching" and "educational." But why not get both by creating a game that's captivating enough to hold a child's attention, but stimulating enough to help develop a young mind?

One such game is Colorasaurus, an educational program aimed at the three- to six-year-old set. Its goals are straightforward-to help young children develop color discrimination and visual memory skills-and it achieves them with style.

The program actually offers three games in one, and each features lively graphics and ear-catching sound. The first game, "Match," allows the child to match a brightly colored dinosaur (the so-called colorasaurs) with one of three appropriately colored landscapes. Each round presents three new colorasaurs,

## The Source Is Illuminating.

At last, a beacon to help you navigate the vast sea of personal computer technology.

It's The Source. The online information service that can guide you to the best deals in the PC market. Shed light on your software problems. And signal the latest developments in micros.

With The Source, you can buy, sell or swap hardware and software. Learn new applications from a Special Interest Group. See what's been written about the printer you're planning to buy. Or send out an SOS to thousands of other PC users when you need advice.

What's more, The Source can enlighten you with current information on everything from business to travel, investments to world news.

The Source is a service mark of Source Telecomputing Corporation, a subsidiary of The Reader's Digest Association, Inc. 01985 Source Telecomputing Corporation.

Whatever kind of help you're after, you can find it faster on The Source. With a system of easy commands and menus. Plus a tutorial-free of online charges-that'll bring you up to speed in a snap.

To sign up today, call 1-800-336-3366. For more information, mail this coupon, or visit your nearest dealer.

Then, no matter how many waves of new technology rock your boat, you'll stay right on course.

The most powerful resource any personal computer can have.

# 240K Apple Compatible - Computer System 

Complete System
and (as the child's responses improve) the three colors become increasingly similar.

The second game, "Find," carries the idea one step further. Like "Match," it asks the child to match colors. However, there are six landscapes instead of three. In addition, it encourages the child to relocate the colorasaurs by recalling which colors were involved. Again, the difficulty increases with the accuracy of the child's responses.

## Painting Dinosaurs

The third game, "Colorasaurus," gives the child a chance to personally color a colorasaurus. The child can dip paint from various "paint pots" and then
apply it to a large (and by then familiar) colorasaurus that dominates the screen. It's even possible to mix colors or to lighten or darken them (by adding white or black). That gives the child virtually complete control over the resulting colors. The result? Captivated fascination, a great deal of fun, and some worthwhile learning, too.

Each game is controlled with the joystick. Even a young child can move the large, easy-to-see cursor and effectively play any of the games.

The program also uses the keyboard for two special commands. The question mark (?) is a help key that calls up onscreen instructions. Another key returns the player to the main menu. Using either key, it's possible for the child to select various play options-a
valuable feature that some educational programs still lack.

Although it's designed for a particular age range, Colorasaurus may prove captivating to younger children, too. Although my 17 -month-old is too young to manipulate the joystick herself, she loves to sit in my lap and watch the colorasaurs while listening to the dinosaurish music. It's entertaining for older children, too, including us Daddytypes. There's just something about multicolored dinosaurs that appeals to young and old alike.

Colorasaurus
The Learning Company

Making you the best.

## Grolier Online Encyclopedia

## Dan Gutman

Requirements：Virtually any computer with a modem，telecommunications soft－ ware，and access to one of 11 major tele－ communications services（including CompuServe，The Source，Dow Jones， Dialog，and others）．

I just looked up LINCOLN，ABRAHAM in the encyclopedia．There＇s nothing particularly amazing about that，except that I don＇t own an encyclopedia．With an＂electronic encyclopedia＂on a mainframe computer that I can tap into anytime I want with my personal com－ puter，I don＇t need one．

The Academic American Encyclope－ dia from Grolier can be accessed easily on any of 11 different online services by anyone with a modem and a computer． After you log on and hit a few keys， you＇re dropped into an encyclopedic wonderland of 30,000 articles and 10 million words．Just type SE（for SEarch） and the item you want to look up．The text jumps on the screen in seconds．

An electronic encyclopedia has a few big advantages over a paper one．I can＇t look up JACKSON，MICHAEL in my parents＇old encyclopedia，because he wasn＇t even born when it was writ－ ten．Grolier＇s encyclopedia gets updat－ ed every three months．In fact，a week after Leonid Brezhnev died，they had a listing for ANDROPOV，YURI．Also， with the Grolier encyclopedia，I can print out entire articles in seconds on my printer．

On the other hand，while Andropov is covered，there are no listings for LASERDISK，OPTICAL MEMORY， COMPACT DISC，or INTERACTIVE FICTION－terms you＇d expect to find in an up－to－date electronic reference source for the 1980s．Michael Jackson gets a paragraph，but you＇ll find noth－ ing more about recent idols－Prince and Madonna．And the encyclopedia refers to the canceled IBM PCjr as ＂among the nation＇s best－selling com－ puters．＂Of course，any encyclopedia has its limitations．

## No Pictures－Yet

There are a few other disadvantages to the Grolier online encyclopedia that are related to its medium．The retrieval commands are picky，so if you misspell a subject you＇re looking up，the com－ puter may mistakenly tell you there is no listing．For example，if you look up NEWSPAPERS，you＇ll find nothing． But there is a listing for NEWSPAPER． With a printed encyclopedia，you
would discover that by flipping through the pages．Also，because of the wide variety of incompatible computers and the limitations of modem commu－ nications，the online encyclopedia can＇t give you the photographs or illustra－ tions you see in a printed encyclopedia．

Someday this may change．Grolier recently announced it is publishing the encyclopedia in the new CD－ROM for－ mat（Compact Disc－Read Only Memo－ ry）．The CD－ROM version，scheduled for release this fall for $\$ 199$ ，is quite similar to the online version，except it＇s stored on a single 4.7 －inch compact disc．It requires a special CD－ROM player connected to your computer， such as the one announced last summer by Atari（see＂Report from the Summer Consumer Electronics Show＂and ＂Monster Memory，＂COMPUTE！，August 1985）．The CD－ROM encyclopedia has all the search and retrieval features of the online encyclopedia and more－ plus it＇s faster．And although the initial CD－ROM version is text－only，there is plenty of room on the disc to add graphics and digitized illustrations in the future．

Still，even with its current limita－ tions，the Grolier online encyclopedia is worthy of consideration．A convention－ al encyclopedia might cost $\$ 600$ or more．On the CompuServe Information Service，Grolier＇s costs $\$ 50$ per year plus the regular connect time rates．De－ pending on how often you access the encyclopedia and how long you stay online，it might take several years before you＇ve spent as much as the conventional encyclopedia would cost． By that time，much of the information in the paper encyclopedia would be out of date and you＇d have to buy another one anyway．

If you have school－age children，or if you do a lot of research at home， consider Grolier＇s online encyclopedia． The convenience of looking things up in seconds is incredible．This is one of the true practical uses for a computer in the home．Besides，think of all the trees you＇ll save．

# BASIC Lightning \& White Lightning For Commodore 64 

Roark Dority

Requirements: Commodore 64 and a 1541 disk drive or a tape drive.

You've probably heard of several different software packages which enhance or extend your Commodore 64's BASIC language. BASIC Lightning, a graphics development system for the 64, is one of the most exciting such programs I've seen.

BASIC Lightning is much more than a BASIC extension. It's practically a whole new language. Besides all the usual Commodore BASIC commands, BASIC Lightning offers more than 150 new commands. They make structured programming possible, let you run up to five parts of a BASIC program simultaneously, and may change your attitude toward using graphics and sound on the 64 .

If you've ever programmed in Pascal or a similar language, you'll be happy to know that BASIC Lightning includes all the control commands found in Pascal. Control structures include IF-THEN-ELSE, REPEAT -UNTIL, WHILE-WEND, CASE-OF, and procedures and functions with full parameter-passing.

The graphics commands in BASIC Lightning are in a class all their own. You can create up to 255 sprites of any size, and these sprites can be scrolled, spun, rotated 90 degrees, enlarged, contracted, and mirrored vertically and horizontally. You can individually design each sprite, place them anywhere on the screen, move part of one sprite into another, copy part of the screen into a sprite, or copy an entire sprite into another.

There are also commands for combining two sprites at once in four different ways, and commands to control the sprite colors when two sprites are combined. Another useful feature is the ability to print characters and doublesized characters inside the sprites.

However, I did find it difficult to design sprites with the sprite editor. You can edit only one $8 \times 8$ grid at a time, and the editor reacts slowly to commands. To design sprites larger than $8 \times 8$ pixels, the grid must be copied to a larger area on the screen. After several grids have been placed
side by side, your sprite begins to take form. Then it's possible to edit more sprites, and even show them in sequence to simulate animation.

## Multitasking In BASIC

What BASIC Lightning does for graphics, it does for sound as well. For example, music data can be stored in sprites and played in the background with the commands PLAY and RPLAY. This means your music can be playing while the rest of your program is doing other things.

One of the most exciting features of BASIC Lightning is its multitasking capability. The TASK command allows up to five things in your program to happen at once. Each task has its own set of variables which are independent of the others. Special commands let you pass values between tasks.

Another product from Oasis Software is White Lightning, a Forth-based language. If you have some background in Forth, or are willing to learn a new language, White Lightning is certainly a worthwhile package. (Incidentally, White Lightning includes BASIC Lightning, with all the commands mentioned above.)

BASIC Lightning and White Lightning both include a disk and two tapes, so tape users as well as disk users can program with the packages. BASIC Lightning is especially ideal for anyone who writes programs in BASIC and is interested in structured programming, sprite graphics, and sound. It's easy to use, too. In minutes it's possible to know enough to handle the screen windows, and everything appears and changes faster than in Commodore BASIC with the POKE commands. White Lightning takes longer to learn because it's an entirely different language.

If you're interested in machine language programming, Oasis Software also makes Machine Lightning, an advanced machine language system.

# Only NRI teaches you to service and repair all computers as you build your own 16-bit IBM-compatible micro 

As computers move into offices and homes by the millions, the demand for trained computer service technicians surges forward. The Department of Labor estimates that computer service jobs will actually double in the next ten years-a faster growth than any other occupation.

## Total System Training

As an NRI student, you'll get total hands-on training as you actually build your own Sanyo MBC-550 series computer from the keyboard up. Only a person who knows all the underlying fundamentals can cope with all the significant brands of computers. And as an NRI graduate, you'll possess the up-to-the-minute combination of theory and practical experience that will lead you to success on the job.

You learn at your own convenience, in your own home, at your own comfortable pace. Without classroom pressures, without rigid night-school schedules, without wasted time. Your own personal NRI instructor and NRI's complete technical staff will answer your questions, give you guidance and special help whenever you may need it.

## The Exciting Sanyo 16-bit IBM-compatible

## Computer-Yours To Keep

## NRI is the only

 home study school that trains you as you assemble a top-brand microcomputer. You'll install and check keyboard, power supply, disk drive and monitor, following step-bystep directions.

# Gato For Apple And IBM 

Michael B. Williams

Requirements: Apple IIe or IIc with a disk drive; Apple Macintosh; IBM PC with at least 128 K RAM and color/graphics adapter; or an Enhanced Model PCjr. The Apple II version was reviewed; other versions are similar.

Just as flight simulators take the danger out of flying while retaining much of the excitement, Gato lets you fight for your country in a submarine from the safety of your desktop. You patrol the South Pacific in your Gato-class submarine, a type of ship actually deployed during World War II.

Your mission begins with a coded message detailing your assignment in enemy territory. At Gato's higher difficulty levels (there are ten), the message is transmitted in Morse code; it's up to you to decipher it. (A Morse code table is included in the manual, but you won't have time to use it without memorizing it first.) You may be ordered to intercept an enemy fleet, cut off enemy supply lines, or rescue allies from enemy territory.

Your patrol area covers 20 allied, enemy, and neutral quadrants of the South Pacific. The patrol chart display offers a view of this entire area, including your sub, the allied subtender, enemy ships, and the area's dozen islands, although not all this information is available on the upper difficulty levels. You can view your position within a quadrant with the quadrant chart, which also shows in greater detail the islands and their surrounding shoals and reefs.

Other displays are the radar screen, the damage report screen, the captain's log (which holds data for eight players), and the main control screen. The damage screen shows a port-side view of your sub, highlighting the damage in any of eight major areas. The main screen demands most of your attention-it contains depth, speed, and heading gauges as well as a fullcolor view of objects in your area. The Apple version of Gato displays these graphics in the extended high-resolution mode; the graphics are adequate, but could be improved.

A nice touch in Gato is the fake spreadsheet screen: You can flip to this display to make it look as if you're working whenever the boss strolls by.

## Coming Up For Air

Gato promises realism, and it delivers. While the lower difficulty levels are excellent for learning to control the submarine, the upper levels offer extreme challenge and give you no unfair advantages over the enemy as the lower levels do. Attention to detail is very good. You run aground if you get too near an island, and the sub's speed is affected by the ship's depth, the periscope position, and whether the torpedo tube doors are open or closed. Because oxygen is constantly consumed below depths of 20 feet, you must surface occasionally to prevent your crew from suffocating. In addition, depth and speed play a role in how soon you are detected by enemy ships during sneak attacks.

The extensive list of factors the program must calculate and recalculate inevitably slows down the game. The
screen updates only about once per second, and takes even longer when ships or islands are nearby.

If one of your torpedos finds its target, you can see the explosions on the display if you're surfaced. The explosion graphics are fair, although the sound effects could use some improvement. Each time you sink a ship, the program updates your captain's log to credit your achievement. The log is reset every time you are sunk-it goes down with the ship.

Gato also includes screens with historic and technical information, plus a demonstration mode (the demo mode explains the submarine but does not show actual game play). The manual moves quickly in an effort to be thorough, including a discussion of strategy and tactics against the five different types of enemy ships. It offers help on attack patterns, defense tactics, avoiding depth charges, and using the radar and periscope.

Gato requires a serious approach if you want to play it well. For those willing to commit themselves to service in the Pacific Fleet, Gato lives up to its claims. Just don't expect to sink the entire Japanese fleet on your first (or even fifth) mission.

## Atari PaperClip

Robert L. Riggs

Requirements: Atari $400 / 800$, XL, or XE with at least 48 K RAM, a disk drive, and a printer.

Word processors for Atari computers are reaching an amazing level of sophistication. In many ways, the Atari version of PaperClip from Batteries Included is the most sophisticated to date.

Besides all the usual features we've come to expect, PaperClip offers a number of capabilities not found in most other Atari word processors. These range from major features such as multiple windows to lesser ones such as character- and word-swap commands. The windows are particularly useful: You can load and edit two different documents simultaneously, and cut and paste text between them.

Typical of the program's flexibility is a configuration menu that lets you customize your own version of PaperClip. For instance, you can change the screen background and character colors; choose the screen line lengthfrom 15 to 132 characters-and then determine whether the entire screen window will scroll or just the line being typed; change the left screen margin to correct for TV sets which overscan; elect to use the cursor keys without pressing CTRL; and switch the XL/XE key click and alarm bell on or off. You can even tell PaperClip to automatically save the text file you're working on after a predetermined number of keystrokes.

Once you've customized PaperClip, you can save it on disk for future use. The program disk isn't copyprotected, so you can make as many backups as you need. You can, for example, create several PaperClip disks with different configurations and preferences. To prevent this feature from
being abused by software pirates, PaperClip comes with a key that must be plugged into a joystick port to make it work.

The configuration menu offers other choices, too, such as a mini-DOS and options to create, save, and load macro files. A macro is a block of previously defined text-such as a letterhead-that can be placed on the screen with a single keystroke. You can define several macro files, each containing blocks of frequently used text.

PaperClip does not come with a quick reference card for its many commands, but pressing CTRL-SHIFT-? calls up either a disk menu or the online help files (assuming the disk containing these files is inserted in the default drive). The help files contain a list of all PaperClip commands necessary for file manipulation, printer control, and screen editing.

## Math And Graphics

PaperClip can manipulate numbers and pictures as well as letters. Its built-in calculator can add, subtract, multiply, and divide, printing the answer at the appropriate place in the document. And a screen dump utility on the program disk prints out images created with any of the well-known graphics programs, including the KoalaPad and Atari Touch Tablet or Light Pen. If you want, these pictures can be embedded in your documents, and the program disk contains $B / G r a p h$ and KoalaPad files for practice.

Other useful utilities are included on the disk, too. One program converts AtariWriter word processor files to PaperClip format. PaperClip-like AtariWriter and most other Atari word processorssaves text in standard ASCII format, but there are differences between formatting codes and so forth. The conversion utility automatically replaces the AtariWriter codes with appropriate PaperClip codes.

There's also a mail-merge feature, a typewriter mode which is ideal for addressing envelopes, a word counter, and the ability to search and replace up to six pairs of text strings in a single pass.

One extra feature of PaperClip which I especially enjoyed was the rapid cursor movement. The cursor begins repeating sooner when you hold down a cursor key, and it zips across the screen considerably faster than your average Atari cursor.

## Versatile Printing

PaperClip is flexible enough to work with virtually any printer. The program disk contains printer drivers for more than 30 of the most popular models. If necessary, you can create your own printer driver by using a program which lets you modify an existing driver or build one from scratch. Therefore,

PaperClip should be compatible with any future printers.

During my testing, I found that PaperClip did not fully support the proportionally spaced font of the Atari 825 printer. PaperClip would print the proportional font, but without proportional spacing. However, I was using the early version 1.0 of the program; Batteries Included says the newer version 1.1 does add microspacing for proportional printing, though it still cannot handle true proportional spacing with this printer.

PaperClip has several printing features that will be appreciated for specialized applications-such as a table of contents creator, an option to print any range of pages in a document, the ability to print multiple copies, and a batchfile capability for printing several documents in sequence. It's also the only Atari word processor I've seen that can print in double-column format without forcing you to roll the paper back into the printer-great for newsletters.

## Future Features

Because PaperClip has such a large number of commands and capabilities, it takes a while to master. The manual is lengthy, and the original edition needs an index and more assistance for firsttime users. Batteries Included says a new edition of the manual corrects these deficiencies and adds the muchneeded index. It is being shipped with later copies of Paperclip 1.1.

Even newer versions of PaperClip were scheduled for release this fall. Version 1.2 supports the full 128 K RAM in the Atari 130XE, treating the four extra 16 K banks as one continuous block of memory. The text area is about 90 K long, and the windowing feature lets you load two documents up to 45 K long. PaperClip 1.2 also will support the extra memory in any future XE models, such as the 256 K XE that Atari has hinted about. If this computer ever becomes a reality, PaperClip 1.2 would allow more than 200 K for text memory.

Batteries Included also planned to make PaperClip work with its announced 80 -column cartridge, the B.I. 80 , but the cartridge was recently canceled due to chip supply problems.

Updates to newer versions of PaperClip, incidentally, are available to owners for $\$ 10$.

Overall, PaperClip is without doubt a superb word processor for Atari computers. You won't be sorry you bought it.
PaperClip

# Commodore 64 3-D Animated Graphics 

Christian-Mare Panneton

This BASIC enhancement for the Commodore 64 makes it easy to draw and animate impressive threedimensional graphic figures. While the commands are designed for creating 3-D shapes, they're useful in any high-resolution graphics application.

Nearly everyone has seen threedimensional computer drawings, but have you ever tried to create one yourself? Since complex math is needed to calculate a 3-D shape and plot it on the high-resolution screen, BASIC takes a long time to draw even relatively simple objects. For this reason, 3-D animation is rarely seen, even in commercial software.

With "3-D Graphics Package," however, you can add several new commands to BASIC for creating sophisticated 3-D graphics-even if you're not a programming wizard.

Type in Program 1 using "MLX," the machine language entry program published elsewhere in this issue. Read the MLX instructions carefully before typing the program, and be sure to save a copy when you're done. Here are the addresses required for MLX:

## Starting address: 34000

Ending address: 39381
Because this is a machine language (ML) program, you'll need to load it with LOAD"FILENAME" ${ }^{\prime \prime} 8,1$ for disk or LOAD"FILENAME",1,1 for tape. Activate it by typing SYS 34000 and pressing RETURN. A startup message at the top of the screen
reminds you that an enhanced version of BASIC is present. Now type in and save Program 2, a short 3-D graphics demonstration. You must activate Program 1 before typing in Program 2. If the enhanced BASIC is not present, the special graphics commands won't work, even if you later reload Program 2 with the enhanced BASIC.

## 3-D Animation

Program 2 displays two complex, multicolored objects rotating around a common axis. When a rotation is finished, the objects are redisplayed and rotated in a different plane. Notice how short the program is. If you've never tried creating such displays in BASIC, it's difficult to appreciate just how fast and efficient these new commands are. Although objects of this complexity usually take several minutes to draw in BASIC, the ML routines draw and redraw them quickly enough to create a convincing illusion of movement in threedimensional space.

This program will be easier to use if you understand a few simple concepts. Three-dimensional objects are usually defined in terms of three dimensions or planes relative to you, the observer. The $X$ plane defines horizontal location. The Y plane defines vertical location. The Z plane defines depth. You can locate any point in this system by specifying a coordinate for each of the three planes.

As shown in the figure, coordinate $(0,0,0)$ defines the spot where
all three planes intersect. In the $X$ plane, negative coordinates lie to the left of the $X$ axis and positive coordinates to the right. In the $Y$ plane, positive coordinates are up and negative ones down. And positive $Z$ coordinates are nearer to you than negative ones.

The 3-D drawing grid is composed of three dimensions or planes. Each point in space has three coordinates on the grid.

Don't worry if that sounds a bit confusing. The best way to learn about these commands is to experiment. Since they all work in direct mode (when you're not running a program), you can type in one command at a time and see the result right away. If it's not what you expect, change one or two values and try again. After a while you'll learn how to draw what you want, even if you're not an expert in geometry.

Here are some of the applications, tutorials, and games from available back issues of COMPUTE!. Each issue contains much, much more than there's space here to list, but here are some highlights:

May 1981: Named GOSUB/GOTO in Applesoft, Generating Lower Case Text on Apple II, Copy Atari Screens to the Printer, Disk Directory Printer for Atari, Realtime Clock on Atari, PET BASIC Delete Utility, PET Calculated Bar Graphs, Running 40 Column Programs on a CBM 8032, A Fast Visible Memory Dump, Cassette Filing System, Getting to a Machine Language Program, Epidemic Simulation.

June 1981: Computer Using Educators (CUE) on Software Pricing, Apple II Hires Character Generator, Ever Expanding Apple Power, Color Burst for Atari, Mixing Atari Graphics Modes 0 and 8, Relocating PET BASIC Programs, An Assembler in BASIC for PET Quadra PET: Multitasking?, Mapping Unknown Machine Language, RAM/ROM Memory, Keeping Tabs on a Printer.

July 1981: Home Heating and Cooling, Animating Integer BASIC Lores Graphics, The Apple Hires Shape Writer, Adding a Voice Track to Atari Programs, Machine Language Atari Joystick Driver, Four Screen Utilities for the PET, Saving Machine Language Programs on PET Tape Headers, Commodore ROM Systems, Using TAB, SPC, and LEN.

August 1981: Minimize Code and Maximize Speed, Apple Disk Motor Control, A Cassette Tape Monitor for the Apple, Easy Reading of the Atari Joystick, Blockade Game for the Atari, Atari Sound Utility, TI CBM "Fat 40," Keyword for PET, CBM/PET Loading, Chaining, and Overlaying, Adding a Programmable Sound Generator, Converting PET BASIC Programs to ASCII Files.

October 1981: Automatic DATA Statements for CBM and Atari, VIC News, Undeletable Lines on Apple, PET, and VIC; Budgeting on the Apple, Atari Cassette Boot-tapes, Atari Variable Name Utility, Atari Program Library, Train Your PET to Run VIC Programs, Interface a BSR Remote Control System to PET, A General Purpose BCD to Binary Routine, Converting to Fat-40 PET.

December 1981: Saving Fuel \$\$ (multiple computers), Unscramble Game (multiple computers), Maze Generator (multiple computers), Animating Applesoft Graphics, A Simple Atari Word Processor, Adding High Speed Vertical Positioning to Atari P/M Graphics, OSI Supercursor, A Look at SuperPET, Supermon for PET/CBM, PET Mine Maze Game, Replacing the INPUT \# Command, Foreign Language Text on the Commodore Printer, File Recovery.

January 1982: Invest (multiple computers), Developing a Business Algorithm (multiple computers), Apple Addresses, Lowercase with Unmodified Apple, Cryptogram Game for Atari, Superfont: Design Special Character Sets on Atari, PET Repairs for the Amateur, Micromon for PET, Self-modifying Programs in PET BASIC, Tinymon: A VIC Monitor, VIC Color Tips, VIC Memory Map, ZAP: A VIC Game.

May 1982: VIC Meteor Maze Game, Atari Disk Drive Speed Check, Modifying Apple's Floating Point BASIC, Fast Sort for PET/CBM, Extra Atari Colors Through Artifacting, Life Insurance Estimator (multiple computers), PET Screen Input, Getting the Most out of VIC's 500 Bytes.

August 1982: The New Wave of Personal Computers, Household Budget Manager (multiple computers), Word Games (multiple computers), Color Computer Home Energy Monitor, A VIC Light Pen for Under \$10, Guess That Animal (multiple computers), PET/CBM Inner BASIC, VIC Communica-
tions, Keyprint Compendium, Animation with Atari, VIC Curiosities, Atari Substring Search, PET and VIC Electric Eraser.

September 1982: Apple and Atari and the Sounds of TRON, Commodore Automatic Disk Boot, VIC Joysticks, Three Atari GTIA Articles, Commodore Disk Fixes, The Apple PILOT Language, Sprites and Sound on the Commodore 64, Peripheral Vision Exerciser (multiple computers), Banish INPUT Statements (multiple computers), Charades (multiple computers), PET Pointer Sort, VIC Pause, Mapping Machine Language, Commodore User-defined Functions Defined, A VIC Bug.

January 1983: Sound Synthesis and the Personal Computer, Juggler and Thunderbird Games (multiple computers), Music and Sound Programs (multiple computers), Writing Transportable BASIC, Home Energy Calculator (multiple computers), All About Commodore WAIT, Supermon 64, Perfect Commodore INPUTs, VIC Sound Generator, Copy VIC Disk Files, Commodore 64 Architecture.
May 1983: The New Low-Cost Printer/Plotters, Jumping Jack (multiple computers), Deflector (multiple computers), VIC Kaleidoscope, Graphics on the Sinclair/ Timex, Bootmaker for VIC, PET, and 64, VICSTATION: A "Paperless Office," The Atari Musician, Puzzle Generator (multiple computers), Instant 64 Art, 64 Odds and Ends, Versatile VIC Data Acquisition, POP for Commodore.

June 1983: How to Buy the Right Printer, The New, Low-Cost Printers, Astrostorm (multiple computers), The Hawkmen of Dindrin (multiple computers), MusicMaster for the Commodore 64, Commodore Data Searcher, Atari Player/ Missile Graphics Simplified, VIC Power Spirals, UnNEW for the VIC and 64, Atari Fast Shuffle, VIC Contractor, Commodore Supermon Q \& A.

July 1983: Constructing the Ideal Computer Game, Techniques for Writing Your Own Adventure Game, SpeedSki and Time Bomb (VIC), Castle Quest and Roadblock (Atari), RATS! and Goblin (64), How to Create a Data Filing System (multiple computers), How to Back Up Disks for VIC and 64, Atari Artifacting, All About the Commodore USR Command, TI Mailing List.

August 1983: Weather Forecaster (multiple computers), First Math and Clues (multiple computers), Converting VIC and 64 Programs to PET, Atari Verify, Apple Bytechanger, VIC and 64 Escape Key, Banish Atari INPUT Statements, Mixing Graphics Modes on the 64, VICplot, VIC/64 Translations: Reading the Keyboard, Musical Atari Keyboard, VIC Display Messages.
September 1983: Games That Teach, Caves of Ice, Diamond Drop, Mystery Spell, and Dots (multiple computers), VIC Pilot, Ultrasort (VIC, 64, PET), Easy Atari Page Flipping, Computer Aided Design on the TI, Relative Files on the VIC/64, Atari Fontbyter, TI Sprite Editor, All About Interrupts (multiple computers), Cracking the 64 Kernal, Making Change on the Timex/Sinclair, Build Your Own Random File Manager (multiple computers).

October 1983: Computer Games by Phone, Coupon File (multiple computers), Dragon Master and Moving Maze (multiple computers), Merging Programs from Commodore Disks, Atari Master Disk Directory, Sprites in TI Extended BASIC, Commodore EXEC, Multicolor Atari Character Editor, High Speed Commodore Mazer, Apple Sounds, Extra Instructions (multiple computers), Commodore DOS Wedges, Invisible Disk Directory for VIC and 64.

February 1984: What Makes a Good Game, Circus (multiple
computers), Quatrainment (multiple computers), Commodore 3-D Drawing Master (Apple version also included), Speedy BASIC for VIC and 64, Dr. Video 64.

March 1984: All About Adding Peripherals, Modern Memory: The Future of Storage Devices, Roader (multiple computers), Barrier Battle (multiple computers), Programming the TI: File Processing, Sound Shaper (multiple computers), Commodore Floating Subroutines, Big Buffer for Atari.

April 1984: Apple's Macintosh Unveiled, Securities Analysis (multiple computers), Worm of Bemer (multiple computers), Programming the TI: File Processing, Part 2, 1540/1541 Disk Housekeeping, Hidden Atari DOS Commands, Function Keys for the Apple, TI Tricks and Tips, Super Directory (multiple computers).

May 1984: The Digital Palette: Fundamentals of Computer Graphics, The Inside Story: How Graphics Tablets and Light Pens Work, Picture Perfect for Atari and Commodore 64, 64 Hi-Res Graphics Editor, Snertle (multiple computers), Pentominos: A Puzzle-Solving Program (multiple computers), A BASIC Cross-Reference (PET, 64).

June 1984: Choosing the Right Printer: The Easy Way to Hard Copy, Pests (multiple computers), Olympiad (multiple computers), Programming the TI: TI Graphics, MacroDOS for Atari, Part 1, Apple Variable Save, Programming 64 Sound, Part 1, Apple Input and Menu Screens.

July 1984: Evolutionary to the Core: The Apple IIc Heads for Home, The ABC's of Data Bases, Statistics for Nonstatisticians (multiple computers), Bunny Hop (multiple computers), Blueberries (multiple computers), Atari Artist, Applesoft Lister, Program Conversion with Sinclair BASIC and TI BASIC, Commodore 64 ROM Generations.

September 1984: New Trends in Educational Computing, Choosing the Best Educational Software, Missile Math (multiple computers), Lightsaver (multiple computers), Multiple Choice Quiz Generator (multiple computers), Lightning Sort (multiple computers), Commodore Autoboot, Apple Editing Hints, Atari Paddle Fixer, Musical TI Keyboard.
January 1985: VIC/ 64 TurboTape: Tape at Disk Speeds, Music in the Computer Age, Inside MSX, Paratrooper (multiple computers), Rescue of Blondell (Commodore/ Atari), Guitar Tuner (multiple computers), Which Computer Language Is Best?, Machine Language Multiplication, Part 1, Enhanced Applesoft Input, Atari Terminal Program, IBM Pie Chart Maker.
February 1985: Special Games Issue, The New Atari, Fame Games, Birth of a Computer Game, Acrobat (multiple computers), Terminal Program for VIC \& 64, Programming the TI Without a Math Background, Adding Sound Effects to Atari, Rebound: Machine Language IBM Game, Apple Bowling Champ, 64 Sound Effects.

Back issues are $\$ 6$ each. Price includes freight in the US. Outside the US add $\$ 1$ per magazine ordered for surface postage, $\$ 4$ per magazine for airmail postage. All back issues are subject to availability.

These figures are redrawn rapidly at different angles to create the illusion of rotation in space.

Following is a description of what each command does. Except for SWAP, every command must be followed by one or more numeric values (numbers or numeric variables).

## Large-Scale Commands

These commands are used to prepare the computer for drawing and to perform other general tasks:
SCREEN determines which of three screens is displayed. SCREEN 0 selects the normal text screen. SCREEN 1 switches you to the first graphics screen, and SCREEN 2 displays the second graphics screen. Switching to a graphics screen automatically sets up multicolor high-resolution mode. Animation is simulated by flipping back and forth between the two graphics screens. For instance, you can display a figure on screen 1 while redrawing it on screen 2 , then display screen 2 while redrawing the shape on screen 1, and so on. SCREEN 0 restores the text screen when a program is finished.

It's important to remember which screen you're working on. When a graphics screen is displayed, arawing commands appear on that screen. When you're using the text screen, drawing commands take effect on the last graphics screen shown.

Use the function keys f1, f3, and $f 5$ to switch from one screen to another in direct mode. For instance, try pressing f1. The computer prints SCREENO followed by a carriage return to execute that command (if you're already in the text screen, nothing changes). Press f 3 to perform SCREEN1, f 5 to perform SCREEN2, and f1 to return to
the text screen. Don't press these keys while a program is running.
DCLEAR clears a graphics screen. Use DCLEAR 1 to erase graphics screen 1 and DCLEAR 2 to clear screen 2. Both screens are cleared when you start up the program.
COLOR sets the screen and drawing colors, using color numbers from $0-15$ as listed in the 64 manual. This command is followed by five values in the general form COLOR BO,BA,C1,C2,C3. The first two values (BO and BA in this case) set the screen border and background colors. The last three values select drawing colors. In multicolor hi-res mode you can draw in up to three different colors. Thus, COLOR $0,0,1,3,6$ sets the border and background colors to black and sets the drawing colors 1,2 , and 3 to white, cyan, and green, respectively. Since drawing commands refer to the drawing colors by number ( 1,2 , or 3 ), you should always execute a COLOR command before drawing.
ANGLE is an important command that sets the observation anglesyour (the observer's) position in space relative to the $\mathrm{X}-\mathrm{Y}-\mathrm{Z}$ grid. Look at the figure again and imagine a cube is drawn there. If you remain stationary and rotate the grid-or if the grid remains stationary and you change your posi-tion-the cube's appearance changes. (Since the positioning is relative, you can visualize the change either way.)

ANGLE takes three values, which refer to the $Y$ plane, $X$ plane, and $Z$ plane, respectively. These values represent degrees of rotation around the axis of each plane and must each be in the range -360-360. Program 3 demonstrates a simple use of ANGLE. By redrawing the same shape at different observation angles, you can achieve the illusion of movement in space. Note that ANGLE changes the effect of subsequent drawing commands. It does not change the appearance of existing objects.
PARAM sets four general parameters and should also be used before you begin to draw. It takes four values in the general form PARAM X,Y,SC,DI. The first two values ( $X$ and $Y$ in this example) locate the origin or center of the 3-D grid on

Only three program lines are needed to draw this spherical surface.
the screen. Coordinate $(0,0,0)$ of the grid is located wherever you put the origin. Since the graphics screen contains 160 horizontal pixels (screen dots) and 200 vertical pixels, the $X$ value must be in the range $0-159$ and the Y value must be in the range $0-199$. Use an $X$ value of 80 and a $Y$ value of 100 to center the origin in the middle of the screen.

The third PARAM value (SC) is scale, which controls the overall size of the image. The larger the scale, the bigger the picture, and vice versa. This number must be in the range $0-100$; a scale value of 20 works well in many cases. The final PARAM value (DI) is the distortion value, a number in the range of $0-250$. On most monitors and TVs the pixels are actually wider than they are high, causing a mathematically perfect circle to look elliptical on the screen. This value adds a correction factor to eliminate the distortion. A distortion value of 165 works well in most instances. If your circles still look squashed, experiment with other values.

## Drawing Commands

These commands draw points, straight lines, and circles or ellipses:
DPLOT draws a point on the current graphics screen and is followed by four values. The first three values set coordinates for the point in Z-X-Y order, and the fourth selects one of the three drawing colors defined in an earlier COLOR command.
DLINE draws a line from one point to another. It requires seven values: three coordinates for the starting point, three coordinates for the ending point, and the drawing color. Both sets of coordinates are in

Here are 145 reasons to buy at Elek-Tek, not to mention the fastest delivery anywhere.

Z-X-Y order. The following program demonstrates a simple use of DLINE:
$1 \varnothing$ COLOR $\varnothing, \varnothing, 1,1 \varnothing, 3:$ PARAM8 $\emptyset, 1 \varnothing \varnothing$ , 20, 165: DCLEAR1:SCREEN1:FOR $\mathrm{J}=\emptyset \mathrm{TO} 36$ ØSTEP5
$2 \emptyset$ ANGLEJ, $9 \varnothing, \varnothing:$ DLINE $35 \varnothing \sigma, \varnothing, \varnothing, 4$ $500,0, \varnothing, 3:$ NEXT

Press f 1 to return to screen 0 when the program is finished. Change the 90 in line 20 to 12 and run it again to see how a different observation angle affects the object's appearance.
DDRAW works like DLINE but starts drawing at the point where a previous DPLOT, DLINE or DDRAW command left off. Since the beginning point is already defined, this command needs only four values: three coordinates for the ending point and a drawing color. For example, DDRAW $-500,0,0,1$ draws a line from the previous point to $(-500,0,0)$ in color 1.

DCIRCLE draws a circle or ellipse and requires eight values. The first three values are $\mathrm{Z}-\mathrm{X}-\mathrm{Y}$ coordinates that define the center of the circle. The fourth value sets the radius, or distance from the center to the circle's edge. The next three values define orientation angles for the circle, and the last value sets the drawing color.

This command takes the general form DCIRCLE $Z, X, Y, R, A Y$, AZ,AX,C. As with ANGLE, the DCIRCLE orientation angles control which way the circle faces. When all three angles are zero, the circle is drawn in the $\mathrm{Z}-\mathrm{Y}$ plane. Increasing the value of AY causes a counterclockwise rotation around the Y axis. If AY is $90, \mathrm{AZ}$ is 0 , and $A X$ is 0 , the circle is drawn in the $X-$ Y plane. Increasing the value of $A Z$ rotates the circle counterclockwise around the Z axis. When AY is 0 , $A Z$ is 90 , and $A X$ is 0 , the circle is drawn in the $X-Z$ plane. Increasing the value of $A X$ rotates the circle counterclockwise around the $X$ axis.

DCIRCLE uses integer computations to speed up the drawing process. Though the command accepts noninteger (fractional) values, it only uses the integer part of the number. This program shows how a spherical surface can be formed out of many circles.
$1 \varnothing$ COLOR $\varnothing, \varnothing, 1,10,3:$ PARAM8 $0,1 \varnothing \varnothing$ 20, 165 : DCLEAR1: SCREEN1

"3-D Graphics Package" helps you draw complex shapes like these.

## Animation Commands

This group of commands simplifies the process of drawing and redrawing complex objects:
ANIM stands for animate and takes one value corresponding to the screen you want to affect. ANIM 1 displays graphics screen 2 , clears screen 1, and lets you draw on screen 1. ANIM 2 does the reverse: Screen 1 is displayed, screen 2 is cleared, and you're ready to draw on screen 2. Program 2 demonstrates a typical use of ANIM.
SWAP exchanges the contents of screen 1 and screen 2 , providing another means of animation. For instance, you might display screen 1 at all times, redrawing the figure on screen 2 (which is not seen), then quickly move the new figure into screen 1 with SWAP. This command requires no parameters. FSET is a very powerful command that lets you define up to three figures. Once a figure is defined, it can be drawn quickly at any time with a FIGURE command (see below). A figure consists of a series of drawing instructions, and each use of FSET lets you add one drawing instruction to the figure.

The general form of the command is FSET FN, Z, X, Y, C,I. In this example, FN sets the figure number that determines which of the three possible figures you are working on. Z, X, Y, and C represent three coordinates and a drawing color,
and I represents the drawing instruction. The instruction can be either a DPLOT or a DLINE command. If I is 0 , then FSET performs DPLOT, drawing a point at $(Z, X, Y)$ in the color C. If I is 1, FSET performs DLINE, drawing a line from the last coordinate defined to the point $(Z, X, Y)$ in the color $C$. The first of the three figures defined by FSET may contain up to 120 separate drawing instructions. Figures 2 and 3 are limited to 80 instructions each.
FIGURE is used to draw an entire figure previously defined with an FSET command. It takes a single value corresponding to the figure number. For instance, FIGURE 1 draws the first figure defined with FSET. FIGURE 2 draws the second, and so on.
FCLEAR clears any of the three figure definitions, permitting you to create new figures with FSET. FCLEAR 1 clears the figure 1, FCLEAR 2 clears the figure 2, and so on.

## Memory Allocation

Here are the various memory areas used by this program:
32768-33791 Screen 2 color memory 33792-40959 Program code 40960-49151 Screen 2 bitmap 49152-52223 Figure definitions
52224-53247 Screen 1 color memory 57344-65535 Screen 1 bitmap

## Quick Reference Table

## IBM Graphics On A <br> Monochrome Monitor

Thomas G. Hanlin III

Though advanced IBM graphics require a color/graphics adapter, you can create simple graphics and even animation on a monochrome system as well. Here's a short program to show how it's done.

IBM PC computers can generate stunning graphics, but advanced BASIC graphics features are available only on PCjrs or PCs with a color/graphics adapter. However, with the right programming methods, your monochrome system can produce graphics, too. Granted, they are fairly low resolution-and no amount of programming skill can make your monochrome monitor display more than one colorbut they are graphics nonetheless. You may find them handy for utilitarian purposes (for example, adding interest to bar graph displays), or you may enjoy making simple graphic screens, animated figures, or games. Once you master the basic technique, more and more applications will come to mind.

## Character Graphics

When an IBM PC boots up, it checks to see if the system contains
a color／graphics adapter and con－ figures itself accordingly．If a color／ graphics adapter is present，you may use advanced BASIC graphics commands like PUT and GET．If not，those commands cause an error． However，even a monochrome sys－ tem has the ability to display a large set of special characters．IBM graphics characters have ASCII val－ ues of 128 to 255 and include a number of different shapes useful in creating boxes，borders，and so on．

The characters we＇re interested in are those which consist of a solid block．All computer graphics are produced by turning pixels（picture elements）on or off to light up dif－ ferent parts of the screen．The smaller the size of the pixel dots， the more detailed the image．Al－ though the IBM character set doesn＇t include any pixel－sized characters－each character is com－ posed of several pixels－it does in－ clude some we can use like giant pixels．

## Giant Pixels

For example，CHR\＄（219）is a solid block character，the inverse of CHR\＄（32），the blank space．Using these two characters together pro－ vides a graphics screen with $80 \times$ 25 resolution．To turn on a＂dot＂ within this coarse screen，print the solid block at the desired spot．To turn off a dot，print a space．The BASIC function SCREEN $(Y, X)$ tells you whether a given location con－ tains a dot or an empty space． Though you＇re limited to simple， quite blocky shapes，this system is fast and simple to use．However， it＇s possible to do much better．

Besides the block and space characters which light up or blank out an entire screen location，there are some which light up only part of a screen position．For instance， CHR $\$(220)$ is solid on the bottom half and blank on the top．The reverse is true of CHR\＄（223）．By using these characters，we can dou－ ble our resolution to $80 \times 50$ pixels． This complicates matters a bit，since we want to use only half a screen position，and BASIC lets you print only to an entire screen position． Here＇s a point－plotting routine that handles the tricky details for you：

1øøøø GR．$Y=Y \backslash 2+1:$ GR．SC＝SCREEN （GR．$Y, X+1$ ）：©R．OFFSET＝（ $Y$ MOD 2）\＃3：IF $\mathrm{Z}=\varnothing$ THEN 1 ตซ2の ELSE IF GR．sC＝32 T HEN GR．SC＝223－GR．OFFSET ELSE IF GR．SC＋GR．OFFSE T＜＞223 THEN GR．SC＝219
$1 ø \varnothing 1 \varnothing$ LOCATE GR．$Y, x+1$ ：PRINT C HR\＄（GR．SC）；：RETURN
10028 IF GR．SC＋GR．OFFSET＝223 THEN GR．SC＝32 ELSE IF g R．SC＜＞32 THEN GR．SC＝22ø ＋GR．OFFSET
1 1øø3ø GOTO 1øø1の
1 1øø4Ø GR．$Y=Y \backslash 2+1: S 9=$ SCREEN（GR ．$Y, X+1$ ）：$Z=(G R . S C=219 \mathrm{OR}$ GR．SC＋（Y MOD 2）$\% 3=223$ ） ：RETURN

To plot a point with this rou－ tine，set the variable $X$ to the de－ sired horizontal coordinate（0－79） and the variable $Y$ to the vertical coordinate（0－49）．Now you＇ve set the screen location for the giant pixel．To turn it on，set the variable $Z$ to 1 ．Set $Z$ to 0 to turn the pixel off．Then call the subroutine with GOSUB 10000．Line 10040 is a sep－ arate routine that tells you whether a given location is lit up or blank． To test any point on the screen，set the variables $X$ and $Y$ to the appro－ priate coordinates；then GOSUB 10040．The variable $Z$ equals -1 if that point is lit or 0 if it＇s blank．

## An Animated Snake

Though this system emulates a sim－ ple graphics screen，keep in mind that you are still printing charac－ ters．Thus，there are four screen locations that cause everything to scroll upward if you plot a point there：locations $(79,46),(79,47)$ ， $(79,48)$ ，and $(79,49)$ ．To avoid scrolling your display，either do not use these particular locations or re－ strict your screen to $79 \times 50$ pixels （use horizontal locations $0-78$ ）． Note that you can mix text and graphics freely，but putting graph－ ics on top of text causes some sur－ prising results．The following program demonstrates how to ani－ mate a simple figure．Add these lines to the point－plotting routine and save the program．Make sure the numeric keypad is in numeric mode before you run it．
$1 \varnothing$ KEY OFF：CLS：DEFINT $A-Z: Y=\varnothing$ ：$Z=1$ ：FOR $X=\varnothing$ TO 24：SNAKE $\$=$ SNAKE $\$+$ CHR $\$(X)+$ CHR $\$(Y):$ GUS UB 1øøøø： $\mathrm{NEXT}: \mathrm{DX}=1$ ： $\mathrm{DY}=$ Ø： $\mathrm{X}=$ $\mathrm{X}-1$

2ø I $\$=$ INKEY $\$$ ：IF I $\$\rangle$＂＂THEN D X＝SGN（INSTR（＂369＂，I\＄）－INST R（＂147＂，I\＄））：DY＝SEN（INSTR（ ＂123＂，I\＄）－INSTR（＂789＂，I\＄）） ：IF I业＝＂＂THEN CLS：END
$3 \varnothing X=$ ASC（RIGHT $\$($ SNAKE $\$, 2))+D X$ ：$Y=$ ASC（RIGHT（SNAKE $\$, 1)$ ）$+D$ $Y$ ：IF $X>78$ THEN $X=\emptyset$ ELSE IF $X<\varnothing$ THEN $X=78$
4ø IF $Y>49$ THEN $Y=\emptyset$ ELSE IF $Y$ ＜ø THEN $Y=49$
5ø $\mathrm{Z}=1$ ：GOSUB 1øøøø：SNAKE\＄＝SNA KE $\$+$ CHR $\$(X)+$ CHR $\$(Y): X=A S C($ LEFT（SNAKE $\$, 1)$ ）$: Y=$ ASC（MID （SNAKE $\$, 2,1)$ ）$: Z=\varnothing:$ GOSUB 1 ஏøøø：SNAKE $=$ MID\＄（SNAKE\＄，3） ：GOTO 20

Control the direction of the wandering animated snake by using the numeric keypad．Press the space bar to end the program． To improve its speed，the point－ plotting routine is as short as possi－ ble．However，if you don＇t require fast drawing，you might want to add other features．Perhaps you＇d like to color or shade the points to introduce different degrees of brightness（of course，since each two－pixel pair corresponds to a sin－ gle character，there＇s a limit to this technique）．You might add range checking to check for valid coordi－ nates before you plot a point．And you could also modify the routine to place graphics on top of text correctly．

# COMMODORE Dynamic Keyboard <br> <br> Part 2 

 <br> <br> Part 2}

Jim Butterfield, Associate Editor

Part 1 discussed the fundamentals of dynamic keyboard programming, which in effect allows the computer to "type on its own keyboard." Now let's look at some important applications for this technique.

As we saw in Part 1, dynamic keyboard programming uses a twostep method to let a program give itself direct-mode commands. Step 1 is to print the command at a specific location on the screen. Step 2 is to put a RETURN character in the computer's keyboard buffer, then stop the program with the cursor flashing over the screen command. The RETURN character makes the computer execute the command just as if you'd pressed RETURN.

It's worth mentioning that you may print more than one command on a screen line. Just as in a program line, separate the multiple direct-mode commands with colons. You can use more than one screen line of direct-mode commands as well. However, you must be careful to put the commands in exactly the right place, and make sure the cursor flashes directly over the line to be executed when the program stops.

Here are some applications for the dynamic keyboard technique:

- Allow a user to enter a formula that the program will use;
- Allow a program to load another program;
- Allow a program to modify itself (tricky);
- Run test programs to determine,
for instance, how the computer responds to certain direct commands and calculations.

## Keyboard Buffer Locations

The following table shows the location of the keyboard buffer counter and the start of the keyboard buffer on most Commodore computers:

|  | Counter | Buffer |
| :--- | :---: | :---: |
|  |  |  |
| VIC-20, Commodore 64 | 198 | 631 |
| Commodore 16, Plus/4 | 239 | 1319 |
| PET/CBM (4.0 \& |  |  |
| $\quad$ Upgrade BASIC) | 158 | 623 |
| PET (Original ROM) | 525 | 527 |
| B128 (Model 700) | 209 | 939 |

Usually your program must POKE a value of 1 into the counter and a value of 13 (the character code for RETURN) into the buffer. That tells the computer there's one RETURN character in the buffer waiting to be processed. If there's more than one line of direct-mode commands on the screen to be performed, you need a higher count and more characters. On the B128, it's wise to execute a BANK 15 command before the POKEs.

## Entering A Formula

Let's write a brief program that allows a student to enter a formula and then generates a table of values based on the formula. More complex versions of the program might solve an equation or draw a graph, but we'll keep the example simple. In practice, it would be wise for your program to check for valid syntax before evaluating the formula. Again, for the sake of brevity, we'll do only the dynamic keyboard portion.

This program is for VIC-20 and Commodore 64 only. If you have another Commodore model, use the table above to change the POKE addresses in line 140. Also, don't forget the colon that appears just before the GOTO statement in line 130.

1 1ø PRINT"\{CLR\}\{DOWN\}FORMULA E VALUATION.":PRINT"INPUT A \{SPACE\}FORMULA" :rem 52
110 PRINT"BASED ON VARIABLE X" :PRINT"SUCH AS:":PRINT"
\{DOWN\}\{2 SPACES\}Y $=\mathrm{X} * 7-\mathrm{SQR}$ (X)":PRINT :rem 7
$12 ø$ PRINT"YOUR FORMULA:": INPUT "\{DOWN\}\{2 SPACES\}Y=";F\$:PR INTCHR (147): PRINT:PRINT
:rem 160
$13 \emptyset$ PRINT"Y=";FS;":GOTO15ø": DI MV(1ø):FORX=1TO1ø:PRINTCHR \$(19)
:rem 178
140 POKE 198, 1:POKE631,13:END
:rem 103
$150 \mathrm{~V}(\mathrm{X})=\mathrm{Y}: \operatorname{NEXT} \mathrm{X}:$ FOR $\mathrm{X}=1$ TO 1 $\emptyset:$ PRINT $X, V(X)$ :NEXT $X$
:rem 2
Notice how this program does a task which would be difficult or impossible without using the dynamic keyboard technique.

## Loading Another Program

If you put a LOAD command in a program, the new program doesn't load in the usual way. Instead, it's chained to the old program. The new program retains the variables and arrays (if certain rules are observed), and the effect is that of two successive programs working continuously on a single job. That's not always what is wanted. Especially with menu programs or bootstraps (program-loading programs), your goal may be simply to start the new program without preserving
variables or data from the old one. That's what happens when you perform LOAD as a direct command. With the dynamic keyboard technique, we can simulate this from within a program.

Let's write a simple dynamic keyboard loading sequence. Again, the program is given for VIC-20 and Commodore 64 only. For other Commodore models, use the table above to change the POKE addresses in line 120.
100 PRINT" \{CLR\} \{DOWN\} PROGRAM L OADING": PRINT"PROGRAM
\{2 DOWN \}": PRINT"PROGRAM NA ME": INPUTP\$
1.10 PRINT"\{CLR\}": PRINT: PRINT: P RINT"LOAD"; CHR\$ (34); P\$; CHR \$(34);", 8": PRINT:PRINT
120 PRINT:PRINT:PRINT"RUN":PRI NTCHRS (19):POKE198, $2:$ POKE6 31,13: POKE632,13
Note that there are two separate command lines: one for LOAD and one for RUN. Of course, it's important to position the lines correctly, but that's not hard to work out when you set up the program. You see everything happening on the screen, and, if you've placed your command a line too high or
low, the problem is easy to spot. (For the VIC, you must limit the length of the filename you enter to seven or fewer characters. Otherwise, an unrelated bug built into the VIC's INPUT statement causes the program to fail.)

## Tricks And Advanced Points

On computers with color capabilities, you can hide your dynamic keyboard tricks if you wish. If you print the direct-mode commands in the same character color as the screen background, they won't be visible to you, but the computer can still see and execute them. Your program can even change colors as it runs so that some parts of the commands are visible and some are not.

Occasionally, you'll want to use the dynamic keyboard technique to change a program as it runs. That's tricky, since any time you add or change a program line, the values of all variables are lost. It's hard to run a program when its variables disappear, but it can be done if handled carefully. The criti-
cal variables can be reentered using the dynamic keyboard technique, using lines such as $X=7: L=120$ : GOTO 580. Another, somewhat more cumbersome method is to POKE the value of each variable into spare memory and PEEK the value later when needed.

Why would a program need to change itself? The most usual situation involves converting an ASCII program listing into tokenized BASIC format. It's common to list programs in ASCII (untokenized) form when translating from one computer to another. This is especially true when you transfer programs over the phone line with a modem. As each line of the ASCII listing arrives, it must be entered as if it were being typed, to store it in tokenized format. While it's possible to do the whole job by hand (by printing each line on the screen and pressing RETURN), the dynamic keyboard technique lets the computer do this busywork for you.

Next month, in Part 3, we'll cover the use of the dynamic keyboard technique for self-modifying programs in more detail.

## Program Your Own EPROMS

 $-{ }_{\mathrm{C} 64}^{\mathrm{VIC}}{ }^{20} \quad \$ 99.50$ PLUGS INTO USER PORT. NOTHING ELSE NEEDED. EASY TO USE. VERSATILE.- Read or Program. One byte or 32 K bytes!
OR Use like a disk drive. LOAD,

SAVE, GET, INPUT, PRINT, CMD,
OPEN, CLOSE-EPROM FILES!
Our software lets you use familiar BASIC commands to create, modify, scratch files on readily available EPROM chips. Adds a new dimension to your computing capability. Works with most ML Monitors too.

- Make Auto-Start Cartridges of your programs.
- The promenade ${ }^{\text {tw }} \mathrm{C} 1$ gives you 4 programming voltages, 2 EPROM supply voltages, 3 intelligent programming algorithms, 15 bit chip addressing, 3 LED's and NO switches. Your computer controls everything from software!
- Textool socket. Anti-static aluminum housing.
- EPROMS, cartridge PC boards, etc. at extra charge.
- Some EPROM types you can use with the promenade ${ }^{\text {tw }}$.

# Simple Assembling With IBM DEBUG 

Tim Victor, Editorial Programmer

You don't need to buy an expensive assembler to write short machine language programs on an IBM PC or PCjr-a copy of PC-DOS already contains the basic tools you require. This article, which assumes some familiarity with hexadecimal numbers and machine language theory, shows how to make the most of the DEBUG utility when you're ready to tackle 8088 machine language.

Tucked away on the DOS Supplemental Programs disk that came with your copy of PC-DOS is a file called DEBUG. DEBUG is a simple but powerful development tool for exploring your computer and writing short machine language (ML) programs. It includes a miniassembler, which converts assembly language instructions into machine language directly in memory, and a disassembler, which allows you to reverse this process and examine ML programs already in memory. DEBUG also has trace and breakpoint functions for testing ML programs, utilities for loading and saving programs on disk, and several other valuable features. Using these tools, we'll show how to write a small ML program.

To get started with DEBUG, boot up DOS from your master disk. When the DOS prompt A> appears, insert the DOS Supplemental Programs disk into drive A:, type DEBUG, and press ENTER. DEBUG loads and runs, replacing the DOS prompt with its own prompt, a hyphen ( - ). You can return to DOS at any time by putting your master disk back in the drive, typing $Q$ for Quit, and pressing ENTER.

Since you should preserve your DOS Supplemental Programs disk as an archival backup, let's ask DEBUG to copy itself onto another disk. You could use the DOS COPY command, but using DEBUG is a good way to learn how to load and save machine language program files.

## Cloning DEBUG

DEBUG has three commands for disk operations: L (Load), W (Write), and N (Name). N creates a data structure called a file control block (FCB) that DOS uses for all disk operations, including DEBUG's Load and Write. The FCB contains the name of a file, along with information such as size and file organization. To learn more about the FCB, consult Appendix E of the DOS 2.00 Manual, or Chapter 6 of the DOS 2.10 Technical Reference Manual.

The first step in backing up DEBUG is to load another copy of it into memory. Type N DEBUG.COM and press ENTER. (You need to include the .COM extension because DEBUG doesn't make any assumptions about the file type.) DEBUG responds with another hyphen. Next, type L and press ENTER. The disk drive whirs, and then another hyphen appears. You've loaded a second copy of DEBUG.

Remove the Supplemental Programs disk. Replace it with a formatted disk that you'll be using for ML programs. Type $W$ and press ENTER. The drive comes on again, and then DEBUG displays the message "Writing 2E80 bytes" and the hyphen prompt. You now have a copy of DEBUG.COM on your ML disk.

## A Sample Program

Let's try assembling a program with DEBUG. Start by typing A 100 to start assembling at address 100 H . (IBM programmers generally denote hexadecimal numbers by appending an H to the number. All input and output with DEBUG is expressed in hexadecimal.) DEBUG responds with $x x x x: 0100$, where $x x x x$ is a four-digit hexadecimal number. This number is the current value of the code segment register. It's of minor importance right now and will be discussed in detail later.

Now type in the following program. DEBUG displays the memory address of each instruction for you. All you need to enter are the instructions.

## MOV AH,09 <br> MOV DX,109 <br> INT 21 <br> INT 20 <br> DB "HELLO THERE\$"

Press ENTER to leave the assembler. This program is the ML equivalent of everyone's first BASIC program:

## 10 PRINT "HELLO THERE"

The ML version looks quite a bit longer, but it would be even more involved if it weren't for the INT 21 H instruction, which calls a DOS function routine (Print String) by executing a software INTerrupt. Before calling this routine, the program takes two preparatory actions. The first instruction loads the AH register (an internal 8088 register) with the value 9. In 8088 machine language, instructions with two operands like MOV AH,09 operate from right to left-just as $A=9$ in

BASIC moves the value 9 into the variable A. You specify the destination operand first, then the source operand. This might seem a little backwards, but it's a common convention and you'll soon adjust to it.

AH is the high (most significant) byte of AX , the 16 -bit (twobyte) accumulator register of the 8088. When a program calls Interrupt 21 H , the value in AH indicates the function you're asking DOS to perform. Function 9, Print String, displays a string on the screen, starting with the character at the address contained in the DX register and ending with the character \$. The second instruction moves the address 109 H into the DX register. The last instruction, INT 20 H , ends the program by returning control to the program that called it-in this case, DEBUG.

Finally, we create the string we want to print using DB, a pseudoopcode ( $p s e u d o-o p$ ). When the assembler sees a pseudo-op such as DB, it performs a function instead of generating code. This particular pseudo-op tells the assembler to store bytes of data in memory, beginning at the current location. The data can be either a list of hexadecimal numbers between 00 and FF , separated by spaces or commas, or a quoted string, as shown above. If the data is a string, the ASCII code for each character is entered in memory. The dollar sign at the end of the string is very important. Without this delimiter, the Print String function will keep printing whatever bytes it happens to find in memory following the message. It might be a long time before it comes across a $\$$ and stops.

## 8088 Memory Addressing

Now that the program is in memory, we can use the disassembler to examine it. Type $U$ for Unassemble, and DEBUG displays several rows of text on the screen (the number of rows differs between 40 - and 80column displays). Notice that the disassembled code is aligned in four columns. The first column shows the address of each instruction as two four-digit hexadecimal numbers separated by a colon, just as was displayed when you entered the program. The first four-digit number is the current value of the
code segment register mentioned before, and the second is the value of the instruction pointer. To understand why two registers are needed to point to a single memory location requires some understanding of the 8088's addressing scheme.

The 8088 microprocessor can access up to one megabyte $(1024 \mathrm{~K})$ of memory using 20 -bit addresses. However, for compatibility with older Intel processors, the 8088 has only a 16 -bit instruction pointer. Because a 16-bit (four hexadecimal digit) register can only have values between 0 and 65,535, another register, the code segment register, is needed to address the entire $1,048,576$ bytes allowed by the 8088. The code segment register is also a 16-bit register, but instead of addressing individual bytes, it points to blocks of 16 bytes, called paragraphs. Any five-digit hexadecimal address that ends in a zero is the beginning of a paragraph. For example, the byte of memory at 5 D 320 H is at the beginning of the paragraph addressed by a segment register containing 5D32H.

The code segment register points to the first paragraph of a 64 K block of memory called the code segment (CS). There are three other segments, the data segment (DS), stack segment (SS), and extra segment (ES), plus a register that points to the beginning of each. In simple programs, however, all the segment registers usually have the same value as CS. To find the next byte of code to be fetched, the value in the instruction pointer is added to the address of the beginning of the code segment. The physical address of this byte can be found with this formula:

$$
\text { Physical Address }=\mathrm{IP}+\left(\mathrm{CS}^{*} 16\right)
$$

The effect of organizing memory this way is that a programmer doesn't have to know where the program will be loaded. When DOS loads a .COM program, it starts the code segment at the beginning of any available paragraph in memory. The program is loaded at an offset of 100 H bytes above the start of the segment and the instruction pointer is set to 100 H . The four segment registers, CS, DS, SS, and ES, all point to the start of the code segment.

The second instruction of the example program moves an address, 109 H , into DX. This address is an offset into the current data segment. The string to be printed is located at an offset of 109 H only if the data segment register is equal to the code segment register and the program starts at offset 100 H . In practice, the CS register is rarely changed except by DOS and needs little or no attention in most programs.

## Displaying Binary Code

The second column of the disassembled listing on the screen contains four- or six-digit hexadecimal numbers. These are the contents of the memory locations, the binary code which the 8088 can execute. Notice that the first MOV instruction is one byte shorter than the second. The first instruction only loads half of a 16 -bit register (AH is the upper half of $A X$ ), so the data occupies one byte, but the second MOV loads all of DX, which takes two bytes of data (a word).

The third column shows the mnemonics-symbolic names for each opcode instruction. The fourth column displays the operands. This program consists of four opcodes: two MOV instructions followed by two INT instructions. Notice that the DB pseudo-op doesn't show up in a disassembly. Instead of displaying your characters, DEBUG tries to convert the string into assembler mnemonics, and therefore prints several meaningless instructions. DEBUG is frequently fooled this way because program instructions and data are both stored as binary bytes. DEBUG has no way of knowing where the program ends and the data begins.

If you type another U, DEBUG continues to disassemble and display the next 16 or 32 bytes in memory (depending on your screen width). Since the program is only 21 bytes long, DEBUG starts displaying part of itself, still in memory from when you copied it. Type U 100 to disassemble from the beginning of your program again. DEBUG's U command also accepts both starting and ending addresses if you separate them with a space.

It's a good idea to save your program on disk before running it.

If the program causes something unexpected, like an infinite loop or a complete system crash, it's nice to have a copy saved. Then you can load it and search for the error without typing the program again from scratch.

As before, you need to tell DEBUG the name of your file. Type N HELLO.COM. Now there's one more thing to consider: How many bytes of memory should DEBUG write to disk? When we used the $W$ command to copy DEBUG, it wrote the same number of bytes that it had loaded, but now we're saving a new program which has never been loaded. When DEBUG loads a file, it stores the size of the file in the $C X$ register and the four least significant bits of the $B X$ register. The same registers are used when DEBUG writes a file. So if your program is less than 65,536 bytes long (most are), the BX register should be set to zero.

To examine and change $C X$, type R CX. DEBUG prints the contents of CX (probably 2 E 80 H , left over from copying DEBUG), then prints a colon at the beginning of the next line. You can press ENTER to leave the value unchanged, or type a new value. Since the new program is 21 bytes long, type 15 (the hexadecimal equivalent of 21) and press ENTER. Now type $W$ to write the program to disk. DEBUG responds with the message "Writing 0015 bytes," then returns the prompt.

## Running And Debugging

Now that your program is safe on disk, run it by typing $G$ and pressing ENTER. The screen should display HELLO THERE. Then DEBUG prints "Program completed normally" followed by its usual prompt. If your program completed but didn't print correctly, disassemble starting from 100 H and check that all instructions are correct. If your program locked up the computer, reboot, restart DEBUG, and thank yourself for saving the program. Reload the program with N and $L$, then disassemble it to see what it looks like. If you don't know what's wrong, one technique is to try setting a breakpoint. This halts the program at a predetermined point so you can check the
contents of the registers.
For instance, to make the program stop before the INT 20 H instruction, you can set one or more breakpoints. To set a breakpoint, type $G$ followed by the addresses of one or more instructions in your program. If you set more than one breakpoint, separate the addresses with spaces. The program begins executing, but stops when the instruction pointer equals the address of a breakpoint. DEBUG displays the contents of all registers and flags and disassembles the instruction at the breakpoint (the instruction pointed to by the instruction pointer, the next instruction to be executed). Type $G$ to restart the program at the instruction that the instruction pointer references.

If you stopped your program with a breakpoint but want to restart it from the beginning, type G $=100$. DEBUG sets the instruction pointer to 100 H (or whatever address you specify) before starting. You can also set both the starting address and one or more breakpoints. Just include the breakpoint addresses on the same command line, separating them from the starting address and each other with spaces.

Keep this in mind: Before DEBUG executes a $G$ command, it saves the values of all the registers, including the instruction pointer. If the program runs normally, and completes by executing INT 20 H , DEBUG restores all the registers. This is great if your program runs all the way from beginning to end. You just type G and your program runs again. If, however, your program has just completed after being restarted from a breakpoint, the instruction pointer now points to the location where the breakpoint was set. Typing G starts it from the breakpoint again. To run the program from the beginning, type $G$ $=100$.

## Learning More About DEBUG

You've now used DEBUG to load and store program files, to assemble and disassemble a new machine language program, and to execute a program. Some other useful commands we don't have room to cover are D (Dump), which displays the
contents of a block of memory as hexadecimal numbers and ASCII characters; E (Enter), to examine and change the contents of individual memory locations; and $T$ (Trace), which executes an ML program one instruction at a time, displaying all registers and flags between instructions.

As you learn more about 8088 machine language, you'll find DEBUG a big help in testing your programs. Though you might use a separate assembler when your programs get larger, DEBUG remains useful for testing and modifying the assembled programs. If you want to know more, there is a complete description of each DEBUG command in Chapter 12 of the DOS 2.00 Manual and Chapter 8 of the DOS 2.10 Manual. Information on the DOS functions and interrupts can be found in Appendix D of the $D O S$ 2.00 Manual and Chapter 5 of the DOS 2.10 Technical Reference Manual. To learn more about machine language programming on the IBM PC and PCjr, see COMPUTE!'s $B e$ ginner's Guide to Machine Language on the IBM PC \& PCjr.

# Save-With-Replace: Debugged At Last Part 2 

P.A. Slaymaker

Last month, Part 1 proved that a longsuspected bug in the Commodore Save-with-Replace command really exists. Using a program that demonstrated the bug on a 1541 disk drive, the article showed how disks can be scrambled when files are scratched and rewritten with Save-with-Replace. The article also offered a brief explanation of the bug and how to avoid it. This month, Part 2 examines the Save-with-Replace bug in greater detail for technically advanced readers. The author is the president of Quantum Software, which produces the Peek a Byte disk utility for the Commodore 64.

What actually causes the Save-with-Replace bug? When and how does it occur and is there a fix for it? We have performed extensive testing to determine exactly how the bug happens. As explained last month, we've determined that the bug is avoidable if the drive number (drive 0 ) is specified in all disk commands. If you don't always specify drive 0 , the bug occasionally bites. That's significant information in itself-but we wanted to know why.

## DOS Thievery

First, we should note that although the SAVE@ command deletes a disk file and saves a replacement in a single operation, it works differently than if you issued separate SCRATCH and SAVE commands. SAVE@ calls entirely different DOS routines-the SCRATCH and SAVE are executed as part of a con-
tinuous procedure, and the SAVE@ command therefore requires that more drive buffers be available.

DOS V2.6 has five internal buffers, numbered 0 to 4 . These buffers start at memory pages $\$ 300$, $\$ 400, \$ 500, \$ 600$, and $\$ 700$, respectively. Normally an image of the disk's BAM (block availability map) is stored in the page at $\$ 700$, an image of the directory sector in use is stored at $\$ 600$, and the other three buffers are available for file use. As long as a buffer is active, it cannot be used for anything else. If DOS has assigned an internal channel to the BAM at $\$ 700$, then trying to open a direct channel to buffer 4 (from BASIC: OPEN $2,8,2, " \# 4$ ") will produce a $70, \mathrm{NO}$ CHANNEL, 00,00 error.

Similarly, DOS assigns channels and buffers to the directory sector and file sectors which are being read or written. Normally DOS assigns two read or two write channels and uses only three of the five buffers. The SAVE@ command, however, requires all five buffers-two read, two write, and the BAM. If DOS can't find a free buffer, it tries to steal an assigned but inactive buffer. This thievery causes the SAVE@ command to occasionally fail-for reasons which will be discussed shortly.

Why does omitting the drive number in disk commands cause DOS to steal a buffer? When a file is opened or loaded via the OPEN routine (\$D7B4), DOS searches the internal directory to look for the specified filename (DOS routine names and addresses in this article conform to those listed in Inside

Commodore DOS, Datamost, 1984). ONEDRV (\$C312) determines whether a drive was specified. OPTSCH (\$C3CA) assigns a default or specified drive for each file in the command, and also calls AUTOI (\$C63D). AUTOI reads the BAM of the disk in the specified drive, and also tries to initialize drive 1 if no drive was specified. Usually buffer 3 (\$600) is allocated for the phantom drive 1 BAM, and a B1 SEEK command is issued to the disk controller. This results in an internal DRIVE NOT READY error in the disk controller. The error is trapped by AUTOI but not reported outside the disk drive. This leaves buffer 3 allocated but inactive. FFST (\$C49D) then reads the directory and tries to find the file.

The reason this inactive buffer assignment is important is that the SAVE@ command requires all five buffers, but only four are now available. Whenever DOS needs to allocate a buffer, it calls GETBUF (\$D28E). If one is not free, GETBUF tries to steal an inactive one by calling STLBUF (\$D339). If the drive number is always specified and no direct access buffers are allocated, STLBUF is never called. We verified this by modifying GETBUF after copying DOS onto an EPROM (Eraseable-Programmable Read Only Memory). If a channel can't be stolen, then a NO CHANNEL error occurs. But if STLBUF is called, the SAVE@ bug sometimes occurs.

## Stealing The Wrong Buffer

STLBUF can be called several times during a SAVE@ command. The

## 

result is that the BAM and directory sectors can be reassigned to different buffers during a single SAVE@. We have found the BAM and directory sectors in every drive buffer after different SAVE@ commands. We have found copies of the current directory sector in two different buffers, one an old sector and one properly updated, but the wrong one had been written to the disk. Somehow, the pointers to the BAM and directory sectors are not properly accounted for. Which buffer is stolen by STLBUL depends on prior buffer usage and the values stored in LRUTBL, Y (\$FA,Y), the least recently used table. It appears that STLBUF updates all pointers except LRUTBL,Y. This means that multiple calls to STLBUF may steal the wrong buffer-in this case the wrong buffer to steal is the BAM!

The BAM is stored in the drive in one of the buffers. STLBUF should not steal the drive 0 BAM, but should instead take back the unused buffer incorrectly assigned to drive 1 . It never steals the drive 1 BAM, buffer 3 at $\$ 600$, because STLBUF cannot take a buffer which encountered a drive error. Remember that an internal DRIVE NOT READY error did occur, because there is no drive 1 !

To test this, we copied into EPROM an altered version of DOS with STLBUF modified to allow stealing a buffer with this error. This allowed the phantom drive 1 BAM buffer to be freed, and the SAVE@ bug did not strike during tests with this modified DOS.

If this buffer-stealing occurs, why does SAVE@ work most of the time? We must dig deeper into DOS to answer this question. When a file is opened and blocks (or sectors) are written to a disk, the BAM is not directly updated in the drive memory. Instead, a BAM image for each of two tracks is stored at BAM (\$2A1-\$2B0). Each time a new block is allocated by WUSED (\$EF90), it is recorded in the BAM image. When a new track is tested for free sectors, DOS checks if it has a BAM image for it. If not, it calls SWAP (\$F05B), which first updates the BAM with the BAM image from the next-to-last track, copies the new track's BAM map into the BAM image, and then zeros that track in
the BAM. This all works perfectlymost of the time.

After the last file sector is written to the disk, the BAM still has not been written to the disk. In fact, the BAM in the drive is wrong because it has not yet been updated from the BAM images. When a file is closed, the disk directory is closed, CLSDIR (\$DBA5), by reading in the file's directory sector, testing for a replace file type, and then rewriting it to the disk. MAPOUT (\$EEF4) is called to read the BAM off the disk, if necessary, and to then update it from the BAM images by calling PUTBAM (\$F0A5). The updated BAM is then written back to the disk.

During a SAVE@ command, DOS performs an additional step after reading the directory sector. The file type is designated as replace, so DELFIL (\$C87D) is called to delete the original version of the file from the BAM. It reads in the BAM if necessary when freeing the first sector, FRETS (\$EF5F), and then proceeds to trace through the file and delete sectors in the BAM images. The BAM is then written to the disk.

## Bungled BAM

Normally this procedure works correctly. But havoc results if the BAM buffer is stolen while the file is being closed. This can happen during a SAVE@ command because DELFIL requires two additional buffers. The BAM can be stolen at different points during the procedure, depending on which buffers were previously used-which, in turn, depends on the number of sectors in the file and the tracks on which it is stored.

After the BAM is stolen, it is read back in when needed and updated from the BAM images. Only two tracks can be updated, however, since there are only two images. If more than two tracks have been accessed by SAVE@, the BAM may not be correctly updated. A track could be updated correctly, left unchanged, or fully allocated, depending on when the BAM was stolen.

If extra sectors are allocated, the BAM is incorrect, but no permanent harm is done. A validate command will cure the problem. If sectors are not allocated, then a
new file will be saved on top of the old file's sectors. In the example program listed in Part 1, a fourth SAVE@ command would result in the file being written on top of the old file's first four sectors, and then the whole new file would be scratched-a tragic result, indeed.

Based on these findings, we recommend that you avoid the SAVE@ command when direct access channels to the drive are open or if you don't always specify the drive number in disk commands. You should also avoid SAVE@ when using programs or cartridges intended to speed up access on the 1541 disk drive. These programs often reserve internal drive buffers and may cause problems even if the drive number is specified. If you're using the DOS Wedge, we recommend issuing a $>$ UI or $>\mathrm{UJ}$ command before each SAVE@ command to be sure all the buffer pointers are reset. Many word processors also allow you to send these commands to the drive. Otherwise, the drive should be turned off and then on before using SAVE@. (On the SX-64, press the drive reset button.)

During our studies we found several other minor bugs in DOS V2.6, including the subroutine which puts the value 2 at the drive memory location $\$ 197$. This bug does no harm since it affects a normally unused section of drive memory. However, we have found it can affect DOS routines downloaded into the drive. There may be other bugs or quirks which we have not found, so the Commodore DOS controversy may never be fully closed.

In Part 1 of this article, there was a minor error in the example to illustrate the problems caused by not specifying a drive number (using the DOS Wedge program). The article stated that giving the Wedge command $>$ \$TEST results in a blinking disk error light if the file TEST does not exist on the disk. Actually, $>$ \$TEST does not cause the error light to blink unless it is used twice in succession. The first $>\$$ TEST correctly prints a blank directory of drive 0 , but leaves the 1541 looking for the nonexistent drive 1 so that the second $>\$$ TEST results in the DRIVE NOT READY error described last month.

# Atari REMover 

Jeff Stefanski

This short BASIC utility automatically removes REM statements from programs. It runs on the Atari 400/800, XL, and XE series computers.

Many programmers use REMark statements to document how their programs work-a good programming practice. Once the program is finished and debugged, however, the REMs can be deleted to save memory and slightly increase execution speed (although it's a good idea to save a version with the REMs in case you have to make modifications later). Scanning through a program and deleting REM statements one by one has always been a tedious job. But it's easy with "Atari REMover."

This short routine automatically removes the REMs from BASIC programs, leaving everything else intact. Type in Atari REMover as listed below, then save the program by LISTing it to disk or cassette. You must store the program with LIST, rather than SAVE. (Example: LIST "C:" for cassette or LIST"D:filename.ext" for disk.) Since Atari REMover deletes itself from memory after running, be sure to save a copy before using it for the first time.

REMover is easy to use. First load the program from which you want to delete the REMs. Then ap-
pend REMover to the end of the first program by ENTERing it from disk or cassette. (Example: ENTER "C:" for cassette or ENTER"D:filename.ext" for disk.) Type GOTO 32000 and press RETURN to activate REMover. The routine looks through your program and deletes each line that contains nothing but a REM statement. If a multistatement line ends with REM, the REM portion is cut off and the line is reentered.

It may take a while for REMover to delete all the REMs in a large program, so be patient. After the job is done, REMover deletes itself.

Note that REMover uses line numbers above 32000 . If your program uses the same line numbers, renumber it before using this routine. If your program contains a GOTO or GOSUB to a REM line (poor programming practice in any case), change the line reference yourself after using REMover.

## Atari REMover

# Plus/Term <br> For Commodore 1660 Modem 

Mark Wood

By adding a few lines to COMPUTE!'s popular "Plus/Term" program, you can use it with a Commodore 64 and the Commodore 1660 direct-connect modem, dialing and hanging up under program control.
"Plus/Term," published in COMPUTE!, February 1985 (and in Telecomputing on the Commodore 64, COMPUTE! Books), is an excellent terminal program, offering an 80column display mode (with "Screen-80,"cOMPUTE!'s GAZETTE, September 1984) and many other desirable features. However, since my Commodore 1660 is a directconnect modem which doesn't allow manual dialing, I had no way to use Plus/Term. My solution was to add auto-dialing and hang-up routines to the program.

To include these new features in Plus/Term, you'll first need to type in the original program. Then type in the additional lines listed below. Once you're finished, resave the program (perhaps with a different name to distinguish it from the original Plus/Term).

Plus/Term now offers two additional options: You can dial a number from within the program (press D) or hang up the line whenever you want (H). After selecting Dial, type in the number you want, then choose between rotary and
tone dialing, depending on which service you have on your phone system. You may add spaces or dashes between the numbers if you like, but they're not necessary. If you press RETURN without entering a number, or enter a string that contains no numbers, Plus/Term simply returns you to terminal mode. Rotary dialing is simulated by rapidly disconnecting and reconnecting the line the correct number of times for each number. Tone dialing signals are generated with the 64's SID chip.

## Plus/Term Modifications

# Atari Animation With P/M Graphics Part 3 

Röbert Powell

#### Abstract

Animation with Atari player/missile graphics involves a number of programming techniques. Parts 1 and 2 in this series showed how to design a player/missile object, display it on the screen, control its color, and animate it horizontally. This month's article shows one method of vertical animation without resorting to machine language.

As we saw in Part 2, horizontal animation with player/missile graphics is quite simple: A single POKE into the horizontal position register moves the $\mathrm{P} / \mathrm{M}$ strip to any place on the screen. Last month, Program 2 demonstrated how easy it is to move a player horizontally with a joystick.

Vertical animation, however, is not so simple. There is no such thing as a vertical position register which corresponds to the horizontal position register. Since $\mathrm{P} / \mathrm{M}$ objects are strips of memory taller than the screen, a vertical register wouldn't make sense-you couldn't see the strip moving, anyway. Instead, to achieve vertical animation your program must move the $\mathrm{P} / \mathrm{M}$ shape you've designed through the strip of player memory.

Program 1 below is a slightly modified version of last month's program which defined player 0 as a happy face. It shows how a shape can be moved through $\mathrm{P} / \mathrm{M}$ memory with a FOR-NEXT loop in

BASIC. Plug a joystick into port 1 to control the player's vertical movement. As you'll see, vertical animation in BASIC is disappointingly slow. BASIC just isn't fast enough to move the player shape through memory without a rippling "inchworm" effect.

There are two solutions to this problem. One is to write a machine language subroutine for vertical animation. Over the past five years, COMPUTE! has published several such routines which require no knowledge of machine languageyou just drop the routine into your BASIC program and call it with a USR statement. The back issues are now out of print, but these and various other routines for vertical motion are discussed in several books (COMPUTE!'s First Book of Atari Graphics; Mapping the Atari; COMPUTE!'s First Book of Atari Games; and COMPUTE!'s Second Book of Atari Graphics).

Another solution which avoids machine language yet is comparable in speed takes advantage of BASIC's fast string-manipulation routines. We'll cover this method here.

## A Few Strings Attached

The string-animation technique depends on making the computer think that a BASIC string is located in the $\mathrm{P} / \mathrm{M}$ memory area, rather than in the usual memory area where the computer stores strings. Therefore, when you redefine the string, P/M memory changes-and the $\mathrm{P} / \mathrm{M}$ object changes along with it. You can use this technique to rapidly change the shape of a player, move it vertically, or erase it off the screen.

Program 2 shows how to fool the computer into thinking a long string is located in the $\mathrm{P} / \mathrm{M}$ memory area. A full explanation is beyond the scope of this article; however, even if you don't understand this technique, you can use it in your own programs by copying lines $10-100$. This module adjusts itself for single- or double-line $\mathrm{P} / \mathrm{M}$ resolution when you change the statement in line 20 . Set MODE $=1$ for single-line resolution, or MODE $=2$ for double-line resolution.

When you run this program, several things become apparent. First, it eliminates the usual delay

Player/Missile Addresses Using String Animation
Double-Line Resolution Single-Line Resolution

| Missiles 0-3 | $1-128$ | $1-256$ |
| :--- | ---: | ---: |
| Player 0 | $128-256$ | $256-512$ |
| Player 1 | $256-384$ | $512-768$ |
| Player 2 | $384-512$ | $768-1024$ |
| Player 3 | $512-640$ | $1024-1280$ |

caused by using a FOR－NEXT loop to clear out P／M memory with ze－ ros．Instead，the three statements in line 100 clear out P／M memory instantly．This trick works by set－ ting A\＄to zeros after lines $10-90$ fool the computer into thinking that A\＄coincides with $\mathrm{P} / \mathrm{M}$ memory．

Second，the program does not define the player shape by POKE－ ing into P ／M memory，as does Pro－ gram 1 and last month＇s programs． Instead，the bytes which form the player shape in line 120 are read into a string（ $\mathrm{B} \$$ ）in line 110 ．This is the key to the string－animation technique．Since the computer thinks that A\＄overlays $\mathrm{P} / \mathrm{M}$ mem－ ory，the statement in line 130 copies the player shape in $B \$$ into the mid－ dle of the player 0 memory area． This places the shape at midscreen．

With a statement like $A \$(Y, Y$ $+\operatorname{LEN}(\mathrm{B} \$))=\mathrm{B} \$$ ，you can instantly change the player＇s vertical posi－ tion．For an example of vertical ani－ mation，replace lines 130 and 140 in Program 2 with the following lines：

```
13g FOR Y=256 TO 512
14g A$(Y,Y+LEN(B$))=B$
15g NEXT Y
160 GOTO 13Ø
```

It＇s a convincing demonstra－ tion that fast vertical motion can be easily achieved in BASIC using strings．

## Self－Erasing Players

If you look closely at the player shape bytes in line 120 ，you＇ll no－ tice that a pair of zeros precedes and follows the series of numbers． Ordinarily，it doesn＇t make sense to see zeros in player shape data，be－ cause zeros show up blank on the screen．But these zeros have a spe－ cial purpose．As the player shape moves through $\mathrm{P} / \mathrm{M}$ memory，it would leave a trail of itself on the screen unless you erased it after every movement．Although it would be easy to erase the player shape by filling $B \$$ with zeros （using a formula like the one in line 100），this extra step would slow down the animation by a fraction of second．By tacking a zero onto each end of the player data，the shape erases itself as it moves．

In this case，two zeros sur－ round the player data．This allows even faster vertical motion by mov－ ing the player shape two steps at a
time．To see this in action，add the above changes to Program 2 with this alteration to line 130：

## 136 FQR $Y=256$ TO 512 STEP 2

Now change STEP 2 to STEP 15．As you can see，you can have as many shapes displayed in the verti－ cal band as will fit．

Another important advantage of string－animation is that you can store several different shapes in dif－ ferent strings（such as $\mathrm{B} \$, \mathrm{C} \$, \mathrm{D} \$$ ， and so on）．You can instantly flip between the shapes simply by reas－ signing $A \$$ ，as in $A \$(Y, Y+$ LEN $(D \$)=D \$$ ．

## What About Diagonals？

Once you learn how to move P／M objects horizontally and vertically， it＇s easy to animate them diagonal－ ly as well．Just combine a horizontal step with each vertical step，inter－ weaving them to achieve a diagonal path．

For an example，start with Pro－ gram 2 and add these changes：

## 136 FQR $Y=256$ TO 511

$14 \emptyset$ A\＄$(Y, Y+L E N(B \$))=B \$: P O$
KE 53248，Y－256
$15 \emptyset$ NEXT Y
$16 \emptyset$ GOTO 130
If you experiment with these programs，you should be able to take it from here．All these exam－ ples use player 0 ，but the other players and missiles can be used in a similar manner．Just calculate the vertical screen position by figuring where $\mathrm{A} \$$ overlaps the appropriate player／missile area，then position the player shape data at that point in A \＄．（Refer to the accompanying table for a guide．）

Trying drawing a background screen with PLOT and DRAWTO， then move your players above or beneath it．Also，although $\mathrm{P} / \mathrm{M}$ graphics are commonly used for games，try using these techniques to add interest and variety to your text programs as well．You can turn players or missiles into thin vertical lines to delineate data columns，or change them into cursors that change color to signal for input． This three－part series merely covers the basics－there＇s a lot more to Atari $\mathrm{P} / \mathrm{M}$ graphics，such as priori－ ty registers and collision registers． The possibilities are endless．

For instructions on entering these listings， please refer to＂COMPUTEI＇s Guide to Typing In Programs＂published bimonthly in COMPUTEI．

# Amiga's Amazing Graphics 

Charles Brannon, Program Editor

Commodore's Amiga presents programmers with more graphics features than ever before-both an exciting prospect and a bewildering abundance. This overview covers the fundamentals of the Amiga's graphics capabilities and shows how they differ from those on previous personal computers.

Graphics make the Amiga special. Although the Amiga's other fea-tures-such as its stereo sound, high-speed 68000 microprocessor, built-in 880 K disk drive, and multitasking operating system-are certainly noteworthy, it's the graphics that first catch your eye. The 4,096 color variations allow nearly seamless transition between colors; the $640 \times 400$ high-resolution bitmap mode is close to broadcast TV quality; and the custom chips permit fast, complex animation. The Amiga is a machine for the artist in all of us.

Making the most of these features requires programmers to master some new techniques, however. There are some important differences between the way the Amiga handles graphics and the methods used on previous personal computers. Of course, there are many similarities, too.

## Mixing A Rainbow

Understanding any computer's graphics is easier if you know some
background about video displays. In any monitor or TV, video images are electronically painted by electron guns on the inside of the CRT (cathode ray tube, commonly known as the picture tube). From our point of view when looking at the screen, three electron beams sweep left to right, top to bottom, across the inside of the CRT. The CRT is coated with special phosphors that glow either red, green, or blue when hit by the stream of particles from the electron guns. Each phosphor dot can glow bright, dim, dark, or anywhere in between.

Once painted on the screen, the video image quickly fades away, so the electron beams repeat the cycle to draw a new frame 60 times per second. This refresh rate is more than fast enough to fool our eyes into seeing motion when the video images are changing each frame, as they are with TV shows and animated computer graphics.

Unlike most computers, the Amiga does not limit you to a fixed set of colors. Instead, you mix three primary colors-red, green, and blue-to create your own custom colors. Each primary color has 16 luminance, or brightness, levels, from 0 (no color) to 15 (very bright). This makes up to 4,096 combinations possible ( $16 * 16 * 16=4,096$ ).

To display all these colors, the Amiga requires a special monitor called analog RGB (red-green-blue).

The Amiga also works with another type of RGB monitor, called digital $R G B$, but these devices can display only 16 colors. (Digital RGB monitors are the type used with IBM computers and the Commodore 128.) If you plug the Amiga into a regular TV via its built-in RF modulator, 3,616 colors can be displayed.

With a maximum of 4,096 color combinations available using analog RGB, almost any hue can be closely approximated. Most colors can be separated into red, green, and blue components. Because video images appear as transmitted, not reflected light, the red-blueyellow primary color mixing you may have learned does not always apply. For example, red, blue, and green combine to form white, not dark brown. To get brown you'd need to combine red and green to get a greenish red color which appears to be brown. Turning up the brightness of green and red gives yellow. Combine dark red and dark blue to get violet. Bright red and dark blue yields a pastel shade of purple.

## Color Indirection

In most of the Amiga's graphics modes, you cannot display all 4,096 colors simultaneously. Instead, you're limited to a palette of 16 or 32 colors, depending on the mode. However, you can choose which of the 4,096 colors will be available in the palette.

P.O. Box 7211 Grand Rapids, MI 49510

Phone 616/241-5510 Telex 709-101

The colors in the Amiga palette are determined by 32 memory registers. Each register is 12 bits wide ( $11 / 2$ bytes), the number of bits needed to hold a number from 0 to 4,095.

When the Amiga draws a video image, the dots that make it up derive their colors from the color registers. In the $320 \times 200$ or 320 $\times 400$ modes, each dot on the screen can be colored from any of the 32 color registers. Therefore, 32 simultaneous colors are possible in these modes.

Some computers, such as the Commodore 64, store color information for the screen in a section of memory known as color memory. Color memory is a grid of memory cells. Each cell defines the color of an $8 \times 8$ pixel zone. The number in color memory is a number representing 1 of 16 fixed colors. Other computers, such as the Atari machines, store color information by another method known as color indirection. The Amiga uses the latter technique. The number representing the dot on the screen does not encode the color directly, but instead selects a particular color register. The dot gets its color indirectly through the color register. If you change the color register, everything drawn with that register instantly changes.

Color indirection is extremely powerful. Unique glowing effects are possible by cycling between all the colors at high speed. You don't have to redraw the entire screen, which takes a lot of time. You can merely change a color register to instantly modify the appearance of everything drawn in that color. A single memory change affects an entire screen, which makes possible some high-speed effects even in a relatively slow language like BASIC.

For example, if you draw a series of concentric circles, each circle deriving its color from a different color register, you could create a 3-D tunnel illusion by changing the color registers in sequence. You could fill all color registers with the same color, then change one color register at a time to create the illusion of growing circles. Objects can be made invisible by changing their color to the same color as the screen
background, then made to appear instantly by giving them a contrasting color.

## A Nybble Of Color

Color information is stored in the color registers by flipping certain bits on and off. Each 12-bit register assigns 4 bits for each primary color. (A group of 4 bits is called a nybble-half of a byte.) In the 320 $\times 200$ and $320 \times 400$ modes, here is the format of the color registers:

| 111098 | 7654 | 3210 | $\begin{array}{l}\text { bit number } \\ \text { blue }\end{array}$ | green |
| :---: | :---: | :---: | :---: | :---: |$| \begin{gathered}\text { red primary color }\end{gathered}$

A handy formula for setting a color register in this mode is:

## BLUE*256 + GREEN* $16+$ RED

where the luminance values of BLUE, GREEN, and RED range from 0-15.

The color registers for the hires $640 \times 400$ mode with an analog RGB monitor are a little trickier:

| 11109 | 876 | 54 | 3 | 210 bit number |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | blue green $\mid$ rm rl $\mathbf{r h} \mid \mathrm{b}$ g r color

As you can see, the color bits have been scattered all over the 12 bit range. Bits $9-11$ define 3 bits of data for blue (range of $0-7$ ); bits 6-8 define 3 bits of data for green (range $0-7$ ). Bits 4 and 5 are the low and medium bits of data defining red, and bit 3 is the high bit of red data. (You would think the red bits would be arranged high-mediumlow instead of high-low-medium, but the Amiga engineers must have had some reason for this strange order.) Bits $0-2$ are the enable bits for the red, green, and blue electron guns.

The formula for setting a color register in this mode is also more complicated:
BLUE*512 + GREEN* 64 + INT(RED/2)*
$16+(\text { RED AND } 4)^{*} 2+$ BEN $^{*} 4+$ GEN *2+REN
This formula assumes RED, GREEN, and BLUE range from 0-7; REN, GEN, and BEN (the RGB enable bits) are either 0 or 1 ; that INT takes the integer result of its argument (as in BASIC); and that AND performs a bitwise AND.

## A Binary Tower

Each screen dot, or pixel, derives its color from one of these color registers. How are these dots laid out in memory? For a 32-color mode, each pixel is represented by a five-bit
binary quantity $\left(2^{5}=32\right)$. However, a five-bit quantity does not pack into a byte very well. Therefore, the Amiga maps its screen memory in a different way from most computers.

Traditionally, computers have laid out their screen memory serially, left to right, top to bottom. For instance, the Commodore 64's multicolor graphics mode fits four pixels into a byte, with each bit pair representing one pixel ( $00=$ color 0 , $01=$ color $1,10=$ color $2,10=$ color 3). That's why the Commodore 64's $160 \times 200$ multicolor mode requires 8 K of screen memory. With this memory scheme, to get more colors you would have to group more pixels together. But with five bits needed to store a single pixel on the Amiga, three bits would be wasted in every byte. If the Amiga used a serial scheme to store its display, it would take 64 K to hold a $320 \times 200$ screen with 32 colors.

This problem was solved by grouping the bits a different way. Instead of using horizontally adjacent bits within the same byte to select a color register, the Amiga overlays bytes and reads the bits vertically. For example, all bits in bit position 7 from each of five overlaid bytes form a five-bit quantity. It's as if each pixel were a fivebit tower rising above the screen map. If you cross-section the vertical bytes making up the screen, you get five layers of bits called bit planes.

Each bit plane permits one bit of color definition. The simplest screen has only one bit plane, with one bit per pixel. This arrangement permits only on/off possibilities for each pixel. To get a broader range, you need to add another bit plane. That way, the bit on the primary bit plane and the bit in the corresponding position in the second bit plane permit two bits, or four possibilities of color definition. The accompanying figure shows how the Amiga uses bit planes for color selection, and the table gives a summary of the Amiga's screen modes.

Incidentally, the Amiga has no true text modes like those found on earlier computers. Text is drawn as graphics objects, usually in $640 \times$ 200 graphics, the default mode used by the Amiga's operating system, Intuition.

|  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Annı | mann |  | anno |  |  |  |  |  |  |

This shows how screen memory is mapped serially. Every pixel is represented by a four-bit binary number. We can pack two pixels per eight-bit byte. This scheme is not efficient for packing pixel sizes of three, five, or seven bits.

Below, the pixels are represented as "binary towers." The planes on the right show the three-dimensional figure separated into two-dimensional bit-planes.

A more flexible and efficient way of representing multiple-bit objects (pixels) is to layer the bits "vertically." Each bit-plane is equivalent to one high-resolution screen. A pixel is represented by a single bit position, hence eight pixels per byte. To permit a pixel to represent more than just on or off, additional bit fields are layered. All bits in a corresponding bit position together define a four-bit value.

## Amiga Screen Modes

| Mode | Pixels | Bit Planes | Memory | Onscreen Colors |
| :--- | :---: | :---: | :---: | :---: |
| Normal res, noninterlaced | $320 \times 200$ | 1 to 5 | $8 \mathrm{~K}-40 \mathrm{~K}$ | 2 to 32 |
| Normal res, interlaced | $320 \times 400$ | 1 to 5 | $16 \mathrm{~K}-80 \mathrm{~K}$ | 2 to 32 |
| Hi res, noninterlaced | $640 \times 200$ | 1 to 4 | $16 \mathrm{~K}-64 \mathrm{~K}$ | 2 to 16 |
| Hi res, interlaced | $640 \times 400$ | 1 to 4 | $32 \mathrm{~K}-128 \mathrm{~K}$ | 2 to 16 |
| Hold and modify | $320 \times 200$ | 5 or 6 | 48 K | 256 to 4,096 |
| Hold and modify | $320 \times 400$ | 5 or 6 | 96 K | 256 to 4,096 |

## Bit Planes Save Memory

Although the bit planes are stacked together, don't think of them as multiple, transparent screens. The pile of bit planes creates only one screen. Bit planes are merely a way to make more efficient use of memory. If you don't need 32 colors, use fewer bit planes. Since each bit plane uses 8 K in $320 \times 200$ resolution, memory usage can range from 8 K (one bit plane, 2 colors) to 40 K (five bit planes, 32 colors). Memory usage for the $320 \times 400$ mode can be up to 80 K ; for $640 \times 200,64 \mathrm{~K}$; and $640 \times 400$ uses as much as 128 K . Again, these are only if all allowed bit planes are used. The mininum memory requirement for $640 \times 200$ is 16 K , for a two-color mode.

The Amiga permits up to six bit planes, though only five are used at a time in $320 \times 200$ or $320 \times 400$ resolution. The hi-res $640 \times 200$ and $640 \times 400$ modes use only four bit planes, for a total of 16 colors. Although six bit planes are available, the video circuitry can't fetch more than five bits per pixel in 320 $\times 200$ mode, or it would lag behind the speeding video beam. The video beam that refreshes the picture can't wait, so the video circuitry must keep up with the beam.

That's why $640 \times 200$ and 640 $\times 400$ modes are limited to four bit planes, or 16 onscreen colors. The video circuitry just can't fetch memory fast enough to change twice as many pixels per line. In fact, adjacent pixels cannot always have different colors in the 640 modes. The adjacent values may point to different color registers, but it's not possible to fully change the hardware color output between even and odd pixels in the 640 mode. A dark green pixel to the right of a bright white one may appear gray ("dark white"). Only the luminance information can be effectively changed before the beam has left that pixel position.

## Interlaced Modes

Most personal computers up to now have been limited to a vertical resolution of 200 scan lines (a scan line is the thin horizontal line painted on the CRT by the electron guns as they scan from left to right). However, the Amiga can make use
of interlacing to double the number of scan lines. A TV or monitor displays more than 400 visible scan lines, but normally uses only every other scan line of a screen, filling in the odd lines with data from the even lines. In interlace mode, alternate screen refreshes are shifted up or down by one scan line, permitting full vertical resolution.

Interlacing on the Amiga works like this: In $1 / 60$ second, the first $320 \times 200$ or $640 \times 200$ screen is scanned. Before the phosphors fade, a second $320 \times 200$ or $640 \times$ 200 screen is scanned, shifted down one line to interweave it with the previous screen. The first screen displays even lines, and the second displays the odd lines. The result is doubled resolution-400 scan lines instead of 200.

Because the total picture takes twice as long to display, the phosphors in the even lines begin to fade as the odd lines are drawn. Therefore, some flickering and jittering in the $640 \times 400$ mode is visible. The only way to avoid this would be to redesign the monitor to refresh its screen at a faster rate than $1 / 60$ second (a technique used by the Macintosh and Atari ST monochrome monitors).

The Amiga's video chip is smart enough to handle interlacing with ease. The bit planes are laid out in memory as if there were just one continuous $320 \times 400$ or 640 $\times 400$ screen. You tell the video chip how far to skip ahead in memory to display the next line. By choosing an offset twice the normal line width, you can make the chip skip the odd lines of data for the first scan, then display the next screen from the odd lines, skipping the even lines. This greatly simplifies screen layout. The operating system actually takes care of these details, so you needn't even know how $320 \times 400$ or $640 \times 400$ are supported.

## Dual Playfield Mode

In the normal-res modes, you can set up and overlay two independent graphics screens. A portion of one screen can be transparent to show the underlying screen. You can specify which screen has priority over the other. Each screen can be manipulated independently, even resized and moved over or
under the other.
The overlay screens can use up to three bit planes each, since there are six available. However, you can use fewer bit planes if you want to save memory at the expense of color selection. Three bit planes permit only eight colors per screen, but each screen has its own color palette. And the palettes can contain any of the 4,096 hues, of course.

Dual playfields raise some exciting possibilities. In a game, one screen could show your cockpit window or starship control panel, with the windshield or viewport simply a transparent hole. The secondary screen could show your view of the sky or of the depths of space, visible through the transparent part of the primary screen.

Intuition uses this feature to let you slide down the top screen to see another behind it. For business applications, you could have two spreadsheets or documents running on the two screens simultaneously. Each screen can have its own windows, too.

## Fine Scrolling

Scrolling is a technique that lets an actual screen pan across a much larger virtual screen. The actual screen is what you see on the monitor; the virtual screen includes the portions which won't fit on the monitor but can be scrolled into view. Scrolling lets you work with a very large document, spreadsheet, or page of graphics, and also makes for exciting computer games (such as Defender or Eastern Front).

Some computers are limited to coarse scrolling-the actual screen can be scrolled over the virtual screen only in character-sized increments. Fine scrolling is a more difficult technique that scrolls the actual screen pixel by pixel.

Fine scrolling is easy on the Amiga. The start of the screen map is found in two memory registers which are bit plane pointers. To scroll the screen up, just change the registers to point one line higher in memory. To scroll down, you subtract the line width from the bit plane pointers, displaying from the previously off-screen line of data.

For horizontal scrolling, a single register lets you shift the screen by up to 16 positions. You must
fetch an extra data word per line to provide the pixels that should appear as the screen is scrolled. After you've scrolled 16 times, the program must perform a coarse scroll by repointing the bit plane pointer to the next word of memory. The whole display appears to move, but you're really just displaying a different section of memory.

## 4,096 Colors At Once

A special video mode lets you display more than just 32 colors at a time. Hold and modify mode can display 4,096 colors simultaneously in the normal-res modes.

It's a difficult mode to use, though. Each pixel is defined as a modification of the color of the previous pixel. You can hold this value, and modify a portion of it (hence hold and modify). Instead of bit plane data defining a color register, the bits from bit planes 5 and 6 determine which portion of the previous color output should be modified, and the bits from bit planes $0-4$ are substituted in the selected portion of the color output.

You can define an entire screen of color, even the background color, just by modifying a single color register in this mode. You could start with bright white, then set the blue bits to zero to select yellow. From yellow you can decrease the red level to get green. You could then turn off the green bits to get black, which can in turn be modified to get bright blue. You can modify only the R, G, or B portion, or start over with data from a new color register.

Since color in the hold and modify mode is dependent on previous values, changing one pixel could change the colors of all following ones. It's a difficult mode to use for dynamic displays, so it is best suited for static pictures that need 4,096 colors.

There's much more to the Amiga's graphics than we can cover in this article. We haven't even begun to discuss blitter animation, sprites, the copper (video coprocessor), and options like external video mixing, video digitizing, and framegrabbing. It will probably be a while before programmers learn to take advantage of all these features. In the meantime, we'll have a lot to look forward to.

# A Better Way To POKE On The Commodore 64 

Matthew MacKenzie

This "program-writing program" for the Commodore 64 can speed up any BASIC routine that uses POKE to fill large areas of memory. Using clever programming techniques, it writes a new routine that employs fast PRINT statements in place of POKEs.

BASIC programs often require that you fill a certain memory area with data. The data may be a machine language routine, sprite shape definitions, a high-resolution graphics screen, or whatever. In most cases, the job is done with POKE statements: The program READs values from DATA statements and POKEs each value into the computer's memory. Unfortunately, POKE is one of BASIC's slower statements. In fact, it's so slow that some programs display countdown timers during memory-filling operations to tell you how much longer you'll have to wait.

PRINT, on the other hand, is very fast. Though it's intended for a different purpose than POKE, PRINT also puts new values into certain memory locations. After all, the screen is just another memory area in the computer: It consists of

1000 locations numbered from 1024 to 2023, with 1024 at the upper-left corner. When you PRINT the letter $A$ in the upper-left corner of the screen, you're storing a new value in memory location 1024. Because of this similarity, it's possible to store values in memory with PRINT instead of POKE.

However, PRINT's memorychanging ability has certain limitations. Usually, you can print only in the 1000 -character screen memory area. And after you've changed character 999, the screen begins to scroll. The top line of the screen disappears, and everything below that line moves up. Finally, POKE and PRINT use different codes to represent characters, requiring conversion from Commodore ASCII (for PRINT) to screen code values (for POKE).

## POKEing With PRINT

"Print Poker" solves all those problems. If you already have a routine that uses POKEs to fill memory, Print Poker can write a new, faster routine that does the same job with PRINTs. You don't have to understand how the special PRINT technique works to use Print Poker; it automatically creates new BASIC program lines containing every-
thing you need. Type in the program listed below, and then save it. Because this program does some unusual things, be sure to read the following instructions before you try to run it.

As an example, say you've written a routine that puts eight sets of sprite shape data in memory locations 12288-12798. Your routine works fine, but POKEing the data into those 511 locations causes a noticeable delay. The Print Poker program can write a new BASIC routine that uses PRINT to do the same job more quickly. Before you run it, however, you must run your own routine to put the sprite data in memory. (Print Poker works only when the needed data is already in the proper memory area.)

Once that's done, enter NEW. Now you can load and run Print Poker. The program first asks you for beginning and ending addresses. In this case, you want the special PRINT statements to fill locations 12288-12798, so you enter 12288 for the beginning address and 12798 for the ending. This tells the program which memory area to look at when creating the special PRINT statements.

Next, you're asked to enter a starting line number. This is the
first line number of the routine Print Poker is about to write for you．Use whatever line number is appropriate for your routine．Since Print Poker itself uses line numbers from 60000 to 60380 ，use numbers considerably below 60000 to pre－ vent a conflict．The program also asks you for a line increment．Since you won＇t have any reason to edit the new routine after it＇s made，line increments of two or five are fine．

Finally，you＇re asked whether Print Poker should delete itself when it＇s finished．If you＇re creat－ ing only one new routine，press $Y$ to answer yes．Press $N$ for no if you＇re creating two or more sets of special PRINT statements in a single ses－ sion．（Use RUN 60000 to run Print Poker a second time．You should always delete Print Poker the last time it＇s used．）

## One Program Writes Another

After you answer all the prompts， Print Poker goes to work，using the dynamic keyboard technique to write each line of your new routine．The program itself is writing another program．First，it puts a line number and the needed characters on the screen．Then it stores the line in BASIC memory just as if you＇d moved the cursor to that line and pressed RETURN．When large memory areas are involved，this may take a couple of minutes．After the program stops and the blinking cursor reappears，your new routine is complete，ready to be saved and incorporated into a program．

The special PRINT statements look quite strange，of course．Be－ cause POKE can take any value from 0 to 255，the equivalent PRINT statement is usually a col－ lection of graphics characters，in－ cluding some nonprinting character values like CHR\＄（2）．Such lines are difficult if not impossible to edit． Thus，it＇s best to use Print Poker only when your data is in final form （after you＇ve finished making changes in the sprite shapes and so on）．If you must make a change， you＇ll find it much easier to change and rerun the POKE version of your routine，and then run Print Poker again．

It took some creative program－ ming to overcome PRINT＇s limita－
tions．The value stored in location 648 tells the 64 where in memory PRINT should put its data．By care－ fully manipulating the value in 648， you can divert PRINT＇s output to any memory location in the com－ puter and defeat screen scrolling as well．When Print Poker has fin－ ished its work，it sets everything back to normal with POKE 648， 4 ． Note that this technique does not work correctly in the highest 256 bytes of memory used by BASIC （locations 40740－40959）．Use the conventional POKE method to put data in those locations．In addition， if you intend to put data at the top of BASIC user space，with Print Poker or without it，remember to move down the top－of－BASIC and top－of－string storage pointers to protect your data．

## Print Poker

# Adding TIME\$ To Atari 

Kenneth S. Szajda

Here's a useful routine that adds a missing feature to Atari BASIC: TIME\$. Now your programs can have realtime clocks and timed loops without PEEKs or POKEs. Requires only 8K RAM for cassette or 16K RAM for disk (with DOS 2.0, 2.5, and 3.0).

Atari BASIC is a very versatile and useful language. However, like all computer languages, it is not perfect. One useful feature that Atari BASIC lacks is the TIME function. For beginners, TIME $\$$ provides a method to accurately time loops; for advanced programmers, TIME $\$$ is a useful tool for avoiding the system timers, saving a lot of extraneous coding.

Timing from BASIC usually comes in two forms: TIME\$ and TI (or some other appropriate numeric variable). Both supply the same information, but TIME\$ represents the time as "HH:MM:SS" (or "HHMMSS") and TI represents the time in jiffies ( $1 / 60$ second). In general, TIME is more useful because it is already formatted and ready for printing. Program 1 adds the TIME\$ function to Atari BASIC, giving you easy access to the time without ever touching the system timers.

## A Few Rules

Since we're patching this function into Atari BASIC, there are a few rules to follow for it to work properly. First, TIME $\$$ must be DIMensioned like any other string variable, and it must be the first variable of any kind to appear in
your program. To DIMension it, always use DIM TIME\$(8). To activate the routine, use $\mathrm{A}=\operatorname{USR}(1536)$ after it has been loaded into memory. (The routine automatically changes the dimension to eight and the length to eight no matter what you specify in the DIM statement, but it is best to use the correct value to avoid slight inaccuracies rippling throughout BASIC as a result.)

Second, TIME\$ must always be the first variable BASIC sees when you LOAD or ENTER a program. If a new program is typed in with TIME $\$$ as the first variable, no problems will result. However, adding TIME\$ to a program already on tape or disk is a little tricky, but not very difficult. First, load your program into the computer (using LOAD or ENTER). When the READY prompt appears, add DIM TIME\$ (8): $\mathrm{A}=\mathrm{USR}(1536)$ as the very first executable (non-REM or DATA) line in your program. Then add any features using TIME\$ to your program. (This step can be done at any time as long as the first line is already in the program.) Then store the program on tape or disk with the LIST command.

Using SAVE instead of LIST disables TIME\$ when the program is loaded, because TIME $\$$ will not be the first variable in BASIC's variable name table (which holds the name of every variable in your program). If you want to store the program with SAVE rather than LIST, just type NEW (to clear the variable name table) and reENTER the program after you have LISTed it to tape or disk. This rewrites the variable name table in the order that
the variables appear in the program: TIME \$ should be first.

Once TIME $\$$ is first in the variable name table, subsequent SAVEs will not change its position, and everything will work smoothly.

The last rule, and probably the most important, is to avoid the CLR command. When CLR is executed while TIME $\$$ is activated, the time will be lost and TIME\$ will show "junk." Then you'll have to either type NEW and repeat the steps above or simply rerun the program (since RUN clears all variables and cleans things up).

## An Autoboot Routine

The $A=\operatorname{USR}(1536)$ statement after the DIM statement actually sets TIME\$ to "00:00:00" and activates the routine. The time will be expressed in military format, from 00:00:00 to 23:59:59. Then it returns to 00:00:00 and begins to count upward again.

The TIME $\$$ program was written to be used as an autoboot fileAUTORUN.SYS with disk and a boot tape with cassette. For a diskbased system, run Program 1 and specify disk at the prompt. Remember, however, that this will erase an existing AUTORUN.SYS file on the disk, unless the AUTORUN.SYS file is locked, in which case the SAVE will fail.

For cassette-based systems, run Program 1 and specify cassette. The loader program will modify the TIME \$ routine to make a boot tape.

In either case, loading the program on power up is simple. For disk, just boot up with the disk containing the AUTORUN.SYS file.

The routine loads into memory and can be activated with the DIM TIME (8):A $=\operatorname{USR}$ (1536) sequence. For cassette, boot the program by holding down the START button while turning on the computer. Press RETURN when the buzzer sounds, and the program automatically loads into memory. Again, activate the routine with the DIM TIME (8): $A=\operatorname{USR}$ (1536) sequence.

You can set the time by using normal string manipulations. For example, to set TIME\$ to 11 a.m., just type TIME $\$=$ " $11: 00: 00$ ". If you press SYSTEM RESET, the time will not be stopped. Once started, the only way to stop the time is to use NEW. As long as TIME\$ remains first in the variable name table, the counter will continue to update the time. No other special commands or techniques are required.

To see TIME \$ at work, try running Program 2 after TIME $\$$ is activated. The program asks for the current time and the time to sound an alarm (both in HH:MM:SS format). The computer displays the time until the alarm time arrives and then sounds five bell characters. Program 2 shows how TIME \$ can be used like any other string variable.

## How TIME\$ Ticks

The TIME \$ routine takes advantage of the Atari's timers. Atari computers contain many timers, but the ones most often used are the five two-byte timers at memory addresses 536-545 (\$218 to \$221 hex). Each timer is set up in the usual 6502 least significant byte (LSB), most significant byte (MSB) order.

Unlike most of the other system timers, however, these timers count down to zero instead of counting up from zero. During each vertical blank period, each timer is decremented. Since a vertical blank occurs every $1 / 60$ second and the highest timer value possible is 65535, the timers can time a maximum of 18 minutes, $121 / 4$ seconds each. When a timer counts down to zero, one of two things happens: Either a flag is set or a JSR (machine language Jump to SubRoutine) is executed. For timers 3, 4, and 5, a flag is set: CDTMF3 (address 554,
\$22A hex) for timer 3, CDTMF4 (556, \$22C hex) for timer 4, and CDTMF5 $(558, \$ 22 E$ hex) for timer 5. When timer 1 or 2 counts down to 0, a JSR is executed through CDTMA1 ( 550 and 551, \$226 and $\$ 227$ hex) for timer 1, and CDTMA2 (552 and 553, \$228 and $\$ 229$ hex) for timer 2.

TIME uses timer 2. Timer 3, 4, or 5 would require another routine to monitor the appropriate flag. Timers 2 through 5 are stopped during critical vertical blanks, which occur during input/output with peripherals. Timer 1 seems ideal, since it's the only timer that isn't affected by the critical vertical blanks. However, the serial input/ output handler (SIO) uses it as a device timeout timer (to provide us with the ever-famous ERROR-138). So the TIME\$ routine is forced to use timer 2.

Furthermore, to create an interrupt every second, the routine stores a value of 60 into the timer (remember, the timer is decremented every $1 / 60$ second), and the interrupt service routine resets the timer to 60 at each interrupt. The only drawback is that input/output with peripherals temporarily stops the timer, and TIME\$ will be slightly behind the true time (but can be easily changed as shown above).

## Startup Routines

The initial call to the startup routine checks to see if TIME\$ is the first variable and, if so, sets up the vector for the interrupt update routine, intercepts the SYSTEM RESET initialization vector (to keep the interrupt routine going after a SYSTEM RESET), determines the address of TIME\$, sets its length and dimension to eight, initializes TIME\$ to 00:00:00, and returns to BASIC. The interrupt service routine again checks to make sure TIME\$ is the first variable (just in case a NEW was executed), determines the address of TIME\$ again (since its address may change as a result of additions and corrections to the program in memory), sets the length and dimension to eight (just in case), and resets the timer value to 60 to cause another interrupt one second later.

Of course, during this entire process, TIME $\$$ is updated to reflect
the change in time. If a NEW has been executed since the last interrupt, the value of TIME\$ is not updated and the timer is not reset to 60. In other words, if a NEW occurs, the routine effectively dismantles itself. The routine must be restarted with another DIM TIME\$(8):A = USR (1536) sequence.

The program traps NEW but not CLR because it is difficult to tell when a CLR has been executedCLR does not cause any actions within BASIC's tables that could not be caused by some other command or routine. Since NEW effectively blocks the variable name table, it is relatively simple to check for.

Please refer to "COMPUTEI's Guide to Typing In Programs" before entering these listings.

# Apple Program Protector 

Boris Troyanovsky

Do you have an Applesoft BASIC pro－ gram you want to protect from prying eyes？With this technique，you can keep other people from listing your programs－while still giving them the freedom to make copies．For all Apple II－series computers with DOS 3．3．
＂Apple Program Protector＂is an easy to use utility that keeps other people from listing your BASIC and machine language programs．It works by moving the disk catalog on the protected disk to another track，and by preventing users from breaking out of the program by pressing CTRL－C or RESET．The only requirement is that your pro－ gram must run itself when the user boots the disk．

It＇s easy enough to ensure that
the program runs automatically when the disk is booted．DOS 3.3 always loads and runs a BASIC pro－ gram whenever a disk is booted if the program is named HELLO． Only a single BASIC program can be started in this way．If you wish to have more than one BASIC pro－ gram on the protected disk，you must make HELLO a menu pro－ gram that allows you to select the desired program from the disk．If the program you wish to protect is written in machine language，you can use HELLO to start it．For ex－ ample，if you want to protect a pro－ gram named MLGAME，your HELLO program might be simply：

10 PRINT CHR\＄（4）；＂BRUN MLGAME＂
The next step is defend against CTRL－RESET and CTRL－C．In each BASIC program on the disk you
wish to protect，add these two lines： 0 POKE 1011，0：ONERR GOTO 63999 63999 RESUME

The POKE in line 0 defends against the CTRL－RESET key（or just RESET on some Apples）．If the CTRL－RESET key is pressed，any Applesoft BASIC program in mem－ ory is erased and the computer reboots．

Since the CTRL－C interrupt code（which is used to stop program execution）is considered an error by Applesoft BASIC，the ONERR GOTO statement in line 0 transfers program control to line 63999 when CTRL－C is encountered．If your program uses ONERR to test for other conditions，include the state－ ment IF PEEK（222）$=255$ THEN 63999 in your error testing．This ensures that CTRL－C is still trapped．

Machine language programs can be protected in this way, too. Just add these lines to your source code:

## LDA \#\$00

STA \$03F3
Like the BASIC lines above, these instructions erase the program from memory and reboot the computer if CTRL-RESET is pressed.

## Preparing A Protected Disk

Begin by preparing a disk containing the program or programs you wish to protect. If the disk is to contain only one program, load it into memory, insert a new disk, type INIT HELLO, and hit RETURN. If you wish to have several programs on the disk, the HELLO program must be a menu program and the others can simply be saved on disk in the usual manner. Remember to add to each program the lines mentioned above to protect against CTRL-RESET and CTRL-C. Make sure all programs are fully tested and debugged before you run Program Protector. To be safe, you should always keep backup copies of the programs on an unprotected disk.

Next, type in Program 1 below and save a copy on a separate disk. Use the filename PROTECTOR. With the built-in machine language monitor, enter the data from Program 2. (If you are unsure about using the monitor, consult your user's manual.) Save the machine language onto the same disk with Program 1 using the command BSAVE IOB, A 0300 , L\$40.

The Program Protector disk is now ready to use. To protect one of your disks against intrusion by outsiders, follow these steps:

1. Insert the Program Protector disk into the drive (the drive should be addressed as slot 6 , drive 1 ).
2. Type BLOAD IOB.
3. Type RUN PROTECTOR.
4. Program Protector is now loaded into memory. You should see the prompt DESTINATION TRACK: on the screen. Remove the disk with Program Protector and insert the disk that you'd like to protect into drive 1 . Type the number of the track to which you want to move the catalog and press RETURN. The number must be
greater than or equal to 3 (DOS occupies tracks $0-2$ ), and less than or equal to 34 , since there are only 35 tracks (numbered $0-34$ ) on the disk. Also, the number can't be 17, because that's where the catalog is already.
5. The disk drive whirs a bit, then the Applesoft ] prompt reappears. The disk is now protected. If you type CATALOG, you'll be shown an empty directory. If you try to load a program from the protected disk or save an additional program to it, you'll get nothing but a DISK FULL error message. However, if you now boot the protected disk, the HELLO program loads and runs normally, except that CTRL-C no longer stops the program and CTRL-RESET only reboots the system.

There is a way to regain access to the programs on the protected disk. Boot a normal disk, then enter POKE $44033, n$ (substitute for $n$ the number of the track to which the catalog was moved). You can now display the catalog and load and save programs. You can also use this technique if the program you're protecting needs to access another program on a different disk. To let the program know where the catalog of the new disk is, POKE 44033 with the catalog track of the disk you'd like to access.

Don't try to relocate the catalog on a disk more than once. The results are unpredictable.

## Variable Accuracy

There are a few more points about integer variables that we didn't cover last month-including some important exceptions to general rules.

Note that in some versions of BASIC, such as Commodore BASIC, you aren't allowed to use integer variables as counters in FOR-NEXT loops. In other words, a statement such as FOR X\%=1 to $10:$ NEXT X\% would cause an error. However, integer variables can be used as counters in IBM BASIC. Just remember that because integer variables are restricted to a minimum value of $-32,768$ and a maximum of 32,767 , you'll have to make sure your loops don't exceed those limits.

In some BASICs, there's also one exception to the rule about denoting all integer variables with the \% symbol. In IBM BASIC, for instance, you can insert a DEFINT (define integer) statement near the beginning of the program to define a whole group of variable names as integer variables by default. The statement DEFINT A-M declares that all variable names beginning with the letters A through M are automatically integer variables. Since integer variables execute faster and consume less memory on the IBM than regular variables, a DEFINT statement can improve a program's performance. (Remember from last month that integer variables don't save memory and actually run slower on Commodore and Apple computers.)

Incidentally, another way to speed up your programs is to replace frequently used constants with variables. In most Microsoft BASICs, variables execute faster than constants (the reverse is true of Atari BASIC). By predefining the most commonly used numbers (usually $0-10$ ) as variables, statements such as $\mathrm{Y}=\mathrm{Y}+1$ can be changed to $Y=Y+C 1$. And if you're programming on an IBM, you can define them as integer vari-
ables and pick up even more speed. Try this technique in your next program and see if it adds a little zip.

## Improving Precision

Another type of variable is provided in some BASICs to improve mathematical accuracy. Called double-precision variables, they can help avoid the small rounding errors that sometimes accumulate and cause strange results. (Rounding errors are slight discrepancies that can crop up when the computer converts our everyday decimal numbers to its internal system of binary numbers, performs some arithmetic, and then converts the answer back into decimal again.)

Double-precision variables are available in IBM BASIC and some versions of TRS-80 BASIC, but not in Commodore BASIC, Applesoft, Atari BASIC, or TI BASIC. Even if your BASIC doesn't have doubleprecision variables, however, they're worth learning about. As personal computers grow more powerful, you're sure to encounter such features sooner or later.

Here's an example which demonstrates a common type of rounding error-in this case, on the IBM PC/PCjr. This program initializes the variable $Y$ to 100 , then subtracts the value .05 ten times using a FOR-NEXT loop. The final value of Y is printed after the loop is finished.
$10 \mathrm{Y}=100$
20 FOR $X=1$ TO 10
$30 \mathrm{Y}=\mathrm{Y}-.05$
40 NEXT X
50 PRINT Y
The answer, of course, should be 99.5. Instead, here's the program's answer:
99.49997

If you swap the statements in lines 40 and 50 so the program prints the current value of Y after each pass through the loop, you'll see that the rounding error starts
with the second calculation and keeps increasing until the final result is off by .00003 . That's not a huge discrepancy-but still, if this were some kind of banking program that was subtracting a nickel-a-day service charge from customer accounts over a period of time, someone might be cheated out of a penny now and then. (It's happened to me, by the way.)

Fortunately, you can program the computer to deliver a better answer. To convert $Y$ from a regular (single-precision) variable into a double-precision variable, add the \# symbol to every occurrence of Y in lines 10,30 , and 50 . The modified program yields this result:

### 99.49999999254942

Well, even computers aren't perfect. This time the rounding error starts with the first calculation, although the errors are smaller and the final answer is off by only .0000001192093 . For even greater accuracy, we can define the value of .05 as a double-precision constant by adding the \# symbol to .05 in line 30. Here's the result:

### 99.49999999999999

This is even more accurate; now the computer is off by only .00000000000001 . Furthermore, by switching lines 40 and 50 to see the results of each calculation through the loop, you'll notice that all the intermediate answers are exactly correct. That still leaves us with an infinitesimal error in the final answer, however. If you're a stickler for absolute accuracy, there are ways to get around these runaway fractions-but that's a topic for a future column.

## Personal Computers And Personal Freedom

Last July I spent a day in Colonial Williamsburg, Virginia, catching a glimpse of life as it was in the mid1700s. The publishing exhibit particularly caught my attention. One could see paper being made by hand-a process that required skill and strength on the part of the craftsman, and which took a long time. In the print shop one could see the pages of a book being printed from hand-set type-another expensive and time-consuming process. The bindery exhibit showed how the printed pages were folded into signatures and stitched together by hand before being bound in leather.

It was clear from this exhibit that access to books was limited to the wealthy. The cost of spreading the printed word was quite high, and yet this period gave us a rich collection of people who had much of importance to say-Patrick Henry and Thomas Paine, to name just two.

As I thought about our advances in communication technology since that period-typewriters, copiers, computers, and so on-it became clear that the reduced cost of communication was one of the main reasons that literacy could spread to the public at large. The printed word has spread like wildfire, carrying messages into homes that would have been bookless in the 1700 s .

The freedom to communicate is one of our most treasured freedoms. There are nations on this planet where individual ownership of copiers and computers is forbidden. It is easy to see why-it's important for a totalitarian government to control the flow and distribution of information. Otherwise, individuals could create, publish, and distribute their own ideas without the censorship of the state.

## Computer Publishing

Prior to the widespread sale of personal computers, we had restric-
tions of our own that limited the widespread dissemination of ideas.

Before an opinion can be expressed in printed form, the author must either convince a publisher that it is worth expressing, or must elect to publish it alone. Even if a publisher accepts a work, it will reach an audience only if stores decide to stock it.

Suppose you've written something you think others might like to read-a collection of poetry, for example, or a political treatise. You may find that traditional publishers are not interested in your material because your market is too specialized. Or, you may find that they are interested, but that if you wait the four to six months (or longer) that it takes for your words to be printed, your material will have lost its currency and impact.

In this case, you may elect to publish the material yourself.

Prior to the personal computer, you might be restricted to running copies of your material at the local print shop. Depending on the size of your document, you may find that it costs several dollars per copy to have it printed.

But, in an era where personal computers are increasingly commonplace, there's another way of publishing your ideas-especially if what you have to say is of particular value to others who own computers. You can publish your ideas on a disk! Disks are inexpensive, reusable, and can be duplicated as needed. Publishing your material on disk lets you fix mistakes quickly without having to wait for a new printing. Your material might consist of text files that can be read with a word processor, or you can write your own program that lets people read or print your files as they choose.

However, along with the freedom to publish your own materials in the privacy of your home using
nothing more than your personal computer there comes a responsibility. It is correctly said that the pen is mightier than the sword. As your own publisher, you can say anything you wish, but you must always keep in mind that the printed (or displayed) word is very powerful. Think your ideas through carefully before publishing them.

## Talking Books

I recently used this publication technique for my book In Search of the One-Minute Megatrends-Surviving the Bad Times in Silicon Valley (Innovision Press, \$12.95). While the information in this book is of potential interest to a broader audience, I initially made it available on a Macintosh disk, since that's the computer with which I do most of my writing. As I was creating the book, it occurred to me that this method of publishing had much greater flexibility than the printed page. For example, readers could change the typeface and size if they desired.

I also included a set of files on the disk that lets the book read itself aloud to the user with the SmoothTalker speech synthesizer from First Byte. This not only provides another alternative for reading the book, but also makes the material available to those with impaired vision.

While this book is not available in stores, I have been able to sell it quite well through direct mail by placing inexpensive advertisements in regional computer-interest newspapers. The success of this venture convinces me that anyone with a message of interest to computer owners can be an author and a publisher as well.

If only the founding fathers could see us now!

# Faster Than A Speeding Byte 

Last month I mentioned Fastlink, a new 10,000 bits per second modem from Digital Communications Associates. Not only is it five times faster than the latest "high-speed" 2400 bps modems, it even works over regular telephone lines. Until now, anything close to $10,000 \mathrm{bps}$ required you to lease special datagrade lines from the phone company. But not the DCA Fastlink. Although the Fastlink's \$2,000 price tag is a little rich for most casual users' blood, there has been a fair amount of incredulous reaction like "how the heck can they do 10,000 bits per second?" from readers of this column (and even from my editor).

While the subject is a bit technical, I've distilled an explanation that will either satisfy your curiosity or teach you never to ask me about this sort of thing again. To get started, let's review our old friend, the ordinary 300 bps modem.

Modems exchange information over phone lines by transmitting and receiving audio tones. A 300 bps modem transmits over two channels, one for each direction. Each second of time is divided into 300 slices, and each slice is called a baud. A 300 bps modem packs one bit into each baud (1200 and 2400 bps modems both operate at 600 baud and pack 2 and 4 bits into each baud, respectively). One channel transmits signals in the audio range of 1070-1270 hertz, and the other at 2025-2225 hertz. That means each channel has a fairly wide bandwidth ( 200 hertz), and they're separated by a guard band of no signal ( 755 hertz wide) that makes it easy for the modem circuitry to differentiate between the two channels.

DCA's Fastlink uses a very low 7.3 baud rate, so it can drastically narrow the channel bandwiths and guard bands. The Fastlink also uses the entire $0-4000$ hertz audio spec-
trum of normal phone lines. When two Fastlink modems link up, they attempt to establish a maximum of 512 separate channels, each 7.8 hertz apart. They analyze each channel to determine which ones are noise-free enough to handle transmission techniques that pack 4 or 6 bits into each time slice, or baud.

Then the Fastlink transmits data by using a hybrid parallel/serial system ( 300 bps modems send data in a serial stream of bits-one bit after another with one bit per baud). The bits carried by all channels in use during one baud are considered a single packet of information. Outgoing data bits are assigned to channels as they're prepared for sending (with either 4 or 6 bits per channel), beginning with the channels at the lowest frequencies. Once the packet is assembled, it's sent across the active channels. So the data is sent in parallel within the packets, and the packets themselves are sent serially.

## Blistering Speed

Using the Fastlink method, the maximum theoretical throughput is 512 channels $\times 6$ bits per baud $\times$ 7.3 baud per second, or more than 20,000 bps. Given the quality of most voice-grade lines, that limit is very theoretical. Most channels operate at only 4 bits per baud, and throughput is further limited by the overhead of error detection and correction, which is automatically handled by Fastlink. All these factors reduce the Fastlink's actual throughput to a blistering 10,000 bps on local phone lines. A Fastlink modem operating on lines provided by the most popular long-distance carrier should work at about 8,000 bps . On the lines provided by other common carriers, the Fastlink averages about $7,000 \mathrm{bps}$.

The Fastlink monitors the quality of the phone line during the
linkup, shutting down channels that become marginally acceptable or opening up channels if quality improves. DCA refers to the process as DAMQAM, or Dynamically Adaptive Multicarrier Quadrature Amplitude Modulation (say it five times fast). To handle all this data manipulation and line monitoring, the Fastlink is actually a fullfledged, highly specialized computer with a megabit of memory and two central processing units-a Motorola 68008 working in tandem with a Texas Instruments 320.

There are some fine points to keep in mind while daydreaming about cruising along at $10,000 \mathrm{bps}$. The Fastlink dynamically assigns channels to incoming or outgoing data based on the volume going back and forth. If there is an equal amount of data moving in both directions, the Fastlink channels would be equally divided between incoming and outgoing data, resulting in an effective maximum speed of only $5,000 \mathrm{bps}$ for each data stream.

In practice, the data flow is usually quite lopsided, with ratios of 99 to 1 more common than 50:50. So the bulk of data flow on a Fastlink is assigned the lion's share of channels, resulting in throughput that is very close to the 10,000 bps ideal.

Fastlink modems currently come in two flavors. An internal version for the IBM PC and compatibles goes for $\$ 1,995$ and includes a special version of Microstuf's Crosstalk program adapted for the Fastlink. An outboard RS-232 Fastlink is priced at $\$ 2,395$. Both modems are also capable of communicating at plain old 300 or 1200 bps with non-Fastlink modems. If you're still curious, you can get even more information by contacting DCA at 1000 Alderman Drive, Alpharetta, GA 30201.

# The Case Of The Phantom Programmers 

Earlier this year I wrote about one of my high school assistantsHoward Boggess, my "Computer Handyman." This time I'd like to introduce you to another one of my assistants-Hunter Baker, my "Phantom Programmer."

Like Howard, Hunter came to me from David James's computer science class at Patrick Henry High School, here in Roanoke, Virginia. When Hunter arrived at my house on the first day, I took him and his mother to the dark, hot attic where Howard had rescued several brokendown computers (see "The World Inside The Computer," COMPUTE!, January 1985). "This is your first task," I said, with a sweep of my arm. "If you can clean this attic, then I know you can do anything."

Hunter is a quiet, mildmannered person. He simply nodded when I told him to clean the attic. But this was no ordinary attic. And I worried about him every day when he trudged up the attic stairs.

I shouldn't have worried. Sending Hunter into the attic was like sending Cinderella into her stepmother's kitchen, or Hercules into the Augean stables. In a month, Hunter had the attic better organized than the rest of the house. He had everything filed away in labeled filing cabinets and had built a computer database so we could instantly know where to look for our long underwear, computer manuals, extension cords, extra paper, Christmas tree lights, winter gloves and mittens, and RS232 cables.

Then Hunter moved downstairs. When he first confronted the downstairs office, computer software was piled to the ceiling and computer cables and circuit cards spilled out the door into the middle of the living room. But, for Hunter, after facing the horrors of the attic, this awful mess was no more than a tasty dessert. In only a couple of
weeks everything was cataloged, labeled, and filed. The mess had vanished, and Hunter was hard at work at one of the computers.

## Computer Trivia

One day I walked into the room, looked over Hunter's shoulder at a BASIC program on the display screen, and asked him what he was doing. He explained that he and his friend Amy Powell were doing a computer project for National History Day. They planned to create a history trivia game on the IBM computer, and Hunter asked if he and Amy could start coming over to our house after hours to work on the program. "Of course," I said, since I was sure he was only talking about a couple of evenings and maybe a weekend or two.

Ha! After watching Hunter clean the attic and the office, I should have been wiser. Hunter doesn't do anything halfway, and this project was no exception. For the next month, he and Amy came over almost every night after dinner, and most Saturdays and Sundays. They rarely left until the wee hours of the morning.

One night I was awakened around 2 a.m. by strange clicking noises. Alarmed, I tiptoed to the bedroom closet and grabbed the machete my parents had bought me in the Dominican Republic. (The machete was duller than a letter opener, and it had a parrot inscribed on its side, but it looks deadly, especially when I wave it threateningly above my head.)

I made my way cautiously down the stairs. I noticed a light was switched on in the downstairs office. I guessed that a thief must be inside stealing one of my beloved computers!

Leaping down the remaining stairs, I burst into the office, screaming and waving the machete.

It took a moment for my eyes
to adjust to the bright lights in the room. When they did, I noticed Hunter and Amy seated at two IBM computers, working on their History Day program. "We're sorry we're here so late," said Hunter politely.
"Tomorrow's the competition," explained Amy.

## Deactivating BASIC

My coworkers and I have received many requests from owners of the Atari $600 \mathrm{XL}, 800 \mathrm{XL}$ ，and 130 XE for a simple way to turn off the BASIC built into those computers．Of course，the method recommended by Atari is to hold down the OP－ TION button when you boot the system．If you forget to do this when booting a program that doesn＇t require BASIC，the ROM－ based BASIC occupies address space that costs you more than 8,000 bytes of RAM．There are oth－ er reasons for turning off BASIC as well．For instance，you might like to turn it off temporarily to gain extra memory while duplicating a few files or disks．These jobs take less time and fewer disk swaps if the computer can use the 8 K of memo－ ry vacated by disabling BASIC．And avoiding a reboot or two can save time，too．

Our solution is a pair of short machine language programs that let you turn BASIC on and off from DOS．（Note that they can＇t turn off a BASIC cartridge－or any other cartridge，for that matter－so they serve no purpose on the Atari 400， 800，and 1200XL computers．）Atari manuals suggest that turning off the built－in BASIC is as simple as changing one bit in the XL／XE memory control location（which used to control joystick ports 3 and 4 in the 400 and 800 ）．That may be true if you＇re writing a machine language program that takes over complete control of the computer， but in many cases it doesn＇t work．

First，whenever you press the RESET button，the operating sys－ tem restores the built－in BASIC to the state in which you booted it． Second，if you＇re using ordinary graphics mode screens（without a custom display list，etc．），the screen handler doesn＇t use the memory freed by removing BASIC．It thinks you＇re still using a 40 K machine．

Going the other way－turning on BASIC after booting without it－ can be even messier．If you sudden－ ly enable BASIC without doing something about the screen，you＇ll find yourself staring at garbage as BASIC blithely wipes out the dis－ play list，screen memory，and per－ haps more．Fortunately，all of these problems can be solved by follow－ ing these few steps：
1．Turn the built－in BASIC off or on．
2．Tell the operating system you did so．
3．Change the master top－of－RAM pointer．
4．Close channel 0 ，the screen editor．
5．Reopen channel 0.
We can tell the operating sys－ tem we changed the state of BASIC via the flag in memory location 1016 （\＄3F8）．The master top－of－ RAM pointer is RAMTOP at loca－ tion $106(\$ 6 \mathrm{~A})$ ．Channel 0 is closed and reopened to force the screen driver to use the highest available memory．Don＇t worry if that sounds a bit arcane．The program listed here automatically creates two machine language programs that do all the work for you．Be sure to save a copy before you run it．

[^10]DL 830 DATA $211,169,1,141,24$ B，3，169，12，32，24，4
$0684 \emptyset$ DATA $169,192,133,1 \varnothing 6$ ， $169,3,141,66,3,169,42$
ID 86 DATA $141,68,3,169,4,1$ $41,69,3,162,6,76,86$
OK $87 \emptyset$ DATA $228,69,58, \emptyset, 226$ ， $2,227,2, \varnothing, 4$
HH B8ø DATA 5ø45，D：BASICOFF． COM
MF $91 \emptyset$ DATA $255,255, \emptyset, 4,44,4$ $, 173,1,211,41,253,141$
JI 930 DATA $1,211,169,6,141$ ， $248,3,169,12,32,24,4$
OC 94ø DATA $169,169,133,196$ ， $169,3,141,66,3,169,42$
ID 95 D DATA $141,68,3,169,4,1$ $41,69,3,162,9,76,86$
OL 97 DATA $228,69,58$, ， 226 ， $2,227,2, \varnothing, 4$
E6 98ø DATA 5295，D：BASICON．C वM

The program writes two binary files to disk on drive 1 ，naming them BASICON．COM and BASIC OFF．COM．The first turns BASIC on and the second turns it off．To use either of them from DOS，sim－ ply choose the L（load binary file） option and enter the filename when prompted．（OS／A＋and DOS XL users need only type BASICON or BASICOFF in response to the D1： prompt．）

The next time you need to du－ plicate a disk or large file，load BASICOFF．COM first，copy the disk or file，then load BASICON－ ．COM to reactivate BASIC．You＇ll save time，especially on a single－ drive system．If you＇re writing ma－ chine language programs，call BASICOFF as a subroutine when you start your program．

IBM Personal Computing

## A Promise Of Things To Come

When I saw the advertisement for the Key Tronic KB 5152V, I knew it was a product designed with me in mind. Who hasn't dreamed of using a typewriter that will type every word you speak-or better yet, a computer that can understand spoken commands? The KB 5152 V speech-recognition keyboard for the IBM PC, manufactured by Key Tronic of Spokane, Washington, seemed to hold just that promise. While waiting for a demonstration unit to arrive, I had visions of a new, laid-back life. Since my hands would no longer be needed for typing, I could dictate prose while holding a beverage and munching pretzels. Nor would I be restricted to a sitting position. This very col-umn-in the interest of evaluating the product, of course-would be written from my bed.

The new keyboard arrived and plugged right into the socket vacated by the original IBM keyboard. It's an enhanced keyboard with separate numeric keypad and LED indicator lights on the Caps Lock and Num Lock keys. And, of course, there's one other enhancement: A telephone operator's headset that plugs into the back of the keyboard. Without bothering to read the manual, I spoke: "Now type this." Nothing happened, nor had I really thought it would.

The first step to using the keyboard is to teach it a vocabulary. Key Tronic supplies a menu-driven BASIC program that creates a standard ASCII text file-the vocabulary. For example, the vocabulary entry for the color BLUE might appear as BLUE;BLUE. The word to the left of the semicolon is the prompt-the word you speak; the word to the right of the semicolon is what is sent to the PC, just as though it had been typed on the keyboard. It's called the response. Thus, saying "blue" types BLUE. But that doesn't have to be true.

You can teach the keyboard that blue is red and red is white, and it won't be the wiser.

The response characters can be more than one word and may contain characters in braces to represent keys, such as Enter, Backspace, and the special function keys. You can also define responses by keyboard scan codes or ASCII codes, so every key and key combination is accessible.

Once the written vocabulary is defined, the keyboard must be taught to recognize each word-or, more accurately, how the user pronounces each word. This is accomplished with a training session using the same BASIC program. As the computer displays each word from the vocabulary, you pronounce it at least three times. Of course, the keyboard doesn't know whether the pronunciation is cor-rect-it can't even distinguish English from Greek or Chinese. It merely associates your pronunciation with the vocabulary word.

## Voiceprinting

How does this work? The keyboard converts the sound into a pattern of zeros and ones called a voiceprint. As you speak, the keyboard tries to match what it hears with a previously recorded voiceprint stored in its memory. If it finds a match, the keyboard sends the appropriate word to the PC, just as though the word had been typed.

Voiceprints are stored on disk so you won't have to retrain the keyboard each morning, and the keyboard lets you mix spoken and typed input.

Following this procedure, I trained my keyboard for six words and said, "Now type this." The screen remained blank.

The manual advises, "Your voiceprints in the morning are slightly different from your voiceprints in the afternoon. Therefore
you can train a vocabulary in the morning, then in the afternoon update it a few passes to build some variation into the voiceprints." With that in mind, I built variation into my vocabulary, and tried again: "Now type this." The keyboard responded by typing this on the computer screen.

On the subject of recognition, the manual continues, "First-time users of speech recognition products usually have poor recognition for the first few days. After working with the equipment, the ability to achieve good recognition improves dramatically. The reason for this improvement is learning to relax." When I relaxed and spoke more slowly (and stopped eating pretzels and drinking beer), the keyboard performed beautifully: type this now type blue now type this blue. But there's only so much that can be written with six or even 160 words. And 160 words is the vocabulary limit.

Of course, the keyboard has more serious uses than accommodating a lazy writer. As a relatively inexpensive (\$995) speech-recognition product for the IBM PC, it has both industrial and personal applications. Voice recognition can be a big help to the physically handicapped. One of Boeing Computer Systems' sharpest programmers is a quadraplegic who uses a workstation built around an IBM PC-XT and a Key Tronic speech-recognition keyboard. He writes programs in BASIC and Pascal and develops spreadsheets using Lotus 1-2-3.

Voice recognition for the IBM PC is not advanced enough that I could comfortably write this column from a horizontal positionbut surely the Key Tronic keyboard is a promise of things to come.

## The States Of The Union

I have previously written programs to identify the states and their capi－ tals in certain regions（＂Southern States，＂COMPUTE！，August 1984； ＂Western States＂and＂New Eng－ land States，＂Programmer＇s Refer－ ence Guide to the TI－99／4A， COMPUTE！Books）．Now，after nu－ merous requests，I＇ll demonstrate a program for the middle Atlantic states．

The central portion of the Unit－ ed States can be outlined on a map as I did with the Southern States and Western States programs．How－ ever，some of the middle Atlantic states such as Delaware，Maryland， and New Jersey are too small to outline adequately on the TI－ $99 / 4 \mathrm{~A}$ ．The color－blinking method used in the New England States program won＇t work，either，be－ cause more color sets are needed than are available．Therefore，I＇ve used a slightly different method for the region which includes Delaware， Maryland，New Jersey，New York， Pennsylvania，Virginia，and West Virginia．The states are drawn in high－resolution graphics with some color sets used for more than one state．

When a question mark appears on a state，the student types in the state＇s name．If the response is cor－ rect，the program asks for the state capital．

Be careful typing the DATA statements－make sure the commas are placed correctly．Lines 290－380 contain definitions for graphics characters．Lines 820－840 contain sets of row，column，and character numbers for drawing the graphics．

If you wish to save typing effort，you can obtain a copy of this program by sending a blank cas－ sette or disk，a stamped，self－ addressed mailer，and $\$ 3$ to：
C．Regena
P．O．Box 1502
Cedar City，UT 84720

Please be sure to specify the title（＂Middle Atlantic States＂） and that you need the TI version．

# COMPUTEI's Guide To Typing In Programs 

Before typing in any program, you should familiarize yourself with your computer. Learn how to use the keyboard to type in and correct BASIC programs. Read your manuals to understand how to save and load BASIC programs to and from your disk drive or cassette unit. Computers are precisetake special care to type the program exactly as listed, including any necessary punctuation and symbols, except for special characters as noted below. To help you with this task, we have implemented a special listing convention as well as a program to help check your typing-the "Automatic Proofreader." Please read the following notes before typing in any programs from COMPUTE!. They can save you a lot of time and trouble.

Commodore, Apple, and Atari programs can contain some hard-toread (and hard-to-type) special characters, so we have developed a listing system that indicates the function of these control characters. (There are no special control characters in our IBM or TI-99/4A listings.) You will find Commodore and Atari special characters within curly braces; do not type the braces. For example, \{CLEAR\} or \{CLR \} instructs you to insert the symbol which clears the screen on the Atari or Commodore machines. For Commodore, Apple, and Atari, a symbol by itself within curly braces is usually a control key or graphics key. If you see $\{A\}$, hold down the CTRL key and press $A$. This will produce a reverse video character on the Commodore (in quote mode), a graphics character on the Atari, and an invisible control character on the Apple. Commodore computers also have a special control key labeled with the Commodore logo. Graphics characters entered with the Commodore logo key are enclosed in a special bracket that looks like this: KA>>. In this case, you would hold down the Commodore logo key as you type A. Our Commodore listings are in uppercase, so shifted symbols are underlined. A graphics heart symbol (SHIFT-S) would be listed as $\underline{\mathrm{S}}$. One exception is \{SHIFT-SPACE\}. When you see this, hold down SHIFT and press the space bar. If a number precedes a symbol, such as $\{5$ RIGHT $\},\{6$
$\underline{S}\}$, or $[<8 Q>]$, you would enter five cursor rights, six shifted S's, or eight Commodore-Q's. On the Atari, inverse characters (printed in white on black) should be entered after pressing the inverse video key.

Since spacing is sometimes important, any more than two spaces will be
listed. For example, $\{6$ SPACES $\}$ means to press the space bar six times. Our listings never leave a space at the end of a line, instead moving it to the next printed line as $\{S P A C E\}$. For your convenience, we have prepared this quick-reference chart for the Commodore and Atari special characters:

## Atari 400/800/XL/XE

| When you see | Type |  | See |  |
| :---: | :---: | :---: | :---: | :---: |
| \{CLEAR\} | ESC | SHIFT < | $\cdots$ | Clear Screen |
| \{UP) | ESC | CTRL | $t$ | Cursor Up |
| [DOWN\} | ESC | CTRL = | $\downarrow$ | Cursor Down |
| \{LEFT\} | ESC | CTRL + | $\leftarrow$ | Cursor Left |
| [RIGHT) | ESC | CTRL | $\rightarrow$ | Cursor Right |
| \{BACK S $\}$ | ESC | DELETE | 4 | Backspace |
| \{DELETE\} | ESC | CTRL DELETE | kI | Delete character |
| \{INSERT\} | ESC | CTRL INSERT | 17 | Insert character |
| \{DEL LINE\} | ESC | SHIFT DELETE | T | Delete line |
| \{INS LINE\} | ESC | SHIFT INSERT | 5 | Insert line |
| \{TAB\} | ESC | TAB | - | TAB key |
| \{CLR TAB\} | ESC | CTRL TAB | \| | Clear tab |
| \{SET TAB\} | ESC | SHIFT TAB | E | Set tab stop |
| \{BELL\} | ESC | CTRL 2 | [ | Ring buzzer |
| \{ESC\} | ESC | ESC | E | ESCape key |

## The Automatic Proofreader

We have developed a series of simple, yet effective programs that can help check your typing. Type in the appropriate Proofreader program listed below, then save it for future use. On the VIC, 64 , or Atari, run the Proofreader to activate it, then enter NEW to erase the BASIC loader (the Proofreader remains active, hidden in memory, as a machine language program). Pressing RUN/ STOP-RESTORE or SYSTEM RESET deactivates the Proofreader. You can use SYS 886 to reactivate the VIC/64 Proofreader, or PRINT USR(1536) to reenable the Atari Proofreader. On the Apple, the Proofreader automatically erases the BASIC portion of itself after you activate it by typing RUN, leaving only the machine language portion in memory. It works with either DOS 3.3 or ProDOS. Disable the Apple Proofreader by pressing CTRL-RESET before running another BASIC program. The IBM Proofreader is a BASIC program that simulates the IBM BASIC line editor, letting you enter, edit, list, save, and load programs that you type. Type RUN to activate.

Once the Proofreader is active, try typing in a line. As soon as you press RETURN, either a decimal number (on the Commodore), a hexadecimal number (on the Apple), or a pair of letters (on the Atari or IBM) appears. The number or pair of letters is called a checksum. Try making a change in the line, and notice how the checksum changes.

All you need to do is compare the value provided by the Proofreader with the checksum printed in the program listing in the magazine. In Commodore listings, the checksum is a number from 0 to 255 . It is set off from the rest of the line with rem. This prevents a syntax error if the checksum is typed in, but the REM statements and checksums need not be typed in. It is just there for your information.

In Atari, Apple, and IBM listings, the checksum is given to the left of each line number. Just type in the program one line at a time (without the printed checksum) and compare the checksum generated by the Proofreader to the checksum in the listing. If they match, go on to the next line. If not, check your typing: You've made a mistake. On the Commodore, Atari, and Apple Proofreaders, spaces are not counted as part of the checksum, so be sure you type the right number of spaces between quote marks. The Commodore and Atari Proofreaders do not check to see that you've typed the characters in the right order, so if characters are transposed, the checksum still matches the listing. Because of the checksum meth-
od used, do not type abbreviations, such as ? for PRINT. The IBM Proofreader is the pickiest of all; it will detect errors in spacing and transposition. Be sure to leave Caps Lock on, except when typing lowercase characters.

## IBM Proofreader Commands

Since the IBM Proofreader replaces the computer's normal BASIC line editor, it has to include many of the direct-mode IBM BASIC commands. The syntax is identical to IBM BASIC. Commands simulated are LIST, LLIST, NEW, FILES, SAVE, and LOAD. When listing your program, press any key (except Ctrl-Break) to stop the listing. If you type NEW, the Proofreader prompts you to press Y to be sure you mean yes.

Two new commands are BASIC and CHECK. BASIC exits the Proofreader back to IBM BASIC, leaving the Proofreader in memory. CHECK works just like LIST, but shows the checksums along with the listing. After you have typed in a program, save it to disk. Then exit the Proofreader with the BASIC command, and load the program in BASIC as usual (this replaces the Proofreader in memory). You can now run the program, but you may want to resave it to disk. The version of your program that you resave from BASIC will take up less space on disk and will load faster, but it can no longer be edited with the Proofreader. If you want to convert a program to Proofreader format, save it to disk with SAVE "filename",A.

## Special Proofreader Notes For Commodore Cassette Users

The Proofreader resides in a section of memory called the cassette buffer, which is used during tape LOADs and SAVEs. Therefore, be sure to press RUN/STOP-RESTORE to get the Proofreader out of the way before saving or loading a program. If you want to use the Proofreader with tape, run the Proofreader, then enter these two lines exactly as shown, pressing RETURN after each one:

AS ="PROOFREADER.T":B\$=" 10 SPACES $\}^{\prime \prime}: F O R X=1$ TO 4:A $\$=A \$$ $+\mathrm{B} \$$ :NEXT
FOR $X=886$ TO 1018:A $=A \$+$ CHR $\$$ (PEEK(X)):NEXT:OPEN 1,1,1,A\$: CLOSE1
Then insert a blank tape and press RECORD and PLAY to save a special version of the Proofreader. Anytime you need to reload the Proofreader after it has been erased-for example, after you reload a paritally completed pro-gram-just rewind the tape, type OPEN1:CLOSE1, then press PLAY.

You'll see the message FOUND PROOFREADER.T, but not the familiar LOADING message. Don't worry; the Proofreader is in memory. When READY comes back, enter SYS 886.

Charles Brannon，Program Editor

MLX is a labor－saving utility that al－ lows almost fail－safe entry of machine language programs published in COM－ PUTEI．You need to know nothing about machine language to use MLX－it was designed for everyone．At least 8 K ex－ pansion memory is required．

MLX is a new way to enter long machine language（ML）programs with a mini－ mum of fuss．MLX lets you enter the numbers from a special list that looks similar to BASIC DATA statements．It checks your typing on a line－by－line basis．It won＇t let you enter illegal char－ acters when you should be typing num－ bers．It won＇t let you enter numbers greater than 255 （forbidden in ML）．It won＇t let you enter the wrong numbers on the wrong line．In addition，MLX creates a ready－to－use tape or disk file．

## Using MLX

Type in and save the appropriate ver－ sion of MLX（you＇ll want to use it in the future）．When you＇re ready to type in an ML program，run MLX．MLX for the 64 asks you for two numbers：the starting address and the ending address．These numbers are given in the article accom－ panying the ML program．

When you run MLX，you＇ll see a prompt corresponding to the starting address．The prompt is the current line you are entering from the listing．It in－ creases by six each time you enter a line． That＇s because each line has seven num－ bers－six actual data numbers plus a checksum number．The checksum verifies that you typed the previous six numbers correctly．If you enter any of the six numbers wrong，or enter the checksum wrong，the computer rings a buzzer and prompts you to reenter the line．If you enter it correctly，a bell tone sounds and you continue to the next line．

MLX accepts only numbers as in－ put．If you make a typing error，press the INST／DEL key；the entire number is deleted．You can press it as many times as necessary back to the start of the line． If you enter three－digit numbers as list－ ed，the computer automatically prints the comma and goes on to accept the next number．If you enter less than three digits，you can press either the space bar or RETURN key to advance to the next number．The checksum automatically appears in inverse video for emphasis．

To simplify your typing，MLX rede－ fines part of the keyboard as a numeric keypad（lines 581－584）：

H | U | I | O |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| J | K | L | become | 0 | 7 | 8 | 9 |
| 4 | 5 | 6 |  |  |  |  |  |
|  | M |  |  |  |  |  |  |

## 64 MLX Commands

When you finish typing an ML listing （assuming you type it all in one session）， you can then save the completed pro－ gram on tape or disk．Follow the screen instructions．If you get any errors while saving，you probably have a bad disk，or the disk is full，or you＇ve made a typo when entering the MLX program itself．

You don＇t have to enter the whole ML program in one sitting．MLX lets you enter as much as you want，save it，and then reload the file from tape or disk later．MLX recognizes these commands：

## SHIFT－S：Save <br> SHIFT－L：Load <br> SHIFT－N：New Address <br> SHIFT－D：Display

When you enter a command，MLX jumps out of the line you＇ve been typ－ ing，so we recommend you do it at a new prompt．Use the Save command to save what you＇ve been working on．It will save on tape or disk，as if you＇ve fin－ ished，but the tape or disk won＇t work， of course，until you finish the typing． Remember what address you stop at． The next time you run MLX，answer all the prompts as you did before，then insert the disk or tape．When you get to the entry prompt，press SHIFT－L to re－ load the partly completed file into mem－ ory．Then use the New Address command to resume typing．

To use the New Address command， press SHIFT－N and enter the address where you previously stopped．The prompt will change，and you can then continue typing．Always enter a New Address that matches up with one of the line numbers in the special listing，or else the checksum won＇t work．The Dis－ play command lets you display a section of your typing．After you press SHIFT－ D，enter two addresses within the line number range of the listing．You can abort the listing by pressing any key．

## CONVERSE WITH YOUR COMPUTER

AT LAST！A FULL IMPLEMENTATION of the original ELIZA program is now available to run on your personal computer！
Created at MIT in 1966，ELIZA has become the world＇s most celebrated artificial intelligence demonstration program．ELIZA is a non－directive psychotherapist who analyzes each statement as you type it in and then responds with her own comment or question－and her remarks are otten amazingly appropriate！
Designed to run on a large mainframe，ELIZA has never before been available to personal computer users except in greatly stripped down versions lacking the sophistication which made the original program so fascinating．
Now，our new personal computer version possessing the FULL power and range of expression of the original is being offered at the introductory price of only $\$ 45$ ．And to let you find out how she does it
（or teach her to do more）we have included the complete SOURCE PROGRAM（written in BASIC）at no extra cost．
Order your copy of ELIZA today and you＇ll never again wonder how to respond when you hear someone say．＂Okay，let＇s see what this computer of yours can actually do！＂
read what the experts say about our version of eliza： ＂Much more than a mere game．．．You＂ll be impressed with ELIZA ．．．A convincing demonstration of Artificial Intelligence． －PC MAGAZINE
＂Delightful entertainment．．．An ideal medium for showing off your system．＂ －MICROCOMPUTING MAGAZINE
＂ELIZA is an astounding piece of software．．．A a tascinating program to use and study．＂－BARON＇S MICROCOMPUTER REPORTS ＂ELIZA is a great way to introduce your friends to computers．．．A very funny party game．＂
－PETER A．McWILLIAMS
＂ELIZA is an exceptional program，one that＇s fun to use，shows off your machine，and has great historical interest．＂ POPULAR COMPUTING MAGAZINE

## Modifications or Corrections To Previous Articles

## Commodore 64 Disk Commander

This program from the September issue (p. 80) has a bug in the DOPEN command. Do not use DOPEN until you correct the problem. If you disassemble the relocated "Disk Commander" code, you'll notice the instruction CMP \$062D, $X$ at location \$A797 in the DOPEN routine. The instruction should be CMP \$026D,X. This portion of the routine is intended to assign a unique secondary address to each opened file, but the bug causes all files to be opened with the same secondary address. If you never DOPEN more than one file at a time, there's no problem. However, multiple DOPENs lead to improperly closed files, which are denoted in the disk directory by an asterisk next to the filename. If you see any of these so-called poison files on your disk, you should remove them with the VALIDATE command (OPEN 1,8,15,"V0:" :CLOSE 1), not the SCRATCH command.

To fix "Disk Commander," first enter POKE 44,20:POKE 5120,0:NEX to reconfigure memory, then load and run "MLX". Use the MLX Load command (SHIFT-L) to load your existing version of Disk Commander. Next, use the New Address command (SHIFT-N) to move to line 3591, then enter the following new data:
$3591: \boxed{1} 8, \varnothing 07,221,109, \varnothing \varnothing 2,240,122$
Now press SHIFT-S to call the MLX Save feature and save a copy of the corrected program.

Our thanks to reader Franz Paulsen for uncovering this bug.

## Atari Animation With P/M Graphics, Part 2

Part of line 90 is missing in the program example in the first column on page 102 of this article from the October issue. It should read as follows:

```
NB 9\emptyset FOR X=PMBASE+1\emptyset24 TO PMBASE+2\emptyset48:
    POKE X,\emptyset:NEXT }
```

## The Last Warrior

A number of readers have had difficulties with line 480 in the IBM version of this game program from the September issue (p. 54). The first character within quotes in that line is the lowercase letter 1 , not the numeral 1. The two characters do have a similar appearance in the listing, but 164 is not a reasonable parameter for a PLAY statement, while 164 is.

## Word Processor For IBM

Professional Software has introduced Write ' $n$ Spell, a $\$ 149$ word processor which contains an integrated 90,000word dictionary that checks and corrects spelling. In addition to standard features found in most sophisticated word processors, Write ' $n$ Spell also contains built-in mail-merge, graphing, and simultaneous typing-while-printing capabilities. The program will merge with Lotus 1-2-3, pfs:File, Multiplan, and many other popular application programs. The word processor also has pull-down HELP and OPTION windows.

Write ' $n$ Spell is available for the IBM PC, PCjr, AT, and compatible computers.

Professional Software, Inc., 51 Fremont Street, Needham, MA 02194. Circle Reader Service Number 220.

## World War II Air War

Strategic Studies Group (SSG), creators of Reach for the Stars and Carriers at War strategy games, has released Europe Ablaze: The Air War Over England and Germany 1939-1945. This historical simulation contains three major scenarios, selected from the various phases of the air war, and also a game design kit that lets you create your own scenarios. Major bombing missions are planned twice each day, and players are required to select targets, plot course and speed, determine H -hour, and allocate squadrons. Fighter aircraft patrol and intercept in response to ground and radar sightings.

Europe Ablaze is available for Apple II-series computers (with 64 K RAM) and for the Commodore 64, at a suggested retail price of $\$ 50$.

Strategic Studies Group, 1747 Orleans Court, Walnut Creek, CA 94598. Circle Reader Service Number 221.

## Apple II Spreadsheet

Mouse Calc, a mouse-controlled spreadsheet for the Apple IIc and 128 K Apple IIe, has been announced by International Solutions, Inc. The program includes integrated graphics, mouseoperated editing and selecting
techniques, pull-down menus, and color display. Mouse Calc is the first in a series of application programs from International Solutions.

Users can perform 24 of the most commonly used arithmetic, logical, search, and other spreadsheet functions with Mouse Calc. The program provides rounding and logical functions such as AND/OR and TRUE/FALSE. Mouse Calc can merge two or more files, and it can read files created with VisiCalc, AppleWorks, and other programs using the DIF format.

The program requires a mouse controller, such as the AppleMouse II, and a second disk drive is recommended. Suggested retail is $\$ 149.95$, and includes a 90-day warranty.

International Solutions, Inc., 910 West Maude Avenue, Sunnyvale, CA 94086.

Circle Reader Service Number 222.

Educational, Entertainment Programs Among the software titles recently introduced by CBS Software are several educational and entertainment programs. Included are The Body in Focus, a self-paced color-graphics human anatomy program for the Apple II + , IIe, IIc, Commodore 64, and IBM PC (\$39.95 each); Success with Math, a series of math tutorials for ages 6 through 18 for the Apple II + , IIe, IIc, Commodore 64, and IBM PC/PCjr (\$24.95 each); Success with Algebra, a similar series covering algebra for grades $7-12$ for the Apple II series, Commodore 64, and IBM (\$34.95); and Quink, a game of pattern recognition and knowledge for ages ten and older, for the Apple II series, 64 , and IBM PC/PCjr (\$34.95).

CBS Software, One Fawcett Place, Greenwich, CT 06836.
Circle Reader Service Number 223.

## 64 Bulletin Board

Bozart Co. has introduced two telecommunications packages for the Commodore 64: Bozboard, a full-featured bulletin board program, and Bozterm, an all-purpose terminal program. Bozboard is set to run with one or two 1541 disk drives or the MSD SD-2 dual drive.

It is compatible with the Commodore 1650 Automodem and also with the Westridge 6420, TeleLearning, Mitey Mo, and HES II modems. The system requires a printer.

With Bozboard (\$40), you have a choice of eight subboards, public messages, electronic mail, uploading, downloading, and a magazine feature which allows the system operator (sysop) to publish a color/graphics electronic magazine on the BBS. The program transfers files using the standard XMODEM protocol and its own Bozart protocol. The Bozart protocol is capable of transferring high-resolution graphics and allows the bulletin board user to view the graphics screen as it is downloaded.

Bozterm (\$20) offers the user the option of automatic dialing or manual dialing. Seven of the function keys can be defined to automatically transmit any 80 -character message, read the disk directory, upload buffer contents, capture incoming data to the buffer, print it to the screen or a printer, or save it to disk as an edited or unedited file.

Bozart Co., 7818 Summerfield Road, Summerfield, NC 27358.
Circle Reader Service Number 224.

## Atari Interface

Integrated Computer Equipment Company (ICECO) has introduced the ICEPIC (ICE's Parallel Interface Converter), a printer interface for Atari computers which also includes graphics software drivers.

The ICEPIC converts parallelinterface (Centronics-compatible) printers to a joystick interface (joystick port 2 or 4 ) which can be used by Atari $400 / 800$ and XL computers with no hardware modifications. The ICEPIC requires no 850 Interface Module, no cable, and no external power supply. The software supports any printer in text mode and provides graphic functions for Epson or Okidata 92/93 graphics compatible printers. The ICEPIC works with most Atari programs, such as most BASIC programs, AtariWriter, Letter Perfect, B/GRAPH, Koala Micro Illustrator, and AtariArtist. Several utility programs are included with
the software, including a diagnostic checkout program, a warm reboot program, and a MicroPainter file display program.

Suggested retail is $\$ 49.95$ for the interface, software, and manual. There is a 30-day money back guarantee, a 90 -day replacement warranty, and a lifetime $\$ 19$ repair/replacement policy.

Integrated Computer Equipment Company, 8507 Natural Bridge Road, St. Louis, MO 63121.
Circle Reader Service Number 225.

## 64, Apple Karate

Data East has converted its arcade action game, Karate Champ, to a new computer version for the Commodore 64 and Apple II series. The $\$ 29.95$ game features two-player and player-versuscomputer modes as you guide your karate fighter through successive matches. Using the joystick, you can make your fighter lunge, kick, spin, somersault, reverse-punch, and block.

Data East USA, Inc., 470 Gianni Street, Santa Clara, CA 95054.
Circle Reader Service Number 226.

Pascal For $64 \& 128$
A complete Pascal development system for the Commodore 64 and 128 has been released by Abacus Software. Super Pascal includes an extensive compiler, a source file editor, an integrated assembler, and a comprehensive utility package for file and disk management.

Also included are a handbook with more than 200 pages and a systems disk. Suggested retail price is $\$ 59.95$.

Abacus Software, 2201 Kalamazoo SE, P.O. Box 7211, Grand Rapids, MI 49510.

Circle Reader Service Number 227.

## New From Epson

Epson has developed several new printers for home users. Among these are the DX-10 (\$399), a daisywheel printer which prints at ten characters per second (cps); and the DX-20 (\$499), a daisywheel with a 1 K byte print buffer, 20 characters-per-second (cps) print speed, and a Diablo All Purpose Interface (RS-232C, IEEE-488, and parallel).

Also new from Epson is the Spectrum LX-90, a dot-matrix printer with draft and near-letter-quality (NLQ) modes. It comes with a printer interface cartridge that makes it ready for use with the IBM PC, PCjr, or Apple IIc. Draft copy is printed at 100 cps ; NLQ at 16 cps . The Spectrum LX-90 retails for \$389.

Comrex, a division of Epson, has released the CR-128 intelligent printer buffer. Features include 128 K buffer
memory and built-in serial-to-serial, serial-to-parallel, parallel-to-parallel, and parallel-to-serial interfaces. Suggested retail is $\$ 299$. Another new Comrex product is the CR-700 series of bidirectional A-B switch boxes, which simplify connections to the computer and eliminate the need to swap cables when changing peripherals. The switch boxes retail for \$39.95.

Epson America, 2780 Lomita Blvd., Torrance, CA 90505.
Circle Reader Service Number 228.

## World War II Combat Game

Under Fire, from Avalon Hill, combines the depth of a war game simulation with the colorful graphics of an arcade game. Authentic armies, weapons, and maps from World War II add to the game's realism. Different maps and scenarios are included on disk; players can also create their own.

A sample screen from Avalon Hill's Under Fire strategy game.

Under Fire is available for the Apple II series. A joystick is optional for the Apple IIc and IIe, but required for the II + . Suggested retail price is \$59.95.

Avalon Hill Game Company, 4517 Hartford Rd., Baltimore, MD 21214. Circle Reader Service Number 229.

## TI Disk Organizer

TI programs can be organized on a single disk with Disk Data Base from Asgard Software. The program lets you sort and print a catalog by either disk name or filename, to print it out unsorted, or to selectively print out all entries that contain a certain string. The catalog can also be broken up into blocks of 250 entries for easy management.

Data files can be converted from the Master Disk File to the Disk Data Base format. Also featured are numerous prompts and an online dictionary of terms. Disk Data Base requires Extended BASIC, a 32 K memory expansion unit, and a disk drive and controller. A printer and second disk drive are recommended. Price: \$15.

Asgard Software, P.O. Box 10306, Rockville, MD 20850.
Circle Reader Service Number 230.

## Bulletin Board Directory

A new directory of computer bulletin boards, called Plumbline, is now available from the publishers of Plumb, a newsletter about personal telecommunications. The directory lists over 1,000 bulletin boards available to the public. Each entry includes a brief description of the bulletin board, the type of computer it runs on, and its primary area of interest.

Plumbline is included with a subscription to Plumb, $\$ 26.50$; or can be purchased separately for $\$ 8$.

Plumb, P.O. Box 300, Harrods Creek, KY 40027
Circle Reader Service Number 231.

## Pascal Tutorial For Apple

Wiley Software's new Visible Pascal uses graphics, word processing, and music to teach the Pascal programming language on Apple II computers. Programs are displayed while they're being created, at a speed controlled by the programmer. The system has more than 80 error messages for pointing out mistakes. Users can create "productions," with animated characters and a soundtrack. The package also includes 56 sample programs that are ready to run.

No prior computing knowledge is needed. Visible Pascal runs on Apple IIseries computers with at least 64 K RAM. A joystick is recommended.

Wiley Professional Software, 605 Third Ave., New York, NY 10158.

## Circle Reader Service Number 232.

## Boolean Games

Sunburst has introduced High Wire Logic, a game for teaching Boolean logic to youngsters in grades 5 through 12. Two sets of colored shapes appear on the screen: one on a high wire and another set that falls to the net below. Using the logical functions AND, OR, AND-AND, OR-OR, and EXCLUSIVE OR, students earn points by writing rules to fit the shapes on the high wire but not the shapes in the net.

High Wire Logic is available for Apple II computers with at least 48 K RAM; retail price is $\$ 59$.

Sunburst Communications, Inc., 39 Washington Ave., Pleasantville, NY 10570.

Circle Reader Service Number 233.

## Life/Time Manager

A new program from Psychometric

Software provides assistance in identifying goals and organizing time. Developed by a psychiatrist, Life/Time Manager is based on psychological and time management principles. It consists of three sections: Goals, Activities, and Schedules. Included are a prioritized daily To Do List and a weekly schedule analysis.

The program runs on the IBM PC, PCjr, or AT, with at least 128 K RAM; or on the Apple II+, IIc, or IIe. Suggested price is $\$ 49.95$.

Psychometric Software, Inc., 2050 S. Patrick Dr., Indian Harbour Beach, FL 32937.

Circle Reader Service Number 234.

## Nutrition And The Apple

The Center for Science in the Public Interest, a nonprofit consumer group, has developed Nutrition Express. This game teaches the basic concepts of nutrition and diet through a series of questions and clues. Action takes place in the land of FodaFoda, where the student answers questions correctly in order to earn currency for the grocery store and to invite friends from FodaFoda back home. The game is geared toward youngsters aged nine and up.

Nutrition Express comes with a user's guide, teaching suggestions, and a "Nutrition Scoreboard" wall chart. For the Apple II series; price is $\$ 39.95$.

Center for Science in the Public Interest, 1501 Sixteenth St., NW, Washington, DC 20036.
Circle Reader Service Number 235.

## Titling Videos

A new program from Videoware can put titles, custom messages, colored screens, and leaders onto videotapes. Video Title Editor offers a menu of more than 20 different displays, including some for weddings, birthdays, and video mail. Also included are displays for Presented By, Starring, and Credits.

The program requires a videocassette recorder and either an Apple II, Atari, Commodore 64, VIC-20, or IBM $\mathrm{PC} / \mathrm{PCjr}$. Price is $\$ 29.95$.

Videoware, 19777 W. 12 Mile Rd., Suite 180, Southfield, MI 48076.
Circle Reader Service Number 236.

## New IBM Telecommunications Utility

Mastercom, a new release from The Software Store, is a full-featured smart terminal and file transfer utility for the IBM PC and PCjr. It turns the computer into a terminal on a time-sharing system, captures data onto a disk and/or printer from almost any computer, and can send files to almost any type of
computer. Mastercom supports most communication protocols including Christensen XMODEM, xon/xoff, line at a time, and no protocol. Other features of Mastercom include auto dial, auto answer, batch file transfer, and host mode unattended operation.

For the IBM PC, PCjr, and most compatibles. Suggested retail price is $\$ 49$.

The Software Store, 706 Chippewa Square, Marquette, MI 49855.
Circle Reader Service Number 237.

## Multi-Color Printing Package

A black-and-white printer can now make up to 80 full-color prints using an Apple computer and Prince, a new program from Baudville. The program's library of fonts can be used to make color T-shirt transfers, banners, letterheads, and labels. Prince can also capture any standard or double hi-res picture for editing and printing.

Four color ribbons are included for the following printers: Imagewriter, DMP, C. Itoh 8510 /Prowriter, 8510 SC, NEC 8023, and Epson MX-80, RX-80, and FX-80. Prince sells for $\$ 69.95$.

Baudville, 1001 Medical Park Dr. SE, Grand Rapids, MI 49506.
Circle Reader Service Number 238.

## Electronic Trivia

Mentor Learning Systems has introduced Ultimate Trivia, a game featuring 4,000 facts and 200 color graphics. The facts are divided into nine categories: Music, Cinema, Geography, Sports, General Information, People, Art, History, and Television. The graphics are revealed piece by piece as each category is answered correctly. Ultimate Trivia can be played individually or in teams.

The program sells for $\$ 49.95$ and runs on all Apple computers (with at least 64 K RAM) and the IBM PC/PCjr.

Mentory Learning Systems, Inc., 1825 De La Cruz Blvd., Santa Clara, CA 95050.

Circle Reader Service Number 239.

## New Infocom Adventures

Infocom has added two new products to its interactive fiction line. In A Mind Forever Voyaging, you play the role of a computer that has been raised as a human being up to the age of 20 . You must enter a simulation of the future to see whether a plan proposed by current government and industry leaders will be beneficial for the country. Due to Infocom's new development system and an expanded 1,700-word vocabulary, the emphasis in this game is less on solving puzzles and more on revealing the story's details. (Requires at least

128K RAM; Apple II series, IBM PC/ PCjr/XT/AT, Atari ST, Amiga, and Macintosh; \$44.95.)

Spellbreaker completes Infocom's Enchanter trilogy of adventures. When a world based on sorcery finds its magic failing, you, as the leader of the Circle of Enchanters, must find and destroy the cause of this failure. (Apple II series, Amiga, IBM PC/PCjr/XT/AT, Macintosh, and MS-DOS compatibles, $\$ 49.95$; Atari 400/800, XL/XE, ST, Commodore $64 / 128, \$ 44.95$.)

Infocom, Inc., 125 Cambridge Park Drive, Cambridge, MA 02140.
Circle Reader Service Number 240.

## Parallel Printer Converters

Two new serial-to-parallel printer converters have been released by Practical Peripherals. The Switchport IIC was designed especially for the Apple IIc and allows the computer to be interfaced with a parallel printer. The Switchport 232 transforms serial data into parallel, allowing any RS-232 computer to be interfaced with a Centronics parallel printer.

Both units come with a five-year limited warranty and retail for $\$ 109$.

Practical Peripherals, 31245 LaBaya Drive, Westlake Village, CA 91362. Circle Reader Service Number 241.

## Productivity, Education, Entertainment Software

Brøderbund Software has introduced a hardware/software combination that turns your home computer into a science lab. The Science Toolkit Master Module includes a temperature-sensing probe, a light-sensing probe, and a special interface that connects them to an Apple II via the joystick port. Using the software's thermometer, light meter, timer, and strip chart, you can perform a wide variety of scientific experiments. (At least 64 K RAM required; Apple IIe/IIc, II + with joystick port adapter; \$59.95.)

Two new packages have been added to the Bank Street series of productivity software. Bank Street Mailer is a combination letter-writing/mailing list program. Bank Street Filer is a database manager/report-generating program. There are two versions of each program: a 64 K version for the Apple II + and IIe offers a 40 -column screen display, and a 128 K version for the Apple IIc and 128 K IIe offers a $40-$ or 80 -column display and includes an onscreen calculator. They are compatible with the Bank Street Writer word processor. All retail for $\$ 69.95$ each.

Captain Goodnight and the Islands of Fear is an arcade game that plays like an adventure movie. In your role as

Captain Goodnight, you must pilot helicopters, airplanes, tanks, trucks, and a submarine in your attempt to save the world from destruction. (Apple II series with at least 48 K RAM; $\$ 34.95$.)

Broderbund Software, 17 Paul Drive, San Rafael, CA 94903.

A strip chart from Brøderbund's Science Toolkit.
Circle Reader Service Number 242.

## Computerized Diet Plan From Bantam

The Complete Scarsdale Medical Diet, based on the bestselling book by the same name, is now available in a software package from Bantam Electronic Publishing. Based on sound nutritional principles, the program offers healthy, controlled weight loss. Diet features a meal-planning calendar, shopping list, expandable food directory, meal planner and analysis, and comparison charts.

Available for the Apple II series and IBM PC/PCjr, the program retails for $\$ 39.95$.

Bantam Electronic Publishing, 6665th Ave., New York, NY 10103.
Circle Reader Service Number 243.

## Koalapad + For Apple II

Koala Technologies has announced an enhanced version of the Koalapad, called Koalapad + , for the Apple IIc and IIe. The new version offers enhanced product styling, a gridded tablet surface, and additional graphics software. The software, Graphics Exhibitor, lets users edit images they have created.

Suggested retail price for the Koalapad + is $\$ 125$.

Koala Technologies, 2065 Junction Ave., San Jose, CA 95131.
Circle Reader Service Number 244.

## Productivity Software For Commodore 64

Datamost has announced the KWIK line of home productivity software for the Commodore 64. Each package includes KWIK-LOAD! (a Datamost fast-loading program) and retails for $\$ 19.95$.

The series includes KWIK-WRITE!,
a word processor; KWIK-SPELL!, a spelling checker; KWIK-FILE!, a database manager; KWIK-CALC!, a spreadsheet program; KWIK-PAINT!, a graphics editor; KWIK-CHECK!, a checkbook balancing and maintenance program; KWIK-PAD!, a desk secretary program; and KWIK-PHONE, a communications program.

Datamost, 19821 Nordhoff Street, Northridge, CA 91324.
Circle Reader Service Number 245.

## Foreign Language Vocabulary Programs

Gessler Educational Software has produced three foreign language versions of its bestselling vocabulary program Word Attack!. Bataille De Mots (French), Batalla De Palabras (Spanish), and Wortgefecht (German) are available for the Apple II series, IBM PC/PCjr, and Commodore 64 for $\$ 49.95$.

Word Attack!, as well as its foreign language versions, teaches vocabulary words and grammar with word displays, quizzes, sentence completion, and an arcade game.

Gessler Educational Software, 900 Broadway, New York, NY 10003.
Circle Reader Service Number 246.

## Inexpensive Accounting Software

 DAC-Easy Accounting, from DAC Software, is a seven-in-one accounting package offered at a special introductory price of $\$ 49.95$. Its seven individual modules-general ledger, accounts receivable, accounts payable, billing, purchase order, inventory, and fore-casting-are integrated, allowing automatic posting between modules.The system also has spreadsheet capability, letting the user experiment with "what-if" scenarios without entering actual data. It is compatible with the IBM PC and PCjr.

DAC Software, Inc., 5580 Peterson, Suite 130, Dallas, TX 75240.
Circle Reader Service Number 247.

## MIDI Editor

RolandCorp has released MUSE (MIDI Users Sequencer/Editor) for the Apple II series and Commodore 64. The program features eight independent tracks for recording and overdubbing sequences, track merging capability, track muting, looping by song or track length, and selectable time signatures. The editing functions can be used to insert, delete, move, copy, and rearrange measures of any track so that a composition can be changed after it has been recorded.

MUSE is compatible with any MIDI instrument and can be synchronized with drum machines, other sequencers,
and multitrack tape decks. An interface is required. Suggested retail price is $\$ 150$ for each version.

RolandCorp US, 7200 Dominion Circle, Los Angeles, CA 90040.
Circle Reader Service Number 248.

## New PCjr Drive

A second disk drive can now be added to the IBM PCjr without adding extra circuitry or another power supply. The Junior Drive II System, from PC Enterprises, includes a 360 K double-sided double-density 5-1/4 inch floppy disk drive with power supply, an adapter module, a software patch, a two-drive signal cable, and an instruction manual. The system is compatible with existing external modems, parallel printer ports, and memory expansions.

The Junior Drive II System lists for $\$ 395$. For those who wish to connect their own IBM-compatible drive, the adapter module and software patch are available separately.

PC Enterprises, P.O. Box 292, Belmar, NJ 07719.
Circle Reader Service Number 249.

## The Smoking Decision

A new program from Sunburst was created to alert students to the dangers of cigarette smoking. It begins by presenting facts about health risks related to smoking, and then explores issues such as peer pressure. Throughout the program, students are confronted with a series of incremental decisions, leading to a final decision whether to smoke.

The Smoking Decision is suitable for youngsters in grades 6 through 12. It runs on any Apple II computer with at least 48 K memory. The $\$ 59$ retail price includes a backup disk and teacher's guide.

Sunburst Communications, Inc. 39 Washington Ave., Pleasantville, NY 10570.

Circle Reader Service Number 250.

## Arcade And Adventure Games For Commodore 64

Artworx has released two new games for the Commodore 64 and 128. Falcon Patrol II puts the user in the pilot's seat of a Falcon fighter, fully equipped with air-to-ground and air-to-surface missiles. The object of the game is to ward off the enemy's helicopter attack squadrons. Its 16 levels of play are enhanced by 3-D graphics and sound effects.

In Sorcery, you are the last of the great sorcerers, given new strength and powerful spells. You must use them to regain your conquered homeland and restore its previous quality of life. Sorcery resembles an arcade game, but
plays much like an adventure game.
Both games retail for \$19.95.
Artworx Software Company, Inc., 150 N . Main St., Fairport, NY 14450.
Circle Reader Service Number 251.

## Educational Software For The

 ClassroomFocus Media, Inc. publishes an extensive line of classroom programs for a variety of computers. In Za -Zoom, The Geography Genie, students take the role of explorer as they try to determine where they are by examining the culture around them. The two programs in this package, Travels with Za -Zoom: The World and Travels with Za-Zoom: The U.S. retail for $\$ 129$; either program can be purchased separately for $\$ 79$. (Apple II series, Commodore 64, IBM PC/PCjr.)

Students learn about such concepts as latitude and longitude with The Language of Maps.

Students can go back in time with The Time Tunnel: America Series Package. During each journey, students must use clues to gather facts and guess the identities of historical figures. The package contains six programs: Early America (2), A Nation Emerges (2), and The Presidents (2). Suggested retail price for the complete package is $\$ 179$; each series can be purchased individually for \$79. (Apple II series, Commodore 64, IBM PC/PCjr.)

The Language of Maps is a series of six programs that helps students learn about maps and map terminology. Topics covered include oceans and continents; land areas and water bodies; highlands and lowlands; and finding places on maps. The Instant Computerized Glossary explains unfamiliar terms. The Surface of the Earth and Location and Distance retail as a package for $\$ 159$; individually, each costs $\$ 79$. (Apple II series.)

A Teacher's Lesson Planner and free backup disks are included with all packages.
Focus Media, Inc., 839 Stewart Ave., Garden City, NY 11530.
Circle Reader Service Number 252.

FACTORY NEW! FIRST QUALITY!

## Save hundreds of dollars on a top name brand!

Here's a sensational value on a fast-operating, excellent quality, heavy-duty printer. It INCLUDES an interface for hookup to your Commodore 64 or Commodore SX64.
Compared to many competitive models, THESE printers are FASTER! Virtually trouble-free. Built to handle BIG office jobs. The P-100 has a memory which allows data storage WHILE the printer is running! And it can print in a variety of type styles, from large and bold to small and light!
Other special features include: Easy loading, longlife cartridge ribbon. Crisp printing. And, with your purchase, you get a TOLL-FREE phone number to call for useful tips or questions you might have.
CHARACTER SET: Full upper and lower case 96 character ASCII set with descenders and underlining. Software selectable single or double wide character fonts. GRAPHICS: High resolution dot addressable graphics.
PRINT FORMAT: 8 " line length; 80 characters per line at $10 \mathrm{CPI} ; 136$ characters per line at 17 CPI .
PAPER SLEW (ADVANCE): 10 lines per second, stepper motor controlled. User selectable pressure roller or tractor feed.
DATA INPUT: Parallel. Centronics type 7-bit ASCII. TTL level with STROBE. ACKNOWLEDGE returned to indicate data was received. SERIAL: RS232C. With BUSY handshake. 10 or 11 bits: 110, 150, 300, 1200 Baud. INPUT POWER: 115 volts.
PRINT RATE: 100 characters/second. Data Buffer: 1K (Optional expandable to 2 K ).
OPERATIONAL CONTROLS: Power on/off, set top of form, select/deselect, line/forms, feed. MEDIA: Roll paper: $8^{1 / 2^{\prime \prime}} \mathrm{W} \times 5^{\prime \prime}$ dia. single ply or pressure sensitive multiple copy paper. . $012^{\prime \prime}$ max. thickness. Fan fold paper: $1^{\prime \prime}$ to $91^{\prime \prime \prime}$

## presenting . . . CAPTURE"

## A NEW WAY TO UNLOCK THE POWER OF YOUR C64 OR C128*

- CAPTURE IS A CARTRIDGE THAT PLUGS INTO YOUR COMPUTER'S EXPANSION PORT.
- CAPTURE DOES NOTHING - UNTIL YOU PRESS ITS CAPTURE BUTTON. UNTIL THEN, A RUNNING PROGRAM CANNOT DETECT ITS PRESENCE.
- CAPTURE THEN TAKES CONTROL - NO IFS, ANDS OR BUTS - AND PRESENTS A MENU.
- CAPTURE WILL NEATLY SAVE EVERYTHING IN YOUR COMPUTER TO YOUR 1541 OR COMPATIBLE DISK DRIVE - ALL 64K OF RAM, CPU, VIC AND SID CHIP REGISTERS - EVERYTHING. IN EASY TO VIEW CHUNKS.
- CAPTURE WILL, IF YOU WANT, PRE-CONFIGURE YOUR COMPUTER'S RAM SO THAT ONLY MEMORY ALTERED BY YOUR PROGRAM NEED BE SAVED.
- CAPTURE WILL WRITE A BOOT ON YOUR DISK SO YOU CAN RELOAD AND BEGIN EXECUTION RIGHT WHERE YOU LEFT OFF.
- CAPTURE DOES ALL THIS AT A COST OF JUST \$39.95

## BUT HERE'S THE BEST PART

- CAPTURE WILL MAKE AN AUTO-START CARTRIDGE OF YOUR PROGRAM. IT'S EASY! JUST FOLLOW THE DIRECTIONS ON THE SCREEN. NOW PLUG IN YOUR CARTRIDGE AND TURN ON YOUR COMPUTER. IN LESS THAN TWO SECONDS YOUR PROGRAM BEGINS AGAIN AT PRECISELY THE POINT WHERE YOU CAPTURE'D IT. MAGIC!

BESIDES CAPTURE, YOU NEED A promenade C1 AND A SUPPLY OF CPR3 CARTRIDGE KITS.

# DISK WORLDH is proud to introduce the lowest-priced, LIFATME-WARBANTY diskettes ever! <br> And they're BRAND NAME PRODUGT to boot! $5.25^{\prime \prime}$ SSDD $\Rightarrow .69$ ea. $5.25^{\prime \prime}$ DSDD $\rightarrow .79$ ea. 5.25 " DSDD-HD $=$ s2. 25 ea. $3.50^{\prime \prime}$ SSDD $\Rightarrow$ ². 2.09 ea. $3.50^{\prime \prime}$ DSDD $\Rightarrow$ s 2.55 ea. 

Boxed in 10 's with heavy-duty cardboard sleeves, user ID labels,
reinforced hubs (where appropriate) and write-protect tabs.

Introducing Wabash Pinnacle Series Diskettes.
Two years ago, if you'd told me I'd be writing this ad, I would have laughed.
At that time, Wabash diskettes were synonymous with s-t"
Just saying that quality control was poor would be charitable.

So much was wrong that DISK WORLD wouldn't sell them. That was yesterday.
Kearney-National Inc., a $\$ 202$-million division of a much larger company, came into Wabash.
Out went the old management, the old methods, the old production techniques... and in went a lot of new people, ideas. production lines and some really imaginative thinking.

## The end result.

Today, I'm proud to offer you the Wabash Pinnacle Series of diskettes at the prices shown

This isn't evolution in diskette manufacturing: it's revolution.

## Here's what you get.

Wabash Pinnacle diskettes are
certified 100\% Error Free
are coverd by a LIFETIME WARRANTY
meet or exceed all industry specifications (by quite some distance)
..and are simply the best value in diskettes available today.

## The torture test.

Considering Wabash's earlier dubious reputation, I wasn't exactly a true believer when their Director of Marketing came into my office with samples.
So I took a box at random, selected a disk, bent the thing every which way and slipped it into my IBM-PC
It formatted. It booted. It stored and retrieved data.

## That wasn't enough.

I gave samples of the diskettes to Curt Rostenbach and, in turn, to Tom Streit, both hackers of long experience and members of the Waukegan (Illinois) Apple Users Group.

Tom really went at it.
He took a quartz-halogen lamp, aimed it at the diskette until it started to smoke (and melt)...and then formatted, booted the diskette and stored and retrieved data!

The same terribly (and intentionally) mutilated diskette ran on an ITT, Corona and IBM.
Curt was nicer.
He simply bent the diskette every which way...and it still formatted, booted and ran on his Apple.

## The best buy l've ever seen.

DISK WORLD!, Inc. sells more flexible magnetic media by mail-order than anyone else in the world.
I, as President of the corporation, won't tolerate a product with a failure rate of more than $1 / 1000$ th of 1 percent.
I also don't like companies who try to milk a "quality" or "premium" image for a higher price like Dysan and Verbatim did... until they failed.
As President of DISK WORLD!, Inc., my motto is simple: "the best diskette for the least amount of money."

Wabash is it.
Right now, there is no better value than the Wabash Pinnacle Series of diskettes.

Granted, you have to buy a hundred at a time, but so what? Split the order with friends, relatives, co-workers or even your worst enemies
The key thing is to get the most diskette for the money.
And this is it.
(Incidentally, as a corporation, we put our money where our

mouth is. Our first order for Wabash Pinnacle Diskettes was 1.5-million units.)

That's an awful lot of faith and confidence.
But, then again, I have the diskette that Tom Streit literally melted...and kept on running.

The truth about $\$ 1.00$ or less diskettes.
More and more ads are popping up offering diskettes for $\$ 1.00$ or less.
By the same token, more and more people who were selling used cars a few months ago are now selling diskettes by mail. We did a little survey of current ads for diskettes advertised for a dollar or less and did some analysis of the market and here's what we found as it applies to $5.25^{\circ}$ DSDD diskettes "supposedly" selling for a dollar or less.

| VENDOR: | ADVERTISED LOW PRICE: | PRICE PER 100: | ACTUAL MFGR |

The real truth about $\$ 1.00$ or less diskettes.
It costs all diskette manufacturers about the same to produce a diskette. Some may charge more because they want to project a "premium quality" image, ala the late, lamented Dysan who bought their basic media from 3M.
Some charge less because they sell a sub-standard product...and we're not foolish enough to name names here.
But here's the truth about the $\$ 1.00$ or less diskette market.
It falls into four categories

1. The DISK WORLD's of the universe who simply are so big that they can buy first quality product in massive quantities and choose to pass on the savings to you. (Precision Data and Diskette Connection on BRAND NAME products also fall into
2. The people who buy "cosmos"...stuff from major manufacturers that usually hits quality control standards, but is cosmetically blemished and thus can't be packaged and sold under the manufacturer's own name.
3. "Duplicator Quality". Uncertified media, usually below manufacturer's own standards and frequently below ANSI and IBM standards. Sold on an "as-is" basis with the understanding that the manufacturer's name will never be divulged. Usually about a 20\% reject rate...as compared to DISK WORLD's standard of less than $1 / 1000$ th of $1 \%$ reject/return rate. Next to garbage, this is the source of most diskettes advertised at a dollar or less.
They may work...and then again they may not. (Frankly, the odds at the Blackjack table in Las Vegas are more in your favor.) 4. Garbage. Stuff that shouldn't be sold at all. But some manufacturers are hurting for cash, so they sell it anyway. (After all, they want to meet their payroll. Look what happens when you don't: you become a Dysan or Verbatim. Lots of history, but no money.) More and more garbage is being dumped into the market as manufacturers become pressed for cash and are motivated into selling anything and everything they can manufacture. (Read the article in FORBES about Verbatim and its "Bonus" brand.
Finally, the Taiwanese counterfeiters are moving into the act. Perfect duplicates of the packaging of major manufacturers with one exception: the quality isn't there

## The Critical Factor.

Only DISK WORLD!, Inc. offers fully brand-identified, LIFETIME-WARRANTY product for less than a dollar.
Every one else offering $5.25^{\circ}$ product for less than a buck doesn't tell you who makes it.
We do.
And that ought to tell you a lot right there

## Ordering \& Shipping Instructions

SHIPPING: Wabash Pinnacle Diskettes are sold in multiples of 100 only. Shipping charges are $\$ 3.00$ per 100 , regardless of type or size
PAYMENT: VISA. MASTERCARD and PREPAID orders accepted. Corporations rated 3A2 or better and government and quasi-government open accounts are accepted on a NET 15 basis.
C.O.D. orders are subject to a $\$ 5.00$ special handling charge. (Sorry for the increase, but too many people have been refusing C.O.D. orders or using bad checks. It's a classic example of a few "bad eggs" making life more expensive for everyone else.)

APO, FPO, AK, HI \& PR ORDERS: Include shipping as shown and an additional $5 \%$ of the total amount of the order to cover PAL and insurance.
No other non-continental U.S. orders are accepted.
TAXES: Illinois residents only, add 7\%. MINIMUM ORDER: $\$ 35.00$
All orders subject to acceptance. Not responsible for typographical errors. ORDERS ONLY: 1-800-621-6827

## What the world really needs is a 69 cent <br> <br> Double Sided, Double Density Diskette <br> <br> Double Sided, Double Density Diskette with a LIFETINE WARRANT Y!

 with a LIFETINE WARRANT Y!}
# And DISK WORLD D has it. 

# Introducing Super Star Diskettes: <br> the high quality diskette with <br> the lowest price and the best LIFETIME WARRANTY! 

In the course of selling more than a million diskettes every month, we ve learned something: higher prices don't necessarily mean higher quality.

In fact, we've found that a good diskette manufacturer simply manufactures a good diskette...no matter what they charge for it. (By way of example, consider that none of the brands that we carry has a return rate of greater than $1 / 1,000$ th of 1 percent!)
In other words, when people buy a more expensive diskette, they aren't necessarily buying higher quality
The extra money might be going toward flashier adver tising, snazzier packaging or simply higher profits.
But the extra money in a higher price isn't buying better quality.
All of the good manufacturers put out a good diskette Period.

## How to cut diskette prices

 .. without cutting quality.Now this discovery posed a dilemma: how to cut the price of diskettes without lowering the quality.

There are about 85 companies claiming to be "diskette" manufacturers.
Trouble is, most of them aren't manufacturers.
Rather they are fabricators or marketers, taking other company's components, possibly doing one or more steps of the processing themselves and pasting their labels on the finished product.
The new Eastman Kodak diskettes, for example, are one of these. So are IBM $5^{1 / 4^{\prime \prime}}$ diskettes. Same for DYSAN Polaroid and many, many other familiar diskette brand names. Each of these diskettes is manufactured in whole or in part by another company!

So, we decided to act just like the big guys. That's how we would cut diskette prices...without lowering the quality.
We would go out and find smaller companies to manufacture a diskette to our specifications...specifications which are higher than most...and simply create our own "name brand" diskette
Name brand diskettes that offered high quality at low prices.

## DISki

DISK CADDIES
The original flip-up holder for $105 \frac{1}{4} 4^{\prime \prime}$ diskettes. Beige or Grey only.
$\$ 1.65$ ea. + . 20 Shpng.

## DISKETTE 70 STORAGE

Dust-free storage for $705^{1 / 4}$ diskettes. Six dividers included. An excellent value.
$\$ 9.95$ ea. + \$3.00 Shpng.

HOURS
Human: 8AM-6PM Central Time, Monday through Friday Answering Machine: 6PM-8AM, All Times MCI MAIL: 24 hours a day.

Super Star diskettes are sold in multiples of 50 only. Diskettes are shipped with white Tyvec sleeves, reinforced hubs, user ID labels and write-protect tabs.

## Boy, did we get lucky. Our Super Star

 Diskettes are the same ones you've been using for years... without knowing it.In our search for the low priced, high quality diskette of our dreams, we found something even more interesting. We found that there are several manufacturers who don't give a hoot about the consumer market for their diskettes. They don't spend millions of dollars in advertising trying to get you, the computer user, to use their diskettes.
Instead, they concentrate their efforts on turning out the highest quality diskettes they can...because they sell them to the software publishers, computer manufaciurers and other folks who (in turn) put their name on them...and sell them for much higher prices to you!
After all, when a software publisher or computer manufacturer or diskette marketer puts their name on a diskette, they want it to work time after time, everytime. (Especially software publishers who have the nasty habit of copyprotecting their originals!)

## HOWTOORDER:

We ship only to United States addresses, except for those listed above. TAXES: Illinois residents, add 7\% sales tax.

Super Star Diskettes. You already know how good they are. Now you can buy them...cheap.
Well, that's the story
Super Star diskettes don't roll off the boat from Pago Pago or emerge from a basement plant just east o Nowhere.

Super Star diskettes have been around for years...and you've used them for years as copy-protected software originals, unprotected originals. Sometimes, depending on which computer you own, the system master may have been on a Super Star diskette. And maybe more than once you've bought a box or two or more of Super Star diskettes without knowing it. They just had some "big" company's name on them
Super Star Diskettes are good. So good that a lot of major software publishers, computer manufacturers and other diskette marketers buy them in the tens or hundreds of thousands.

We buy them in the millions.
And than we sell them to you
Cheap.

## When every little bit counts,

it's Super Star Diskettes.
You've used them a hundred times...under different names.
Now, you can buy the real McCoy, the same diskette that major software publishers, computer manufacturers and diskette marketers buy ...and call their own

We simply charge less

## Super Special!

Order 50 Super Star Diskettes and we'll be happy to sell you an Amaray Media-Mate 50 for only S8.75, shipping included...a lot less than the suggested retail price of $\$ 15.95$.

Regular DISK WORLD! price: $\$ 9.69$ ea

+ \$2.00 Shpng.

## The Super Star LFETIME WARAANYY:

Super Star Diskettes are unconditionally warranted against defects in original material and workmanship so long as owned by the original purchaser. Returns are simple: just send the defective diskettes with proof of purchase, postage-paid by you with a short explanation of the problem, and we'll send you the replacements. (Incidentally, coffee stained diskettes and diskettes with staples driven through them don't qualify as "defective".)

# $\$ 699$ computer Breakthrough 

IBM compatible computer with 128 K memory and two disk drives is more than a bargain.

> It's a new concept. And if my hunches are correct, the new Visual Commuter will take years for others to copy.

## By Joseph Sugarman, President

First, it is a tremendous bargain. At $\$ 699$ nothing even comesnear. Secondly, it'spowerful. You get 128 K memory that's expandable to 512 K . And finally, it's totally IBM compatible. It will even runthe Flight Simulator program and Lotus Symphony! ${ }^{\text {TM }}$ But there's more.

The unit can be used as a stand-alone office computer asshownabove or itcan be packed up and used as a portable-but without all the weight. There's an optional 16 -line $\times 80$ character LCD display that popsupto replace the heavy CRT monitor. Unlikethe smaller portable computer keyboards, the Commuter keyboard is a full-size replica of the IBM with itstenfunction keys and numerickey pad. And the Commuter uses $51 / 4^{\prime \prime}$ ' disks so you havefull access to all the popular IBM software.

It's lighter (only 18 lbs ), flatter (only $31 / 22^{\prime \prime}$ thick) and carries like a briefcase. In short, the Visual Commuter is a combination of all the good features of a portable computer (size, weight, portability), all the good features of atraditional desktop computer (full-size keyboard, 514" disks, full power) and none of the disadvantages of either.

## USE IBM PROGRAMS

Even if you have another computer but miss some of the IBM programs, for only $\$ 699$ and an IBM compatiblemonitor, you've got acomplete MS/DOS system.

It was alsomade modular so you can select just those components that you need for your particular application. For example, you may not need the 16 line $\times 80$ column LCD display which adds 2 lbs to the unit's weight (a blank lid comes with the unit). Or you may not need a monitor because your other computer may already have one. But you may want more power-256K or 512 K -soyou order just what you need.

For all you technical people, listen to these specs. There's a 16 -bit 8088 processor, 128 K memory with parity, parallel printer port, serial ASYNC RS 232C port, Din connector RF modulator orcomposite videooutputfor TV and composite video input monitors, RGB/direct drive output for high resolution monochrome or color monitors, IBM compatible color graphic support, support logic for $80 \times 25$ or $40 \times 25$ character display and LCD display, connector to IBM expansion unit, disk controller
supportingtwo $51 / 4^{\prime \prime}$ ' diskdrives, ANSI standard ROM-based terminal emulation, and ROMbased extended diagnostics. The dual disk drives are double sided-double density ( 360 Kbytes). The Commuter runs at the sameclock speed as the IBM PC ( 4.77 MHz ) but because of its new design, it runs between 8 to 10 percent faster.

## ATTRACTIVE CASE

There's an attractive carrying case made by American Tourister that holds your software, your power cord, your documents and even our optional 1200 baud modem. The compatible Maxwell modem lets you communicate with other data banks. Made by the world's largest modem manufacturer, Racal-Vadic, it is normally a $\$ 500$ value but our price is only $\$ 249$ which includes a complete communications software package. There's also a toll free, online warranty service and a customer hotline to answer any of your technical questions.

You may have recently heard of Visual Technology Incorporated. They areinnovators in the design and manufacture of smart alphianumeric terminals and some of the finest graphic terminals in the country.

TheVisual Commuter was scheduled to sell for over $\$ 2500$ with the LCD display. And even at that price, when compared to the IBM system, it was a good value. But JS\&A and Visual (in a joint venture with SGD Holding Corp.) saw the opportunity of having just one customer. Together, by selling directly to you, we've eliminated the distributors, dealers and all the sales, administration and advertising costs and have passed the savings on to you. But there are a few catches.

## JUST A FEW THOUGH

Once we install the memory, you'll have to send the unit back to us to add more memory. So we ask that you estimate, in advance, the maximum power that you'll require for your needs. 128 K memory is plenty formostapplications but if you want to run Lotus Symphony, you'll need all 512 K . Secondly, weask that you act quickly. Although we havemost of the product in stock right now, there's always the chance that we'll run out.
The Visual Commuter measures only $31 / 2 x$ $151 / 2 \times 18^{\prime \prime}$ wide and comes complete with power cord (it only operates on standard AC current), the operating system (Micro-Soft's MS/DOS ver. 2.1) complete with basic and utilities, two beautifully written manuals, lid (without LCD display) and alimited 90-day warranty. Thereare service centersthroughoutthe United States set up to service the unit in addi-
tion to the service-by-mail facility at Visual's home office near Boston.

I urge youto givethe Visual Commuter atest. Order one from JS\&A and use it for 30 days without risk. Plug in your IBM monitor and load any of the IBM software you currently have. See how the large keyboard matches the IBM perfectly and how its handle makes a perfect hand rest while typing or a comfortable handle for carrying the unit. See how convenient the unit is to take home or bring with you on a trip with its fold open LCD monitor. If you don't feel that the Visual Commuter is morethan you expected, packitup and ship it back within 30 days for a prompt and courteous refund includingthe $\$ 25$ postagecharge. Youcan'tlose.

## PERSONALLY USED

I have personally usedthe Visual Commuter. I have taken it with me on trips, set it up as a stand alone by plugging in my IBM monitor. I have run everything from Symphony ${ }^{\text {TM }}$ to Wordstare-from 1-2-3® tothe FlightSimulator program. I strongly recommend the system.
To order, send your check or money order to the address below listing the items and order numbers (shown in parentheses) or order by credit card using our toll free number below.

Thanks to the latest in technology and a direct-to-consumer marketing program, this system can be yours at a tremendous value. Order your Visual Commuter at no obligation, today.

## Technical

# HOW TO EVOLVE tOA HICHER RTEELIGENCE. 

THE COMMODORE 128.
The first step is buying the Commodore $128^{\text {m" }}$ Personal Computer. The smartest computer available for the price. It's like getting three computers for less than one usually costs. You can run CP/M ${ }^{\oplus}$ business software, the new programs written for the 128 , and over 3,000 Commodore $64^{\circ}$ programs. You start out with more sofftware than most machines give you after years on the market.

影 a

To run all that software and run it faster, you'll want the 1571 Disk Drive. You can't find a faster drive at the price. It transfers nearly 1,000 words a second ( 5200 cps ), so you can load most programs instantly.

## THE COMMODORE 128 <br> WORKS FASTER.

THE COMMODORE 128 GETS SMARTER.
Now try improving your memory. Plug in our 1750 RAM Expansion Module and your 128 moves up to a powerful 512K. That's enough to handle just about anything you can dish out, from complicated business forecasting to giant data bases.

$\square$

There's no real intelligence without the ability to communicate. So you'll want our 1670 Modem/1200. It puts you in touch with a new world of shopping, banking, communications and information over your telephone line. And it operates at a lightning-fast 1200 baud to save on your phone bill.

## THE COMMODORE 128 LEARNS TO COMMUNICATE.

 -

THE COMMODORE 128 LEARNS TO WRITE.
Looking good in print could be your next move with the MPS 1000 Printer. It's a new dot matrix printer designed to make the most of the 128 's speed and high-resolution graphics. The MPS turns out about 1200 words a minute ( 100 cps ) of draft-quality printing, or gives you near-letter-quality at about 240 words a minute ( 20 cps ).

THE COMMODORE 128 IMPROVES YOUR VISION.
Brains aren't enough without good looks, so improve your vision with Commodore's new 1902 RGB Color Mon:itor. The high-resolution screen gives you a sharper image and better color than your standard TV, so you can really appreciate the 128's great graphics.

All these evolutionary steps ahead won't set you back when it comes to paying for them. Additions to your Commodore 128 are available at a store near you and are as affordable as the 128 itself. We think that's a smart way to help you build a computer system.
