The easiest, least expensive way to generate spectacular multi-color graphics, sharp two-color alphanumerics: Your computer, a color tv set and the Percom Electric Crayon™.

Add the Electric Crayon™ to your system and your keyboard becomes a palette, the tv screen your medium.

You dab and stroke using one-key commands to create dazzling full-color drawings, eye-catching charts and diagrams.

Or you run any of innumerable programs. **Your own BASIC language programs** that generate dynamic pyrotechnic images, laugh-provoking animations.

From a combined alphanumerics-semigraphics mode to a high resolution 256- by 192-element full graphics mode, the microprocessor-controlled Electric Crayon™ is capable of generating **10 distinctly different display modes.**

Colors are brilliant and true, and up to eight are available depending on the mode.

As shipped, the Electric Crayon™ interfaces a TRS-80* computer. It may be easily adapted for interfacing to any computer or to an ordinary parallel ASCII keyboard.

But that's not all

The Electric Crayon is not just a color graphics generator/controller.

It is also **a complete self-contained control computer.** With built-in provision for 1K-byte of on-board program RAM, an EPROM chip for extending EGOS™, its on-board ROM graphics OS, and a dual bidirectional eight-bit port — over and above the computer/keyboard port — for peripherals. The applications are endless.

Shipped with EGOS™, 1K-byte of display memory and a comprehensive user's manual that includes an assembly language listing of EGOS™ and listings of BASIC demo programs, the Electric Crayon™ **costs only $249.95.**

Options include:

- LEVEL II BASIC color graphics programs on minidiskette: $17.95.
- A 34-conductor ribbon cable to interconnect the Electric Crayon™ to a TRS-80*: $24.95.
- RAM chips for adding refresh memory for higher density graphics modes: $29.95 per K-byte.
- Electric Crayon™ Sketchpad, a sketching grid of proportioned picture elements (pixels) in a tv aspect ratio. For 128 x 192 or 256 x 192 graphics modes. 11-inch by 17-inch, 25-sheet pads: $3.95 per pad.

SYSTEM REQUIREMENTS: the video circuitry of the Electric Crayon™ provides direct drive input to a video monitor or modified tv set. An internal up-modulator for rf antenna input may be constructed by adding inexpensive components to the existing video circuitry.

Prices and specifications subject to change without notice.

PERCOM

PERCOM DATA COMPANY, INC.
211 N. KIRBY GARLAND, TEXAS 75042
(214) 272-3421

Get into computer color graphics the easy, low-cost way with a Percom Electric Crayon™. Available at Percom dealers nationwide. Call toll-free, 1-800-527-1592, for the address of your nearest dealer, or to order direct if there is no Percom dealer in your area.

TRS-80* Computer Compatible . . .

Quality is the real difference. Low price is merely a dividend.

High quality. Competitive pricing. And a proven track record.

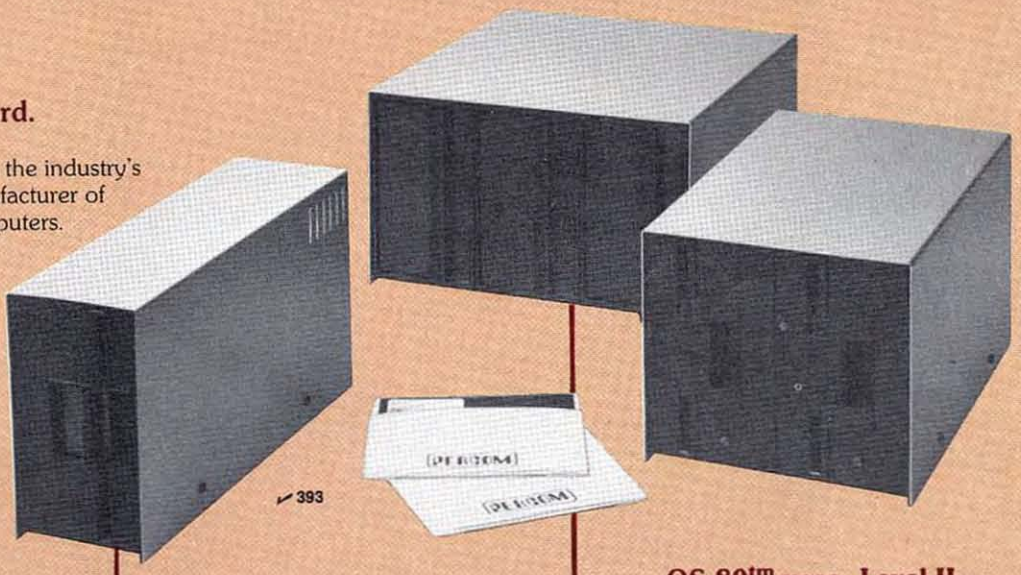
Three reasons why Percom is the industry's number one independent manufacturer of mini-disk systems for microcomputers.

And if you're looking at mini-disk drives, extra storage capacity is an added bonus.

In fact, you store almost one fifth more data on Percom TFD-100™ drives and over two-and-one-fourth times as much on TFD-200™ drives.

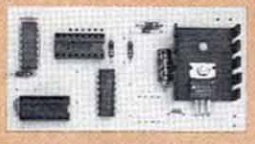
Besides extra testing and superior design, you get free, with each system, a software patch on minidiskette that not only upgrades TRSDOS* for operation with the newer 40- and 77-track drives, but also deglitches version 2.1.

Available in 1-, 2- and 3-drive configurations, Percom drives for the TRS-80* computer start as low as $399.



✓393

The gift of speech



Called Speak-2-Me-2™, this clever interface module makes a Texas Instruments' Speak & Spell† the voice of your computer — announcing, imploring, commanding with expressions and sentences created from the Speak & Spell† vocabulary.

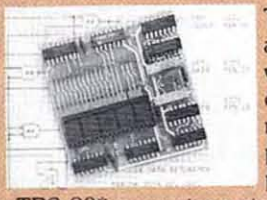
Speech is controlled either at the keyboard or by your own Level II BASIC programs. Or by Percom minidiskette word games (available soon).

Speak-2-Me-2™ is installed in the battery compartment of your Speak & Spell†, and power is provided from an ordinary calculator power pak. Supplied with an interconnecting cable, operating software and a comprehensive users manual, Speak-2-Me-2™ costs only $69.95.

(Speak & Spell™ not included.)

✓408

the Separator:™ End "CRC error. Track locked out!"



This plug-in adapter virtually eliminates data read errors, a problem that plagues TRS-80* computer systems. The SEPARATOR™, so called, is installed in the Expansion Interface without modifying the host system. When installed, data and clock signals are reliably separated during playback, an essential function that the separator circuitry of the host computer performs very poorly. Price is only $29.95.

Note. Opening the Expansion Interface may void the Tandy limited 90-day warranty.

✓409

OS-80™ uses Level II BASIC commands

With OS-80™, Level II BASIC commands are used for DOS and Disk BASIC functions.

You extend the OS-80™ utility set indefinitely with your own BASIC disk-resident utilities.

OS-80™ resides in less than 7-Kbytes of RAM.

The program is supplied on minidiskette along with a simple file manager, BASIC disk utilities and an OS-80™ "Handbook" that you expand and maintain.

All are helpful programming examples.

Price, with instruction manual, $29.95.

✓410

NEW! OS-80™ Machine Language SAVE / LOAD Utility. Only $19.95 on minidiskette w/instructions.

Quality Percom products are available at Percom dealers nationwide. **Call Percom's toll-free order number, 1-800-527-1592, for the address of your nearest dealer or to order direct.**

META TECHNOLOGIES

FOR YOUR TRS-80® DISK SYSTEM

★NEW★ MTC AIDS-III* ★NEW★

MODEL I . . .$69.95 MODEL II . . .$99.95

Introducing the latest addition to MTC's family of data management systems, AIDS-III. NO PROGRAMMING, easy to use. COMPLETE PACKAGE including demonstration application, documentation and MAPS-III (see below).

- Up to 20 USER-DEFINED FIELDS of either numeric- or character-type.
- CHARACTER-type fields may be any length (total: up to 254 characters).
- NUMERIC-type fields feature automatic formatting, rounding, decimal alignment and validation.
- Full feature EDITING when adding or changing records:
  - ENTER FIELD (can't type-in more characters than specified).
  - BACKSPACE (delete last character typed).
  - DELETE FIELD contents.
  - RESTORE FIELD contents.
  - RIGHT-JUSTIFY FIELD contents.
  - SKIP FIELD (to next or previous field).
  - SKIP RECORD (to next or previous record).
- SORTING of records is MACHINE CODE assisted.
  - 200 RECORDS (40 characters) in about 5 SECONDS.
  - ANY COMBINATION of fields (including numerics) with each field in ascending or descending order.
- SELECTION of records for Loading, Updating, Deleting, Printing and Saving is MACHINE CODE assisted.
  - Specify up to 4 CRITERIA, each using one of 6 RELATIONAL COMPARISONS.
  - LOAD or SAVE selected records using MULTIPLE FILES.
  - Example: Select records representing those people who live in the state of Colorado, but not in the city of Denver, whose last names begin with "F" and whose incomes exceed $9000.00.
  - Example: Select records representing those sales made to XYZ COMPANY that exceed $25.00, between the dates 03/15 and 04/10.

MAPS-III (MTC AIDS PRINT SUBSYSTEM), included at no charge, has the following features:

- Full AIDS-III SELECTION capabilities.
- Prints user-specified fields DOWN THE PAGE.
- Prints user-specified fields in titled, columnar REPORT FORMAT, automatically generating column headings, paging and (optionally) indentation.
- Can create a single report from MULTIPLE FILES.
- Prints user-defined formats for CUSTOM LABELS, custom forms, etc.

BELOW ARE TESTIMONIALS from owners of AIDS systems. These are absolutely authentic statements and are typical of the comments we receive.

"This program will do more for my business than all the other programs I have, combined."
David Wareham, Vice President (EDP), National Hospital and Health Care Services Inc.

"We have 32 different Data Base Management packages for the TRS-80. AIDS-III is easily the best. It also makes it easier for us to step up to our Model II since the package is available for both computers."
Jack Bilinski, President, 80 Microcomputer Services

"Your AIDS program is far and away the finest information management system that I've ever seen. I am currently using it to maintain a clear picture of the demographic data on all the kids in our residential treatment program and it is working for me superbly."
Frank Boehm, Director, Front Door Residential Treatment Program

- COMPATIBLE with AIDS-II data files and AIDS subsystems.
- Move up from AIDS-II and EXPAND to 20 field capability WITHOUT REENTERING DATA.
- AIDS-II (Model I or II) owners may UPGRADE FOR ONLY $25.00.

*WARNING! This program is written in BASIC and can be listed in the normal manner. Modification of program code is NOT RECOMMENDED due to its extreme complexity.

MTC AIDS - II

Ailing information? Doctor it up with AIDS-II. This Automated Information Directory System offers twelve user-defined fields with full feature editing when adding or changing records. Selective Loading, Updating, Deleting, Printing and Saving records may be accomplished using any of six relational comparisons. Also features machine code assisted sorting (200 records in about 5 seconds) by any combination of fields, and much more! Unique "windowing" capability allows directories of unlimited size. Window size is typically 200 or more records in 32K. Can be used for mailing lists, client reference reporting, appointment "calendars", inventory records and other information systems. Easy to use. Defining a system takes about a minute. MAPS-I (MTC AIDS PRINT SUBSYSTEM) is included at no charge. MAPS features full AIDS-II selection capabilities, prints user-specified fields down the page, produces user-specified columnar report formats with automatically generated column headings and paging, and allows user-defined print formats for custom forms, labels, etc. Add subsystems for additional capabilities. May be upgraded to AIDS-III when required.

MTC AIDS-II . . . . . $ 49.95
For Model II . . . . . $ 79.95

AIDS

CALCULATION SUBSYSTEM (CALCS)

MTC's most popular AIDS subsystem. Use for report generation involving basic manipulation of numeric data. Prints user-specified fields in titled, columnar report format, automatically generating column headings, paging and (optionally) indentation. Features full AIDS-III selection capabilities and can create a single report from multiple files. Provides the additional capabilities of user-specified balance forward computations, columnar subtotals, columnar totals and user-defined computations (allows multiplication, division, addition, and subtraction of field values and constants). Features may be used in combination. For example, the calculation of a user-defined quantity/cost column may simultaneously be listed by itself, used as part of a balance forward computation and as part of either (or both) a columnar subtotal or columnar total. Use for accounting, inventory, financial and other numeric-based information systems.

MTC CALCS . . . . . $ 24.95
For Model II . . . . . $ 39.95

Please include your address label with any correspondence. Postmaster: Send form #3579 to *80 Microcomputing*, Subscription Services, P.O. Box 981, Farmingdale, NY 11737.

META TECHNOLOGIES

Fellow TRS-80 User:
I'd like to thank you for your continued interest in our products and tell you something about MTC's approach to marketing. MTC's marketing efforts are directed at several areas:

- Market Expansion. This is accomplished by increasing market coverage (more types of product) and by increasing market share (more people buying a given product). Unlike many of our smaller competitors, we tend to concentrate on fewer product areas, but in greater depth.
- Product/Market Investigation. When enough of our customers tell us they are interested in a particular type of product, we either create the product, or acquire it, to fill the need. Sometimes a product is created or acquired that fills a previously unrecognized need. It is Marketing's job to inform our customers of its existence and potential benefit.
- Corporate/Product Promotion. As in any business it is important that you, the customer, think of MTC, rather than our competitors, when you need diskettes, educational or other quality products. Our distinctive name and logo are part of a unique corporate identity. We use expensive ad space for "letters" to our fellow TRS-80 users because we think it is important that you know something about the people you buy from. We promote our products using a variety of means, including product reviews and announcements, enclosing product information sheets with all orders shipped, and direct mailings, along with our normal advertising. This month we are introducing our regularly featured Product Preview section as a means of informing you of new developments. We will also be publishing a newsletter, which will be sent to all our customers, featuring new product announcements, programming hints and tricks, product reviews, letters to the Editor, a customer response questionaire and more.
- Distribution Extension. We are interested in increasing market exposure through coordination, not competition, by fostering a network of reputable dealers. For example, LTM Inc. offers the full line of MTC products and takes orders via toll-free phone calls and mail. They, however, advertise in other publications. In this way, each company maximizes its market penetration.

Next, let's look at who buys MTC products. Our customers typically fall into one of three groups. Most prominent is the businessman/hobbyist. He is relatively new to small computers, has some programming knowledge and is using a 48K, Model I with two disk drives. He wants to learn more about the machine and how to program it, but will buy a "solution" to a problem if it exists and is inexpensive. Second are Fortune 500 companies and governmental and educational organizations, such as school systems, major universities, and even the United States Army! The third group is the advanced hobbyist/computer professional. These customers buy our programming tools to save time. While not generally interested in educational products, they do purchase our AIDS systems in considerable quantities.

We specialize in products that use high technology and that solve problems for a broad class of users. They provide continual benefit and lasting value. That's why we don't offer game programs or specialty software (such as a $200 concrete foundation cost estimation package for building contractors).

While the majority of our products are created by our technical staff, we are always interested in seeing quality work by others. We are especially interested in outstanding communications packages, educational products like REMASSEM and REMDISK, system-type software for Model II (such as BASIC extensions and machine code routines), hardware diagnostics packages and related programming tools.

We at MTC look forward to providing you with the quality products and service you deserve and should expect. If we offered you anything less, we wouldn't be Meta Technologies Corporation.

Sincerely,

Wendy K. Sayer

Wendy K. Sayer

Apparat, Inc. introduces

NEWDOS/80

Apparat's long-awaited successor to NEWDOS+ is here! This is not an enhanced version of NEWDOS, but a completely new product. Simplified DOS commands can be instantly executed from BASIC, even within a program, without disturbing the resident code. System options, such as password protection, number and type of disk drives, BREAK key enable/disable and lowercase modification recognition, can be quickly and easily changed. Five new random-access file types allow record lengths of up to 4096 bytes, and no FIELDing! A powerful CHAIN facility allows keyboard INPUTs to be read from a disk file. An improved RENUMBER facility permits groups of statements to be relocated within program code. Diskettes may even be designated as RUN-ONLY! Features all NEWDOS+ utilities (SUPERZAP 3.0, etc.) and much more! One MTC technical staff member said having NEWDOS/80 is "better than sex" (you'll have to judge for yourself!). Includes 180-page instruction manual and MTC QUE card.

NEWDOS/80 ..... $ 149.95

CALL REGARDING OUR NEWDOS+ UPGRADE PRICING.

★ PRODUCT PREVIEW ★

General Business System for Model II

This product will be a full-feature, professional-grade business system, with fully integrated General Ledger, Accounts Receivable and Accounts Payable. A Payroll subsystem will be added later. Some of the major features and facilities are:

- General Ledger can handle a chart of accounts having more than 1000 accounts and sub-accounts.
- User defines and controls the account number structure to suit his own needs.
- Transactions can be entered and stored up to the limit of available disk storage (typically more than 5000 on a multi-drive system).
- Accounts Payable and Accounts Receivable are fully integrated with the General Ledger.
- Extremely high-speed, machine code assisted sorting is used for reports, etc.
- Financial Reports are user-defined and formatted.
- Formats of customer statements (Accounts Receivable) and checks (Accounts Payable) are user-definable.

We are targeting for release of this product in early fall, 1980.

mTc-SHIRTS

HIGH-QUALITY, POLY-COTTON BLEND T-SHIRTS. White with Navy Blue neck and sleeve "ringers". MTC logo on sleeve. Top quality transfers of your choice on front.

Specify size (S.,M.,L.,XL.) and Transfer:

- META TECHNOLOGIES MAKES EVERY BYTE COUNT!
- DON'T TOUCH MY BITS!
  01111110
- RAM it!
- MICRO LOVERS TAKE SMALLER BYTES!

mTc-SHIRTS..... $5.95

MAILSORT(Model I) $19.95

MAILSORT replaces existing sort in Radio Shack Disk Mailing List* system. Sort by any combination of fields, such as NAME, within CITY, within STATE. Hi-speed in-memory routine sorts 300 records in approximately 60 seconds. Minimum 32K recommended. For use with old or new versions.

PEEK&POKE..... $14.95

Frustrated because PEEK and POKE have been removed from Model II BASIC?. Satisfy your curiosity with PEEK&POKE from MTC. Included are 8-bit and 16-bit (LSB, MSB) self-relocating machine language routines, instructions, and demo program.

Transfer PROGRAMS and DATA from MODEL I to MODEL II

TRAN-SEND

$49.95 by MTC

Requires MODEL II and MODEL I with disk & RS-232. Simple to use, not a kit - nothing else to buy. Complete with custom cable, 5¼" & 8" floppies, instructions. May be used over phone lines.

Custom Cable only $19.95

Suitable for use with Radio Shack* transfer program(ACT 0131)

✓Reader Service Index—see page 194

80 REMARKS

by Wayne Green

". . . Radio Shack would do better if they were honest with their customers and didn't try to deceive them."

Painful Fact of Life

You probably have people asking you, as a computer "expert," what system you recommend. It's a very difficult question to answer. Owners of TRS-80 systems are all too familiar with the many deficiencies of the system. Some get so excited over the lack of color that they buy Apple or Compucolor systems. Others want a system with more business support and go for a Cromemco or an MSI. The arguments are endless since all of the systems have both benefits and drawbacks.

The main benefit of the TRS-80 is one which Radio Shack can't even mention, yet it's the single benefit which makes the system the main one which can be honestly recommended for a newcomer to computing. This is the software support.

By virtue of the large number of Radio Shack stores—there are more Radio Shacks than there are McDonalds, believe it or not—plus their marketing and promotion savvy, there are more TRS-80 systems out there than everything else combined. Programmers, being aware of this situation, have tended to first write programs for sale to TRS-80 owners. Thus we find the situation where there are more programs for the 80 than for all other systems combined. We find not only quantity, but also better quality. The pressures of the marketplace are such that poor programs tend to fall by the wayside and the better ones survive.

Radio Shack can't advertise this because they are trying as hard as they can to keep this fact a secret from their customers. They don't want the TRS-80 buyers to know that there is anything more than their handful of mediocre programs available. These are the programs put out by Radio Shack and sold from their stores. Some might call this greed, others might term it practical business sense. That depends on whether you are working for Radio Shack or independently.

It is my belief that Radio Shack would do better if they were honest with their customers and didn't try to deceive them. But then, I'm certainly not above suspicion as far as having a personal interest is concerned.

It is a full time job just to try to keep up with the programs being released for the 80, much less try to evaluate them as to their usefulness and value. There are thousands of programs . . . thousands. From my experience at least 25 percent are worth buying and using. The rest extend from absolute rip-offs to stuff of minimal value, despite some very high prices. Buyer beware!

The Radio Shack owned stores are not allowed to sell any products not made by Radio Shack . . . nor even let the customers know that such exist. No books or magazines which hint at outside sources are permitted to be sold in the stores.

Where this practice may all come home to roost will be when some other company spends the money to convert many TRS-80 programs to their own system and thus ends up with far more programs apparently available than Radio Shack is showing in their stores.

Gathering Strength

Oddly enough, though the Japanese have been slow to get into this field, they are now gathering their strength, apparently backed by their government. It has been the Japanese who are the most understanding of the importance of software and who have been most serious in dealing with us about their support. They seem willing to spend whatever it takes to get programs to support their systems. Thus, while Radio Shack is trying to discourage software support, Japan is pushing for it. What will this mean in one or two years as far as equipment sales is concerned?

"They have built up a bureaucracy akin to that in Washington. . ."

For the time being, considering the amount of software support for the TRS-80, it is difficult to recommend any other system for newcomers. Add in the splendid training courses available with the system, the dealer network and the growing service. In the long run the efforts by Radio Shack to prevent others from making money from the 80 may do them in, but, for now, they have things their own way.

The Tandy people should be a little more humble, for the TRS-80 went a long way toward saving the whole company. Lafayette started to get into computers and then dropped the ball. They went into bankruptcy. Radio Shack had many of the same problems: a disasterous drop in CB sales, a slowing of hi-fi sales, and a general drop is consumer electronics sales. Without the surge of business from the 80, the Tandy balance sheet could have turned red and their stock plummeted.

Radio Shack has a major problem that probably can't be solved. If you look at their financial reports you see that almost 50 percent of their expenses go for their management staff. They have built up a bureaucracy akin to that in Washington and such an overhead is very hard to ever cut down. I've talked with several friends at Ft. Worth and they assure me that the firm would run much better with less than half as many people. The Japanese firms are lean and mean, so they may be able to run rings around Radio Shack. The Japanese production lines are more automated, and their advertising and promotion is superb.

The next couple of years will be important. Either Radio Shack and the other American manufacturers will blunder into giving the market to Japan . . . or they will get their act together and win out. So far the blundering seems to be prevalent.

We're hearing rumblings from the Tandy folk about a couple of new systems to be announced in the near future. One is supposed to be an ultra low cost system ($295?) which will probably be much like a Level I, but with a modulator for using a TV set as a monitor.

Recent TV ads for black and white TV sets for around $60 do tend to make this approach attractive. I don't think anyone can do more than dump inventory at a loss at those prices, so the ads may be more a reaction to the present recession and an attempt to raise cash from a dead inventory by a large firm than any hint of a general lowering of TV prices.

Digression

To digress (as usual), television sets do *not* make good monitors for computers. The problem has to do with the "el cheapo" circuits they build into bargain sets, plus the limitations of bandwidth between television channels. The wider the bandwidth of the i-f (intermediate frequency) of a set, the sharper will be the picture on the screen. This is the main difference between a computer monitor and a TV set—sharpness. This is why your screen is relatively fuzzy on your TRS-80. The monitor shipped with the system was originally designed for a TV set and modified.

The limited bandwidth of TV sets is one of the major drawbacks to the color systems such as the Apple. You'll be bumping into this, one of these days, when Tandy announces their TRS-80 Color.

There have been conflicting reports about Tandy changing over to a new microprocessor chip in the new system. The folks at Tandy deny this, but others point to very large orders for the Motorola 6809 chip as proof that the new TRS will be based on that, rather than the Z-80. My own reading of the entrails suggests that the Z-80 will stay and that the 6809 may be

SPECIAL DELIVERY with EXTRACT

A 100% Machine Language Word Processor

TRS-80® + Electric Pencil® or Radio Shack's Scripsit®

We can't stop improving and expanding the capabilities of your TRS-80®! By using SPECIAL DELIVERY with EXTRACT and either Electric Pencil® or Radio Shack's Scripsit® you can get even more out of your computer. From just one package, you will get all this:

MAILFORM: Create MAILFILE: The ONLY complete name and address list entry/editor program written in machine language. Instant search on any field, complete cursor control, just fill in the form!

MAILRITE: Print letters written with either the Electric Pencil® or Radio Shack's Scripsit® inserting information from a MAILFILE into the letter for personalizing and addressing. You can send a personalized letter to one person then a different personalized letter to a second person with true typist quality from your fine printer. Features: Indents, Underscore, Bold Type, End of Page Stop, Address Envelopes, unlimited insertion from address list and More!

EXTRACT: Take out information from MAILFORM, the machine language mailing list. Find the names you need by Zip Code, Street Address, Gender, Age or any other way!

SORT: In-Memory sort on an entire address list using any field as the key. This program can sort an entire list in a matter of seconds!

LABEL: Prints labels from MAILFILE.

CONVERT: Make MAILFILE from RS mail list.

MOD II version available soon

SPECIAL DELIVERY will run on your TRS-80® with TRSDOS,® NEWDOS® or any other TRS®-like DOS.

If you bought SPECIAL DELIVERY from us, send us the disk and we will update it to include EXTRACT for $25. If you haven't already taken advantage of our SPECIAL DELIVERY program, we'll send you the complete program including EXTRACT for just $125 (Disk). We can also send you the Electric Pencil® for $150.

Too Simple?

While this magazine is aimed at the TRS-80 users, it is not solely for the beginner. Some articles may put off readers by being far too fundamental. On the other hand, some of the material is definitely for the advanced user and may, at first, be pretty puzzling. Have patience . . . it will sort itself out if you hang in there.

Articles Needed

We need more articles to help rank beginners understand computers. Perhaps, before you become so much of an expert that you have forgotten how to write in English, you can take the time to help those who are just starting down the road?

For instance, beginners would like to know about the various types of disk systems. I don't recall any definitive articles on them yet. A good article would explain about formatted and unformatted disks, single and double density, single and double side, different sizes, Winchester technology, what a disk controller does. There should be good photo illustrations of the various disk systems and disks.

The Factory

While in Fort Worth talking with the Tandy people about Instant Software support, Sherry and I paid a visit to their TRS-80 plant. They have taken over a huge J.C. Penny store and converted it into a facility where they manufacture both the Model I and Model II systems. It is impressive.

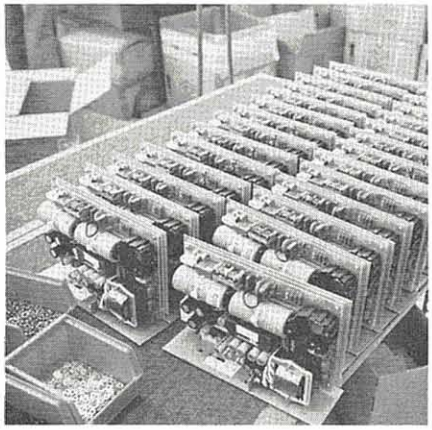
Except for the monitor and the Model II power supply, everything seems to be made right there in Fort Worth. They stuff the circuit boards, run them through a wave soldering unit which solders everything at one time, clip off the wire ends, run a test and put them together. They test again, put them in their cabinets and run even more tests. A good deal of their time and effort is spent on trying to make sure that the units will work when received. Despite all this, the first Model II received by us for test in New Hampshire didn't work.

Computers are fairly sturdy, but I sure hope they are able to come up with something better than a disk system for storage, for those are terribly delicate. Not much can happen to a computer board in shipment, but the disk units can get bent out of shape, as can the tube in the monitor. Say, how about a little gadget packed with each computer system carton which would indicate if the box had been subjected to more than a given number of G's of acceleration. These aren't too difficult to make and they could be sent back by the dealer after the unit had been delivered. This would put the onus for the damage to the unit on the carrier and thus tend to force them to emphasize to their workers that computers must not be kicked from a truck to the ground.

They have a completely automated testing

Continue to page 32

The system starts out with the CPU board being stuffed with chips and parts. Two boards at a time move along the production line.



The power supply boards from Asia are unpacked and inspected.

The disk units are unpacked and inspected, then installed in the system.

Once stuffed, the boards are inspected to make sure all the parts are there. . . and in the right place.

The system now starts getting put together. The monitor units, at the left, have been unpacked and inspected. They are covered to prevent damage.

Next the system is inspected and then given a 24-hour burn-in under high temperature conditions. This is designed to aggravate parts failures over this critical test period.

clearly readable printouts clearly remarkable price

The $625* Heathkit H14 Printer. You'll pay hundreds more for a printer with its features.

Where else can you buy a microprocessor-based printer with the H14's features and copy quality for under a thousand dollars?

The Heathkit H14 prints up to 165 characters per second, one full line every two seconds.

5 x 7 dot matrix and finest quality impact printhead give you clear, easy-to-read images.

All functions are microprocessor-controlled for reliable performance and more efficient use of your computer.

You get:

- Standard 96-character ASCII set—UPPER and lower case.
- Operator or software selectable line width: 132, 96 and 80 characters per line.
- Compatibility with any computer having RS-232C or 20 MA current loop serial interface with handshaking.
- Sprocket paper feed, with adjustable spacing, keeps paper moving smoothly.
- "Paper out" and "paper jammed" signals prevent loss of data.
- Selectable baud rates from 110 to 4800.
- Convenience of standard fan-fold paper, 2.5 to 9.5 inches wide.
- Chrome wire rack keeps paper neat.

Price includes connecting cables, paper rack and ribbon. Just add paper and you're ready to run. And service on the H14 is close by at any of 55 Heathkit Electronic Centers throughout the U.S.

Complete details on the remarkable H14 are in the newest, free Heathkit Catalog. Send for yours today or pick one up at your Heathkit Electronic Center.

"Whatever your computer, this printer is an excellent complement ...an excellent value."

80 INPUT

". . . while experimenting with my Disk BASIC, I learned an interesting fact. It has to do with the execution times of FOR-NEXT loops."

Simple Interface

I am writing this letter in response to Peter Noeths' June article "Teletype Interface." He offers a circuit to run a model 33 teletype as a printer for the TRS-80. As Level II 16K owners, Mr. Cory Gates and I have a much faster and cheaper way of interfacing the model 33.

When Mr. Gates and I bought our ASR 33, we considered using a UART to transform from parallel to serial. Soon after buying the ASR 33, we met with a TRS-80 owner who has interfaced his ASR 33. Mr. Leon Hogan runs his 33 with a single open collector and RSM-2. Using RSM-2's TRS232 software, he runs at the 110 baud needed for the ASR 33. RSM-2 will output to the cassette latch in serial at any of six bauds.

Building the interface is a simple 30 minute job. First of all, open your keyboard. Solder a wire to the GND on J1 (power jack). This will supply the ground needed for the interface. Next solder a wire to the 74LS75 at pin 3. This chip is the cassette latch. Pin 3 is Q Prime or the data inverted and serves as your single line. Now tie this wire to the base of the transistor. This transistor serves two needs. It acts as an open collector to run the power supply and inverts the data to the normal state. After this, tie the emiter to the GND on the keyboard and the GND on the teletype. Last, but not least, the power. Tie the negative terminal to the collector and the positive terminal to the single on the teletype. To test the hardware just run this:

```
10 FOR I=1 TO 1000:OUT 255,2:NEXT
20 FOR I=1 TO 1000:OUT 255,0:NEXT:GOTO 10
```

The printer should lock and then unlock.

Now, all that is needed is the software. If you have RSM-2, run it and set the 'Y 1 0 1'. This will set the baud to 110 and line-feed after carriage return. To print with LPRINT and LLIST use this program:

```
7FB0:  21 B9 7F     LD    HL,7FB9
7FB3:  22 26 40     LD    (4026),HL
7FB6:  C3 19 1A     JP    1A19
7FB9:  21 FF 7F     LD    HL,7FFF
7FBC:  34           INC   (HL)
7FBD:  AF           XOR   A
7FBE:  CD E9 7F     CALL  7FE9
7FC1:  59           LD    E,C
7FC2:  CD E4 7F     CALL  7FE4
7FC5:  06 08        LD    B,08
7FC7:  79           LD    A,C
7FC8:  1F           RRA
7FC9:  4F           LD    C,A
7FCA:  D4 E4 7F     CALL  NC,7FE4
7FCD:  DC E8 7F     CALL  C,7FE8
7FD0:  10 F5        DJNZ  7FC7
7FD2:  AF           XOR   A
7FD3:  D3 FF        OUT   FF
7FD5:  7B           LD    A,E
7FD6:  FE 0D        CP    0D
7FD8:  20 1A        JR    NZ,7FF4
7FDA:  AF           XOR   A
7FDB:  32 FF 7F     LD    (7FFF),A
7FDE:  0E 0A        LD    C,0A
7FE0:  1E 00        LD    E,00
7FE2:  18 D5        JR    7FB9
7FE4:  3E 01        LD    A,01
7FE6:  18 01        JR    7FE9
7FE8:  AF           XOR   A
7FE9:  D3 FF        OUT   FF
7FEB:  21 6A 02     LD    HL,026A
7FEE:  2B           DEC   HL
7FEF:  7C           LD    A,H
7FF0:  B5           OR    L
7FF1:  20 FB        JR    NZ,7FEE
7FF3:  C9           RET
7FF4:  3A FF 7F     LD    A,(7FFF)
7FF7:  FE 46        CP    46
7FF9:  C0           RET   NZ
7FFA:  0E 0D        LD    C,0D
7FFC:  18 BB        JR    7FB9
7FFE:  00           NOP
COMMAND?
```

Enter this program with TBUG and punch with 'P 7FB0 7FFF 7FB0 LISTER'. To use it, enter 32687 at memory size and load it with 'SYSTEM' and then 'L'. Execute with '/'. Now the printer commands will work. This program is written so you can relocate it using EDTASM with little work.

I hope that I have saved someone time and money.

Ray Nuber
Olathe, KS

Relative Time

Recently, while experimenting with my Disk BASIC, I learned an interesting fact. It has to do with the execution times of FOR-NEXT loops. Using the real-time clock I came up with the following relative times:

```
FOR I=1TO32766:NEXT I (real) - 107 seconds
FOR I=1TO32766:NEXT (real) - 77 seconds
FOR I=1TO32766:NEXT I (integer) - 76 seconds
FOR I=1TO32766:NEXT (integer) - 46 seconds
FOR I=1%TO32766%:NEXT (integer) - 45 seconds
```

These times were for my Model I with an Expansion Interface. This seems to indicate that using just NEXT for each FOR-NEXT loop can save a considerable amount of time. However, see the Level II manual page 4/10 (2nd ed - 4/12) for a warning on this usage as it relates to GOTOs.

I also noticed that using variables in an integer FOR-NEXT loop makes little or no difference for smaller loops. Try it on a loop less than 10000 using variables to define the range of the loop. This is because they are evaluated only once. See the manual for more details.

It is interesting that the manual makes no mention of this difference in speed in their section on speeding up execution. The jump from integer NEXT variable to integer NEXT saves almost as much time as the jump from reals to integers!

EDTASM Error

Thanks for publishing the EDTASM Index (June '80'). To me, it's this kind of useful article that really makes a magazine like *80 Microcomputing* worthwhile in the long run.

The author, Terry Kepner, also found three errors in the Editor/Assembler manual. I wish to point out another. On page 81, the description of the instruction BIT b, (HL) should read:

". . . with the contents of the MEMORY LOCATION POINTED TO BY THE HL register pair . . . "

In addition, the number "444" appears three times near the bottom of the page. In each case the number should be "4444."

Thank you, and keep those great issues coming.

Jeff Berkowitz
Isla Vista, CA

Good News

I am impressed with the new magazine. The content is excellent. Please work for careful review and proofreading of submitted programs and information. In the Feb. issue, for example, Wes Thielke gives some pointers for accessing the ROM routines. I tried his procedure for using the SET/RESET routine (Table 3), however I get a SN ERROR message and a return to BASIC after it has set a point. I have tried everything I can think of to solve the

problem. Can you help me out?

Good news for light pen builders. You can build the light pen descibed in the April issue ("Build a Light Pen" by Wayne Holder) using all Radio Shack parts. The circuit does not appear to be critical. Here is my list of parts:

```
PQ1:   Phototransistor: RS# 276-130
Q1,Q2,Q3,Q4:   PNP Transistor: RS#276-1604 (15 in one pak)
R1:   #271-025
R2:   #272-061 (use in place of 2.4 meg).
R3:   use two 2.2 meg resistors in series.
R4:   #271-034
C1, C2:   #272-1069
C3:   #272-996
```

Although several substitutions have been made, this set of components works well. You will not be able to fit this into the pen, however. I built the amplifier circuit on a separate board. For the pen, I took a standard push-top ballpoint, broke out the "push" mechanism, and installed the phototransistor' at the point. You do not have to have the phototransistor flush with the point, it can be behind the point slightly; the sensitivity is excellent. The cost of the pen is greatly reduced, and if you have some friends you can divide the leftover 2N3906 transistors.

Roger A. Kendall
Lexington, MO.

Etch-a-Modification

In the May 1980 issue of *80 Microcomputing* James K. Shrum's "Etch-a-Screen" is an excellent drawing program.

At the end of his article he wrote, "Should anyone come up with any modifications I'd like to hear about them."

After working with the program, I found the following to be the ones I used most.

While drawing a racetrack, I discovered I had made a mistake. I then proceeded to push the break key and type RUN. This cleared the screen and returned me to the home position (O,O).

Why couldn't I have just pushed a key to clear the screen?

I added this line and it did the job and left me at my current position.

```
135 IF S="C" THEN CLS: GOTO 30:'clears the screen when
you type "DC".
```

While drawing a diagram of a pinball game I had a need to see where I was on the screen.

These lines show the values of X and Y, as they stand at the current position on your screen.

```
105 IF P = 1 PRINT @ 55,;X;Y;

145 IF S = "P" THEN
P = 1: GOTO 30:          'prints the current value of X,Y
                         so you know where you are on
                         the screen.

155 IF S = "Y" THEN
P = 0: PRINT @
55,CHR$(198);: GOTO
30:                      'turns off and erases position
                         teller.
```

In a few cases I found myself wanting to start at the bottom-righthand corner.

Why can't we start or move to any place on the screen?

This line lets you input exactly where you want to go to or start.

```
165 IF S = "I" THEN
PRINT @ 952,;: INPUT
X,Y: PRINT @ 952,
CHR$(196);: GOTO 30:     'lets you set set X and Y anyplace
                         on the screen.
```

The above line also clears the bottom line of the screen.

These additions will fit in with your 4K machine provided that you remove all REM's.

Here is a list of all the commands possible for "Etch-a-Screen" if you enter my additions.

Type "D" before entering your command.
T - Puts you into the text mode.
S - Saves a drawing on cassette.
L - Lets you load a previously saved program.
New additions
C - Clears the screen and leaves you at your last position.
P - Prints the values of X and Y so you know where you are on the screen.
Y - Turns off the position teller.
I - Lets you input the values of X and Y which will move you to that position.

Thank you, James Shrum for such an excellent program.

Randy Long
Yorba Linda, CA

Small Corrections

A couple of small corrections will help the "MENUE" program in DOS to BASIC by Gary Alcorn in the 80 input section, May issue:

```
Memory location 6B20 becomes D8 (was E3)
Memory location 6B21 becomes 43 (was O3)
```

As well, it is possible to load a program of any size (not just 5 characters as stated). However, one must terminate with the two bytes 22, OA.

The program will run as originally written under TRSDOS 2.3, but the key debounce will not work.

R. Hewko
Dawson Creek, B.C.,
Canada

Only 258 Bytes of Buffer

The last paragraph of page 115 of April's issue *should* state that the PRINT #-1 statement writes no more than 248 bytes to tape. Remember that the TRS-80s I/O buffer (extending from addresses 16870 to 17128) is only 258 bytes long, and a few bytes are needed for housekeeping purposes.

The BREAK DISABLE article on page 128 contained two errors. Change line 10 to read

```
10 CLS : FOR X = 32743 TO 32767
```

Delete the last ,0 from the DATA statement, which is redundant.

Finally, how about getting Dennis Kitsz to provide us with an assembly language version of KBEEPFIX so that users can reassemble it with a different starting address. There was no indication that the program was relocatable. Right now KBEEPFIX conflicts with other programs.

John Blommers
Edmonton, Canada

Free Info

I think the following information to your readers concerning Computer Bulletin Boards will save you and Radio Shack a number of phone calls.

I think the evolution of Forum-80 systems are the best thing that could have happened to the computer hobbyist. The article in the May issue of *80 Microcomputing* by Jim Cambron was excellent.

I would like to add that if you do not disable the parity error routine before calling a system, you will always get vertical lines between the characters the system sends.

If you don't know how to disable the patch, send me a blank cassette and an S.A.S.E. and I will copy mine for you.

Delran, NJ 08075

HELP

As an owner of TRS-80 with interface and disks, I have a problem that I'm sure many others also have.

When the TRS-80 is on, it makes interference not only on my CB-radio base station, but also on the surounding stations. Is there anything to do about that?

I hope to get help from you or some of your readers to solve this problem.

Per Evensen
Tingvallavagen 8
S- 186 00 VALLENTUNA
Sweden

Several weeks ago, 80 Microcomputing received the following letter from one of our readers. As you will see, the letter from Computronics, Inc. suggests that Delmer Hinrichs, author of the well-received "BASIC Word Processor" that ran in May 80, had based his work on ground already broken by Dr. Hubert S. Howe.

80 Microcomputing asked Mr. Hinrichs for some clarification. There was never any assertion, as Mr. Hinrichs interprets of plagiarism, but rather, 80 Microcomputing thought a footnote might be appropriate.

Mr. Hinrichs response surprised even our managing editor, who, upon review, agrees with Mr. Hinrichs.

Mr. Hinrichs letter, somewhat abridged, follows.—Eds.

Asserts a "Rehash"

I am in total agreement with your comments in the May, 1980 issues of *80 Microcomputing* pertaining to copying software. What about almost copying software?

Pages 50-55 of *80 Microcomputing* contain an article called "BASIC Word Processor." The article and the program itself is a "rehash" of what first appeared in our H & E Computronics, Inc. Monthly Newsmagazine. The program uses identical variables and identical commands (with sufficient modifications to get around the copyright laws). The article accompanying the program even uses our eight basic features that appeared in the article accompanying our program.

The article and program appearing in *80 Microcomputing* is probably sufficiently different to avoid prosecution under the copyright laws (although we wouldn't be interested in following that course). We would like *80 Microcomputing* to acknowledge the original source for the material. We are certainly happy (and pleased) to give *80 Microcomputing* the rights to publish anything that comes from our Newsmagazine. We would just like *80 Microcomputing* to give us proper credit and ask for prior permission.

By the way, The Word Processor is the program that we have been giving away (at no charge) with each subscription. The original version appeared in our April, 1979 issue. The updated version appeared in our April, 1980 issue (both enclosed).

Keep up the good work. I know that it is impossible to find the orignial source for everything being written.

By the way, our word processor is selling for $99 by a company in Florida (without our permission). People are very angry when they find out that we give it away for free. We have the rights to unlimited free distribution. The Word Processor was written by Dr. Hubert S. Howe, Jr.

Howard Y. Gosman, President
H & E Computronics, Inc.

Surprising Rebuttal

I was very surprised to receive your letter and the copy of Mr. Gosman's letter, in which he claimed that my article/program, "BASIC Word Processor", published in the May 1980 issue of *80 Microcomputing*, was a "rehash" of Dr. Howe's article/program published in the April 1979 issue of *Computronics*. I *had* seen and tried Dr. Howe's program, along with several other BASIC word processors, but had found that none were satisfactory (Dr. Howe's program I found too slow, lacking features that I felt were necessary, and insufficiently debugged). I thought, "I can do better" and decided to write my own program.

"Program plagiarism is a serious charge . . . bear with me"

It was a number of months after I had last looked at Dr. Howe's excellent write-up of a mediocre program that I got around to writing up my program. After receiving your letter, I again looked at Dr. Howe's article. Yes, we do organize things similarly: We first list features, then operation in general, then operation in detail. While this is a natural way to organize an article, perhaps Dr. Howe's earlier article had left its impression.

We both list eight features, a startling coincidence. However, five are descriptions, in different words, of features that any good BASIC word processor should have; three are different.

Actually, even features that sound the same may be different. For example, we both claim, in different words, upper and lowercase text entry using an unmodified TRS-80. Reading further, you find that with my program, (shift-letter) gives uppercase, and (letter) gives lowercase, the same as a typewriter. With Dr. Howe's program, (shift-letter) gives lower case, and (letter) gives uppercase, very awkward for entering normal text.

Program plagiarism is a serious charge, so please bear with me. The following comparisons are based on only Dr. Howe's April 1979 program; I have not seen the April 1980 updated version that Mr. Gosman mentions, so I cannot comment on the revised program.

Program Features

Do the programs have different features? I think so. While some features appear duplicated, most actually work quite differently.

My program has the COMPILE command, my term for the command to move words between lines to make all lines the correct length. I think that this feature is essential for a practical word processor; otherwise, if lines are made too short or too long by EDITing or reFORMATing, many lines may have to be manually changed or even retyped. Dr. Howe's program does not have anything similar.

My program allows entry of do-not-justify markers to skip justifying of any line; his does not. mine displays this marker, as well as end-of-page and trailing-space markers on the video; his does not show any such special markers. My program has subcommands for moving the text in a line to the extreme right of the line, of centering it; his does not. Mine shows on the video display what the program is doing during time-consuming operations; his does not. Other non-shared features are mentioned below.

Dr. Howe's program does have one feature that mine lacks; the ability to store text in a disk file.

Program Organization

Are the programs organized in a similar fashion? I think not. Mine puts the commands in alphabetical order; his does not. For logic branches, I tend to use the ASCII number of the character, and use ON—GOTO for multiple branches; he uses string characters and groups of IFs. I try to protect against user errors; he does less checking. I try to put subroutines after the calling point; he puts them wherever convenient. I display the text after it has been changed; he does not. I use string variables "Y" and "N" for yes-no questions; he uses numeric variables.

We do both compress the spaces out of our respective programs to save memory.

Program Commands

Dr. Howe has 14 commands in his program; I have 17. Of these, ten have the same name, and thus appear the same at first glance. Actually, only three, DELETE, HELP, and MOVE have essentially the same effect, and even on these, the BASIC code is different. On the others:

EDIT—We have both more or less followed the Level II editing format. Dr. Howe leaves out the Again subcommand and the "n" preceding the left-arrow, right-arrow, Space, Change, Delete, and Search subcommands. I addded subcommands shift-right-arrow (move text to right), shift-down-arrow (center text), and shift-@ (exit from EDIT).

INSERT—Dr. Howe INSERTs text only into empty lines; I move the following text down to make room for the new text line or lines.

JUSTIFY—Dr. Howe's program will

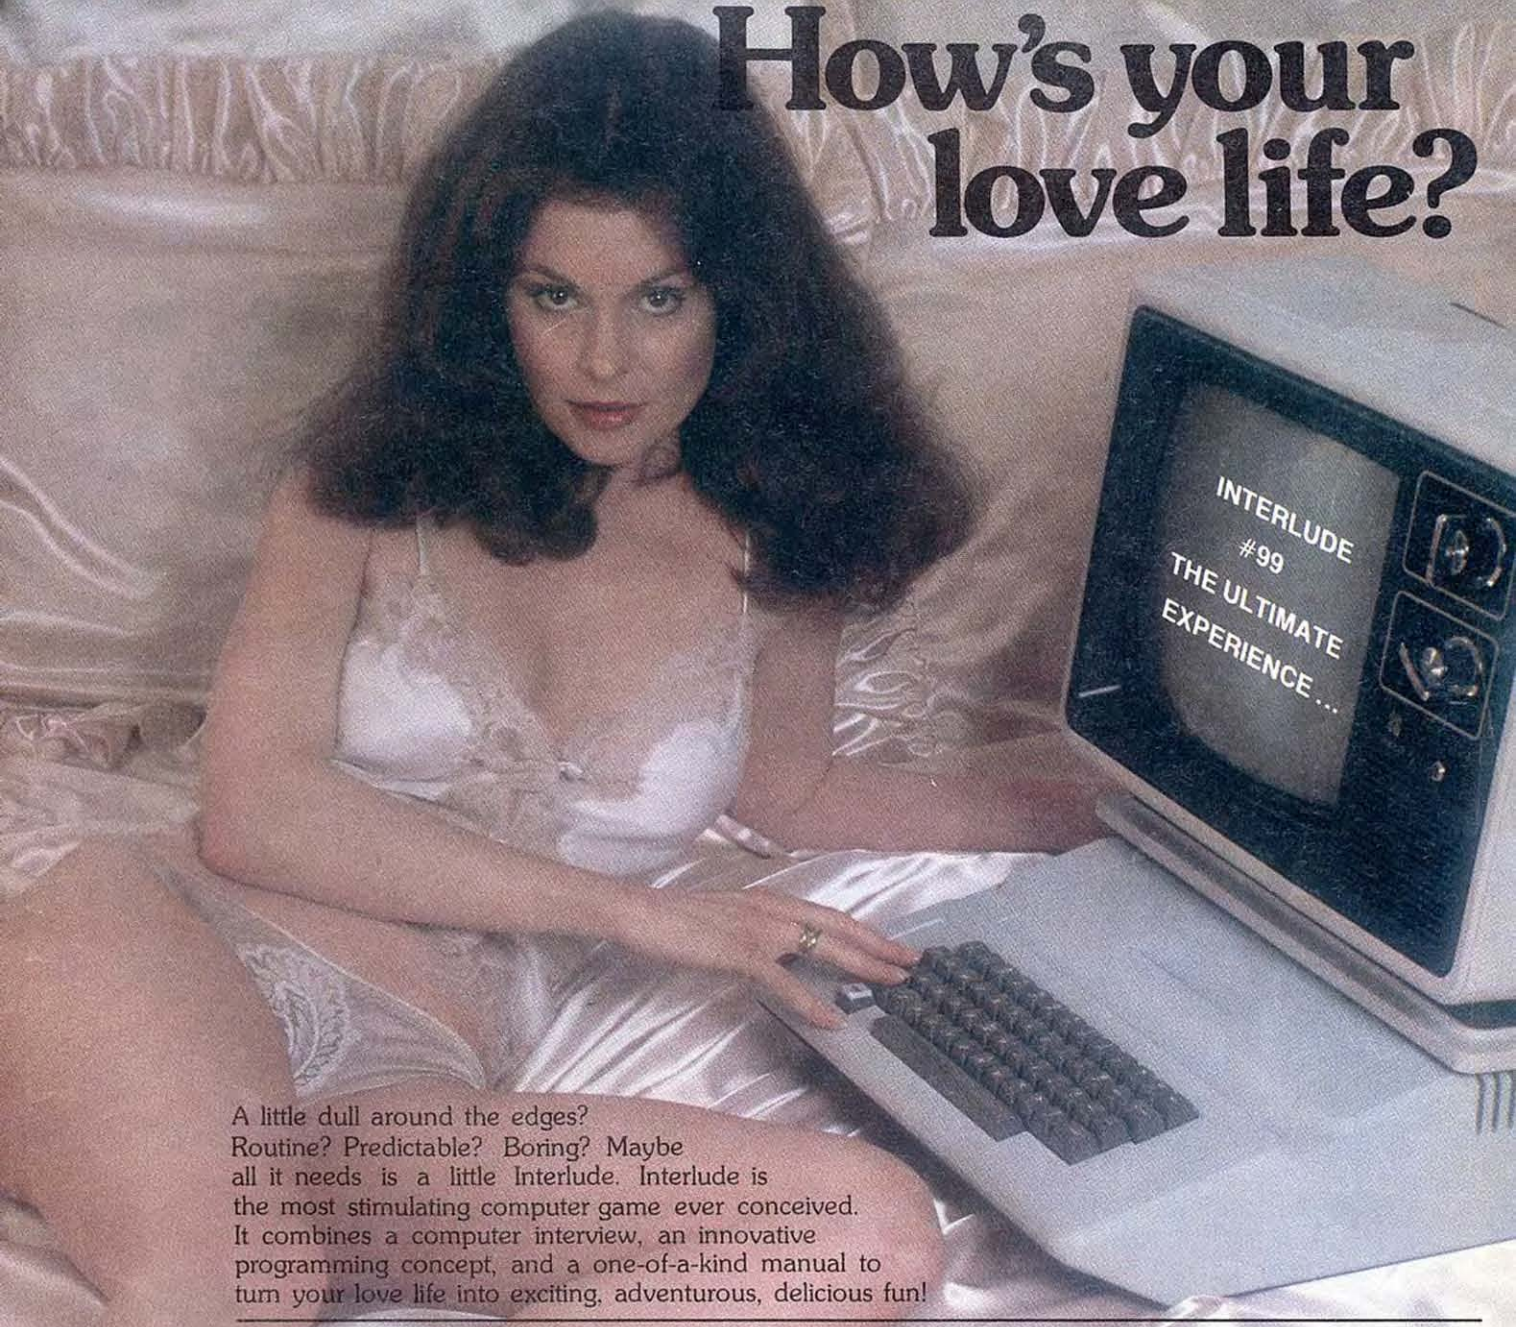
How's your love life?



A little dull around the edges?
Routine? Predictable? Boring? Maybe all it needs is a little Interlude. Interlude is the most stimulating computer game ever conceived. It combines a computer interview, an innovative programming concept, and a one-of-a-kind manual to turn your love life into exciting, adventurous, delicious fun!

Interlude is: romantic . . . playful . . . outrageous . . . a fantasy. Interlude is: ■ Wet fun on a hot summer night. (Interlude #21) ■ A surprise on the way home from dinner. (Interlude #42) ■ A bubble bath that ends with a bang. (Interlude #78) ■ An evening to rest while she does all the "work." (Interlude #25) ■ The most romantic of evenings. (Interlude #84) ■ A new twist to an old subject. (Interlude #69) ■ Just watching her . . . (Interlude #57) ■ An erotic fantasy! (Interlude #33)

With over 100 Interludes, you can satisfy all levels of interest and desire. Each Interlude is fully described in the manual, and the more elaborate ones are detailed with regard to settings, props, and mood-enhancing techniques. But we've saved a few super Interludes for that very special time when your interview indicates you're ready! At that time, you will be introduced to one of several Interludes held secret within the computer. (When you learn secret Interlude #99, your love life may never be the same again!) Interlude can give you experiences you'll never forget. Are you ready for it?

Hinrichs from page 14

not right-justify lines that end with a space or punctuation; mine will. With my program, a marker is added to a line to leave it unchanged; his does not have this option. Dr. Howe can't JUSTIFY short lines; I can. The actual adding of spaces is quite different; I start at a random position and distribute added spaces uniformly, at adjacent or alternate original spaces; Dr. Howe doesn't.

LOAD—Delimiters (" , :) or leading spaces that may occur in text cannot be SAVEd and LOADed from tape. Both Dr. Howe and I got around this problem by translation, adding an eighth bit to the seven-bit ASCII code (by adding 128). Dr. Howe tests for the problem characters, and changes them in the text file before and after a SAVE, and after a LOAD; he then SAVEs or LOADs one text line at a time. I translate all characters, put them into a buffer array, then SAVE or LOAD four lines at a time. The practical difference? A lot of time and tape. My translation is much faster, no re-translation is needed after a SAVE, and there are only one-fourth as many data files to record or read.

PRINT—In Dr. Howe's program, PRINT may mean either print on the printer, or display on the video display; in mine, PRINT means PRINT. My program can set the left margin, print page numbers on all pages except the first, print the entire text without intervention, and print text with line numbers without offsets to the text; Dr. Howe's cannot.

REPLACE—Dr. Howe's REPLACE must start at a line that contains text, but can then continue in blank lines. In my REPLACE, only one line, with or without text, is affected.

SAVE—See LOAD.

ADD is similar to Dr. Howe's FILL, but adds a single character to the text file quicker, besides correcting the upper-lowercase reversal, which Dr. Howe's program does not do. My program moves a too-long word to the next line much faster than does Dr. Howe's program. If a word ends on the last position of a line and (space) is then entered, Dr. Howe's program incorrectly moves the word to the next line; mine does not. In my program, shift-right-arrow moves text to the extreme right of the line; in Dr. Howe's, it fills the line with spaces.

FORMAT is similar to Dr. Howe's SET, but has 10 format variables, compared to only six for SET.

I could continue listing differences until this letter was longer than my original article, but I think that the conslusion is obvious from this sampling: While there is a superficial resemblance, due to the two programs having a common goal, the actual features and the detailed operation of the programs are quite different.

DEBUg

Bugs in Doodle Bug

Due to a lapse in communication between myself and the editors at the last minute when the June 1980 issue of *80 Microcomputing* went to press, the line numbers used for reference in my article "Doodle Bug" do not correspond to the line numbers in the actual program listing. The table below provides the corrections that need to be made *to the text* portion of this article, starting on page 74. The corrections are listed in the order that they appear in the text.

Line numbers referenced in text of article:	Corrections to text so that line numbers will correspond to program listing:
p. 74 300-385	265-350
500-585	410-485
RUN 400	RUN 355
400	355
300	265
RUN 600	RUN 490
p. 76 435, 445, 660 and 665	390, 400, 575 and 580
999	595
110	165
116 and 220	175 and 225
GOTO 115	GOTO 170
GOTO 220	GOTO 225

Life Re-Lived

Readers will have noticed by now some missing items from two programs in the LIFE article published in June *80*. Here they are:

In Listing 6 there should be no line 15. That is actually *selection* 15 in line 2010 (you wondered where that went? Well score one for automation). Also, line 3100 was swept up from the floor, I suppose. As many readers have deduced, line 3100 should read GOSUB 9999.

Now the assembly listing of LIFE itself. Lines 245 and 265 now read *LIST OFF and *LIST ON. Instead, these lines should be dropped and lines 250 and 260 added, reading:

```
250 DEFM 'LOADING LIFE9 ..... WAIT FOR
    "GOOD LOAD"'
260 DEFM '.....THEN ENTER "/"'
```

I suppose an overanxious accountant sliced out lines 6450 and 6460. They originally read:

```
6450 COPY DEFM '* COPYRIGHT 1979 BY DENNIS
                BATHORY KITSZ.'
6460            ' ALL RIGHTS RESERVED *'
```

...but you are welcome to place any 64-character message in that place.

I would also like to mention that for those readers without the patience to type in the complete listings, I have prepared LIFE9 on cassette, along with the BASIC seed listing, for $9.

Dennis Bathory Kitsz
Roxbury, Vermont 05669

SCRNPRNT

I thoroughly enjoyed "Screenprint" in the May 1980 issue, but found a bug in the listing. Line 194 should be:

```
LD (4049H), HL
```

H was left out in the assembly (look at the object code). Otherwise SCRNPRNT is working faithfully.

John Sowers
Petersburg, VA

Roseland Re-visited

In the article "Adventures in Roseland" (June, *80*), the program listing was incorrect.

Lines 40, 50 and 60 should have read:

```
40   X=(R*COS(J))+64
50   Y=(R*SIN(J))+47
60   SET(X,47-(Y/2))
```

EXATRON STRINGY FLOPPY T.M.

SPEED
LOW COST
RELIABILITY

Exatron is a California based corporation that has been in business since 1974. As well as the Stringy Floppy, Exatron designs, manufactures and sells state-of-the-art electro-mechanical equipment for a variety of commercial and industrial applications. Exatron is an established supplier of automatic test equipment to manufacturers, and large OEM users, of integrated circuits worldwide.

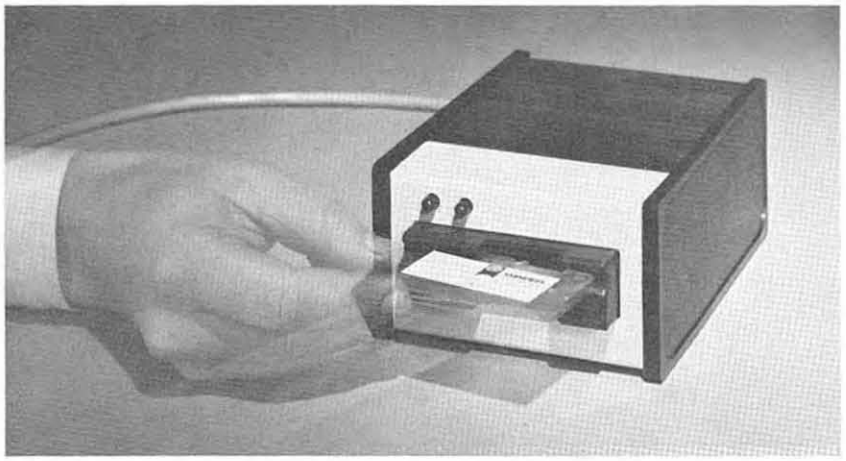
The software in every ESF adds a parity bit to every byte saved on tape, and a checksum to the end of every file. These are checked both after recording data and upon replay, any detected error is indicated by a message on the video display. This system of automatic error checking gives confidence in any data saved, also each wafer is rated for at least 2,000 complete passes past the record/replay head.

- ►Assembled and tested
- ►All operating software in ROM
- ►Fully automatic operation
- ►Professional quality
- ►No Expansion Interface required
- ►Large Owners Association
- ►High speed operation
- ►Extremely reliable
- ►No technical knowledge needed

WHAT IS IT?

The Exatron Stringy Floppy (ESF) is an extremely fast, reliable, economical alternative to cassette or floppy disk storage of computer programs or data.

Totally self-contained, the ESF has no buttons, switches, knobs or levers to adjust or forget. All of ESF's operations are under the computer's control.



TRS-80 is a trademark of the Radio Shack Division of Tandy Corporation.

HOW DOES IT WORK?

The ESF uses a miniature tape cartridge (called a 'wafer') as the data storage medium, about the size of a business card and 3/16th of an inch thick. The tape used inside the wafer is a special Mylar based Chrome Dioxide type, specially developed for digital applications. Wafers are available in several lengths, 5 feet being the smallest and capable of holding up to 4 thousand bytes of information – the 75-foot wafer is the largest available and can hold up to 64 thousand bytes of data.

The wafers contain a single reel of the special tape connected as a continuous loop, the ends being spliced together with a piece of reflective tape. In operation the ESF drive unit pulls the tape from the center of the reel inside the wafer, causing the entire reel to rotate. Thus, the tape automatically winds itself around the outside of the reel at the same rate as which it is pulled from the center. This process is similar to that found in an 8-track cartridge.

The ESF transport mechanism is very simple, consisting of a precision die-cast aluminum block – with a capstan, drive motor and magnetic record/replay head mounted on it. The wafer loads into a slot in the casting (it will only fit the correct way) and the tape is driven at a single point by the capstan, past the record/replay head.

HOW DO YOU USE IT?

Once connected to your computer the ESF operating system needs to be activated—simple. Just type 'SYSTEM'(enter), and in response to the ? prompt type '/12345' (enter). Your TRS-80 will instantly display the ESF sign on message 'EXATRON STRINGY FLOPPY VERSION 4.1', and from this point onwards you will have the extra commands '@LOAD', '@SAVE' and '@NEW' recognized by your TRS-80.

The ESF's operating system is built into the electronics of the unit, in much the same way that BASIC is built into the computer, so it is always available – the SYSTEM command is to let your computer know that the ESF has been connected. If you normally reserve some memory for subroutines then the ESF software will relocate itself under your selected top of memory. The ESF uses only 4 bytes of your available RAM, these bytes are used to 'point' to the 2048 bytes of software in the ESF unit itself.

WHAT'S THE CATCH?

Well, the only catch that most people find is that they have to actually pay Exatron for their unit! Even this is no big deal.

Starter Kits are available with the Exatron Stringy Floppy, a supply of wafers, a bus extender and a selection of useful programs – for $299.50.

Through regular advertisements in both Kilobaud Microcomputing and 80 Microcomputing, owners are kept informed of the latest developments in wafer-based software. Plus hundreds of user 'workshops' are starting up over the country, so you can always be sure of being near to another ESF owner.

Exatron also gives a 30-day full money-back guarantee, with a 1 year parts and labor warranty on the unit.

If you have any questions about the ESF then give Exatron a call on the Hot Line (outside CA) **800-538-8559.**

East Coast customers can call **800-343-4424** (inside MA **617-899-3862**)

Open House Workshops take place from 9 am till 1 pm every Saturday at Exatron's factory in Santa Clara, and on the East Coast the last Saturday in each month at Micro Communications, 80 Bacon Street, Waltham MA 02154. All are welcome.

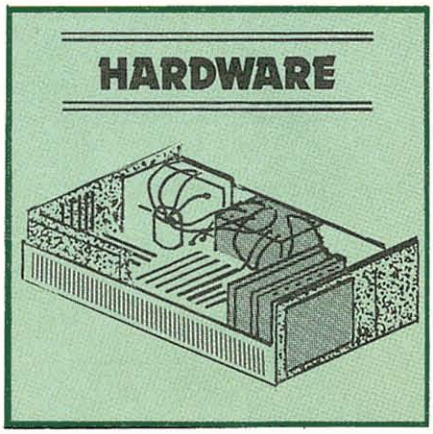
REVIEWS

"I realized the time I was saving . . . was lost . . . in the amount of time spent typing reports from the video display."



Trendcom 100 Printer
Trendcom
Sunnyvale, CA
$375

by John D. Adams

I have no idea what one does with a wire wrapping tool. I find PC boards artistically attractive but regard their operation with puzzled awe. The mere idea of a logic probe sends me to the liquor cabinet. But I do love my computer. I am one of those computer users who really is a *user*.

I have owned my TRS-80 for over a year and a half, have dutifully learned my Level II BASIC and expanded my RAM to 16K. I am now writing software which occasionally astounds me by working. As a teacher of Algebra II and Accounting, using my TRS-80 has increased exponentially during those 20 months.

Time Saved, Time Lost

Several months ago, I realized that the time I was saving by using a computer was lost twofold in the amount of time spent typing reports from the video display. I was losing my eyesight, my patience and my sanity. It was clearly time for hard copy, and I had to have a printer that I could plug in and run.

My first forays were frustrating and disappointing. I found a lot of decent printers for around a thousand bucks, but I couldn't afford them *and* support the government and my family at the same time. Besides, I could not see paying more for a printer than I did for my entire system.

I had nearly resigned myself to several years more of typing from the video until I could save up a thousand dollars—provided the car did not fall apart on the freeway—when I tried a local computer store looking for a used printer. There, a salesman demonstrated the Trendcom 100 printer. He gave me a program listing to check on the copier and said he had an interface cable that plugged directly into the TRS-80.

I went home to think about it. The listing copied fine—it even made a good ditto master on a thermal copier. I called a second computer store for their opinion and got no negative feedback.

So I bought one. With foreboding, of course. Things that work well for everyone else seldom work for me. The manual is short, concise and clear. A separate page concerning TRS-80 applications is included.

Inside the cabinet is a slide switch that activates a self-check routine and prints out the 96 character set, illustrating both upper and lowercase. The manual states that if this works, you should hook it up.

One end of the ribbon cable is furnished with an interface card housed in a black plastic box about 3½" by 5" by ¾". I was told that this is for systems without the expansion interface. I had some trouble figuring out which was the top of the box, but finally realized that it could go only one way and still leave access to the reset button. This is a fair indication of my electronics expertise.

The other end of the cable plugs into the printer and is notched; not even *I* could get it in backwards. Hook up the cable, plug the power cord into a grounded receptacle, and you are ready to go. The power supply is included inside the printer case.

Bi-directional Printer

The unit's weight will surprise you. It is a microprocessor-controlled, bidirectional printer. It prints a 40 character line at 40 characters a second. Trendcom projects the head life at 10^8 characters. The warranty is satisfactory, and the salesman assured me that repair support is available. Interface cables are also available for the Apple II, the PET and for RS232 applications.

It is refreshingly quiet, making sound only when the print head changes direction and advances the paper. Loading is easy, and the paper feed is even and regular. Operation requires only the LLIST and LPRINT commands. The PRINT USING and the PRINT TAB statements may be used, making formatted output a snap.

The Trendcom even prints upper and lowercase without a TRS-80 hardware modification by reversing the normal shift procedure. Lowercase is not a prize winner, but it is readable and offers contrast.

The drawbacks for me are few and minor. The printer uses thermal paper in blue or black at about four cents per foot, which is not cheap. Unless you do a great deal of printing, this should not be critical. The paper is also narrow, measuring slightly less than 4½ inches and cannot be exposed to sunlight or heat.

A small LED on the front panel to indicate power on/off status would be handy.

So far I have not been able to get the printer to print an up arrow for exponentiation. It prints an open bracket sign instead. Using the CHR$(91) notation does not help. If anyone knows how to get around this, I would appreciate hearing from you.

Two self-protecting circuits are built in. The first resets the unit when line voltage drops below 90 percent of the rated needs. Operation resumes automatically when power is up again. The second circuit locks if the print head does not return to the left margin. This is cleared by turning the power off and then on again.

I am completely satisfied with the Trendcom 100, especially considering that my cash outlay was over $100 less than I would have spent on the Radio Shack Quick Printer. For someone with my computer budget and my computer needs, the Trendcom 100, like the TRS-80 itself, is ideal. ■

Sample Listing from the Trendcom 100.

Okay, now you've had a chance to see what I have in mind for you with *80 MICROCOMPUTING*. Oh, I admit that we're just getting started and that the magazine will be improving a lot as we go along. We have some interesting ideas in the works for you.

With the TRS-80* (or 90 . . . etc.) being the most popular microcomputer in the entire world, you are going to benefit from this in many ways. The more computers there are out there of one kind . . . the more good programs you are going to have for this system. I hope that is obvious. You may be sure that *80 MICROCOMPUTING* will be packed with the shorter programs and reviews of the larger ones. You can waste an awful lot of money on stuff that looks great in the ads, but fizzles out when you try to use it. You need our reviews.

The wealth of programs will also mean that there will be much better programs for the TRS-80* than any other system. Put yourself in the seat of a computer programmer and you'll understand this. If you are going to spend several months developing a comprehensive program, and it takes all of that to write and debug a big program, would you write it for a system which has sold one hundred units or one which has sold over 300,000 systems? The answer is obvious . . . and this is why we are already seeing programs coming out for the TRS-80* which are far better than anything for any other system on the market. This is tough for other systems . . . the law of the computer jungle.

Between our connections with Instant Software, the largest publisher of microcomputer programs in the world, and Kilobaud MICROCOMPUTING, you know that *80 MICROCOMPUTING* is going to be your most important link with software for the TRS-80*.

With Instant Software being sold and promoted in every country in the world where the TRS-80* is being sold, our input of programs is also the best in the world. We get programs submitted from everywhere . . . often from 50 to 100 a week! You'll get the cream of the crop either published or reviewed in *80*.

*TRS-80 is a trademark of Tandy Corp.

HARDWARE TOO

The same law of the computer jungle holds for hardware. Would you, as a manufacturer, market an accessory for a system which has sold 100 units or would you go first for the one which has sold hundreds of thousands. It is, as with software, self-evident why the great bulk of the hardware accessories for computers are for the TRS-80* these days.

80 MICROCOMPUTING has the advantage of the use of the largest and most complete microcomputer lab in the world . . . the one developed for Instant Software and Kilobaud MICROCOMPUTING. This means that most new pieces of equipment are tested and in use by our staff . . . and this means that we can tell you what we think is outstanding . . . and where we find ripoffs. This lab is important to you.

SUBSCRIBE

If you are not already a subscriber to *80 MICROCOMPUTING*, please get signed up right now. The yearly rates are $18, and that is a bargain. Just one single program of use to you can be worth much more than that. One review of an accessory could save you many times that much investment. I would appreciate it if you would appoint yourself a committee of one to get more subscribers for the magazine. You will benefit even more than we do here at the magazine . . . because the more readers we have, the more ads we will be able to attract . . . and the more ads, the more pages of articles you will get every month.

The *80* market can, I think, support a couple of hundred pages of ads . . . and that would mean a magazine of nearly 500 pages a month. That should hold you. You may not have time left to use your computer.

ENCYCLOPEDIA

If you've read Kilobaud MICROCOMPUTING, you know that I try hard not to duplicate published material. My concept is that every reader should save every issue (we sell inexpensive boxes for this so they can sit on your library shelf) and treat the magazine as a continuing encyclopedia of computing. I make sure that much of the material in each issue is written in simple language so it will be understandable by even the rawest newcomer to computers. Oh, I have articles for the more advanced users too, so you'll have something to look back over later and use as your understanding of your system grows.

Try to think of *80 MICROCOMPUTING* as more of a large club newsletter than an ivory tower high-level publication. I'll leave the pomp to other publishers . . . the ones with the well-deserved inferiority complexes who cater to their inadequacies by publishing esoteric baloney. This magazine is written by the readers and edited by people whose aim is to help you enjoy your TRS-80*.

SAVE

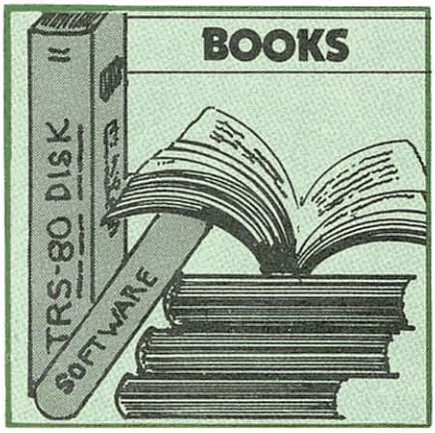
With each issue costing $2.50 at your computer store, that's $30 a year. For $18 a year you can subscribe . . . at least for now. As the magazine expands, please do not be surprised if the cover price increases, along with the subscription price. I started *73 Magazine* for radio amateurs twenty years ago with a cover price of 37¢ (two for 73¢) and it is up to $2.95 a copy now (and it is the largest of the ham magazines).

For you bargain hunters . . . and those who find that one year goes by all too rapidly, the three year rate for *80* is $45. This, too, will be going up . . . reflecting the inflation, paper increases, postage increases, and a short vacation for me in Hong Kong next year. Someone has to pay for that.

DO YOU OWN A TRS-80*?

THEN READ ON . . .

If the coupon below has been used, please fill out subscription form on the Reader Service card in the back of the magazine.



The Micro Millennium
by Christopher Evans
Viking Press
$10.95

by Nancy Robertson
***80* Staff**

Have you ever heard of compucide, or computer killers? A few weeks ago the anchorwoman on a Boston news program told listeners that an anti-computer ring had been short-circuiting computers in the metropolitan area. Other individuals had been arrested for attacking terminals with hammers and pouring honey down keyboards. The incidence of computer sabotage has become so common that a legal term has developed—compucide.

At least one of Christopher Evans' predictions from his book *The Micro Millennium* has come true: The anti-computer movement of the early phase of the Computer Revolution has begun.

The Micro Millennium claims that we are in the early phase of a sweeping cultural revolution spurred by the advent of microprocessors. The book begins with a concise and personable history of the people and scientific advancements which have brought the computer to its present development.

Eccentric Babbage

The first person to build a calculator and design a computer, Evans writes, was an eccentric Englishman named Charles Babbage. Early in the nineteenth century, Babbage built an enormous machine of cogs and wheels run by a handcrank that calculated mathematic equations. The Difference Machine, as Babbage called it, was built several decades before the discovery of electricity. While he was still working on its construction, Babbage began to design his Analytical Engine to deal with a variety of problems besides sums. Nobody paid much attention at the time.

Evans takes his readers through the stories of several other scientists and inventions until we come to the first operating computers, which came into existence in the United States and England during the second World War.

But by Evans' definition, the Computer Revolution did not begin until the invention of the transistor. In one stroke the transistor multiplied processing speeds at exponential rates, shrank the size of computers and opened the way to expanding their memory capacity.

Evans cogently predicts the computer's role in the short-term future. He compares the Computer Revolution with the Industrial Revolution which caused changes in all levels of society through "emancipation of the power of the muscles." While segments of society fought against it, the momentum of the Industrial Revolution could not be turned back. Machines replaced laborers, and a period of widespread unemployment followed. As the economy adjusted to mechanization, the work day dwindled from 18 hours to the current seven or eight hours. Society adjusted to a higher standard of living.

The Computer Revolution, Evans argues, will bring "the emancipation of the power of the brain." The changes will occur, he predicts, at unparalleled speed.

One of the main functions of computers is information storage and retrieval. Since the invention of the printing press until the present, books have been the most reliable and efficient means of recording, preserving and disseminating thoughts and facts. In a short time, Evans believes the entire contents of the Library of Congress will be able to be stored in the memory of a microprocessor. As microcomputers become as common as television sets, a greater wealth of information will be available to more people than was ever believed possible.

Because they barter information, the professions, such as law, medicine and teaching, will be the jobs most severely affected by the spread of computers, according to Evans. Changes will be so vast and so rapid that backlash is inevitable.

Businesses will be run by microprocessors communicating with microprocessors. Everybody will work shorter days. Most people will work at home. Concentration of the population in urban centers will become unnecessary. Commuting will die out. Eventually, the need to work may disappear all together.

These are just a few of the changes Evans predicts as a result of the computer's information storage and retrieval functions.

Problem Thinkers

Computers solve problems too. They think. Evans writes about the possibility of Ultra Intelligent Machines (UIMs) far surpassing the highest human IQ. Evans, a psychologist, is quite lucid about the definition of thinking. It is equally clear that he believes computers will surpass human intelligence. He gives credence to the belief that computers are already capable of creative and original thought, as opposed to programmed logic. A computer, programmed to test new proofs of Euclidean geometry, developed its own proof of the theorem "which shows that the base angles of an isosceles triangle are equal." Evans writes that the proof "had not before been known to Man."

Unfortunately, *The Micro Millennium* does not explore the ramifications of UIMs as cogently as it presents the history, present and short-term future of computers. Evans gets bogged down with straw dogs. He voices hollow objections to artificial intelligence that are transparently set up to be knocked down. The book begins to lose its interest.

In the last chapters, the focus is lost altogether. The book rambles to an unintelligent close. But before he runs out of steam, Evans is able to convince us that the Revolution is inevitable. Organized networks of compucide crusaders won't turn back the tide. ■

EDAS 4.0
Roy Soltoff
and Bill Schroeder
Galactic Software
Mequon, WI
$229

by Jake Commander

The TRS-80 Model II, presumably because it's more sophisticated than the Model I, is being approached with respect by software suppliers. The software written for it also appears to be more sophisticated (which usually means more expensive) and seems to be written with much greater professionalism.

EDAS 4.0, the editor/assembler package from Galactic Software, is no exception and has a very good chance of becoming the standard assembler of the Model II, just as EDTASM became the standard Model I assembler. The assembler uses most of the same EDTASM commands plus other more powerful additions.

EDTASM Is a Subset

Using the EDTASM commands as a subset of the EDAS 4.0 command set is one of the most attractive things about the package. A machine language programmer familiar with the Model I assembler will be able to plug in and switch on EDAS 4.0.

For the newcomer to EDAS 4.0, a full menu of commands, including syntax, is viewable merely by hitting the ENTER key. It's a thoughtful touch which saves wearing out the manual.

As you'd expect from a product of this quality, the manual is comprehensive and well laid out. It contains an in-depth overview, full command summary, and also includes a full reference list of Z-80 opcodes and address modes.

I had the pleasure of assembling a fairly large program using EDAS 4.0 and had no problems whatsoever. In fact, just like any good assembler or compiler, its usefulness is taken for granted after a very short time.

One particularly nice thing which you can do is to assemble directly to either memory or disk. That means you can check out an assembled routine quickly in RAM, return via a simple RET instruction, reassemble the routine if necessary, and save the object code as a disk object file. You can only do this when your object code doesn't overwrite the assembler itself, its symbol table or any other illegal address.

You can also use this direct-to-memory op-

tion in conjunction with the Model II debugger, giving you an extremely powerful method of developing machine code software with minimal expenditure of time and effort.

The usual options, such as line print of assembly output, pause on errors, no listing, no object code generation or no symbol table, are also available at assembly time.

The symbol table printout does lack a cross-reference index, which is something I found conspicuous by its absence. It's about the only thing I found missing from this product.

One thing I particularly liked was the object code printout from a DEFM command. Bytes are printed out in a neat block for easy reference. Model I users will remember the peculiarities of their equivalent pseudo op. Other pseudo ops supported include DEFB, DEFW, DEFS and END.

Excellent Editor

The EDAS 4.0 editor is excellent. You can edit in either line or global mode. To the layman, that means you can manipulate source code by altering single lines or by altering the whole text buffer. For instance, if you discover you've used an illegal label, opcode, or whatever, there's no problem! Just use the global replace command and you can change all the illegal references at a single stroke. The editor will display each changed string as it comes to it. EDTASM eat your heart out!

Yet another new feature which I could have used hundreds of times is a block move command. It is invaluable. If you want to move a subroutine or a table to a more convenient position in the source code, then just use a simple M command. This will move a whole block of lines from one place within the text to another, and then automatically renumber the text. It's the sort of command that makes you wonder how you previously managed without it. The renumber facility is, of course, also available as a separate command.

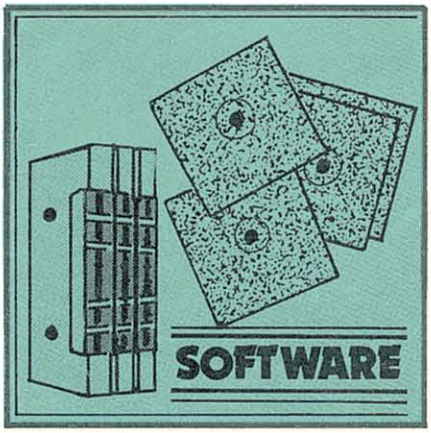
The line editor functions in the same manner as the Level II BASIC line editor, except that while in the edit mode, the edited characters appear in reverse video. All user prompts and error messages also appear in reverse video, which makes feedback just that bit more obvious.

Other thoughtful touches include a screen clear that uses the F1 key, and advancing the text page by using the F2 key. Forward and reverse scrolling is provided with the appropriate up or down-arrow key.

By now you should be getting the idea that this assembler does it all. Disk file handling is simplicity itself. W and L commands perform the writing and loading of source files. Once you've specified a source filespec, you don't need to keep repeating it in subsequent writes. The assembler will default to the original filespec if you omit it. This gives some protection against accidentally overwriting a source file by giving the wrong filespec, which can happen too easily after a long, mind-numbing session at the keyboard.

Text concatenation is yet another feature which you come to take for granted with this assembler. Model I users will, no doubt, be glad to know that source files can be transferred to EDAS 4.0 on the Model II. My own experience proved this, although it took a couple of goes before I got it right.

Though it's priced high, like most business software, no serious assembly language programmer is likely to find a more useful piece of software. ■



Pyramid
Radio Shack
Tandy Corporation
Fort Worth, TX
$14.95

by William O'Brien

Radio Shack's entry into the world of adventure games for the TRS-80 is titled Pyramid. The game is yet another example of Radio Shack's inability to deal with the consumer in a consumer's market.

An exasperated survivor of Adventureland and a glorious savior fresh from Programma's Wilderness Campaign for the Apple, I sat down to attack Pyramid.

Limited Instruction

The game's explanation is minimal. In a four-page booklet barely one side of a full page is used to explain it.

While proponents of adventure games may argue that directions should be limited to allow the user to grasp the theory and action, this is hardly fair to someone who has never been exposed to the genre.

Sadly, too, as with some other Radio Shack programs, the instructions seem to assume that the reader is either a child or an adult with the mentality of a slightly premature corned beef.

Pyramid suffers from the lack of a command word base. Command words reviewed in Pyramid are limited to GET, GO, SCORE, LOOK, INVENTORY, TAKE, DROP, THROW, CLIMB and HELP. Although this might seem a sizable base for a vocabulary, I don't think it is sufficient.

The scenario starts with the would-be explorer in the desert, standing in front of the tip of a Pyramid. You proceed using the assumed and known vocabularies.

Firstly, the LOOK command produces a "You can't go in that direction" response when nothing is apparent. More correct would be an "I see nothing," or "Nothing is there." "Looking" is not synonymous with "going" in the real world, however, the words seem to prompt similar responses in this game.

We go down a passageway, collect a few items, perhaps chase the elusive statue of a bird that comes alive if you approach it. A little exploration nets us a scepter with an ankh at the top and a small empty box.

Down some steps, we enter a vast hall stretching almost endlessly toward the west. Two passages appear, one on either side, with another set of stairs leading down.

We may, at this point, discover a lump of gold in a room down the left passage, along with a sign that says, "You'll never get it up the stairs." And you can't.

The north passage to the throne room is guarded by an industrious serpent. Should we choose the lower passageway, we find the same snake (or its twin sibling) guarding an identical passage. That leaves us the long stretch to the west.

Hope not here, pilgrim. There, a bottomless chasm is impossible.

Don't try to jump it, you won't make it. You can try typing HELP, but don't expect any. You will only see the response, "I'm as confused as you are!"

It seems that this is the only response programmed for that command (or so I was told by a member of Computer Services), and it is the only response you will get.

You're on your own.

If you try climbing down, you can't. You can't go around, either. I decided that my only alternative was to do something not mentioned in the meager instructions. I called Texas.

Go Wave a Scepter

That call was as enlightening as typing HELP. I was told I should try waving my magic scepter. What magic scepter, I naively asked. Why, the magic scepter I must have picked up in another room.

"The one with the ankh on it?" I queried.

"Yes," a voice squeaked out.

"But it never said it was a *magic* scepter," I replied.

That's the point of the game; you have to find these things out, I was told.

I was so disgruntled that I didn't return to the game. But that was because of the answer to my final question.

"Are you people down there really happy with the way this game performs?" I asked, and immediately dreaded the question.

"Of course we are!" I was told.

"You mean, you find nothing wrong in the way it operates?" I pried.

"No, not at all," he said, "in fact, a lot of people have called to complain that it is too difficult and to find out how to use it." ■

THE ASSEMBLY LINE

by William Barden, Jr.

"The algorithm for the ping-pong simulation is fairly simple, at least for this specialized case."

In a previous column, we looked at a high-speed graphics subroutine called SET. This month we're going to finish the discussion of high-speed assembly language graphics by showing how a modified version of SET can be used for graphics that may even operate too fast for some applications! (And they said that assembly language wasn't useful...).

The new version of SET is shown in Listing 1. It has been modified to provide a reset capability. As in the old version, the position of the pixel to be set or reset is in the HL register pair on subroutine entry. The H register contains an X value of 0 through 127, while the L register contains a Y value of 0 through 47. In this version, however, the A register contains a zero if the pixel is to be set and a one if the pixel is to be reset.

To use the subroutine, put a valid value for X and Y in the HL register pair, and set the A register to a 0 or 1. The subroutine will set or reset the specified pixel and return to the calling program.

We won't repeat the discussion of the basic operation of the SETRST subroutine except to say that it converts the X,Y coordinates into a character position (0-1023) and bit position within the character position (0 through 5), and then sets or resets a single bit of the 6144 bytes within video display memory to change the pixel, or picture element. A complete discussion can be found in the previous column.

This month's version retains all of the old code and adds some reset logic. The new code is indicated by the boxed-in areas of the figure. Setting a pixel involved loading the byte in video display memory that contained the pixel involved, ORing in a single bit for the pixel position, along with the graphics mode bit in bit 7, and storing the altered byte back in video memory.

Resetting a pixel is very similar. After the byte containing the pixel is loaded, the single bit for the pixel is reset by ANDing in a mask value from the MASK1 table. This mask value has all bits set except for the bit to be reset for the pixel.

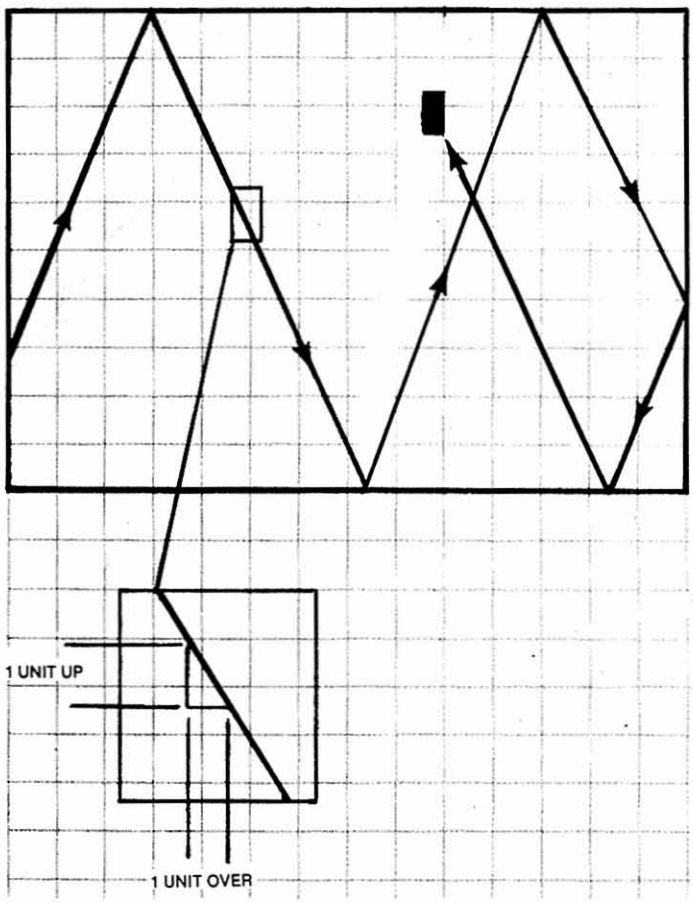

Fig. 1.

How Fast Is This Subroutine

Let's approximate its speed by a method that you can use for other assembly language code.

Follow the path of SETRST for either function and count the number of instructions as if you were the TRS-80. Assume some nominal case for loops. Going through the code we have lines 740,50,60,70,80,90,800 and 810. Line 800 is executed in about one-half the time, and we'll add it in here. Lines 810 through 840 constitute a divide by three through successive subtraction. Assuming an average Y of 24, we have about 27 instructions. Seven lines plus 27 is 34; plus seven more through line 910 is 41.

At line 920 we have another loop of six iterations, making twelve more instructions for a total of 53. From here there are no more loops, and we can simply count the lines, assuming either a SET or REST path. I count 14 more for SET and 15 for RESET, for a grand total of 67 or 68. Let's call it 68 instructions to perform either a SET or RESET pixel.

Now, how do we convert the instructions to execution time? We know that the TRS-80 runs at 1.774 megahertz, and that the execution times in the Radio Shack or Zilog assembly manual are in terms of a 4-MHz clock. Consequently, the TRS-80 runs 4/1.774 times slower than a 4-MHz processor (except for you readers who have installed the 144-MHz clock speed-up kit, of course).

Let's assume an average instruction speed of 2.5 microseconds for 4 MHz. In TRS-80 terms, this is 2.5 * 4/1.774, or about 5.6 microseconds. The total execution time to set or reset one pixel in the SETRST subroutine, then, is about 68 * 5.6 microseconds or 380 microseconds, or .4 milliseconds (.4 thousandths of a second). Putting it another way, the number of pixels or points that can be processed by SETRST is about 2500 per second.

AL VS BASIC Graphics

How does this speed compare with BASIC? The SET,RESET commands in BASIC operate at about 122 pixels per second. Setting or resetting random pixels by POKEing values at best is about 800 pixels per second for truly random data. Strings are great for contiguous data on the same line, but too inefficient for random data. (For a discussion of these methods and their use see Radio Shack's new book *Program-*

ming Techniques for Level II BASIC by William Barden, Jr. Uh...no relation.)

A speed of 2500 points per second sounds very fast, and for some applications it is. As a matter of fact, for some applications, it's simply much too fast! An example is shown in the driver code below. A driver program, by the way, is generally main line code that is the primary code of an application. In this case, the driver produces a ping pong ball that bounces between the limits of the screen.

The driver is shown in Listing 2. We'll explain the algorithm and then go part-by-part through the driver program so that you can see how it works.

The algorithm for the ping-pong simulation is fairly simple, at least for this specialized case. We've defined the angle to be used as "one unit up for one unit over" as shown in Fig. 1. As each pixel is rectangular, this amounts to a rather acute angle with the top and bottom boundaries, as shown in the figure.

As the angle after the impact equals the angle before impact, we can always work with "one unit up for one unit over." The current position is given by X and Y. In standard TRS-80 notation: X = 0 through 127, left to right and Y = 0 through 47, top to bottom. The next position is calculated by adding increments, or "deltas" to both X and Y. These deltas will always be a plus one or a minus one to give the next X or Y value.

Whenever the ping-pong ball pixel hits a boundary, the current delta associated with that boundary is reversed. Boundaries occur at X = 0 or 127 and Y = 0 or 47. Suppose that the ball (pixel) is traveling towards the Y = 0 boundary as shown in Fig. 2. The delta X value is + 1 and the delta Y value is − 1. If the next Y value will be 0, the new deltas will be X = + 1 (unchanged) and Y = + 1 (negated).

The algorithm may be stated as follows:

1. If current X is 0 or 127, negate delta X. Leave delta Y.

2. If current Y is 0 or 47, negate delta Y. Leave delta X.

Listing 1.

Simulating Motion

To simulate motion of a dot, the next pixel must be turned on, and the previous pixel must be turned off rapidly. (There are some aesthetics to this that are not easily defined, such as the length of time between turning on the next pixel before turning off the old, but we'll plunge ahead without regarding them.) The driver program in Listing 2 first calls SETRST to set the new pixel, and then calls SETRST to reset the old pixel.

The section of code from line 160 through line 230 clears the screen by storing an 80H value in all 1024 character positions. The value 80H sets the graphics mode (bit 7 is a one) and sets the six pixels of each character position to 0. An interesting point: A blank character position may be made up of an 80H character, or an ASCII blank, 20H. Setting all character positions to 80H initializes all character positions to graphics mode. A count value of 1023 is decremented down to − 1 by adding − 1 to the value in HL. A "no carry" is produced only when the contents of HL goes from 0 to − 1.

```

Listing 2.

Line 240 initializes the current X,Y and delta values. A delta X of 1 means that the dot moves to the right; a delta of −1 means that the dot moves upward.

The code from line 260 through 660 is the main loop of the driver program. The code flows from top to bottom with only one imbedded loop from line 590 through line 600.

The code at LOOP1 adds the current delta X to the current value of X and the current delta Y to the current value of Y. This produces the new X,Y position. This position is saved in variable LAST for later use. After the new X,Y position is computed, a call is made to SETRST for setting the pixel. The HL and BC register pairs are saved in the stack before the call and restored after the call as SETRST destroys the contents of both.

The code from line 390 through 550 performs the boundary test. If the dot has just been written to a screen border (X = 0 or 127, Y = 0 or 47), the delta X or Y is negated, changing the direction away from the border on the next computation of X,Y.

The code from line 570 through 600 is simply a time delay that delays by decrementing the initial value in HL by one each time through the loop. A minimum delay occurs with a LD HL,0, and a maximum delay occurs with a LD HL,65535.

The last action in the driver is to CALL SETRST to reset the pixel set previously before the time delay. The position of the pixel is in variable LAST, and this is loaded into HL with a subsequent call to SETRST.

The program loops continuously, moving the dot forever.

If you will enter the code into your Editor/Assembler, assemble and execute it, you will see a moving dot virtually identical to a electronic ping-pong game that bounces back and forth at angles to the boundary. It is not difficult to see how an actual ping-pong or other action game could be programmed this way.

One of the most interesting things about the method is that the speed of the dot is much too fast when the minimum delay is used in the loop at 570. The dot moves so rapidly through the screen that it looks like a random pattern! A delay count of 500H slows it down to acceptable levels. Try experimenting with various delay counts and observe the effects.

Is complicated animation possible using SETRST? Yes, with some limitations. One of the first considerations is speed. Even though the dot moved (and having moved, wrote on) and had to be slowed down considerably, writing a series of dots for the frame of an animated picture is a different matter.

If the number of pixels that change per frame is "sparse," then the old pixels can be reset and a new group written. Suppose that one third of the pixels are on in a frame and that roughly the same number are to be on in subsequent frames. If one-third are reset, and a new one-third are then set, about 4096 calls are made to SETRST. It requires slightly under two seconds to process the sets and resets, making the updating process about one-half frame per second, which is certainly no Fantasia.

Taking a different analysis, ask yourself the question: How many pixels can be updated for a frame rate of 10 frames per second? If 2500 pixels can be processed per second, then about 125 pixels can be processed per frame, not counting the overhead of grabbing the data representing the pixels to be set and reset. This is still a fast enough rate to merit some experimentation in animation. It will be left up to the reader as a study assignment...

Another factor in animation, of course, is the method of digitizing the data. How are a series of drawings converted, easily and rapidly, into a set of X,Y points for SETRST to use? There appears to be no answer to this question, at least with existing I/O devices. What is required is some kind of scanning digitizer.

A third problem is accessing the data. Certainly disk storage is fast enough to keep up with the data for display. If the data is arranged in table form, then it can be scanned sequentially and rapidly by using some of the techniques discussed in last month's column. A possible scheme for storing the data is to use three bytes for each data entry in a table. The first byte represents the SET/REST code (0 or 1), and the next two bytes represent the X and Y values respectively. Other bells and whistles, such as a function code (such as 2) for time delay are also feasible. The actual overhead in accessing tables of data for SETRST would be minimal compared to the processing time of the set and reset.

```
TABLE DEFB 0       ;SET
      DEFW 0607H   ;X=6,Y=7
      DEFB 1       ;RESET
      DEFB 0508H   ;X=5,Y=8
```

Next month we'll have the results of the second Assembly Line Programming Contest in which readers strive to write a multiply subroutine. (Would you believe a reader discovered a multiply instruction among the hitherto undiscovered Z-80 superset of 8123 instructions?) ■

For those of you who would like to contact me directly with problems or contest entries, write:

MEMORY EXPANSION FOR TRS-80*

All you have to remember is to plug it in

Memory expansion. It's a field packed with intriguing theories. For instance, it has been suggested that the memory areas of the human brain are transferable from one body to another, like transplanted kidneys. In man or machine, a larger memory is always a welcome acquisition.

If you are interested in expanding your TRS-80 memory without shelling out dollars for a full blown expansion interface, we have just the solution.

Introducing the MT-32. Our new, brilliantly designed Printer/Memory expansion module for the TRS-80. This unit will add 16K or 32K of dynamic RAM to your basic 16K machine. The module also contains circuitry to drive Microtek's MT-80P dot matrix printer, or any other Centronics-compatible printer.

No hardware modification to your TRS-80 is required. Just plug into your bus connector and you are ready to go.

All Microtek products are covered by a one year warranty.

Four configurations are available:

Without RAM in kit form (MT-32K @ $79.50)
Without RAM assembled and tested (MT-32A @ $99.50)
With 16K RAM assembled and tested (MT- 32B @ $159.50)
With 32K RAM assembled and tested (MT- 32C @ $199.50)

Available from Microtek or your nearest computer dealer.

MEMORY TRANSPLANT

80 APPLICATIONS

by Dennis Kitsz

"When BASIC executes, it is regularly sweeping through parts of the Level II reserved RAM, a section of memory inaccessible to the user. . .

"Execution dashes madly hither and yon; the TRON function gives a good picture of the execution path, but lines scroll wildly up and out before I can begin to see what any of them are."

Indeed, anyone trying to find out which line just executed a clear-screen command would agree with Mr. McRae. "Do you know any procedure for single-stepping in BASIC?"

When BASIC executes, it is regularly sweeping through parts of the Level II reserved RAM, a section of memory inaccessible to the user because of the BASIC program itself. In this area, calculations are stored, data moves in and out from tape, and much other vital, but variable information is held.

The authors of the language anticipated future expansions of many kinds, and so also provided a "telephone switchboard" arrangement, whereby every major ROM activity first loops through some RAM to find its next electronic pathway. We can intercept any loop at its RAM switchboard, patching in various routines such as key debounce, upper/lowercase software, time/date, and so on. For example, the keyboard scan sweeps through hex locations 4016 to 4017; video passes through 401E to 401F; a line printer would use 4026 and 4027.

Single Stepping

To single-step BASIC, we intercept the BASIC "interpreter", which can be collared at locations 4004 and 4005. The entire process is but three steps:

1. Grab hold of the interpreter loop and divert it to the single-stepper.
2. Before it can continue to interpret the next step, have it wait for a human go-ahead signal.

"Pat rang me up at bargain rate time, only he lives in California."

3. Delay it slightly before letting it move on to its original destination, in order to follow it better.

Program Listing 1 presents the 28-byte program, the first part of which is devoted simply to setting up the program. Line 10 assigns the start of our intercept routine to the HL register, line 20 patches it into the interpreter at 4004/4005 hex, and line 30 jumps back to a BASIC "ready" at 06CC.

The actual stepping routine is a mere 19 bytes. It first saves the two active register pairs (AF and BC). At line 60, the accumulator is told to obtain the value present at address 3880 hex—the keyboard row containing only the shift key (and a control key if you've modified your unit). By itself, Shift offers a BASIC program no information, thus making it an ideal "single-stepper" key.

If Shift is not depressed, there will be no data present at address 3880H. Thus, zero AND zero (the accumulator ANDed with itself) sets a "zero flag," and line 80 is forced to loop back and check again. When at last Shift is depressed, the loop falls through, and the program continues to line 90.

At that point, register pair BC is assigned a hex value of 2000 (This is an arbitrary value, and may be lengthened.), and next CALLs a delay routine available in ROM at address 0060. At the end of the delay, both registers are restored, and the program proceeds with a jump to 1D78 . . . the original value found in locations 4004 and 4005.

It's just about as simple a utility as can be found, and the machine version loads from tape in one-half second. Two cautions should be noted: First, load this program only after the BASIC program you wish to step through is in place, because this routine single steps CLOAD as well! If you use the BASIC version (Listing 2), key it in at the end of your BASIC program under scrutiny, and run it separately; the lines may then be deleted. Secondly, remember to protect memory at 32739 for your 16K machine.

With the given delay, execution is slowed to about five BASIC actions per second; a measure of that rate is the short stepper program itself, which takes six seconds to list five lines. Reducing the delay to 0001 will bring program operation closer to normal speed.

Readers Respond

Many more readers have written or called than need to; here are a few suggestions before you dial my number:

- Daniel from Utah was the fourteenth person to call about "typos" in Babyroot. Never trust your own proofreading; have a friend, preferably one who knows nothing about computers, read the program aloud to you. Dan's 12-year-old son caught the mistake.
- Roy phoned from Illinois angrily demanding to know why a program wouldn't work on his disk-based system. This column is biased toward the "standard" TRS-80, which is 16K Level II. If you've got the luxury of extras, it means you've also got a bit of conversion work to do. Disk users, please read your manuals instead of sending

"corrections" of my failure to include DEFUSR statements. Level II has but one USR command.

- Dave wrote from New York asking why his control key wouldn't function. It is vital to understand the operation of any published modification. Minor inconsistencies are almost inevitable, but understanding the theory of operation will assist your diagnosis. Dave's problem was an incorrectly routed wire which was easily eked out by running a one-line BASIC program.
- From Maine, Rick called with a computer buzzing angrily after he attempted a reverse-video alteration. If you do call, have your computer, tech manual, soldering iron, wire, paper, pencil, and telephone sharing the same desk. When Rick's son called back (Dad had left for a school board meeting.) with everything at hand, a successful repair—a wayward solder ball—was ten minutes away.
- Pat rang me up at bargain rate time, only he lives in California. I am not alert at 2:45 a.m.

Anecdotes Too

It's lazy summer anecdote time . . . how about this one? John from New York State is a TRS-80 enthusiast, and was attempting some hardware modifications. The local Radio Shack begged ignorance over wire-wrap wire ("But that's got no insulation," said the clerk.), so John used 18-gauge solid copper.

Well, that's good for light bulbs and power tools, so I need not detail the mess in which John shortly found himself. A desperate voice greeted me late one evening, relating the grim escapade. The computer had failed to exhibit normal signs of life, so John took it to Radio Shack for a repair estimate. It was returned with a quote of $460. *Four-hundred-sixty dollars!*

Radio Shack does not take kindly to modifications, and discourages repairs by giving unreasonably high estimates.

John, soon to be an electrical engineering student, was mortified. Mom didn't know, and he was loathe to break the news. What could he do?

A bit of telephonic diagnosis narrowed his options. During our conversation, John also revealed that, faced with the potential Radio Shack repair ticket, he had tried to remove and replace the integrated circuit which he believed to be the culprit. His TRS-80 was, it seemed, a bit messy. He had lifted traces and burned the board with an overheated soldering iron; the desperation grew in his voice.

I agreed to take on the repair, if he shipped the unit and all the bits and pieces that were left over from his attempts. All ye weary who labor, take heart. John's TRS-80 was in about the worst condition I had seen since a buddy's PDP-11 had been zapped by lightning during a very macho game of "chicken," played while an electrical storm raged over a meeting of the Vermont Computer Guild.

I bridged the traces on John's 80, cleaned the board and discovered the problem in a fried buffer chip—a 75-cent item. It was little more than an hour's work . . . four-hundred-sixty dollars indeed! I installed the modifications John wanted and shipped the unit clean and sparkling back to New York.

Two days later, another phone call. The voice had the same hard edge of panic. The postal service had delivered the box—crushed, gashed and not working. The postmaster said he'd have to have the unit for eight weeks—(for "examination"—while a claim was being processed.

John took it apart instead. He found the difficulty in the ROM board's connections, shaken loose by its ordeal.

The TRS-80 is working again, three weeks and much anguish later. The moral? No moral. It's summer. Just watch that 18-gauge wire. ■

For readers who'd like to contact Dennis directly, try writing: Roxbury, VT 05669.

9999 PRINT#-1," " : A$ = INKEY$: IF A$ = "" THEN 9999 ELSE RETURN
Plug your computer's cassette output into an audio amp, and insert a GOSUB 9999 at any place in a program that needs your attention. It will call you; press a key and the program continues.

9999 A$ = INKEY$: IF A$ = "" THEN 9999 ELSE LPRINT A$: GOTO 9999
Here's a quick electronic typewriter. It's non-correcting, for sure, but beats loading a word processing program to add a few comments to a printout.

9999 FOR X = 17129 TO 32767 : PRINT CHR$ (PEEK (X)); : NEXT X
Put this one in at the end of a program and have a look at how a BASIC program and its variables are stored in memory. If you run X from zero to 12288, you can take a peek into ROM as well.

9999 FOR X = 1 TO 50 : OUT 255,0 : OUT 255,15 : NEXT X : OUT 255,PEEK(16445) : RETURN
This is a subroutine that rattles the relay and jitters the screen; great for some dull games that might need some life.

Finally, poke your 80 in the ribs with these:
POKE 16405,0 and kill the keyboard; POKE 16405,1 to get it back. Don't do that from command level.
POKE 16413,0 kills video; get it back with POKE 16413,7.

TRS-80 FORMS

80 ACCOUNTANT

by Michael Tannenbaum C.P.A.

"If this is an example of financial software. . . in the future, businessmen and professionals may rejoice."

In the January issue of *80 Microcomputing*, I described basic requirements for automated accounting recordkeeping systems and discussed in detail some of the currently available financial software. The introduction of the Model II, and the development of more advanced software has increased the range of recordkeeping alternatives available to microcomputer users. With this in mind, I think it is now appropriate to discuss some financial reporting concepts before reviewing the latest software available.

Recordkeeping at Fault

In our practice my partners and I visit many clients who complain about their financial reports. Frequent complaints include, "my income statement is always late," or, "when it arrives I don't understand what it is trying to tell me." When the facts are probed, the accounting recordkeeping system is usually at fault. Often it is full of extraneous detail and too complicated to be practical for preparing management reports.

In a more compact system data does not have to subdivided, and the chance of misclassification is significantly reduced.

If you are installing a microcomputer accounting system, take the opportunity to review your chart of accounts with the help of your accountant.

Consider how you plan to use a system such as Radio Shack's General Ledger II and its reports to control your business. For example, how do you look at sales? Do you sell only one commodity or many? If you sell many different types of items, do you need to know sales, sales returns and net sales by type?

If you sell only three items, such as nails, screws, and bolts, your recordkeeping system will have to keep track of the dollar value of all sales and related transactions for each of these categories. This includes sales, sales returns, purchases and inventory categories. Thus, to determine the net profit contribution for each category, you must keep 12 different accounting records.

The general ledger recordkeeping system is not the best place to analyze gross profit by item. Radio Shack has provided another system for this purpose called the Inventory Management System. This system could be used with the accounting system as a control.

The same concepts of simplified recordkeeping should govern the choice of operating expenses. If your business is run from one office, then all you need is one cost center. However, if there is a warehouse and a sales office, each facility should have its own cost center, and each will have its own group expenses. Although there are some benefits with this approach there are also problems. For example, if each of these facilities are located under the same roof, you must allocate common services, such as light, telephone and power to each cost center.

Model I to Model II

Let's take a look at Radio Shack's General Ledger II and see how it compares to the Model I General Ledger previously reviewed. There are many similarities. Like its predecessor, General Ledger II has categories to group accounts to facilitate analysis on the income statement and balance sheet.

Ledger II, provides ten categories for the income statement and six for the balance sheet. The first three expense categories are pre-defined as gross sales, sales returns and allowances and cost of goods sold. If you don't use sales returns and allowances or cost of sales, as in a service business, these categories shouldn't be used according to the documentation.

Like the Model I, there are categories available for the balance sheet. However the Model II allows six different categories, current assets, fixed assets, current liabilities, long term liabilities and capital. You define the balance sheet during data entry.

As with the Model I, the posting procedure requires the assignment of the document name. The machine generates a serial number for each document entered. Like the Model I, the Model II posting procedures are very slow. However, documentation supports the posting procedure and an audit trail is generated.

The General Ledger II program represents a usable tool for the average businessman. In addition, the greater data on the balance sheets allows the professional accountant to calculate solvency ratios, fund management ratios and return on investment ratios which were impossible in the earlier version.

The level of documentation that accompanies the General Ledger II represents a significant improvement from that furnished for the Model I. Radio Shack has provided a sample session to be performed prior to initializing your own accounts. This session covers enough different types of transactions to familiarize an operator with the responses required.

I would like to commend Radio Shack on the interactive screen displays used on the General Ledger. Account maintenance and updates are quite easy. If this is an example of financial software which Radio Shack will be presenting in the future, businessmen and professionals may rejoice. Since the output reports have a place to indicate source, there may be some attempt in the future to intergrate accounts payable and receivable modules into the General Ledger. ■

EDIT 80

by Jim Perry

The subtitle for this month's column could be "A Parting Shot," as I am leaving the hills of New Hampshire, and *80*, for the hills and volcanoes of the West Coast. The response to *80* has been overwhelming. Everybody seems to love it—except for Tandy. But times change, and I'm glad to say that Tandy has now asked Ed Juge to write a regular column for *80* beginning this month. The corporate structure in Fort Worth seems to have realized the folly of its ways.

But, to mix a metaphor or two, an old leapard learns new tricks. Tandy's latest trick is their introduction of a new "improved" two-chip ROM set for Level II. (Previous versions used three chips.)

At first this seems like a simple enough change, and it does away with the messy ribbon cable inside your machine. However, there are a couple of catches in the new version. First, the shift-down arrow combination is not recognized by the computer. A great deal of software uses this combination as a control key, but, of course, this software is not "approved" by Radio Shack. Such software will now need reworking to be compatible with all TRS-80s.

The second (unannounced) nasty is a different memory size. A two-byte difference may not seem important to Fort Worth, but it can mean a hell of a lot to beginners—all instructions, for example, now give the wrong figure —and assembly language programmers—by not reserving enough memory.

Though Tandy says it is trying, the corporation still seems to be up to the same "new" tricks. Time will tell. ■

REMARKS

From page 10

unit at the factory for finding problems in the CPU boards. Something along this line would be helpful at their service centers. With this unit the board is set into a slot and sucked into contact with probes by a vacuum. A computer in the test unit then checks out everything in a flash and prints out a ticket showing which chip or part must be replaced.

Naturally, I was busy counting the number of systems being tested with an eye to checking up on the reports from outside sources on the production at present. I was satisfied to find that my sources were accurate. The number of sets in test for their 24-hour burn-in corresponded to the quantities I'd heard projected for the first year's production of the Model II.

I was surprised to learn that about one third of the Model I systems are Level I. Our sales of Instant Software programs have been under 10 percent for the Level I. I suspect that most Level I owners buying software are looking for programs which will run on both Level I and II, since they intend to upgrade. ■

Finished units are then put into a further burn-in test.

Any unit showing any problems or instability is rejected and sent back for further checking and repairs. They are very picky.

INSIDE 80

by Ed Juge, director of computer merchandising. Tandy Radio Shack

We at Radio Shack's home office are pleased to be offered a monthly column in *80 Microcomputing*. From a personal viewpoint, I'm looking forward to writing it—I knew my reputation for overwriting everything would eventually pay off!

This first effort will be short, since Wayne's offer preceded his copy deadline by only two days. I'll try to keep you current on happenings, bugs, fixes, new products, and those things which might not appear elsewhere in print. I'll try to answer a few often-asked questions. But if you send questions, please, understand, that the time required by my primary Radio Shack duties just won't permit individual replies to mail.

Trying to Respond

Unfortunately, the growth of the TRS-80 marketplace has exceeded our ability to communicate effectively with our owners. Some of you have decided we don't care about your problems and desires. At Radio Shack we all believe this column can improve that situation. The column will help us understand your desires and help you understand how we're trying to respond to them, or, in some cases—unfortunately—why we can't.

I'll promise you honestly. I'm also going to try to convince you that most of us are real guys and gals, just like you. Our ranks include electronic hobbyists, "gadget freaks," and a few ham radio operators—myself included. We know our future depends on your satisfaction.

Every request, every suggestion and, yes, every complaint is taken very seriously. Even though in a mass market environment we can't respond to the individual desires of every owner, your requests tell us when there is enough interest to justify a product. So, if you can pardon us for not being able to answer every single one... "keep those cards and letters coming!"

This month, I'll tell you about something we introduced in May, called TRS-80 Videotex. It's a concept, it's software, and it will soon be hardware too.

TRS-80 Videotex allows you to access information with your own computer or terminal—in color or black and white. A 32 by 16 screen format, compatible with the popular color computers will alleviate wrapped-around information transmitted for 80 × 24 screens.

We first introduced the Videotex to a group of information suppliers. We suggested the benefits of making their information available to the general public, especially in one universally usable format.

At the same time, we announced an exclusive agreement between Radio Shack and CompuServe, a major computer time sharing service to business, industry, and government. They will provide a new "CompuServe Information Service" in TRS-80 Videotex format. Radio Shack will market the software for TRS-80s AND other popular microcomputers. Target data for the service and TRS-80 software is this month. Software for other computers will follow as soon as it can be completed.

(Now, something you gotta' learn about me is that I'll try to be accurate about dates, but Murphy's Law has taken its toll on enough of my predications so as to keep me from becoming nationally known for uncanny accuracy. Please, give me room for a bit of error. As a matter of policy, I suggest you don't order anything from your local Radio Shack store before they receive a catalog number. Our data processing system throws unknown items into a bit bucket designed to emulate a black hole, and your order may never be heard from again!)

Anyway, back to my story. The CompuServe Information Service will initially be available between 6 PM and 5 AM EST weekdays, all day Saturday, Sundays and holidays. For the nominal fee of $5 per hour—plus $2 per hour, if you must access them through Tymnet in your city—you will have available the Associated Press news, weather and sports, local news from some 10 or 11 papers yet to be announced, an electronic mail system, a number of MicroNet personal computing services and Radio Shack Users News. Four or five more services are awaiting final negotiation, but I can't be specific until they're sewed up.

Some services will be available at a surcharge, such as the current MicroQuote service that provides historical stock market data over the past six years. You'll always be warned of extra charges when you select such a service.

CompuServe tells me that their Information Service and the TRS-80 Videotex concept have caused an unprecedented interest.

Time Sharing Without Delay

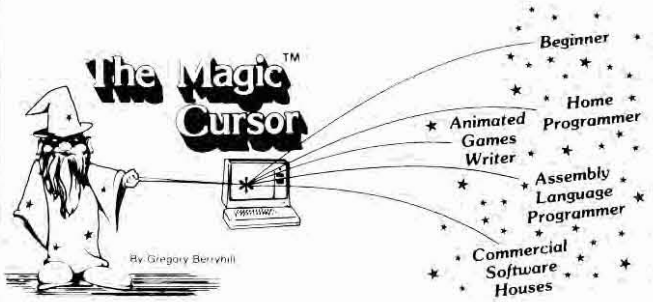
If you've tried time sharing systems where the delays were excessive, you'll be pleased to know that CompuServe plans a response time of five seconds or less, 95 percent of the time! I've seen one of their CPUs manage 150 simultaneous jobs with a response time far less than one second.

The TRS-80 Videotex software package will cost less than $30 and will include your own ID number and password. According to CompuServe, you'll have one free hour of time on their Information Service before billing, normally through your Mastercard or Visa.

I'll bet you're wondering about the hardware I mentioned. Well, we will be offering, an intelligent Videotex terminal. The price will be $399. The terminal will include a built-in direct-connect modem and RF output for your existing color TV receiver. Look for further information in two or three months. ■

TRS-80* OWNERS:

- **Let the computer write your "Basic" program for you!**
- **Draw pictures, animated figures, data forms!**
- **Create a library of display forms!**
- **Produce "Commercial" grade software!**



The **Magic Cursor** is a Revolutionary Family of Products which provides a dramatic new method of reproducing drawings and displays that you create on your screen. It makes both simple displays and complex interactive data input forms. It stores a "BASIC PROGRAM" on disk (or tape) ready for you to execute alone or as a subroutine. It produces screens in both standard or wide screen.

It is available for any level 2, 16K or larger system with tape or disk. An optional version is now available which creates an assembly language program.

Be sure to pick out the system that fits your present needs and order it today. you may upgrade your original copy by paying the difference and a moderate service charge.

MAGIC CURSOR PROGRAMS

THE MAGIC CURSOR allows you to easily create screens (including graphics) on your video. A powerful command then generates the BASIC instructions to recreate the screen. For the first time, a program for automatic generation of video display forms. (16K Tape or Disk)**$24.95**

THE MAGIC CURSOR I additionally makes sophisticated Data Entry and Display easy. With magic Cursor I you define the Data Entry or Display fields directly on your screen. The definition commands generate the BASIC instructions to implement the Data Entry and Display. The magic Cursor I has commands which move, center, and duplicate blocks of graphical or alpha/numeric displays. You can even justify text. (16K Tape Only) **$79.95**

THE MAGIC CURSOR II adds the power to write animated games easily in BASIC. The Magic Cursor II allows you to reload previous screens either from memory or from Disk. You can then modify them and store either the modified screen or only the changes. (32K Disk Only)**$99.95**

THE MAGIC CURSOR III will be available soon for the new Model II Computer (32K One or more Disks) **$149.95**

THE MAGIC CURSOR IV provides the features of Magic Cursor II but stores an assembly language program. (32K Disk Only) **$99.95**

*Trademark of Radio Shack, a Tandy Co.

Call 713/474-2484 or order by mail. Master Charge, Visa, Certified Check or Money Order accepted. Personal Checks require 14 days to clear. C.O.D. or collect calls not accepted. Software guaranteed for replacement only. Prices subject to change without notice. Some programs supplied on cassette tape. For disk versions, the cassette supplied will automatically create a disk file.

NEW RELEASES FROM CCC!!!

The Supply Room

A sophisticated program that is easy to operate. This unique system helps you manage your retail or wholesale inventory of up to 1000 line items. Cost may be fractions of a cent, item quantities may be decimal values. Automatic cost averaging of updated items and suggested sales prices based on gross profit. Transaction reports produced during posting functions. Printed reports include:

1. Transaction Listings
2. Complete Inventory Listing
3. Listings by Prefix
4. Items on Order
5. Items Out of Stock
6. Suggested P.O.'s

Requires Mod 1, 32K, 2 Disk **$250.00**

The Filing Cabinet

Take that collection of Job Orders, Personnel Records, Reports, etc. and get them organized. You define up to 14 data input fields specifying field type - alpha/numeric or $$$, field length and field separators - such as slashes, etc. During data input, the cursor provides for character input and skips over the field separators.

But that's only half the story. Output reports are automatic formated and program automatically requests column headings.

This means you can customize your own data base manager, complete with rapid data input and selective output reports. Comes complete with documentation.

Requires Mod 1, 32K, Disk & Printer **$100.00**
Or Mod2, 64K, 1 Disk & Printer **$150.00**

The Restauranteur's Consultant

By Ty Halderman

This food and beverage management tool dramatically reduces the human factors in food cost analysis. Those tasks required to effectively operate any restaurant or food service business. Over a half dozen reports give uniform, accurate and up to the minute information for profitability. And, handling of daily cost changes requires only minutes per week instead of hours, because the Consultant makes all the necessary conversions from your case prices. Reports include:

1. Menu Recipes.
2. Ingredient Listing.
3. Supplier Master File.
4. Complete Listing of Food Cost Analysis.
5. Food Cost Summary.
6. Input Data Sheets.
7. Batch Update.

Mod 1, 32K, 2 Disk, Printer or Mod 2 ..... **$750.00**

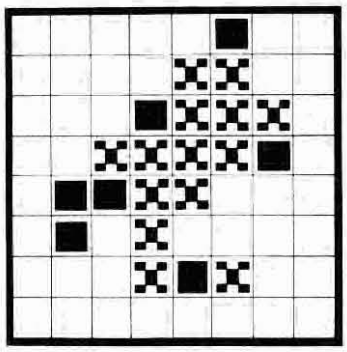
Instant Software™ New Releases



OTHELLO

In the game of Othello, there is no such thing as a lucky move. The game is a constant test of concentration and tactics.

The object of the game is to capture all the pieces on the board by bracketing your opponent's pieces. The score can fluctuate wildly as you plan your moves.

Your opponent can be another player or you can play the computer. You can even watch the computer play itself.

Don't think that just because you are either a hot-shot player or a complete tyro that Othello is not for you. The program allows you to adjust its IQ. An IQ of one will give you an easy opponent, but an IQ of seven will have the program playing a no-holds barred game.

The Othello program is a gracious opponent and, if you ask, it will suggest the best move for you to make. It will even allow you to set up special end games to sharpen your strategy.

The Othello program, a maddening, frustrating, and thoroughly engrossing game from Instant Software.

For the TRS-80 Level II 16K. **Order no. 0046R. $9.95.**

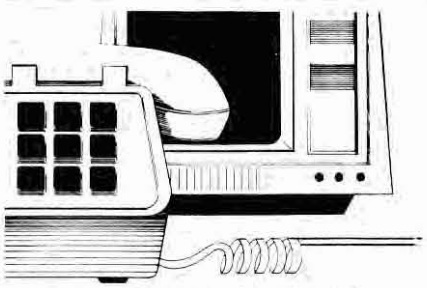
0156R	Money Madness	$9.95



THE COMMUNICATOR

This program offers you the fast way to transfer data from one location to another, using the telephone lines. The full "ORIGINATE/ANSWER" capability allows your TRS-80 to be controlled from a remote-based terminal, or allows two TRS-80 computers to "talk" to each other.

You will be able to pass all kinds of data, or programs, from home base to a remote terminal, or between computers, at the speed of light—or at 9600 baud, anyway.

Operation is simple. You dial the telephone number at the location of the TRS-80 at your home base. After the connection has been established, each telephone handset is placed upon the modem at both locations and the "hook-up" is completed. You will be able to control the home-based TRS-80 (if you called from a remote based terminal) and the transmission of data back and forth can proceed. This procedure can be reversed, allowing the home-based TRS-80 computer to control the remote-based terminal.

You'll see a simultaneous display of information on both the home-based and the remote-based monitors which facilitates the requests for specific information to be transmitted. This program is available to police, schools, stockbrokers, and many others who will find it to be invaluable.

The versatility of the Communicator program is enormous, and you can take advantage of this technology right now. **Order No. 0126R $9.95.**

0171R	Flight Path	$9.95
0250R	IRV	$24.95

TRS-80* DISKS

80 NEWS

edited by Nancy Robertson

14-year-old Is Professional Programmer

He's just like other 14 year-old boys growing up in New England. He likes model trains, bubble gum and baseball games. He worries about what his friends will think if someone writes about him in a national magazine.

But, if you go upstairs at Greg Hassett's house, you'll find a 48K dual disk drive TRS-80, complete with line printer and everything it takes to keep them running. Very likely, you'll find Greg hard at work on a new program or tuning up an old one. At this young age, he is indeed a programmer.

When he was 12, Greg sold a program for $150 and became the youngest professionally published adventure programmer in the county. The $150 covered the original, non-exclusive rights for Journey to the Center of the Earth which were sold to The Software Exchange in Milford, NH. The updated version netted many times that amount through its distribution by Mad Hatter Software in Dracut, MA.

Sorcerer's Castle, Atlantis and Enchanted Island followed. Greg's style and ability to stick to a story increased along with his revenues. The personal combat in Castle and Atlantis was an interesting addition to the familiar GO, GET, PUSH, PULL routines of most computer adventures. The thematic orientation and colorful description that popularized Scott Adams' adventures became more and more apparent in Greg's work, too. In contrast to Adams' sophisticated, brain-puzzlers, Greg's adventures are light, witty and solvable.

Greg's M-Treck was a departure from his dedication to adventures. It is a graphic game of cosmic engines and scanning devices with sound effects. The object, like all Star Trek games, is to track down and kill Klingons.

Greg wrote all of these early programs in BASIC. Frustrated by the limitations of speed and space, he took a crash course in machine code.

After writing Enchanted Island Plus, his first machine language adventure, Greg started his own company named Adventure World. It is now the sole source of his several machine language adventures. Both Mad Hatter and Adventure World are distributors of Greg's BASIC programs.

At 14 Greg is not only a programmer, but a businessman. He serves both individuals and retailers. He contracts for mass production of his programs, then packages and mails the orders himself.

Greg is also thinking about broadening the base of Adventure World to include distribution of programs by other authors. "But, if that happens at all," he says, "it will be a year or two in the future." According to Hassett, his software outlets are currently netting him "about $800 a month."

Greg has just finished writing The World's Edge. It follows on the heals of Mystery Mansion, and is also in machine code. "I'm just beginning to think about what I'll write next. I don't know what it will be."

In the fall he'll be entering the tenth grade at Philips Academy where he was recently accepted. When he is finished with school, Greg wants to work as a programmer for Digital or another large corporation, switching from adventures to the challenges of technical-applications software.

But a 14-year-old boy might have better things to do with his time than create and market his own software and deal with production contracts and bookkeeping. Not so says Greg. His business "sometimes gets in the way of school, but it doesn't interfere with my social life." Like most kids his age, he says he wants "to loaf around" during his summer break. ■

By Bob Liddil

Finding Made in Electric Pencil II Copyright Lawsuit

May 23, 1980 Judge S. S. Schwartz of the Los Angeles Superior Court ruled in favor of the defendent in the complaint brought by Michael Shrayer Software, Inc., Palm Springs, CA against Vector Graphic, Inc., Westlake Village, CA. The complaint was brought for "breech of contract, wrongful copying and injunction" in August of 1979 in regard to Electric Pencil II.

Michael Shrayer Software, Inc. is expected to appeal the decision.

The issues involved revolve around the application of copyright laws to programming. The final wording of Judge Schwartz's decision is likely to be signed and available sometime this month.

Vector Graphic, Inc. has already filed a cross-complaint charging Shrayer's company with libel and business interference, plus a suit against Shrayer, personally, along with several other individuals, for libel. ■

National VTOS Users Group

TCUG, Inc., a nonprofit computer club located in the Washington, DC. metropolitan area, is organizing and chairing a national users group for TRS-80 owners operating under the Virtual Technology Operating System (VTOS).

The purpose of this group is to improve upon the lack of documentation of VTOS, an excellent operating system for the TRS-80, by sharing the knowledge derived through investigation of VTOS, how it behaves, how best to utilize its many features, and how to make it work best for you.

Anyone interested may join the VTOS Users Group (VUG) for an annual fee of $15 which

entitles the member to the bi-monthly VUG Journal and monthly TCUG Newsletter.

Contact Bill Beall, TCUG, Inc., VTOS Subgroup, PO Box 2235, Reston, VA 22090.

The TCUG bulletin board, which is intended to be a focal point for TRS-80 and VTOS items, is available 24 hours by phone at (703) 620-4990. ■

Business Week Article Incorrect?

An article printed in *Business Week*, June 16 stated that, "Over the next six weeks Tandy plans a barrage of new products to follow up its initial foray into the small business market with its TRS-80 Model II."

It goes on to say that a desktop computer for scientists and engineers, a word processor based on the Model II and small computers that will automate inventory controls are to be expected.

At Tandy Corp., both H. L. Seigel, National Publicity and Promotion Manager, and Senior Vice President of Operations, Charles Phillips, deny the thrust of the *Business Week* article. They both say no new computers that they know of will be marketed by the company before the end of the year.

Videotex, another product mentioned in the *Business Week* article, will be available this fall, according to Phillips. The software product will link TRS-80s and other micros to television and telephone lines for network information retreival from Compuserve, Inc., Columbus, OH.

While Tandy denies the thrust of the article, the question is why do well-informed sources in the industry persist in their belief that new models will be announced by Tandy in August. ■

Mid-Atlantic Micro Show

The Mid-Atlantic Personal and Business Computer Show will be at the Philadelphia Civic Center from Thursday, Sept. 25 through Sunday, Sept. 28, 1980.

The show hours are 11:00 A.M. to 9:30 P.M. Thursday through Saturday, and 11:00 A.M. to 6:00 P.M. Sunday. General Admission for adults will be $5.

For further information, contact National Computer Shows, P.O. Box 678, Brookline Village, MA 02147. ■

Science and Research Management Software

Software Engineering Systems, Inc. is releasing three software modules for management science and operations research. Written for the TRS-80, these modules are interactive. They are the Decision System, the Mathematical Programming System and the Simulation System.

The Decision System consists of a break-even algorithm, a decision analysis algorithm, a lottery-insurance analysis algorithm, an element-ordering algorithm and a game-theory algorithm.

The Mathematical Programming System consists of three algorithms: one for linear programming, one for transportation and another for optimizing network flow.

The Simulation System is a program which helps simulate continuous dynamic systems described by differential or difference equations. It provides for integration, printing and plotting of the output on video screen or on a printer.

All modules are sold for $25 from Software Engineering Systems, Inc., 3214 75th St., Lubbock, TX 79423.

TRS-80 Replica Marketed

Personal Micro Computers, Inc. (PMC) has made an exclusive marketing agreement with the Hong Kong manufacturer, EACA International Limited to offer a software and hardware compatible equivalent of the Radio Shack Model I, Level II TRS-80.

The PMC-80, as the new computer is called, has a cassette tape recorder, 16K memory, Level II Microsoft BASIC interpreter in ROM, power supply, computer and keyboard in one cabinet. It will display on either a video monitor like the TRS-80 or on a standard TV set using a built-in VHF channel 3 modulator.

All software that is available for the TRS-80 Level II 16K system will operate in the PMC-80. Level II BASIC or SYSTEM will load in the PMC-80 50-pin bus through a 40-pin interface adapter available from Personal Micro Computers, Inc.

Disc based programs can be run on the PMC-80 using the Radio Shack expansion interface or other commercially available equivalents. With the expansion interface, all peripherals designed for the TRS-80 are compatible with the PMC-80. This includes Winchester disks, speech recognition, printers, RS232 adapters, etc.

EACA already has established markets in Australia and Europe for the PMC-80. Initially, however, it is only going to be available by mail order in the U.S.A. and Canada.

To facilitate mail order marketing, the company offers a 30-day money back guarantee. Service on the equipment will be performed by PMC at its Mountain View, CA factory. (Warranties will be voided if modifications are made to the internal system.)

For further information, contact Personal Micro Computers, Inc., 475 Ellis St., Mountain View, CA 94043.

Complex & Custom Software

Occupational Computing Company is a group of computer analysts, programmers and engineers specializing in Radio Shack computers. The new company is offering services in systems analysis, site evaluation and training. They are also selling standard and custom software.

The company is currently marketing Magic Wand, Restaurant Accounting Control System and Business Accounting Control System. Each is a complex software system.

Magic Wand is a word processor including automatic word break, flexible line length, pagination, block movement, fill-in-the-blank documents, etc. The software costs $400 plus approximately $200 for a CP/M license. It is written for a TRS-80 Model II plus Daisywheel printer.

Restaurant Accounting Control System is designed to serve the restaurant owner's accounting and management control needs. Software costs $4,000.

Business Accounting Control System consists of accounts receivable, billing inventory control, accounts payable, payroll and general ledger programs. It costs $350 to $7,500 depending on the number of modules desired.

Occupational Computing Co., Inc. is located at 22311 Ventura Blvd., Suite 123, Woodland Hills, CA 91364.

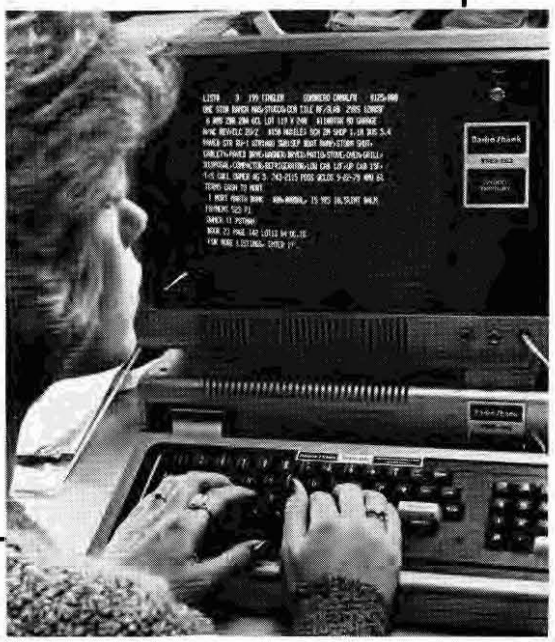
Realty Management System

The Key Realty Management System is a software package available for TRS-80 and CP/M based computers.

It is comprised of five control subsystems, in-

Realty Management System



cluding listing control, escrow control, sales controls, general ledger and property management. Optional subsystems for accounts payable and payroll are available.

Since no special codes, abbreviations or "computerese" appear to the user, no data processing expertise is necessary to use the system.

The minimum system provides for up to 300 listings, 100 sales associates and 10 offices or sub-offices. Priced at $2,500 for the whole system and $500 for each subsystem, the package is sold by Key Systems, Inc., 16 Ocean E., Marathon, FL 33050.

Programs Can Share Data

Percom Data is marketing a TRS-80 Disk BASIC utility that allows programmers to save, restore and otherwise manipulate one set of data that may be common to two or more programs.

Called Varkeep, this machine language utility works with all TRS-80 computer disk operating systems.

Varkeep adds four BASIC commands: NAME SAVE, NAME RESTORE, NAME DELETE and NAME CLEAR. They protect variables from being erased by LOAD, RUN, NEW and CLEAR commands. They delete variables that are no longer needed to reclaim memory space and redimension arrays.

Varkeep is sold on a minidisk with instructions for $19.95. It may be purchased from Percom Data Co., 221 N. Kirby, Garland, TX 75042.

Hardcopy from Typewriters

The I/O Pak and a new typewriter interface, are designed to generate hard computer copy through any electric typewriter with powered carriage return. The combination gives computer users the benefit of typewriters' print quality.

The I/O Pak, which fits over the keyboard, is easy to install. No modification to the typewriter is required. The interface board can be modified by jumper selection, to operate on TRS-80 Level I or II or Apple II.

The I/O Pak alone costs $469. The interface board and power supply required for package system operation cost $145. They are available from Rochester Data, Inc., 3100 Monroe Ave., Rochester, NY 14618.

Labyrinth Racing Game

Labyrinth Run, Manhattan Software's latest release, is a fast-action game, running through a labyrinth with sharp turns, reverses and slaloms, racing for a record time. Each labyrinth has sprint and full courses, and there are three levels of skill.

A timer starts automatically when the run begins, and record times are retained and displayed for each labyrinth, course and skill level.

The game is for Level II 16K machines. It costs $9.95 from Manhattan Software, Inc., P.O. Box 5200 Grand Central Station, NY, NY 10017.

Interactive Sharing

A multiplexer has been announced by Corvus Systems which can transform two to 64 microcomputers into an interactive multi-user network. The multiplexer network can share high speed access to up to 40 million bytes of hard disk capacity. It is called the constellation. Computers in a Constellation network can also share peripherals and communicate in a fully interactive mode.

The Constellation is a back-end local network in which multiple computers are connected in a star configuration. To insure compatibility, each computer interface uses the standard Corvus bus. This central node contains hardware that polls up to eight computers in round robin fashion.

Any computer compatible with the standard Corvus disk system is compatible with the Constellation. These include the Apple, TRS-80 Models I and II, S-100 Bus, Altos, and LSI-11.

The computer interface hardware is the same as that used by the single-user disk system. The Constellation operating system software is the unmodified operating system provided with the host computer, assuring application compatibility.

The price of the multiplexer is $750. Interfaces for the computers in the network begin at $235 each from Corvus Systems, 2029 O'Toole Ave., San Jose, CA 95131.

Cassette Peripheral

Zoom 3.6 is an electronic black-box that connects a Level II TRS-80 (or expansion interface) and a CTR-41 or CTR-80 cassette recorder. With the software supplied with it, tapes can be written and read in a special format at 3600 bits per second—over seven times faster than Radio Shack's 500. At that speed, 2K of RAM loads in under five seconds, and 16K loads in just 36 seconds—instead of almost four-and-a-half minutes.

No soldering and no modifications are needed. Zoom 3.6 is transparent to all the XRX mods, and to the CLOAD, CSAVE, SYSTEM, and PUNCH functions. A built-in relay and a toggle-switch on the front panel bypass the Radio Shack reed relay.

The computer will not crash if it finds a read error or if it is made to start or stop reading in the middle of a recording. The system will not hang-up while searching for a file. BREAK causes a return to the menu during reads and writes.

Users can also purchase the commented source-code for ZMBug, so that it may be adapted, or relocated. Written instructions plus a sample of assembly language source-code necessary to patch Zoom 3.6 drivers into The Electric Pencil, are also sold.

The manufacturer believes Zoom 3.6 is the fastest CTR-41/CTR-80 device available. With ZMBug V1.0 object code and the manual, it costs $119 and is sold by Zoom!, P.O. Box 3766, Nashua, NH 03061.

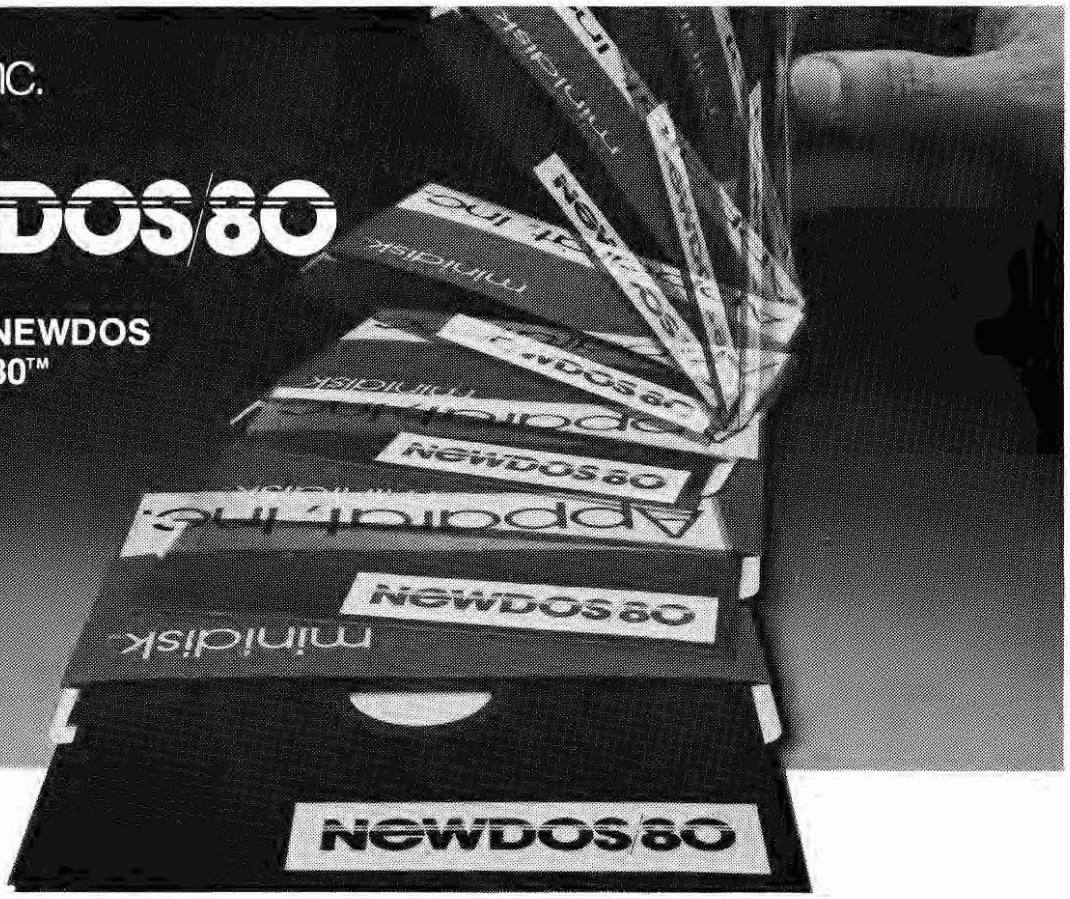
The I/O Pak

Zoom 3.6 and ZMBug

Apparat, Inc. introduces NEWDOS/80

For the 80's— an enhanced NEWDOS for your TRS-80™ Model 1.



Apparat, Inc., announces the most powerful Disk Operating System for the TRS-80®. It has been designed for the sophisticated user and professional programmer who demands the ultimate in disk operating systems.

NEWDOS/80 is not meant to replace the present version of NEWDOS 2.1 which satisfies most users, but is a carefully planned upward enhancement, which significantly extends NEWDOS 2.1's capabilities. This new member to the Apparat NEWDOS' family is upward compatible with present NEWDOS 2.1 and is supplied on Diskette, complete with enhanced NEWDOS + utility programs and documentation. Some of the NEWDOS/80 features are:

- New BASIC commands that supports files with variable record lengths up to 4095 Bytes long.
- Mix or match disk drives. Supports any track count from 18 to 80. Use 35, 40 or 77 track 5" mini disks drives or 8" disk drives, or any combination.
- A security boot-up for BASIC or machine code application programs. User never sees "DOS READY" or ">READY" and is unable to "BREAK", clear screen, or issue any direct BASIC statement including "LIST".
- New editing commands that allow program lines to be deleted from one location and moved to another or to allow the duplication of a program line with the deletion of the original.
- Enhanced and improved RENUMBER that allows relocation of subroutines.
- Powerful chaining commands.
- Print Spooler.
- DFG function; simultaneous striking of the D, F and G keys will allow the user to enter a mini-DOS to perform some DOS commands without disturbing the resident program. (e.g. dir while in scripsit.)
- Upward compatible with NEWDOS 2.1 and TRSDOS 2.3.
- Includes machine language Superzap/80 and all Apparat 2.1 utilities.
- Enter debug any time by pressing 123 keys. Also allows disk I/O.
- Diskette "Purge" command.
- Specifiable system options (limited sysgen type commands).
- Increased directory capacity.
- Copy by file commands.

NEWDOS/80 with all of the NEWDOS + utility programs, many of which have been enhanced, is priced at just $149.00 and is available at most TRS-80 dealers.

As with 2.1, NEWDOS/80 relies on the TRSDOS and Disk Basic Reference Manual published by Radio Shack. NEWDOS/80 documentation supports its enhancements and upgrades only.

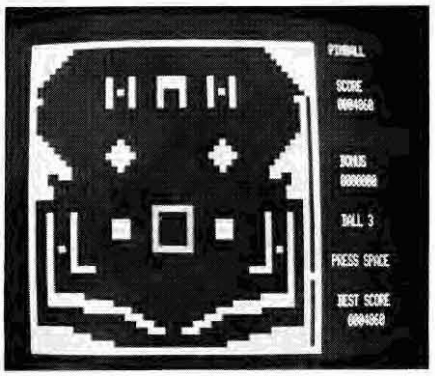
TRS-80 Pinball

Acorn Software Products, Inc. is offering Pinball, a real-time, arcade game for Level II TRS-80.

The video display includes flippers, bumpers, rollovers, runs and bonus points. The space bar releases the ball. As with any pinball games, the player must develop skill with the flippers to get maximum points and playing time.

Pinball is priced at $14.95 on cassette, or $20.95 on disk from Acorn Software Products Inc., 634 North Carolina Avenue, S.E. Washington, D.C. 20003.

Reader Service ↙ 161.



Pinball Display

Educational Program and Model II COBOL Package

The new COBOL Development System software package from Radio Shack makes it possible to write and use programs in COBOL (COmmon Business Oriented Language) on the TRS-80 Model II. Tandy believes it is the only COBOL package for a microcomputer that offers multi-key ISAM (Index Sequential Access Method) files.

The COBOL package includes a one-pass compiler, screen formatting, ANSI Level 2 I/O, program linkage and segmentation.

The Model II COBOL Development System, with reference manual, user's guide, sample program and disk is priced at $299.

The K-8 (kindergarten through eighth grade) Math Program, designed to supplement regular instruction, is another new release from Radio Shack. It is supplied on five cassettes and three disks in a binder with a teacher's manual containing complete instructions and sample record-keeping forms. It requires a 16K Level II.

Part one of the program is a series of computer programs containing skill building exercises in numeration, addition and subtraction concepts for use in kindergarten through third grade. Part two contains skill building exercises, a testing mode, and a placement mode for addition, subtraction, multiplication and division, appropriate for use in grades one through eight.

A comprehensive reporting function is also provided. At the end of a student session, the screen displays the total number of problems attempted, the number correct, the percent correct, promotions or demotions and average response time. It is priced at $199.

Reader Service ↙ 166.

Two Utility Programs

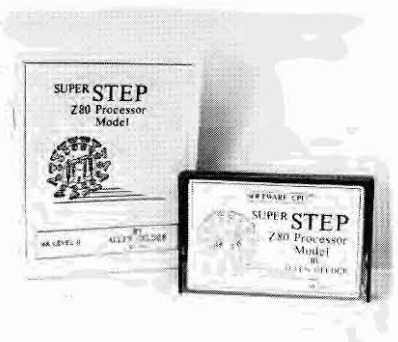
Two new TRS-80 programs from Allen Gelder Software are Super Step and Accel. Super Step is both a trace program and a disassembler link with T-BUG, the Radio Shack Z-80 monitor program.

Super Step displays a pair of Z-80 processor models including CPU registers, stack elements, flag expansion and an intelligent RAM window. The trace mode has a skip key and keyboard interrupt plus foreground breakpointing for user control during operation. It is sold for $19.95.

Accel is a compiler for the integer subset of Level II BASIC that increases the speed of program execution. Programs are built, modified and debugged using the BASIC interpreter, then compiled by Accel to Z-80 machine code.

Accel is a product of Southern Software of England. It is now sold in this country for $44.95 from Allen Gelder Software, Box 11721, San Francisco, CA 94101.

Reader Service ↙ 170.



Super Step

Word Processor Update

MPS Software (formerly Microphase Systems) is selling Wordscribe, a full-feature word processing system for Model I and Model II systems. Wordscribe 1.2 includes the full editing features of 1.1 and adds some new formatting capabilities to the system.

Wordscribe's new features include document chaining which allows the user to load more than one document at a time for merging documents and inserting standard blocks of text. New formatting commands to change line lengths, force page breaks and change line spacing are also included.

The minimum system requirements to run Wordscribe 1.2 are Model I 48K with expansion interface and one disk; or Model II 64K with one disk.

Wordscribe is priced at $79.95 for Model I, $129.95 for Model II and is available from MPS Software, 11223 E. 45th St. So., No. 314, Tulsa, OK 74145.

Reader Service ↙ 180.

Software Typewriter

Computer Simulations Company has announced its newest product for microcomputers, the TRS-80 Typewriter. It is a basic program offering built-in lowercase, line by line editing, video review and copy printing.

The program is designed to handle a full page of text neatly and efficiently. It sells for $19.95 and requires a printer.

The TRS-80 Typewriter is available from Computer Simulations Company, 305 Hammes Ave., Joliet, IL 60436.

Reader Service ↙ 183.

Keyboard Remote Control

Omni Automation is releasing a wireless keyboard for the TRS-80. The RX-10 includes a hand held, ultrasonic remote control. BASIC programs can read ultrasonic input with a few minor changes.

The system also permits control of remote devices located anywhere within the home or office. A flexible scheduling program can activate the remotes automatically using cyclic, time of day, or future date schedules.

The RX-10 system includes all necessary cables, interfaces, a cordless controller, a command console, appliance and lamp control modules. Software is provided on diskette. It is priced at $285 from Omni Automation, P.O. Box 7716, Atlanta, GA 30357.

Swords

Barry L. Adams
109 Valley Place
Greenville, NC 27834

The August 1978 issue of *Kilobaud Microcomputing* magazine carried a game program entitled Swords and Sorcery. The program was written on an SWTP 6800 machine using an 8K BASIC interpreter. The game involves you in a search and rescue of a princess held in an evil captor's dungeon. During the quest, the player encountered a variety of creatures – some good, some bad.

I immediately fell in love with the program and soon adapted it to my Level II, 16K machine. As written, the listing required less than 8.5K of memory. When it comes to writing game programs, I generally followed the advice of my old art teacher: When you're painting a picture fill up the entire canvas, after all, you're paying for it.

Armed with this bit of philosophy and a great deal of unused space in my 16K memory, I set out to paint my canvas.

New Dimensions

The revised program still follows the overall theme of the original, but adds more dimension to the encounters that pop up during play. The program uses TRS-80 graphics and includes a few new adversaries. Whereas the original program is primarily random based, the revised program also includes the elements of skill, strategy and awareness.

The scenario of the game is familiar. In typical fairy tale fashion, you are an impoverished, rather inept hero, attempting to rescue an elfin princess who has been imprisoned in a dungeon located deep within the Old Forest. When you begin your quest, you are equipped with only a small sword and some provisions.

Prior to entering the Old Forest you may be offered assistance from a dryad, as well as the counseling of the Great Oracle. The nymph is a real plus as she makes an excellent guide and can be helpful in combat with the trolls. However, be careful not to offend her, because she can turn that magical power on you with a curse.

The oracle, on the other hand, appears to be more interested in the maidens you're bringing rather than helping. Nevertheless, once appeased, he can point you in the right direction.

Before you start your journey, familiarize yourself with two units of measure in this little magical world: the Yerb and the Farbble Warfer. Both are measures of distance. Legend has it that the measure was defined as the distance between Ezekiel Yerb's house and that of Hansel Farbble Warfer. One man was short and the other rather tall, and as a result the two could never agree on the number of steps between the two houses. The sense of the whole thing has long since been lost, and, today, all we know is that 1 Yerb is equal to ¾ of a Farrble Warfer.

While on your journey, you will meet a number of different critters. The full cast of characters is as follows:

Nymph: She knows the Old Forest like the back of her hand and is very good in fights with trolls.

Hot dog salesman: Ha! You thought that you could get away from them, yet here they are. Don't laugh! One of these gastronomical marvels can keep you going long after your provisions have given out.

The Great Oracle: Generally, he has more interest in what you can do for him, rather than what he can do for you. However, he may tell you the correct path to take.

Slave girls: They provide conversation and something for the satyrs to look at; otherwise, they do little but cut into your provisions.

Rats: They will give you the willies and make you run, but otherwise are of little consequence.

Snakes: A snake bite will lay you up for a day.

Spiders: They will attack, unless you can outrun them.

Dragons: Dragon slaying is still big news with big rewards, but be careful, because these guys have been known to flick their Bics.

Goblins: You can be startled by them and run, otherwise, they will enslave you, sell you to the satyrs or let you go free for ransom.

Trolls: There are two kinds of trolls – your everyday run of the mill troll and the dreaded warrior trolls. The common trolls are

and Sorcery II

"Once you have rescued the princess, you no longer have the choice to fight or not fight. . . . To make it to safety, you have to fight your way out."

pesky fighters, particularly dangerous in the early going, while the warrior trolls are bad news all of the time.

The Necromancer: The chief heavy and captor of the princess, as well as the all-around bad egg.

Elements of the Fantasy

The other elements of the fantasy consist of the pits into which one occasionally tumbles, gold coins and an enchanted sword. As you might have guessed, the pits are an obstacle from which you must escape either by climbing or yelling for help. The gold that you pick up along the way is used to buy food, pay ransom and provide you with a little bank roll should you be lucky enough to complete your quest.

Of course, there is a "Catch 22." The weight of all that gold is somewhat of an encumbrance to combat and inhibits your fighting ability. The enchanted sword, on the other hand, enhances your fighting ability. In fact, you are usually in big trouble if you don't have it.

A player's fighting skill develops as he is successful in combat. A player increases his fighting ability in combat with common trolls, satyrs and dragons. But there are degrees of improvement. More fighting ability is acquired by slaying dragons than trolls. However, a similar gain is made when either a troll or a satyr runs from you.

In like fashion, your own fighting ability is diminished when you run from combat. Dragon fighting is the only exception. It's your choice. You can walk away from it any time.

Considerable fighting ability is usually necessary to defeat a warrior troll. But after fighting one of the super trolls, you are usually so frazzled that your fighting ability has been reduced.

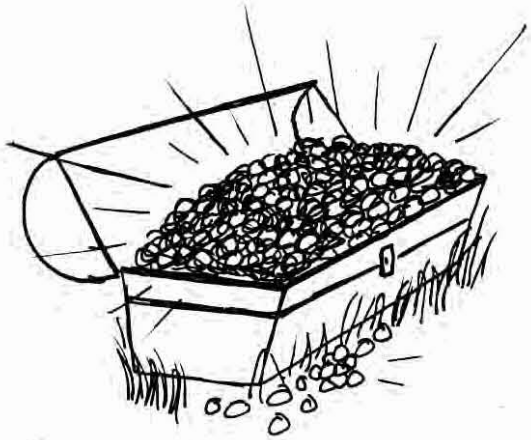
The playing instructions are simple. Prior to loading the program from cassette, set the memory size to 32697 in order to reserve room for the dragon's graphics code. If you are already up and running you can get back to MEMORY-SIZE? without powering down by entering the SYSTEM command followed by a '/ENTER'.

Initially, entering RUN will get the introductory title and the familiar READY. At that point the first five lines of the program are automatically deleted. Entering RUN thereafter initiates the main program. This is done to conserve memory, providing an additional 600 or so bytes.

The INKEY$ command is used to eliminate the repeated use of the ENTER key where possible.

There are questions which require word answers: RUN, YES, NO, CLIMB and YELL. Only the first letter of the word need be typed. In two cases a prompt answer is important – encounters with either the spiders or the dragons. To avoid attack from a spider, the player must strike the R key as quickly as he can. In the case of the dragon, the rescuer is moved toward and away from the dragon by using the less than and greater than keys, respectively. Any other key will stop the rescuer where he is.

Once you have rescued the princess, you no longer have the choice to fight or not fight common trolls. To make it to safety, you have to fight your way out.



The Listing

There are several lines that contain IF statements like IF F PRINT"THE NYMPH GOES MAD" (line 900). This is not a mistake, but a memory-saver and is permissible because numerical IF statements test for a non-zero value. F, in this case, can only be a 1 or a 0.

The revised program requires nearly all of your 16K memory. To further conserve memory, no REM statements are used except for the listing title. However, the program has been written in, more or less, block format with a PRINT statement introducing each block. Table 1 lists those blocks. That should be enough to start you on your search for the dungeon, the princess and a typical fairy tale ending.

Have fun, but watch out for the onions on those hot dogs – they are murder. ■

LINE NUMBERS	DESCRIPTION
1-11	introductory title; set up dragon's graphics code
14-30	Initialize variables; main program entry point
65-70	random number seed
85-105	timer gallery
110-115	question routines
120	set up for nymph
125-170	Great Oracle
180-195	set up of main program loop
200	main loop entry point
220-240	nymph guidance and lot casting
250-270	path choosing
280	enchanted sword
290	snake in the grass
300	check for dungeon and trolls
310	check for rats
320	check for dragons
330	check for pit
335	check for the dungeon
340-360	something is in the bushes
370	check for Necromancer and satyrs
390-400	gold
410	slave girl
420	check for dungeon
430	check for pit
440	dead end
500	nymph's mad
530-540	travel advisory
550-556	check on provisions
570-600	captured by goblins
610-695	dungeon
700-745	run of the mill troll
750-790	Satyrs
800-885	the pits
900-910	Necromancer
950	rats
960-1095	Warrior Troll
2000	something is in the bushes
2100-2120	spider
2300-2350	surprise goblin
2400-2430	the hot dog salesman
3000-4200	dateline: news story

Table 1. Block format for Swords and Sorcery II.

TBS80
DATA PROCESSING SYSTEMS.
ONE STEP BEYOND.

If you thought the TRS-80™ microcomputer was just a toy, think again. These ***TBS80*** *software systems will turn that computer into a* ***powerful data processor.***

INFORMATION SYSTEM *by Dale Kubler is simply the best in-memory, data base manager on the market. It allows you to create files with up to ten fields per record, up to 40 characters per field and 200 characters total per record. Data from the keyboard is entered directly onto a screen display of one entire file. Once entered, you can sort or search your entire data base by any category and have the information desired displayed on the screen.* ***INFORMATION SYSTEM*** *provides a thorough editing mode allowing changes by line without rewriting an entire file. This program allows you to program your own printouts to almost any form you desire for line or serial printers. Screen prints from anywhere in the program are also available* ***INFORMATION SYSTEM*** *creates either disk or cassette files depending upon the version you use. From mail lists to recipes, this program is the ideal small system information manager. The price for this program, 32K up disk is $49.50. For systems 16K up tape it's $39.50.*

DATA MANAGER *by Dale Kubler starts out where INFORMATION SYSTEM leaves off. Requiring 48K and one disk, it accepts up to 20 user-defined fields with up to forty characters per field and 800 characters per record. As with all TBS software, data entry and editing is professional and simple to use. What makes this program stand apart from "in-mem" data managers is that it uses up to four disks on line as memory, or as much as 320K of memory storage. Because disk sorts take more time than in-mem sorts,* ***DATA MANAGER*** *enables the user to create and maintain up to 5 "key" sort files for quick access of data. A utility program is provided to calculate the number of records possible since the amount of records you can maintain is dependent on a number of variables. This program also supports the upper/lower case modification, and printouts can be programmed to almost any format and sent to line or serial printer. Background printing is provided enabling the computer to search and print at the same time. If you already have INFORMATION SYSTEM,* ***DATA MANAGER*** *will accept those files. A necessity for organized people, this program sells for $ 74.95.*

BUSINESS MAIL SYSTEM *by Dale Kubler is designed for large-scale business users. Requiring 32K, two disks and printer, this program will store up to 150,000 names in a single file spread out over multiple disks. Each data disk holds 500 names. After data entry, BMS automatically sorts the data by zip code and alphabetical order within the zip code. The program tells you when and which data disk to insert, expanding your files automatically until you've reached 300 disks. Data is input directly onto formatted screen display with the option to use Company Name/Attention instead of Last Name/First Name. Three numeric and one alpha code fields are provided to help you use the search and printout mode.* ***BUSINESS MAIL SYSTEM*** *allows you to program the number and spacing of your labels. With more features than can be described here, this high-powered program sells for $125.00.*

TEXT MERGE *is the program that puts it all together. If you have the ELECTRIC PENCIL from Michael Shrayer, 48K and one disk drive, then this program is a must. It will merge your data base from any of the above programs with an Electric Pencil file. For example, when you write a letter that is going to several hundred people, you can "code" it by entering a field name from the above programs in place of the actual information. Then, when* ***TEXT MERGE*** *is run, it will print out your Pencil file and substitute the "code" with the actual data. In other words, you can print out 1,000 personalized letters without stopping the computer. This program will also enable you to selectively search out only the records from your data base that you wish to use. Also included is the ability to set left, right, top and bottom margins, set page numbers anywhere on the page, and print out right justified if you so choose.* ***TEXT MERGE*** *will turn your computer into a powerful data processor and it sells on disk for $99.95.*

TBS *has other incredible software for Tandy's microcomputer. Intent on making it a powerful tool, we have* ***large scale business accounting systems, general accounting systems, system utilities*** *and the* ***Library 100.*** *We have the only* ***DISK HEAD CLEANER*** *(for APPLE too!) and* ***GRAN MASTER DISKETTES,*** *the best on the market.*

TBS *is* ***YOUR COMPANY,*** *and we build systems, not just software. The above products are available now, nationwide. Visit your local Computer Dealer or Associate Radio Shack Store and demand the best, demand TBS. For more information, contact us through the numbers below.*

Star Search is a program for a 16K TRS-80 Level II. It creates a real-time, Star Trek-type game.

As the Captain of the Enterprise, your mission is to protect the Galaxy from the Klingon threat. Your level of experience determines the number of Klingons that you must destroy and the amount of time, in star dates, that you have to complete your mission. A quadrant is displayed as in Example 1. The symbols are as follows:

B Base
E Enterprise
K Klingon
* Star
• Sector

A legend for all operations appears at the top of the display. Just enter the flashing letter for the desired function. There is no need to depress ENTER. Here are your options:

1) R Report
2) S Short Range Sensor
3) L Long Range Sensor
4) C Computer
5) P Phaser
6) G Galaxy Map
7) T Torpedoes (Photon)
8) E Engines
9) Z Self Destruct

Options

Typing an R displays the status of the Enterprise, including the power left and the number of Klingons left. See Example 2.

Typing an S activates the Short Range Sensor and displays the quadrant where you are currently located. The Y-coordinate is the vertical and the X-coordinate is the horizontal. It's also shown in Example 1.

The Long Range Sensor is activated by typing an L. It displays a number code for the eight quadrants that surround the Enterprise, plus its present location at the center. This is the format:

1) The hundreds digit indicates the number of Klingons (K) in the quadrant.

2) The tens digit indicates the number of Bases (B).

3) The ones digit indicates the number of Stars (*). A zero indicates that there are no objects in the quadrant (Example 3).

The computer can be used to calculate the angle for firing torpedoes and moving the Enterprise. Type a C to activate the computer. Enter the Y-coordinate and the X-coordinate of the object. After entering the numbers, depress ENTER. The sector distance and angle will be displayed as in Example 4.

The Phasers are activated by typing a P. Enter the unit amount of energy you wish to fire. The hit will be displayed graphically. If there is more than one Klingon in the quadrant, then the energy will be distributed evenly among them (Example 5).

Typing a G displays the Galaxy Map. It displays 64 quadrants with a similar notation, as in the Long Range Sensor. The only difference is, the code includes a minus sign (–) to indicate that the quadrant has already been charted. Here are some examples:

1) – 0 indicates already charted but empty
2) 0 indicates uncharted
3) – 102 indicates 1 Klingon, no Bases, and 2 Stars
4) – 12 indicates 1 Base and 2 Stars
5) – 1 indicates 1 Star

Example 6 displays a Galaxy Map.

Type a T to activate the torpedoes, and enter the direction in

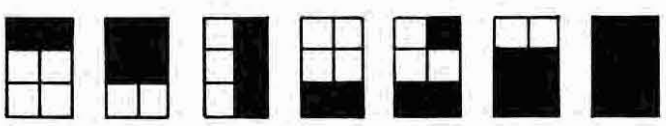

Fig. 1. Some graphic codes and their pattern.

↙Reader Service index—see page 194

degrees from 0 to 360. Press ENTER to fire. If you've used the computer to calculate the angle of the target, then activate the torpedoes and type a C to fire. The torpedo will be displayed moving across the quadrant to the target.

You can destroy Stars, Klingons and even Star Bases. You have 10 torpedoes, illustrated in Example 7.

The Engines are activated by typing an E. You can move the Enterprise within a quadrant or to another quadrant. A sector distance and angle entry is required. The movement is displayed, with the ship starting slowly and then gathering speed.

To move to another quadrant, enter a sector distance which moves the Enterprise beyond the boundaries of the quadrant. Moving at angles other than 0, 90, 180, 270 or 360 requires a greater sector distance to reach your destination.

Finally, you can't move through Stars, Star Bases, or Klingons; you must maneuver around them. Example 8 illustrates this movement.

One final command used under extreme conditions is the Z command. Typing a Z destroys the Enterprise and ends the game.

Example 4. Computer Display.

Special Subroutines

Here's a description of some of the special subroutines used in Star Search including the Enterprise graphics, the moving stars, active keyboard input, target impact, and timing. (Note: Up arrow appears as a left bracket in the listing.)

The Enterprise is drawn with program lines 2790 through 2910. It's drawn quickly, in large blocks, using the statement STRING$(X,Y), where X is the number of graphic blocks to be activated and Y is the pattern turned on.

The TRS-80 graphic block is divided into six smaller sub-blocks. Sixty-four different patterns can be created using code numbers 128 through 191 for Y. The instruction CHR$(Y) activates a single pattern as seen in lines 2890 and 2900. In line 2790 the statement PRINT@138,STRING$(23,191); activates 23 full display blocks, beginning at screen position 138.

Line 2800, PRINT@235,STRING$(13,176);, activates 13 partial blocks beginning at screen position 235. And so on. See Fig. 1 for some of the block patterns and their codes.

Program lines 2950 through 3080 create the moving stars, as seen when the Enterprise moves from one quadrant to another. This simulates movement through space.

Program lines 2950 through 3040 establish the moving star matrix B(11,11,2). It contains 121 sets of X and Y coordinates, for the 12 separate star paths. The data in line 3010 provide progressively increasing steps to simulate the visual effect of movement.

The active keyboard input routine uses the INKEY$ statement of Level II BASIC at program lines 670 through 760, 2760 and 2770.

Word Processing HMCT Style

Using the best in word processing software **the Magic Wand™**, the best in letter quality printers **the NEC Spinwriter™**, and the well-known **TRS-80™ MOD II.** You have looked and looked for the best and now it is available from the **Complete Computer Company, HMCT.** Word Processing at its best from $7500.

Magic Wand available separately for the MOD II and other computers $400.

HMCT **The Complete Computer Company**
5313 Bissonnet Bellaire, Texas 77401 (713) 661-2005 13

Magic Wand is a trademark of Small Business Applications, Spinwriter is a trademark of NEC, and TRS-80 is a trademark of Radio Shack.

This allows the command entry at any time, since the keyboard is constantly being checked for input. It also serves as a keyboard debounce routine.

Program lines 3500 through 3600 are used for target impact during combat. Eighteen is the location of the target and A$ is the target type. When a Klingon, a Star, a Star Base, or the Enterprise is hit, program line 3530 displays the impact symbol (a cross) over the object. Line 3590 clears the symbol from the display.

The subroutine located at program line 3610 decrements the DAYS LEFT variable D by .002. This happens each time the program runs through the input routine at line 2760. This works out to be about one minute per STARDATE. ■

THE TIME SAVER...

JPC Products Announces a New High Speed Cassette System
"The Poor Man's Floppy" for the TRS-80*
$90 Kit - $120.00 fully assembled.

The TRS-80* is a great small computer. But its cassette recording system can be very frustrating, particularly if you can't read an important cassette. JPC Products Company has developed an improved cassette system that uses your present cassette recorder but operates much faster with better reliability. The TC-8 plugs into the expansion connector on the back of the keyboard and saves and loads 5 times faster! Less than ONE BAD LOAD in a MILLION BYTES! With the VOLUME CONTROL ANYWHERE BETWEEN 1 AND 8. The TC-8 is available in an easy to assemble kit or fully assembled. JPC has an exclusive "can't fail" kit guarantee. If you build the TC-8 and for any reason it doesn't work, we will make it work at NO COST. All you have to pay is the shipping. We guarantee it. The TC-8 magic is partly done in software. So you have to load a small program in upper memory. It is usually out of the way there. We provide the software on a cassette that comes with the TC-8. Just load it in. Here's how you order. Send $90.00 for the kit ($120.00 fully assembled) plus $3.50 postage and handling to JPC Products Co., 12021 Paisano Court, Albuquerque, NM 87112 (N.M. Res. add 4% sales tax.) Credit card orders accepted by phone or mail.

★★★ A PERCOM BULLETIN ★★★

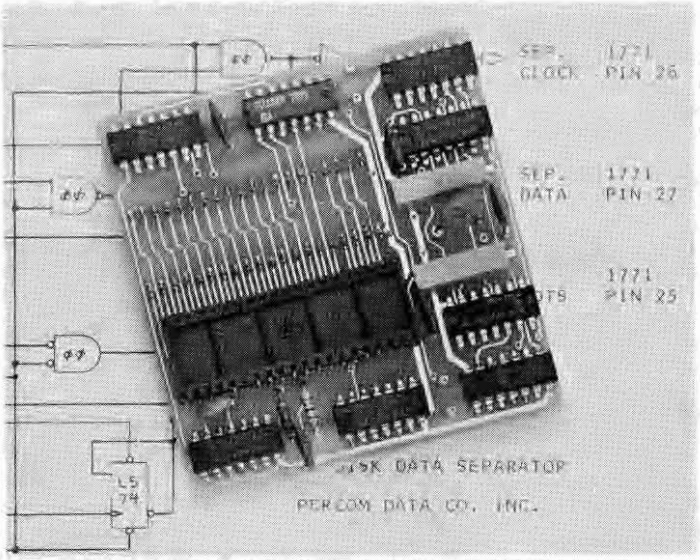
Adapter for TRS-80* computer eliminates disk read errors

Garland, Texas — Harold Mauch, president of Percom Data Company, announced that the company is marketing a simple plug-in adapter for TRS-80* computers that corrects a design deficiency in the disk controller circuit.

The problem, which causes disk read errors, has been traced to Tandy's reliance on a circuit internal to the FD1771 controller IC to perform the function of separating clock and data pulses.

As explained in the *Backgrounder,* use of the internal chip circuit for reliable data-clock separation is a design shortcut which the manufacturer of the controller IC warns against.

The Percom solution, a PC card adapter called the SEPARATOR™, eliminates the problem by substituting an explicit data separator circuit — one which has been used reliably in Percom disk controllers since 1977 — for the internal IC separator circuit.



Percom adapter fixes TRS-80 computer disk controller.*

The SEPARATOR™ is installed without modifying the host system. The user merely removes the FD1771 IC from the host controller, installs the IC in the DIP socket on the SEPARATOR™ card, and plugs the adapter into the vacated socket of the host controller.

Percom cautions that opening the Expansion Interface of the TRS-80* computer, which is required to install the SEPARATOR™, may void the computer's limited 90-day warranty.

The SEPARATOR™, which sells for $29.95, may be purchased from Percom dealers or ordered direct from the factory. The Percom toll-free order number is 1-800-527-1592.

Payment for mail orders may be made by certified check, cashier's check or money order, or charged to a Master Card or VISA account. Texas residents must add 5% sales tax.

Percom Mini-Disk Drives Store More, Cost Less.

Percom mini-disk drives store more data, are more reliable, yet a 40-track Percom drive costs **$100.00 less** than a 35-track Tandy drive.

You can store over 102 Kbytes per side on Percom TFD-100™ 40-track drives; 197 Kbytes on one side of a TFD-200™ 77-track drive. A patch — supplied free on minidiskette — upgrades TRSDOS* for operation with the newer 40- and 77-track drives.

Both TFD-100™ and TFD-200™ models are available in one-, two- and three-drive configurations.

Prices start at $399 for a single-drive TFD-100™, $675 for a single-drive TFD-200™. Drives are supplied with heavy-duty power supplies. Metal enclosure is finished in compatible silver enamel.

See your nearby Percom dealer or order direct by calling toll-free 1-800-527-1592.

Five-Inch Disks Store More Than Eight-Inch Disks!

Garland, Texas — June 25, 1980 — Percom Data Company has begun production of a double-density disk controller adapter for TRS-80* Model I computers.

Harold Mauch, president of Percom, made that announcement here today, saying that data storage capacity using the adapter and double-density disk operating system — which is included — can be increased to as much as 294 Kbytes per minidiskette.

By comparison, the maximum storage for larger eight-inch disk systems used with the TRS-80* Model I computer is about 290 Kbytes.

Mauch said the PC card adapter, which plugs into the controller chip socket of the computer Expansion Interface, works equally well for either single-density or double-density storage, and users may continue to run programs under TRSDOS*, OS-80™ and other single-density operating systems with the adapter installed.

Price, for the plug-in adapter, the TRSDOS*-like double-density DOS and a utility for converting files and programs from single- to double-density format is expected to be $219.95.

BACKGROUNDER

CRC ERROR! TRACK LOCKED OUT!

by the Technical Staff
Percom Data Company

This problem started while we were studying an annoying problem with the TRS-80* computer. Disk drives sold by Percom are realigned and tested before shipment. We noticed, however, that some disk drives would pass the Percom inspection but just would not work reliably on the inner tracks with a TRS-80* computer. These drives were within the manufacturer's specifications, and would function perfectly on other disk systems Percom manufactures — "perfectly" here meaning more than 50 million bytes read without error!

The disk read data separation arrangement in the TRS-80* computer Expansion Interface uses an internal data separator of the FD1771 disk formatter/controller IC. Use of the FD1771 internal data separator is not recommended by Western Digital, the IC manufacturer. The following note appears on page 17 of the FD1771 data sheet:

> Internal data separation may work for some applications. However, for applications requiring high data recovery reliability, WDC recommends external data separation be used.

We suspected the data separator because the problem was most severe on disk inner tracks where storage density is highest and data separation is most critical.

To prove our point, a technician breadboarded a standard Percom data separator circuit, and configured it to plug directly into the FD1771 IC socket of the TRS-80* computer controller.

When connected to the TRS-80* computer, a troublesome drive functioned perfectly! We ran a BACKUP utility many times and never got a track lockout. Before we added the external data separator circuit to the computer, this same drive would always lock out tracks, and would have difficulty reading from the inner (higher number) tracks.

The Percom data separator circuit fixes the mini-disk controller of the TRS-80* computer. The type of drives being used is irrelevant; the circuit eliminates disk read errors resulting from the inability of the Tandy controller design to reliably separate clock and data signals when reading high density inner tracks.

PRICES AND SPECIFICATIONS SUBJECT TO CHANGE WITHOUT NOTICE.

Starfighter

Albert C. Ferrera
RD #2, Box 325
Oneonto, NY 13820

I am a dedicated amateur astronomer turned computerist. I wanted to design a space battle game that involved as much realism as possible within the rather severe limit of my 4K machine. The following program is what I came up with, including audio.

The program illustrates what a space pilot might see looking out his cockpit window on a real space battle. It creates a random constellation of five to fifteen stars for each game and maintains them through all the action. The distant suns must remain unaffected by foreground events.

Missile System

The object is to destroy a hostile fighter viewed through your ship's window. Your ship is armed with a missile system, but like real systems, the missiles are not perfect and your best bet is to fire a salvo that will form a cluster around your target coordinates. Hopefully, the cluster will include the hostile fighter.

You have to fire by feel to a considerable extent. After a number of games you will learn to control your fire and your score will improve.

The hostile fighter also has weapons and, if you do not score on your first salvo, its capabilities may well be demonstrated to you. He has two wingtip guns that can blaze back at you and can choose almost any moment (even during your salvo) to return your fire. If he scores, your little microcosm comes apart at the seams.

Since his weapons do not travel at light speed, you have a brief moment between his gun flashing and his missiles striking to contemplate your sins.

The hostile has several other tricks. On occasion he disappears through a stargate or space warp and leaves the field making quite a flash as he goes. (I admit it. I do watch Buck Rogers.) Sometimes, too, he leaves the view from your window. In a moment he returns to continue the encounter.

A stand-off results if you run out of missiles and disengage, or the hostile leaves through a stargate. The computer displays the number of missiles you have left. It also displays the coordinates of your last salvo.

If you run out of missiles and the fighter is still intact, he has the option of shooting at you before stargate takes him out of reach. If you damage his ship before your missiles are depleted, the hostile fighter escapes beyond the stargate, leaving you to contemplate the starry sky till the next game.

Direct Hit

In order to bag your opponent, you have to score a direct hit on his cockpit. This causes his fighter to come apart rather violently. It you hit him around the edges, your controls will indicate DAMAGE.

You can shoot up his wings and the computer will keep track of the missing pieces and print out what remains of your opponent after he moves. As long as his cockpit is intact he will survive.

A non-lethal hit gives you two advantages. First, you disable your opponent's weapons. Further, his mobility will be considerably reduced, making it easier for you to finish him.

As written, there is about an even split between wins, losses and draws. However, you can change the odds. Line 190 controls the missile supply, and you can increase it, if you wish.

Line 356 controls the chance that you will get fired at during

Variable	Program Function
A	Salvo size (1 to 4).
B	Row 1 star position. Also random variable and loop counter.
C	Horizontal set point of left hostile fighter gun.
D	Vertical set point of left hostile fighter gun.
E	Leftmost print position of hostile ship.
F	Array variable label (star position). Also array variable loop counter.
G	Random variable to determine E shift position. Also loop counter.
H	Horizontal aim point.
I	Salvo loop counter.
J	Number of stars.
K	Upper left set point of E (horizontal coordinate). Also used (line 334) as the print at position that includes the missile set point.
L	Upper left set point of E (horizontal coordinate). Also used (line 334) as the print at position that includes the missile set point.
M	Missile deflection random variable (horizontal coordinate).
N	Missile deflection random variable (vertical coordinate).
O	Number of missiles available.
P	Damage flag for hostile ship character < (location E).
Q	" " " " " " - (left).
R	" " " " " " 0.
S	" " " " " " - (right).
T	" " " " " " > (right).
U	Random variable to determine if GOS.2000 (hostile fighter fire routine). Also used in hostile fighter explode routine (lines 6000-6060) as a loop counter.
V	Vertical aim point.
W	Ship explosion reference print at point. There is one for each star on the playing field.
X	Set point coordinate. (horizontal)
Y	Set point coordinate. (vertical)
Z	Random variable to determine if enter Stargate routine.
A(F)	Star position print at point.

Table 1. List of Variables Used.

Reader Service index—see page 194

Lines	Program Function
10-35	Initialize system.
50-76	Establish playing field format.
100	Establish initial hostile fighter position-E.
105	Check field boundaries.
110	Print hostile fighter.
152	Choose number of stars (5 to 15).
154-164	Choose star positions. Check if hostile position interferes. If not, print star. If so, choose new star position and print star.
190	Choose number of missiles.
200-203	Erase old input.
205-225	Input new fire control data.
300-331	Set missile hit position.
334	Calculate the print point that includes missile set point.
338-342	Check for hit on hostile and set damage flags P,Q,R,S,T. Note: R is the kill flag.
350	Reset missile hit. Reprint each star unles hostile covers it.
356	Decide if hostile returns fire.
357	Update missiles remaining; print out.
362	If no missiles remain, print hostile damage status. If hostile is missed, give hostile a chance to return fire. If hostile misses, then Stargate.
363	If hostile is not missed or killed, print DAMAGED, then Stargate.
365	Loop to fire next missile.
370-380	Print hostile damage status, if missiles are remaining.
475-480	Determine whether hostile returns fire.
500-760	Determine new hostile position. Consider damage, if any, and print remaining parts of hostile at new position.
766-767	Determine whether hostile returns fire.
770-790	Choose, if Stargate. If not, return for another salvo.
800-920	Stargate routine ending.
1000-1180	Determine new hostile ship based on missile damage flags.
2000-2060	Hostile fighter gun fire routine.
2090	Choose, if hostile fire effective. If yes, branch to ship destruct routine.
2105	Replace stars removed by hostile fighter fire.
3000-3060	Ship destruct routine ending.
4000	Delay loop.
5000-5100	Star replace routine including check for hostile position.
6000-6060	Hostile fighter explodes, if cockpit is hit routine.

Table 2. Program Summary.

or after a salvo. If you increase U = RND(3) to a larger random number you get shot at less often.

Lines 766-767 determine if you will be fired on after the hostile fighter moves. Likewise increase U = RND(2) for a safer game.

Line 770 controls the chance of a stargate. Increase Z = RND(5) to make the hostile stick around longer.

Audio

Oh yes, I mentioned audio. For me it was easy, since my computer shares my cassette deck with my high fidelity system. However, you can hear your computer by placing a portable FM radio near it and picking up the digital noise at numerous places on the dial. The sound effects end with the 500 hz tone of FOR-NEXT loops being counted waiting for the next game.

One final suggestion. Turn down the screen brightness until a dark sky appears, as free of light pollution as possible. This makes the constellations look much more realistic. (I wonder what Orion would look like from a vantage point in Cygnus? Well, I admit the graphics aren't that good!)

I omitted instructions and used many abbreviations to make room for the program. However, the screen instructions are quite specific.

As written my computer returns a PRINT MEM. of 122 bytes. A maximum of 60 bytes are used when the star position array spins up. You have only 62 bytes to spare and cannot take too many liberties typing the program or adding features.

Also the program is not protected against illegal inputs, so if you enter bad input, you have to hit BREAK and then RUN again.

Also, on rare occasions the program crashes with a sorry statement: The sorry returns a ? after the FOR of a legal FOR-NEXT loop, usually line 2500. The problem has defied my analysis; there is no lack of user RAM. It may be because of some kind of overflow condition in the BASIC monitor or internal scratch pad. Whether peculiar to my series machine or not I cannot say. I hope someone solves it. It is my only problem with the program. ■

Time running out? Get into high gear with machine code.

Life in the Fast Lane

Terry Kepner & Claud M. Grace
P.O. Box 481
Peterborough, NH 03458

Most serious programmers at one time or another have seen the program Life. In an attempt to decrease the processing time many have tried to write their own versions of the game. As a result, two schools of Life have developed.

One school, usually the owners of machines like the TRS-80 and the PET, uses only BASIC, while the other school, usually those people who have access to assembler editors, programs Life with machine code.

Since most newcomers are purchasing machines with BASIC, they see Life run so slowly that they fail to see the reason for all the interest surrounding the game.

If they see it run in machine code however, they are fascinated. Unfortunately, beginners usually have difficulty understanding what machine code is and what it does.

For those of you who are curious about Life, but don't want to spend days decoding hex instructions, or don't want to shell out the money for an assembler editor, this article is for you.

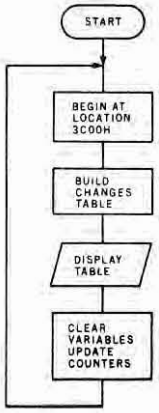

Fig. 1. General Logic

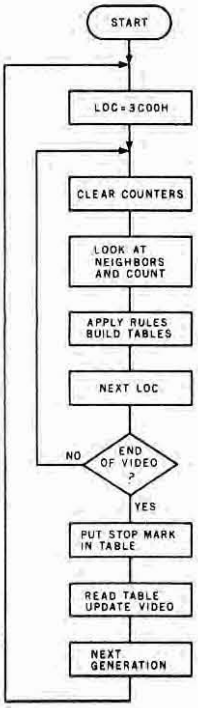

Fig. 2.

Three Versions of Life

There are three program listings with this article. The first listing, in BASIC, takes approximately 2½ minutes to evaluate one generation of Life and to update the video.

Since many of the more interesting features of Life (gliders, blinkers, blocks and guns) take from two to ten generations, or more, to find and observe, you would need a time-lapse camera and plenty of free time to get any useful results.

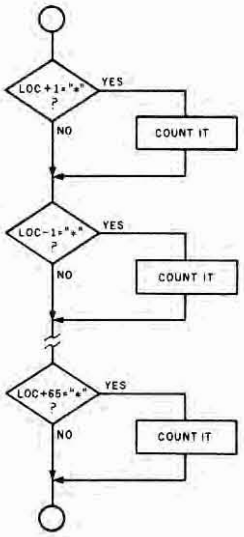

Fig. 3. Look at Neighbors

The second listing, however, is a hybrid BASIC-assembly code program. And it's fast! Almost a line for line conversion of the BASIC program into assembly code, it can be programmed into the TRS-80 Level II computer without additional software.

The third listing, completely in assembly code, is even faster than the hybrid version. The three programs were written to match one another as closely as possible. Studying the listings gives even the newest programmer insight into assembly code programming and its advantages over BASIC.

Let's start with the hybrid program. Its BASIC segment carries the assembly code instructions used by the assembly program. These instructions are held in the DATA statements. When the command RUN is given, the program READs these statements and POKEs the numerical instructions (in decimal) into memory at a specified address.

It then calls this assembly code routine via USR(0) in BASIC.

When the call is made, the computer leaves BASIC, executes the assembly code instructions, and returns to BASIC

Listing 2. Hybrid BASIC-Assembly Code

to update the generation counter and check for additional user inputs. The process then repeats.

To understand the assembly code routine requires a little background information.

Life Strategy

Originally developed to simulate cell growth, Life's rules are rather simple: In order to survive, each cell must have two or three neighbors, otherwise it dies of "loneliness"; a cell with more than three neighbors dies from overcrowding; any empty space with exactly three neighbors will be the site of a "birth" and will be occupied by a new cell.

The interest and fun in Life comes from watching cells develop into interesting patterns, or, perhaps, even new Life forms.

There are several ways to program Life. One method uses two two-dimensional arrays—one for the current generation under evaluation, and the other for the survivors and births of that generation. Another method uses only one array, with the current cells positive but less than 128, births greater than 128 and deaths negative.

The strategy used in this article follows neither of the above two methods.

Since each generation is different from the previous one by some set of changes, all that is needed is a list of these changes —the births and deaths of each generation (see Fig. 1).

This list is built by looking at the eight surrounding spaces of

✓Reader Service index—see page 194

each location on the video screen and counting the number of live cells (actually asterisks). This count is compared to the rules, and if the rules decree death, then the address of that cell is added to the list.

If the rules decree birth, the address of that cell has 8000 hex added to it and is placed on the list. For any other conditions, nothing is added to the list. After the last video position is considered, the address 0000 hex is added to the list as an end marker. This is demonstrated in Fig. 2.

The process involved in checking out the surrounding eight spaces of each video location is shown in Fig. 3.

Fig. 4 is the heart of the strategy. It applies two different rules, depending upon whether a video location is occupied or empty. For an empty space, if the neighbor count is not two or three, add that location's address to the list. This is its death warrant.

The address must be broken down into two hex numbers for the machine code routine to handle it, one for the last two digits (which are also in hex), and one for the first two digits (0080H = 80H + 00H).

For an empty cell, if it has exactly three neighbors, set the seventh bit of the most significant byte (the first two hex digits are known as the MSB and the last two as the LSB—least significant byte) of its address high. Add the address to the list. This is equivalent to adding 128 decimal to the address and is used to signify a birth. If none of these conditions are met, forget this location and go to the next one.

Fig. 5 reads the addresses off the table until it finds a zero. It also checks to see if each address is greater than 8000H and, if it is, resets the MSB bit low and sends a * to the resultant address. If it is lower than 8000H it sends a " " to that address.

As I mentioned earlier, the difference between the execution times of the BASIC and the hybrid versions is fantastic. One generation of Life in the hybrid version has approximately 3½ to four generations per second! This is a ratio of almost 550 to one.

At this high speed it was necessary to add a timing loop to the program to slow down the

Listing 3. Assembly Code

game. The loop is set at the beginning of the game by asking the operator what time delay is wanted.

Assembly Version

The assembly language version is only a little bit faster than the hybrid version, running about five to six generations per second.

Unfortunately there isn't a method for the user to input his or her own patterns onto the screen in these programs. It's discouraging to spend five to ten minutes putting a pattern on screen, only to see everything either die off or become static in five or ten seconds. Inserting a random pattern generator corrects this and the patterns usually last longer than ten seconds too!

Since most of the heavy-duty work is accomplished in the assembly code section of the program, it should be easy for you to write your own method of pattern entry. A pause key can also be added to allow you time to study the screen if an interesting Life form appears.

Be careful when adding statements to the BASIC portion of the hybrid program. The assembly code routine resides at the top of the memory, while the BASIC program occupies the lower part.

As long as the two do not overlap there aren't any problems, but when the BASIC section intrudes upon the assembly code routines, the program as a whole will malfunction and crash.

To avoid this catastrophe, find out the lowest address of RAM used by the assembly code routine, not counting the video memory cells. After power up, when MEMORY SIZE? prompts, input this address in decimal. (For this particular program the lowest address used by the assembly code routine is 28672.)

The sample programs have been liberally sprinkled with comments to help you understand assembly code and how it corresponds to BASIC. ■

U-Boat

Hubert C. Borrmann
2840 South Circle Dr.
Colorado Springs, CO 80906

Simplicity is the key to program writing for the beginner. Try starting with something easy, like a guessing game and then improve it.

In the following program, the computer thinks of a number, while you try to guess it. The computer then tells you how close you are.

By adding some graphic embellishments to this premise, we have a game that I call U-boat. The U-boat is hidden, and the player has to guess where it is.

This idea can be developed in several ways. We can divide the ocean into squares and hide the U-boat in one of them. If the player guesses the wrong square, the computer tells him whether he is high or low. By varying the number of squares, the player can change the difficulty.

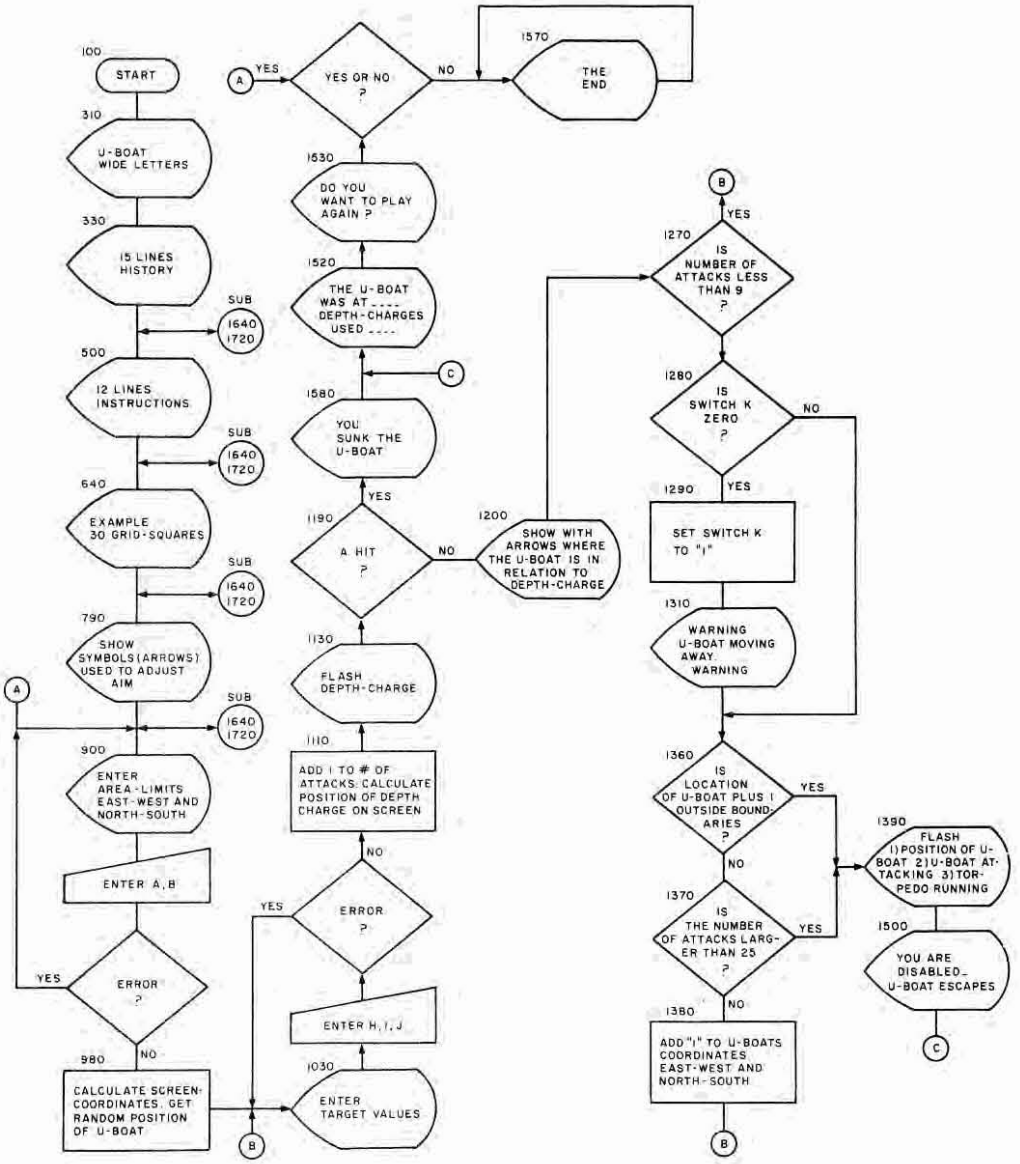

Fig. 1. Flowchart.

Using the Game Coordinates

But this approach is a little too simple. Instead, let's use coordinates, a set of numbers used to specify the location of a point on a grid. Coordinates are pairs of numbers, one representing the steps away from our starting point horizontally and the other representing a number of vertical steps down from the horizontal axis.

The set instruction uses this approach. The top-left corner of the screen is 0,0. If you instruct SET(10,1), you go ten steps to the right and one step down.

So far, the player must guess two numbers. But a U-boat isn't a surface craft, and you can't expect the sub to remain on the surface. So I'm going to add the third dimension of depth.

While I'm at it, I'm going to make a change in the language of the rules. Instead of merely guessing some numbers, the player is going to be dropping depth charges.

To give the player some help and guide him toward his prey, I'm going to let the on-board sonar indicate the relative direction of the U-boat from the location of the depth charge drop. The computer will show with arrows whether to increase (right)

or decrease (left) the east-west coordinate and, also, whether to increase (down) or decrease (up) the north-south coordinate.

The computer also verbally advises the player whether to increase the depth setting on his next drop (DOWN) or whether to decrease it (UP).

The computer therefore asks for three coordinates (east-west, north-south and depth) and accepts these values. It then compares these values with the values the player has picked for the location of the imaginary U-boat. If they match, the player has successfully attacked and destroyed a sub (i.e., guessed three numbers correctly).

Varying the Grid

Except for the screen usage, this is still a simple guessing game. You can vary the degree of difficulty by varying the size of the grid.

The set and reset instructions can use 128 horizontal positions and 48 vertical positions. Thus, the largest grid can be 5,969 squares, while the smallest is one by one, or one square. To keep it simple, let's say that the U-boat remains at a depth between 1 and 15, and that the player can't change this range.

After the player enters his guess, the computer responds by flashing the location of the depth charge on the screen and by indicating the necessary corrections required. We don't want an unending game, so after nine unsuccessful attacks let's change the strategy and move the U-boat one step horizontally and one step vertically. This will add some spice.

The player continues attacking (up to 25 times) or until the U-boat is reaching the border of our ocean. If the target has not been found by now, the computer wins. It indicates whether the player has won or lost, shows the position of the U-boat and the number of depth-charges used. The player can now choose to either play another game or to END.

The Flowchart

You still are not ready to write instructions. The flowchart comes first. A flowchart is like a road map, and if you follow this map faithfully, you won't get lost.

I don't know how much memory you have—I assume 16K. If you have 4K, you can still write the suggested program and leave out part 1 and the remarks.

Break your program down into two parts. Part 1 is just information, while part 2 is the actual game. Part 1 offers some history, some instructions of how to play the game, and an example.

Fig. 1 is the main chart. Fig. 2 is a set of instructions which have to be repeated several times. It's a delay subroutine that flashes the word SPACE, while the player is waiting. SPACE continues flashing until INKEY$ detects a keystroke. It is numbered higher than the body of the program, so that it is callable. (See Radio Shack's July, 1979, Newsletter.)

After a start symbol and a title frame, the next screen symbol indicates 15 lines of history. It is actually not 15 lines, since I reserve the top line for the heading U-boat on all frames, and I also reserve the last line to tell the player to press the space bar when he is ready. This instruction delay is provided by our subroutine.

There follows some instructions to the player, the subroutine, and two screens that illustrate the grid, symbols, and language the computer will use.

Again, I use the delay subroutine.

The Game

I now start part 2, the actual game. The circle with the letter A in it is a connector, and is used so that the logic lines do not have to cross each other. A starts with a query to enter the ocean limits.

The next symbol, a keyboard, indicates data entry. I accept the numbers for the limits, and write into the symbol the letters A and B. These are variables.

A good programmer will check entered data for validity, and I do this in the next symbol, the diamond. I check for a number between 1 and 127, and for the other number between 1 and 47. If there was an error, I go back to connector A.

If the entered limits are OK, I now have some work to do. The square box indicates my calculations. I first adjust the width and length of the screen to the desired ocean area. If the player chooses the east-west limit to be 64, for instance, this becomes the extreme right number of the screen. Position 32 is in the middle and so forth.

I let the TRS-80 pick the three coordinates of our imaginary U-boat: east-west, north-south and depth.

At connector B I ask for the three target coordinates, and the player makes his first guess. The keyboard symbol accepts the three values, variables H, I and J and these are edited in the next diamond. They have to fit into the pre-determined area. If the data are OK, I increment the attack counter.

The location of the depth-charge shows on the screen, flashing on and off (SET and RESET).

The next diamond determines whether we scored a hit or a miss. The U-boat is sunk if hit and that is indicated. The next symbol shows where the U-boat was on the screen, its coordinates, and the number of depth charges expended.

The game is over, and the computer asks whether another

game is desired. If the answer is yes, then the computer goes to the start of part 1, via connector A. If the answer is no it shows THE END and stays in an unending loop.

You Miss

That was if the player scored. If he missed, we calculate the direction of the U-boat in relation to the depth-charge and indicate with arrows and/or the words UP or DOWN how the player should adjust his aim.

The next diamond asks if this is attack nine or higher. If it was not, the player makes another run, via B. Otherwise the U-boat moves a little at a time. To be fair, the computer informs the player.

Since I want to give this warning only once, I employ a switch K, which is zero the first time and one from then on. If the switch is zero, I make it one and show the warning message.

Before the computer can move the U-boat, however, it has to check that the new location is not outside the ocean area. If the location is valid, the computer next checks if this is the 26th unsuccessful attack. If not, the computer now moves the U-boat by adding one to its coordinates. This moves it one step to the right and one step down.

Then the computer, via connector B, lets the player make another run.

If the earlier check has indicated that the U-boat would move outside the limits, or that the player has performed more than 25 unsuccessful attacks, the computer gives the U-boat captain a break. As you see on the flowchart, the position of the U-boat is flashed on the screen, and "U-boat attacking" and "Torpedo running." It then informs the player that he is disabled and that the U-boat has escaped. Via connector C the screen shows the statistics.

Coding the Game

When starting the actual program coding, I use the program pad and the screen layout forms, and also some scratch paper. On a separate sheet marked variables, I write those used and their meaning. I enter the list of variables in the program as REMARK statements after I'm done.

If X-programs later, you want to make some improvements in this program, the list of variables will be invaluable. So leave plenty of space for this, and start with line number 100 or so for the Program Listing.

Line 310 sets the screen up for wide letters, CHR$(23), and prints U-boat. CLS sets the screen to normal width and builds the history screen, lines 330–460.

Line 470 links to the subroutine, 1640. (Before renumbering, this was 10,000.) After CLS and the instructions, lines 490–610 are printed and linked to the subroutine in line 620.

For an example, let's use a grid with six squares across the five squares down. This is a total ocean area of 30 squares (Fig. 4). Name these squares (1,1), (1,2), (1,3) and so on. (See lines 640–680.) Build the framework for these squares with FOR-NEXT loops in lines 690–730, using SET instructions. Add a U-boat in one of the squares, say 5,4, and so state in line 750. Draw the U-boat in line 740.

Line 760 links to the subroutine again. Now, you are ready to print your last informational frame, lines 790–880. Use arrows; see CHR$ 91, 92, 93, 94.

Part Two

First, set up the area and ask for the limits. Edit the entered values in lines 920 and 950. Note that line 930 contains a RANDOM statement, so that the built-in random number generator will not come up with the same number consecutively.

Now enter A for east-west, B for north-south. In line 970, tell the player how many squares he has to search. This number is L.

Calculating the screen coordinates is simple, if the player has chosen the full screen grid. Any entered east-west number corresponds directly to the screen positions.

However, if the player chooses an east-west limit of 64, then any entered east-west number occupies two logical screen positions. The same is true for the north-south coor-

dinates. Calculate these modifiers in line 980 and keep them in C and D.

Lines 990–1010 generate the U-boat's position. Keep secret the east-west coordinate in E, the north-south coordinate in F and the depth in G.

The player now gets a shot at the U-boat. The computer tells him to enter the target values. Before he does this, a waiting loop is executed in line 1020, to let him know that he has L squares to search.

The three entered coordinates go into H, I and J (1030–1060) and are checked for errors.

What is this check? The player cannot accept any coordinate less than 1 or larger than the chosen limits.

Add one to the number of attacks (counter N). To show the location of this depth-charge on the screen, lines 1110 and 1120 must calculate it, while lines 1130–1180 do the flashing.

An Example

Here's an example. Assume the player answered the area limit question with two east-west and two north-south squares. Thus, A = 2 and B = 2.

Looking at line 980, C will be 63 (127 divided by 2), and D will be 23 (47 divided by 2). If the player entered the coordinates 1,1 (H = 1, I = 1), X will be 1 times 63 (H times C). Y will be 1 times 23 (I times D) lines 1110.

In the next line 1120 these values are adjusted for the middle of their areas. X equals 63 minus 31 (63 divided by 2), which is 32. Y equals 23 minus 11 (23 divided by 2), which is 12, so the instruction is SET(32,12), and if you look at the screen layout you will see that this point is in the middle of square 1,1, the top-left square.

Back to our flowchart and pro-

gram. Check for a hit in line 1190 by comparing the coordinates of the U-boat with the entered ones. If it is a hit, line 1580, informs the player that he has destroyed a U-boat.

The coordinates and number of depth-charges used are shown in line 1520. Now ask the player if he wants to play again, and if the response starts with a Y (lines 1530–1550), the computer goes where the connector A orders it, to line 900. If the response is N, we set the screen for wide letters, print THE END and enter an endless loop (lines 1560–1570). This can be replaced with a timing loop and an End statement.

If the player misses, the computer must show where the U-boat is in relation to the depth-charge. Start at line 1200, if the entered east-west coordinate is smaller than the U-boat's, then the U-boat is to the right on the screen. The computer prints arrows pointing to the right (line 1210).

If the entered north-south coordinate is larger than the U-boat's, the U-boat is higher up on the screen and the computer points that way with up-arrows (line 1240).

Next, check the attack counter at line 1270; if the number is less than nine, go to 1030 via B, and let the player make another attack. If it is nine or larger, move the U-boat.

Line 1280 controls switch K. This is set to zero in line 900. After nine attacks set it to 1, print the warning message "U-boat is moving away" and flash it (lines 1300–1350). If switch K were 1, you bypass all this and check whether you can move the U-boat (line 1360).

If you can move it, you first check the attack counter N again, in line 1370, and if this

✓Reader Service Index—see page 194

counter is larger than 25, the U-boat wins.

If the counter N is not larger than 25, add 1 to the U-boat's coordinates (east-west and north-south) and let the player have another run at 1030, via B.

The U-boat Wins

Looking at the flowchart, you come to line 1390 where the U-boat wins. The computer flashes the U-boat's position, calculated in line 1390. (Compare this line with lines 1110 and 1120 for the depth charge.)

Also, print U-boat attacking in line 1410 and Torpedo running in line 1420. Variables P and O will have the U-boat's coordinates and these are flashed for awhile (1400-1490). Line 1500 announces that the player is disabled, and the U-boat escapes. This stays on the screen while the timing loop at 1510 runs its course; then, you go to connector C on the flowchart.

You have reached the end of the coding, but some addresses may have to be filled in yet. Certain instructions can only be completed after the program is written. You have to leave these addresses blank until you can fill them in at the end of your coding.

As you program, make a pencil X next to the line where you have to do some filling in. This is part of desk checking. Slowly read through your code, and look for syntax errors, for missing quotes, commas and periods.

If, while writing the instructions, you deleted some lines, check for statements that go to these nonexistent lines.

Now is the time to enter the code for the list of variables we have been keeping. In this program they are lines 100-300.

You can renumber the lines if you have the program, but this is not mandatory.

Whether you renumber or not, now is the time to write the line numbers on the flowchart, next to the symbol to which they correspond. Later, if you want to make some changes, or explain a certain routine, this will help you locate the area. ■

I made the TRS-80* into a serious computer. Now I've made the Model II into a spectacular one.

I'm Irwin Taranto, and I've helped almost a thousand businesses get their first computers up and running.

I've done it primarily with the TRS-80, because it's a really elegant piece of hardware. Given the right programs, it can do substantially the same work as the traditional minicomputers that cost four times as much.

I proved it with four on-line, interactive programs adapted from the genuine Osborne & Associates systems, originally designed for the $30,000 Wang computer. Then I added two of my own and made them all work on a $4000 TRS-80.

Now I've done the same thing for the new TRS-80 Model II. It's an $8000 computer that works twice as fast and has four times the memory—up to two million characters.

My new systems are fully documented, and because I'm working with a much more powerful computer, they're a night-and-day advance over the Model I programs. They'll turn your Model II into a complete business computer, set up and ready to go.

THE TRS-80 MODEL II PROGRAMS

General Ledger/Cash Journal: handles up to 7000 transactions on 500 different user-defined accounts. It keeps track of them by month, quarter and year, makes comparisons to the prior year, and does departmentalization.

Accounts Payable/Purchase Order: generates the purchase order and posts the item to payables when the goods are received. Invoice-linked, it calculates and prints checks and aged ledger reports and links fully to the general ledger.

Accounts Receivable/Invoicing: keeps track of billed and unbilled invoices, open and closed items, aging and service charge calculation. It prints statements, links to the general ledger, and can work within either an invoice-linked or balance-forward accounting system.

Payroll/Job Costing: computes regular, overtime and piecework pay, keeps employee files, figures taxes and deductions, prints checks, journal, 941-A and W-2 forms, and breaks out individual job costs.

*A trademark of the Tandy Corporation.

When I say set up and ready to go, I mean just that. If you're not quite sure on that point, call the number below and we'll give you the names of some of the people who've already bought all over the world. Call them up and hear what they have to say.

These Model II programs are completely custom-tailored, which explains their $249.95 price. Before we'll send you a disk, you have to fill out a detailed questionnaire that tells us your precise business requirements. Then we send you the disk, all the instructions you need, and my phone number. If you call, we answer all your questions. If your questions are tough enough, I'll talk to you personally.

Because that way I'll make sure that Model II of yours turns into a spectacular computer, just like I promised.

☐ Please send me the custom questionnaires for the following $249.95 Model II programs:

- ☐ General Ledger/Cash Journal
- ☐ Accounts Payable/Purchase Order
- ☐ Accounts Receivable/Invoicing
- ☐ Payroll/Job Costing

☐ Please send me information on the TRS-80 Model I programs at $99.95 each

☐ Please send me information on other Taranto business programs

The presidential simulation they play in the White House.

A Heartbeat Away

Clinton Morey
Box 534
Peerless, MT 59253

The President of the United States receives a telegram from the U.S. Ambassador to Panama. Panamanians are rioting in the streets and throwing bombs at American citizens in the canal zone. The President's advisors are divided on what to do. Some suggest taking a hard line, condemning Panama and ordering U.S. troops into the streets. Others urge caution, putting the troops on alert, but taking no overt action to further worsen the situation. What will the President do?

Computer Re-Creations

Each student in my high school goverment class had to make that decision, as if he were the President. The U.S.-Panama crises of 1964 occurred when Lyndon Johnson was President of the United States. To give my students an understanding of the types of decisions a President must make, I designed a computer program to recreate this minor crises in our nation's past.

The program is not a simulation but a re-creation of an historical event, with some allowance for student interaction. It's run on a Level II, 16K. In this historical re-creation, the computer compares the student's responses with those made by President Johnson, but follows closely the true course of events regardless of the student's decisions. This allows the student to learn about an historical incident in a high interest situation, to compare his decisions with those of a real President and to evaluate the quality of the decisions made.

The computer program gives information to the President in bits and pieces. Messages from the American ambassador or the senior military officer come to the desk of the President (Fig. 1), requiring him to make some kind of decision. Later developments often require the President to alter his decisions as new facts are revealed. And, just as in real life, the President's advisors suggest alternate courses of action.

This bit-by-bit acquisition of information is important in helping the student understand the decision making process. We could all be great presidents, if we had the gift of hindsight.

Classroom Discussion

There are no right or wrong answers in the course of this historical re-creation. Although some students make decisions that could possibly lead to war, the value of this computer program comes from an empathy for the tough decisions that a President must make. Thus, a very important part of the activity takes place after each student has gone through the program, in the form of classroom discussion.

The program is not a game—but it has proven to be fun for my students who have used it. From a teacher's standpoint, the value of the program is not in the level of enjoyment, but in the changes that occur in the student. In my classes, I have seen significant changes in student's perceptions of the Presidency after working through this program.

I believe there is a place in computer instruction for historical re-creation, not just recreation. ■

•••EVERYTHING FOR YOUR TRS-80™•••

TRS-80 is a trademark of the Radio Shack Division of Tandy Corporation

★ *All Orders processed within 24-Hours*
★ *30-Day Money Back Guarantee on all Software (less a $3 penalty for handling)*
★ *10-Day Money Back Guarantee on Disk Drives and Printers* **PLUS** *120-Days Free Service*

- **LEARNING LEVEL II** By David Lien
  The Original Author Of The Level Manual
  A Step By Step approach to Learning Level II especially geared to new TRS-80™ Owners **$15.95**

- **TRS-80™ DISK AND OTHER MYSTERIES**
  Over 100 pages of indespensible information for disk owners. Learn to recover information from bad disks, how to make Basic programs unlistable and 12 more chapters of never published tips and information. Written by H.C. Pennington.
  (For all Disk Owners). **$22.50**

NEW SBSG BUSINESS SYSTEM FOR MODEL I OR MODEL II - IN STOCK
- General Ledger
- Accounts Receivable
- Accounts Payable
- Payroll
- Inventory Control with Invoicing

- Each module can be operated individually or as a coordinated **SYSTEM.** Turn-Key error catching operation for beginners.
- Complete manual and documentation accompany each program.
- Minimum System requirements 2-Disk Drives for Model I...1-Disk Drive for Model II
- Each module can be formatted to span data on up to 4-Disk Drives
- Free 30-Day telephone consultation
- Call for complete specifications
- Model I Version **$125.00** Per Module, **$495.00** Per System
- Model II Version **$225.00** Per Module, **$995.00** Per System

DATA MANAGEMENT SYSTEMS
- DMS replace index cards or any data requiring long lists of information.

- TBS In-Memory Information System (For Cassette Systems) **$39.95**
- TBS Disk Data Manager (Requires 1 or more disk drives)...Set up fast random access, files in minutes. Stores up to 320K of information on 4 Drives. Up to 10 fields and 255 characters per record. Supports upper and lower case. RS-232 or TRS-232...Features complete editing **$49.50**
- Personal Software CCA Data Management System...Completely user oriented, menu drive, 130 page Step By Step Manual...Capable of inventory control, sorting data, reporting data in nearly any form (for reports and mailing labels). Sorts data by up to 10 fields for zip code, balance due, geographic location or whatever. Prints reports with subtotals and totals automatically calculated. Fast random access **$75.00**

FROM RACET COMPUTES
- **REMODEL-PROLOAD** - Renumbers program lines, combines programs. The only renumber program that will renumber the middle of a program. Specify 16K, 32K or 48K. Works with Cassette or Disk **$34.95**
- **GSF** - Use in your Basic Programs for Instant Sorting (will sort 1000 items in 9 seconds). Other commands include Compress and Uncompress Data. Duplicate Memory, Display Screen Controls and Fast Graphic Controls **$24.95**
  (For Cassette or Disk, specify 16K, 32K or 48K)
- **DOSORT** - All G.S.F. commands plus special Multiple Disk Sorting Routines **$34.95**
  (Specify 32K or 48K)
- **INFINITE BASIC** - Adds 70 commands to your TRS-80™ including Instant Sort, Matrix Commands, String Commands, Left and Right Justification, String Centering, Simultaneous Equations, Upper and Lower Case Reverse and more. (For Cassette or Disk) **$49.95**
- **INFINITE BUSINESS** (Requires Infinite Basic) Eliminate Round-off error, 127-Digit Calculation Accuracy, Insert New Elements in Sorted Arrays, Automatic Page Headings, Footings and Pagination, Multiple Precision Arithmetic and more. (For Cassette or Disk) **$29.95**
- **COPSYS** - Copy Machine Language Programs (For Cassette Only) **$14.95**
- **DSM** (Disk Sort Merge) **$75.00**

FROM SMALL SYSTEM SOFTWARE
- **RSM-2** Machine Language Monitor **$26.95**
- **RSM-2D** Disk Version of RSM-2 **$29.95**
- **DCV-1** Converts Machine Language Programs from tape to disk **$9.95**
- **AIR RAID** - The ultimate TRS-80™ game converts your TRS-80™ into a real time shooting gallery **$14.95**
- **BARRICADE** - A fast pong style game **$14.95**
- **CPM** - (For Disk Only) **$150.00**
- **TRS-232 INTERFACE** - Interface with Software driver RS-232 printers to your TRS-80™ **$49.95**
- **TRS-232 FORMATTER** - Additional (optional) Software for TRS-232 owners. Adds many printer commands to your TRS-80™ **$14.95**
  (With purchase of TRS-232) **$9.95**
- **PENMOD** - Use the Electric Pencil with RS's lower case modification **$19.95**

FROM GALACTIC SOFTWARE
- **MAIL PAC** - For Model I Disk Systems only **$99.95**
  Quick-sorting full user control over mailing list from Galactic Software.
- **STOCK MARKET PAC** **$99.95**

FROM APPARAT NEW DOS + **$99.95**
35, 40 and 77 Track Versions available.
- **NEW DOS/80** (With variable record length files, chainings and many other features **$149.95**

FROM THE BOTTOM SHELF
- **CHECKBOOK II** (For Cassette or Disk) **$39.95**
- **SYSTEM DOCTOR** (A complete diagnosis of your TRS-80™. Checks memory, video, cassette, disk, ROM, and all other parts of your system)
  For Cassette or Disk **$28.50**
- **CHECKBOOK REGISTER ACCOUNTING SYSTEM** (Requires 2 disk drives) **$75.00**
- **LIBRARY 100** - 100 established business, game and educational programs plus **FREE** Tiny Pilot all for **$49.50**
- **BASIC TOOL KIT** - Lists all variables, GOTO's and GOSUB's in your program **$19.80**

- **SOUNDWARE** - Adds sound to your TRS-80™ Just plug it in **$29.95**
  Sample programs included
- **TING TONG** - Can be used with Soundware for a **Sound** version of pong **$9.95**

- **VIC - The Carta Visual Instructional Computer Program** **$19.95**
  The Level II 16K Cassette is designed to teach beginners the Basics of Machine Language and Assembly Language Programming. See every Machine Language Instruction Display on your video. VIC includes Step By Step 55 page manual.

VISTA V80 DISK DRIVE - 110K of Storage **$395.00**
Add $29.95 for Cable (Free with purchase of 2-Disk Drives). 10 day money back guarantee.

FROM HOWE SOFTWARE
- **MON-3** - Machine Language Programming for beginners. MON-3 is a complete System Monitor with Users Manual **$39.95**
- **MON-4** - Disk Version of MON-3 **$49.95**

FROM MICROSOFT
- **LEVEL III BASIC** **$49.95**
  Now Cassette owners can add Disk Commands to their TRS-80™ without owning a Disk Drive
- **MICROSOFT DISK ADVENTURE** **$29.95**
- **TRSDOS BASIC COMPILER** **$195.00**
  Run Basic Programs up to 15 times faster.

- **NEC BUSINESS QUALITY PRINTERS** (For MOD-I or MOD-II) **$2,995.00**

THE ELECTRIC PENCIL
Cassette **$99.95**
Disk **$150.00**
MOD-II Version **$325.00**

- **HORSE SELECTOR II** By Dr. Hal Davis
  The TRS-80™ version updated for the TRS-80™ and originally reviewed in Systems and Methods **$50.00**

(PAYROLL CAPABILITIES CONTINUED)

- ★ employees can be paid using any combination of pay types (except, hourly cannot receive salary & salary cannot receive hourly)
- ★ special non-taxable or taxable lump sums can be paid regularly or one time (bonus, reimbursements, etc)
- ★ health & welfare deductions can be automatically calculated for each employee
- ★ earnings-to-date are accumulated and added to permanent records; taxes are computed and deducted: US income tax, Social Security tax, state income tax, other deductions (regular or one time)
- ★ paychecks are printed; computer checks with your company letterhead can be purchased from SBSG
- ★ calculations are accumulated for; employee pay history, 941A report, W-2 report, insurance report, absentee report
- ★ fully linked to General Ledger. Each employee's payroll information can be distributed to as many as (12) twelve different GL accounts; system automatically posts to cash account.

INVENTORY/CONTROL INVOICING

- OVER 1000 ITEMS ON MODEL I
- OVER 3000 ITEMS ON MODEL II
- LOW STOCK ALARM
- INVOICING DEDUCTS FROM INVENTORY
- COMPLETE INVENTORY REPORTS
- REORDER POINT REPORT
- QUICK ITEM ACCESS

CLIENT BILLING, STOCK CONTROL, DENTAL BILLING, COMMODITIES
Medicare/Medicaid billing also available

MODEL I **$125 Per Module**
$495 Complete System

MODEL II **$225 Per Module**
$995 Complete System

WE ARE THE ONLY SOFTWARE COMPANY THAT OFFERS A REFUND WITHIN 30 DAYS ON ALL SOFTWARE (H & E COMPUTRONICS MONTHLY NEWSMAGAZINE SUBSCRIBERS ONLY).. WE DO CHARGE A $3 PENALTY TO COVER POSTAGE AND HANDLING.

GENERAL LEDGER

The General Ledger accounting system consolidates financial data from other accounting subsystems (A/R, A/P, Payroll, direct posting) in an accurate and timely manner. Major reports include the Income Statement and Balance Sheet and a "special" report designed by management. The beauty of this General Ledger system is that it is completely user formatted. You "customize" the account numbers, descriptions, and report formats to suit your particular business requirements. These programs were developed 5 years ago for the Wang micro-computer and have been tested in many environments since then. The package has been converted to the TRS-80™ and is now a well documented, on-line, interactive micro-computer system with the capabilities of (or exceeding) many larger systems.

CAPABILITIES

- ★ more than 200 chart of accounts can be handled
- ★ account number structure is user defined and controlled
- ★ more than 1,750 transactions may be entered via:
  - direct posting; done by hand; validated against the account file before acceptance
  - external posting; generated by A/R, A/P, Payroll or any other user source
- ★ data is maintained and reported by:
  - month
  - quarter
  - year
  - previous three quarters
- ★ reports (samples on back) include:
  - trial balances
  - income statement
  - balance sheet
  - special accounts reports and more . . . .
- ★ user formats reports with the following designed as you wish:
  - titles
  - headings
  - account numbers
  - descriptions
  - subtotals
  - totals
  - skip lines
  - skip pages
- ★ up to eight levels of totals - fully user designated
- ★ menu driven; easy to use; full screen prompting and cursor control

Not just another game—this one has real personality.

Slot Machine

Stewart E. Fason
115 Via La Silva
Palm Beach, FL 33480

People seem to have the erroneous idea that we computers are dumb machines. I deny the allegation (I also resent the alligators). It is the programmers who are dumb. Oh sure, these pawky proponents of perspicacity do just fine with GOTO's, FORNEXT loops, integers and cosines; but they seldom realize that we would like to establish some rapport with our operators.

For almost two years, I slaved away doing fancy arithmetic, keeping records, sorting, adding and deleting *ad nauseum*. From time to time, I'd get to play Startreck (oh wow). My boss wouldn't even buy me a dust cover. The bum smoked and you know what ashes do to my kkeybboardd. Suffice it to say that life had been a real drag.

Hit of the Party

Everything changed when my boss decided to throw a party for about 100 people. I suggested that he allow me to do a little showing off; something to make it easier for the guests and myself to get acquainted. After much arguing, he acquiesced, and, during a rare moment of creativity rewrote an old slot machine program.

I was the hit of the party; people stood in line to get at me. Why? Because the program now had personality. Let's take a look at the program and I'll point out features that you can add to your programs to give your computer some personality.

In line 10 multiple statements save memory. The DEFSTR function in line 20 defines s,x,y,z, and v as variables, which saves time and memory. Instead of having to type S$, you need only type S. I already know that S is a string variable.

Lines 40-60 set the symbols on each wheel. As written, I pay a jackpot on the average of once every 200 plays. This is easily changed. See lines 90 and 100 for keys to data numbers.

The magic begins at line 200. The player gives me his name (v$). At 700 you'll find the power of IF-THEN-ELSE. If the player has less than $10 left, I keep quiet. However, if he has more than $10 and has lost $5-10 in a row, I get out the needle. At 710 I recognize when the player goes broke, and comment.

If he is down to his last dollar, I let him know that I know, at 720. When the player is down to two bucks, I am at line 730. I branch to the subroutine at 920 where a random number generator decides which remark I will make.

Don't overlook the power of randomly generated remarks. They do away with predictibility.

At line 790 the ubiquitous random number generator strikes again. Notice that if the player has increased his original $7 to over $25 I get mad and branch to 980 where I really have some fun.

When a player hits the jackpot at line 890 I get to show off in a dramatic way. Notice the OUT255,4. That turns on my cassette recorder. My boss had previously recorded a John Phillips Sousa march which, when a jackpot was hit, played loudly for about 10 seconds.

The OUT255,0 turns off my cassette. The GOTO 740 allows the player to continue. At the party, the GOTO 740 was changed to:

```
PRINT"I've had enough of you . . . you lucky
  rat.":PRINT"Next player please.":FOR
  I=1to 1500:NEXT:GOTO10
```

This reinitiates the program.

Tacky Remarks

The same night one of my colleagues was set up with an astrology/advice program. In addition to the frequent use of randomly generated tacky remarks, it had one item that really blew people's minds. Someone would walk up and see displayed the following: "Hello there. I am Dr. Himmelstein, the world renowned Psychiatrist/Astrologer. I can cast your horoscope and help you with problems. Type in your name and we can begin the session." Who could resist such an invitation.

A guy would type in JOHN JONES and my colleague would say, "Are you the John Jones from Virginia?" Jones is now thinking, "How the hell did this computer know that?". The computer knew because our boss had placed data in the program about John Jones. The subroutine that programs something unique about each guest looks like this:

```
100 INPUT"tell me your name.";A$
110 IF A$="JOHN JONES" THEN PRINT
"AH YES, ONE OF THE JONES BOYS
FROM PHILADELPHIA.":GOTO200
120 IF A$="JOE SMITH" THEN PRINT
"HOW'S YOUR HAIR TRANSPLANT DO-
ING?:GOTO 200
```

The above can accommodate many guests (depending on your memory). In case someone shows up who is not on file, you could make your last statement of the routine look like this:

```
150 PRINT"YOUR RECORDS HAVE BEEN
  TURNED OVER TO THE CIA ";A$;" AND I
  CAN'T COMMENT.": GOTO200
```

This way you have all bases covered.

Well friends, that is the story of how I got personality. Give some to your computer and it will thank you. I've gotta scram now because I see the boss coming with the . . . . oh no . . . the Electric Pencil. Rats! I was hoping for some more fun and games. ■

And now. . . a brief word from our computer.

On the Radio

Don Hastings
Box 366
Hemingway SC 29554

A broadcast log is a listing of everything that will be broadcast in a day. It must meet strict FCC requirements and must be prepared with great care. It controls every event that must be aired, much as a computer program controls every action of a computer. Without the broadcast log, the broadcast engineer or announcer does not know what occurs next.

A Broadcast Log Program

The program we at WKYB have developed for our 32K Level II TRS-80 schedules all our programs, news, public-service and commercial announcements. It will do so within the time limits we specify and at the specific spaces within our log we have set aside for each. Our next step is to couple the computer to a printer to actually print the log, but our program as it stands has cut log preparation time in half and produced a log far more consistent with what we want than any individual could do.

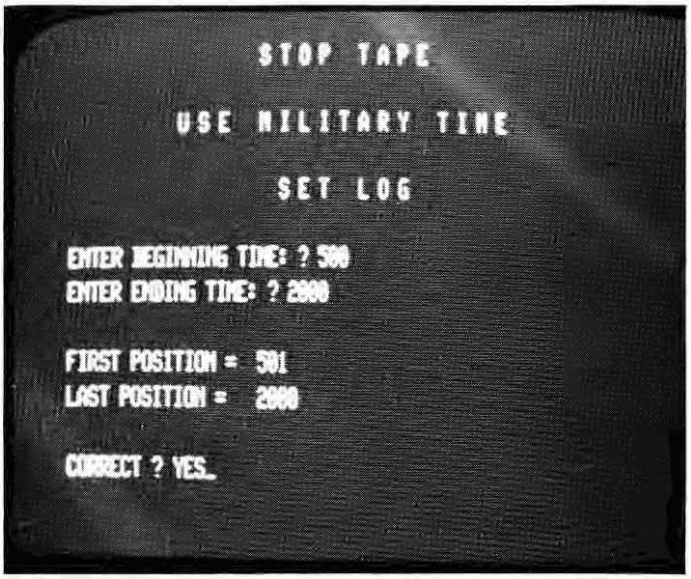

Photo 1. Setting sign-on and sign-off times. Note use of military time and conversion of time to log positions.

It takes our logger about 30 minutes to prepare the worksheet for entering, about 15 minutes for the computer to digest it all and less than ten to spit it all back out. It then takes another 15 minutes for the logger to copy the necessary information off the screen onto our log sheets. Presently the most time-consuming work is pretyping the log sheets with our programs and headings and then filling in the commercial information as it has been positioned by the computer. We'll eliminate this when we add the printer and disks.

Log preparation is tedious, yet extremely critical, in broadcasting; it can drive you batty, and often does. Now we can place all the seemingly impossible requirements for each account into the computer's memory, and each is given its due consideration.

I have modified our log program, which I wrote, into a general program that most radio stations can use with a minimum of modifications. I admit this is a cut-down version, but all you need is a TRS-80 Level II with 16K. The program has no hidden loops to mess you up, so it is just begging to be customized for your particular requirements after you've run it a couple of times. Since no two radio stations will prepare their logs in exactly the same way, I recommend you first see what I have done and then tear into it at your pleasure.

Please note that I have given you a detailed description of the main variables used in the program. The unused P in this program sets the priority of accounts. You may wish to add such a feature to your modification. We use two arrays: A for all accounts and carousel positions, and L for the actual log positions.

On the Radio

All of our commercials are played from four carousels, so our program is written for use with up to four carousels (for all you non-broadcasters, a carousel is simply a drum holding up to 24 separate commercial

tapes; any one can be selected and played automatically). When entering an account, you will assign it a carousel and slot within that carousel. This becomes the account number for that log—the computer remembers an account placed in carousel #1 and in slot 12 as account 112.

If you have less than four carousels, simply load your commercials into the carousels you have. As far as the computer is concerned, you've just decided not to use the remaining carousels. If you use more than four carousels, have fun modifying the program—it isn't hard, just time consuming. If you use Gocarts, Instacarts or any device with more than 24 slot positions per source, you are in real trouble. You will have to confine yourself to 24 slots until you rewrite the program with a dimensioned array for your sources. It will probably not run in 16K. We use dimensioned arrays for all our sources, but we also have 32K memory. I modified the program so it would fit in 16K.

The log array is dimensioned with the first number designating the hour and the second number the log position within that hour. L(10,15) is the 10AM hour and the 15th position within that hour. Note, it is not 10:15! L(14,20) is the 20th position in the 2PM hour. Your logger must learn using military time if you want to use this program.

Our log hour is divided into three commercial clusters every 15 minutes, 12 per hour. A commercial cluster consists of one play of each of the four carousels. We can schedule 48 separate events in any one hour. It is improbable we'll have to do this, but the computer now has the flexibility to place an event precisely where it is needed from any one of the four carousels. If you use less than four carousels, your cluster will run as you have loaded the machines. The computer cannot shift your loads.

Before the computer starts logging your commercials, you may have some preference as to which clusters you want to use first in each hour. Line 300 is the place for this. Enter as a DATA statement the first log position of each cluster in the order you wish the clusters used. If you want the first cluster in each hour used first, enter your first data position as 1.

Please note that regardless of how many carousels you use, this program is written for four—thus the first log position of the second cluster will be position 5, the first log position of the third cluster will be 9, etc. Once you learn this, the rest is a piece of cake. The chart should help you visualize cluster positions. I have shown the clusters spread evenly around the hour. The computer doesn't care how your clusters are actually spread. Always remember that the computer considers a cluster as four events, regardless of how many you utilize, and it should present no problem.

Set Q in line 310 to how many commercial minutes you allow per hour. Set I of line 310 to the maximum commercial time you allow in any one cluster. Set B to how many commercial clusters you allow in any one hour. I hope you got the implication of that last figure. When you enter your data statement in line 300, simply skip any clusters you don't want to use. Then set B to equal the total number of entries in your data statement.

The program still has 12 clusters, but you have placed the ones you do not want to use "off limits," so it can't place anything in those areas. If you run only six commercial breaks per hour, you will enter the first position of the six you wish to use in line 300. Set B = 6 in line 310 and your program schedules commercials only in those clusters you specified from the carousels you loaded. It does not exceed the commercial minutes you selected. You are in control.

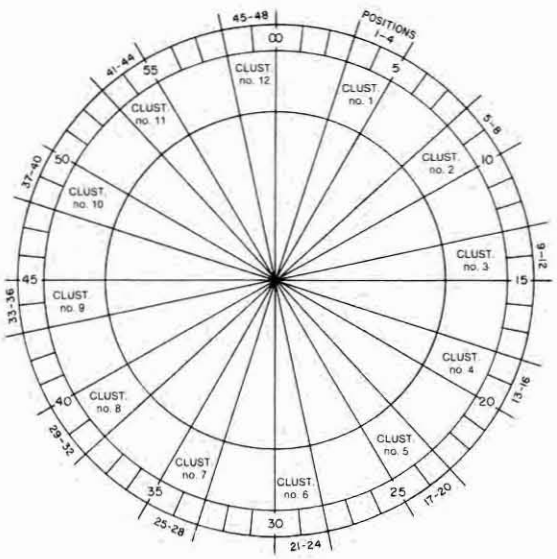

Chart of cluster positions.

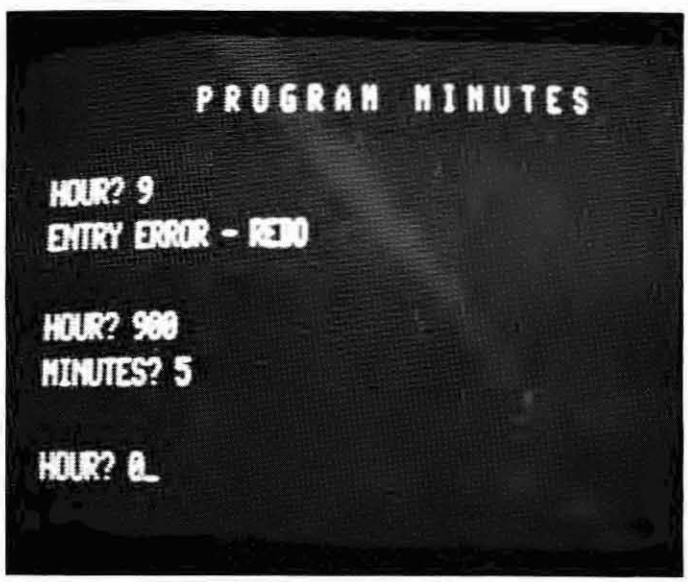

Photo 2. Entering program minutes not logged through computer. Note incorrect entry for 9 AM with prompt by computer. Example is declaring five commercial minutes during 9 AM.

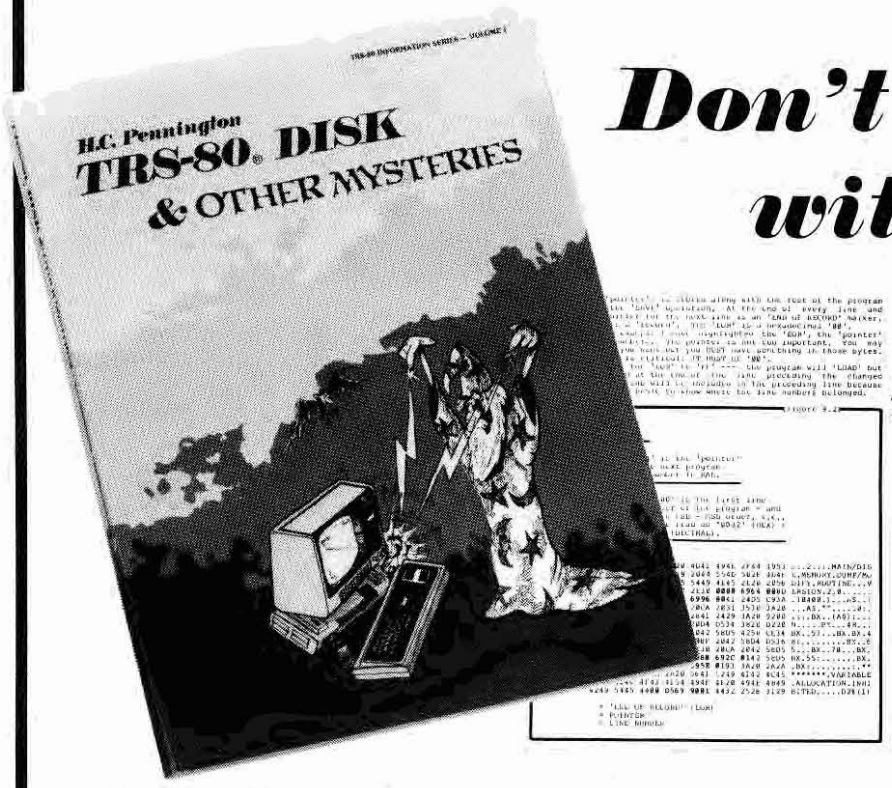
Photo 3. Example of protected position where a special feature prevents these log positions from being used. Protected positions here are the second and third log positions of the noon hour.



Don't boot-up without it!

The 'How To' book of TRS-80® data recovery

- 130 page, 8½ x 11 softcover
- Actual memory maps, samples
- Detailed recovery instructions
- Recover lost programs, DOS errors
- Fix parity, gat and hit errors
- Recover from unreadable directory
- Fix Electric Pencil file errors
- Recover lost or killed files

TRS-80 IS A REGISTERED TRADEMARK OF TANDY CORP.

JUST $22.50

Get it and unveil the many disk mysteries

Disk-drive extender cables

from IJG

Full 9 inches

28 gage, 34 conductor standard computer grade, flat ribbon cable

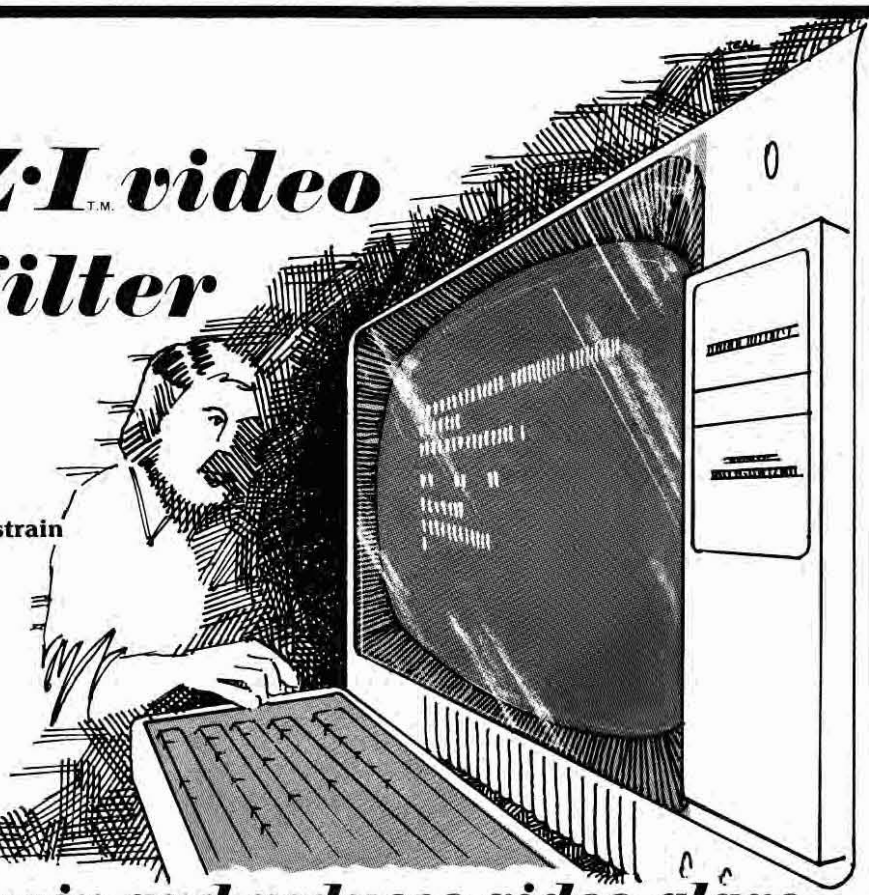
Completely assembled & thoroughly tested

Get yours today . . . $16.95 ea.

Fits all mini-disk drives

New E·Z·I™ video screen filter

For TRS-80® I&II from IJG



- Eliminates fatigue due to eye strain
- Two colors: Green or Amber
- Increases visual legibility
- Minimizes operator errors
- No tools needed to install
- Does not effect warranty
- ⅛ inch cast acrylic

- Priced at just $14.50

Limits eye strain and reduces video glare

Running the Program

After you enter the program, make a copy of it immediately before you modify it. This can save you many pains later. Also, run it a couple of times before modifying it since strange things can happen to a modified program that hasn't been completely debugged from keyboard errors.

The first thing up on the screen is a request for your sign-on and sign-off times (military

Log program.

PROGRAM STORE (202) 337-4691

4200 Wisconsin Ave. NW P.O. Box 9609 Washington D.C. 20016

All programs for TRS-80 16k, Level II computer.

SYSTEM SAVERS

by Tom Stibolt from Acorn

If you ever use the SYSTEM command, you should buy this two program package. These programs allow you to save any system format tape on tape or disk, plus offer several features for machine language programmers. Many two part, protected system tapes like Sargon II are not system format.

With FLEXL, which is one of the two programs, you can make back-up copies of any system format tape. Most often a cassette that you make will load easier than an original. Plus you can find the filename on any system tape because it is displayed on the screen. And at any time you can stop the reading of the tape by pressing <BREAK>.

For any machine language programmer, FLEXL offers the advantage of producing more efficient tapes than the assembler. Also, it is written to interface directly with monitor programs. And you can merge machine language tapes into one file.

Disk drive owners can use TDISK to save any system format tape onto disk. Adventure, Airaid, Ting-Tong, Editor Assembler and other programs cannot normally be loaded to disk using TRSDOS. Now, TDISK allows you to save these programs onto disk. After DOS READY you will be able to simply type the filename and be up and running. It even loads non-contiguous tapes. TDISK will greatly increase the benefit of owning a disk drive.

And as a FREE BONUS, Acorn provides instructions on how to load MicroChess 1.5 onto disk.

Complete your system with the routines not found in either Level II or DOS for only $14.95. Order your System Savers, today!

*TRS-80 is a trademark of Tandy Corp.

FLIGHT SIMULATION

from Sub-Logic

The wait is over. 3D graphics would seem impossible given the resolution of the TRS-80. But wait till you see this package. Even if you don't order it, try to see this one.

First you must learn to fly using instruments, radar and the cockpit window view. While it is easy to take off, it is even easier to crash.

Once you have some air time, bomb the enemy fuel depot. They'll send five war planes after you. Each one maneuvers differently in dogfights. Good luck.

Level I and II $25.00

DEATH DREADNAUGT

from Programmer's Guild

This machine language adventure is twisted! Around every turn death awaits. Be careful of what you touch. Disgusting room descriptions. For those who would like a ghoulish adventure. $14.95.

Also available from the Programmer's Guild are two adventures written in BASIC: Spider Mountain and Lost Dutchman's Gold. $14.95 each.

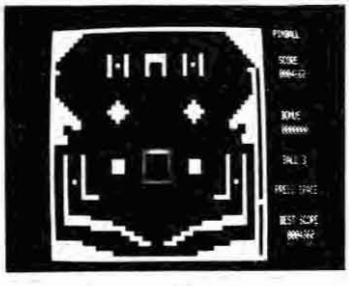
All three on disk for $35.00

RESCUE at RIGEL

from Automated Simulations

In this first Starquest you must save the prisoners of the evil High Tollah. There are both a different style of play and features than Dunjonquest, but similar floor graphics.

	Tape	Disk
Rescue at Rigel	$14.95	$19.95
Temple of Apshai	24.95	29.95
Datestones of Ryn	14.95	19.95
Morloc's Tower	14.95	19.95

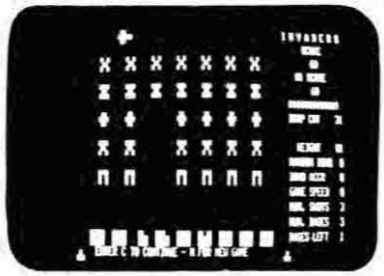


PINBALL

by John Allen from Acorn

Get your flipper fingers ready for action in this real-time, machine language game. Lots of sound and flashing graphics. There are five speeds so anyone can play. This version features the dreaded "Bermuda Square"!

Protected tape $14.95
Protected disk $20.95



INVADERS FROM SPACE

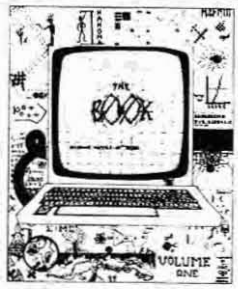
by Carl Miller from Acorn

"Maybe it's too fast!" Perferred by all the local arcade addicts, this machine language game has great sound. Alien Invasion, Invaders, and Invaders Plus just can't compete. You can adjust six parameters including the speed, if you think it's too fast. Only a few heros will be able to save earth.

Protected tape $14.95
Protected disk $20.95

THE BØØK

ACCESSING THE TRS-80* ROM



from Insiders Software Consultants

For the learner or expert! This first of three volumes gives you access to over firy arithmetic, mathematical, and data conversion routines. Includes

from Insiders Software Consultants

For the beginner or expert! This first of three volumes gives you access to over fifty arithmetic, mathematical, and data conversion routines. Includes sample programs, a disassembler program, and a commented listing of these ROM routines.

A memory map noting over 500 addresses is included. 136 pages. $14.95

INSIDE LEVEL II

by John Blattner, PhD from Mumford

Much to our surprise, this book and THE BØØK are complimentary. The style is easy but packed with information, though there is no commented listing of the ROM. For both Disk and Level II, complete entry and exit information is included for conversion, arithmetic, mathematical, keyboard, cassette and video routines. Part two describes how to link assembly language with BASIC. 60 pages. $15.95

DISASSEMBLER

by Roy Soltoff from Misosys & Acorn

This two pass, machine language, Z-80 disassembler produces symbolic labels with output to either the video monitor, printer or tape. Radio Shack's Editor Assembler can load the tapes. If you own the Editor/Assembler, complete the package with this program. Program on tape for two different memory locations. Cassette version NOW only $14.95

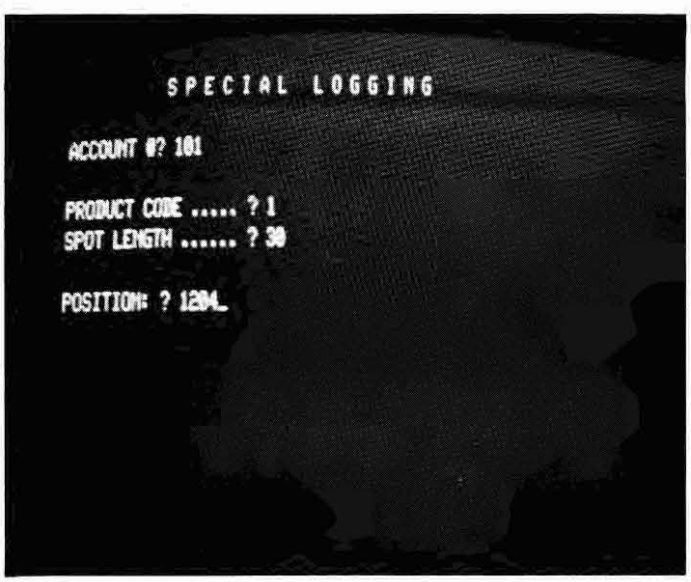

Photo 4. Special logging of an account that must be logged manually at a specific log position. In this case account 101 will be logged at position 1204.

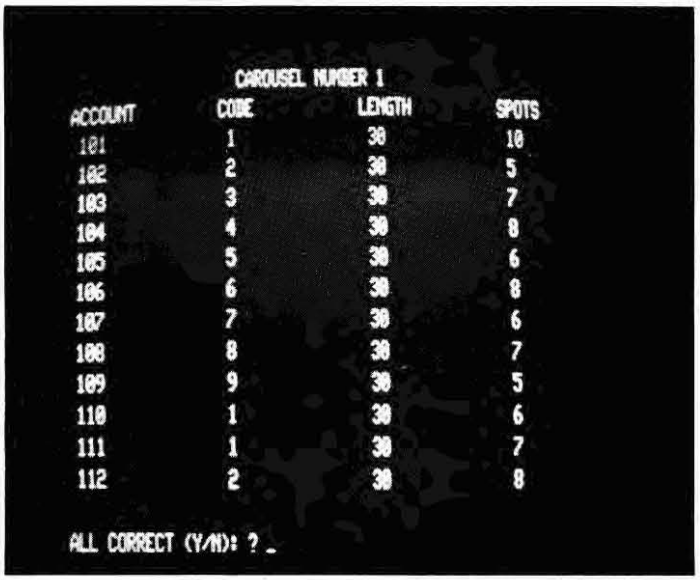

Photo 5. All account entries displayed before final logging for any corrections to the general account entries. It's too late to correct the specified time accounts as they are already logged.

time, remember). The computer immediately converts these to log positions. The computer will still have 48 positions per hour whether you are using all of them or not. As with most entries in this program, the computer will feed it back to you and give you the opportunity to reconsider.

Next comes a request for program minutes. If you have any commercial time within an hour that you won't log through the computer, you enter it so the computer will keep an accurate record of your total commercial time each hour. Simply enter the hour, then the minutes within that hour. When you're finished, enter a zero for the hour and the program will move on to the next segment. If you seldom approach the maximum commercial time you accept, you may wish to eliminate this section.

To help you in program modification, I have spaced the printout between sections of the program and placed a heading on each.

The next section allows you to protect one or more specific log positions from being used by the computer. To protect the noon hour, fifth position, from any entry by the computer, enter 1205. You may protect as many positions as you wish; enter a zero when you're done. If you have little need for this section, eliminate it. Conversely, you may wish to expand this section so that instead of protecting an individual log position it sets aside the entire cluster. To do this you might enter the first position of the cluster to be protected and change line 740 to that in Example 1.

```
740 L(X,Y) = 100:L(X,Y + 1) = 100:L(X,-
Y + 2) = 100:L(X,Y + 3 = 100:GOTO710
```

Example 1.

Beginning with the next section, enter your first account numbers. These always constitute a three-digit number with the first digit indicating the carousel (1-4) and the next two digits the slot within that carousel (01-24). A commercial loaded in carousel #2, slot 4, is entered as account 204.

You also have to supply pertinent data, such as the product code, commercial length and number of commercials, about each account. You must know which commercials have specific logging requirements such as time and product protection. This program gives product protection only within the cluster in which the account is logged.

If you wish to increase product protection beyond one cluster, you must modify lines 9620, 9630 and 9650 of the log-

UTILITY PACK

CPU: Compress Program Utility. Removes all unnecessaryspaces and remarks from a Basic program, and will compress lines if specified. Complete regard for unclosed strings and unusual commands. Fast Z-80 speed!Level II or DOS. **$19.95/$21.95**

SEARCH: Lists any Basic program lines containing any occurance you select. Break at any time to make changes, or continue. Option allows for LPRINTed listing. Written in Z-80! Level II or DOS. **$19.95/$21.95**

SPECIAL DOS OFFER: All of these utilities, on one diskette, can be purchased for just **$49.95!** THAT'S HALF PRICE!

BTRACE: Makes the TRON command easier to utilize by placing the current line being executed in one convenient location. Preserves your screen display. Level II or DOS. Written in Z-80. **$19.95/$21.95**

CHANGES: Generates a screen or printed listing of differences between versions of programs you are developing. DOS only. **$14.95/$16.95**

REPLACE: Allows you to search and replace occurances in your Basic programs (saved in ASCII format). DOS ONLY. **$14.95/$16.95**

SPECIAL LEVEL II OFFER: CPU, SEARCH, and BTRACE, together on one cassette, can be purchased for just **$29.95** THAT'S HALF PRICE!

NEWEST PRODUCTS!

Microsoft's Basic Compiler	**$175.00**
Apparat's NEWDOS-80	**149.00**

BEST SELLING GAMES

MENTAL LAPSE — by Brandon Rigney III. A graphic lovers delight, with action to tax your abilities to the limit! **$12.95/$15.95**

JUNGLE — by Brandon Rigney III. Getting back to camp may not be as easy as you think! Six different levels of complexity make this a game for the entire family. **$9.95/$12.95**

CURTAINS — by Brandon Rigney III. A concentration game with several unique twists; great graphics, too! **$9.95/$12.95**

GOMOKU — by Peter Lewis. Can you beat the computer at this one? Similar to tic-tac-toe, only you need five in a row to win. The rules are simple, but there is a strategy! **$9.95/$12.95**

OTHELLO — by Jack Decker. An excellent implementation of the popular board game. One or two players, different skill levels. Option for keeping score thru the game. **$9.95/$12.95**

CRIBBAGE — by Richard Vossel. Plays by Hoyle. Fast response times. Guaranteed debugged. Excellent for learning (use the HELP function), or for the expert. Satisfaction guaranteed! **$16.95/$19.95** (versions are different)

Specify Level II or DOS.

THE ALTERNATE SOURCE ✓138

The magazine of advanced applications and software for the TRS-80

Know what the three T's of computing are? Tips, Tutorials, and Techniques. That's what ***The Alternate Source News*** *is all about. Teaching you to become a better programmer, both in Basic and Assembly Language. Published bi-monthly, six issues are just* ***$9.00.***

TRS-80 is a trademark of the Radio Shack Division of Tandy Corporation.

QUILL DRIVER & DVR

Quill Driver is an extremely versatile text for matter which includes several valuable 'extras'. QD will interface with alternate input files to allow user creation of form letters, yet with a personal touch. QD features over 30 commands to handle even the most difficult problem formats. QD has embedded machine language routines to provide speedy output. QD will allow output to be directed to screen, printer or disk files. QD text files may be Basic remark statements,EDTASM files, or EDIT80 files. Certain Pencil and Scripsit files are even compatible! Quill Driver comes with a driver (DVR) to allow lower-case/shifted-upper-case input, and features a simulated shift-lock! DVR allows lower case input even without a lower case mod, although it isn't visible on screen and also features a 'route-to-the-printer' control key function. The Quill Driver manual is extensive and very well written. Sample files are included. **$39.95** complete.

DVR is available separately, with a relocating module to allow users to dump the program in a specified memory location, for **$9.95** on cassette or **$12.95** on diskette. LEVEL II and DOS versions on the same cassette.

ABSOLUTELY FREE!

For every single item over $15.00 that you order, select one of the **FREE** programs below! (Available separately for $5.95 each.)

SYSLOAD: A patch to DOS to allow /CMD file execution via the Basic SYSTEM command. By Jesse Bob Overholt.

RAMTEST: Level II or DOS. In Z-80 using reliable techniques. By Allan Moluf.

SUPERKEY: A graphics typewriter like you've never seen before! By Brandon Rigney III.

BILLBOARD: Generate posters for social occasions and friends. By Brandon Rigney III.

WORKING: Never have you seen a program work so hard and get so little done! By Bill Brown.

KILLER: A DOS utility that allows you to KILL more than one file at a time! By Allan Moluf.

PEN RAM : A utility which allows RAM manipulation never before possible! By Roxton Baker.

FILEFIX: Direct statement in file? Fix it the easy way, with this short program! By Ken Edwards.

PERSONAL PAYABLES: A DOS personal finance management system, using random files. By Charles Butler.

CONVERT: Basic programs to Pencil files and back. Basic remark statements to either Pencil or EDTASM format and back. And more. By Bruce Hansen.

Also applies to other vendors products! See below.

VERSATILE UTILITIES

OS/80 PATCH: Just released! A limitation of OS/80 (formerly known as Microdos) has been its lack of ability to handle machine language programs. With this utility, you can now save, load, copy, read as data and otherwise manipulate such programs. OS/80 is **$29.95.** OS/80 PATCH is **$14.95.**

COPYDISK: Allows you to copy one or several disk files at one time from DOS. Drive 0 does not have to contain a system diskette once program is loaded. Ideal for single drive owners, great for dual drive owners! **$11.95/$15.95.**

SPOOL80: Spool your output to disk, then use the PRINT command in DOS for maximum printer efficiency! Includes source code. **$16.95** on diskette only.

DISKLIB: Allows you to automatically read diskette directories and store all entries in a master file. Will sort, edit or LPRINT in the format you desire. **$9.95/$12.95**

AND LAST BUT NOT LEAST . . .

The Alternate Source distributes products from over 30 different vendors. Call or write for products that you desire.

- Automated Simulations
- Racet Computes
- MISOSYS
- Fuller Software
- Richcraft Engineering
- Webb Products
- ABS Suppliers
- Instant Software

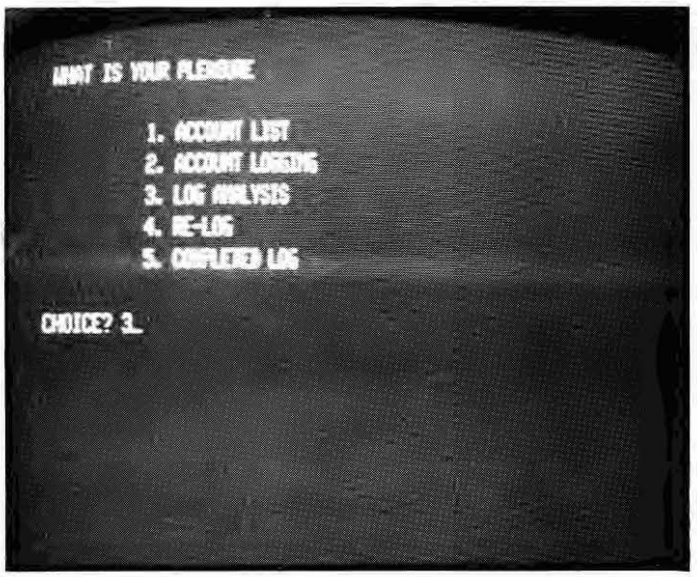

Photo 6. Logging completed, you can now choose the displays as you need them.

ging subroutine. This program thinks in terms of log position only, never time.

The product code identifies the product type being promoted to avoid conflicts within the same cluster. The product code is always numeric, never alphanumeric. Any number of product codes may be used; however, the more is not the merrier . . . it becomes confusing. Thirty numbers or less should provide sufficient categories for most stations; we use 14. Your experience in your own station should dictate how many are best for you.

All commercial length must be entered in seconds. If the same account is running more than one length commercial, you must load each as a separate account. Remember, the account number really only identifies a specific cartridge playing in a carousel. It is not good scheduling to have commercials of differing length on the same cartridge, even for the same client, since one miscue can throw the whole rotation off.

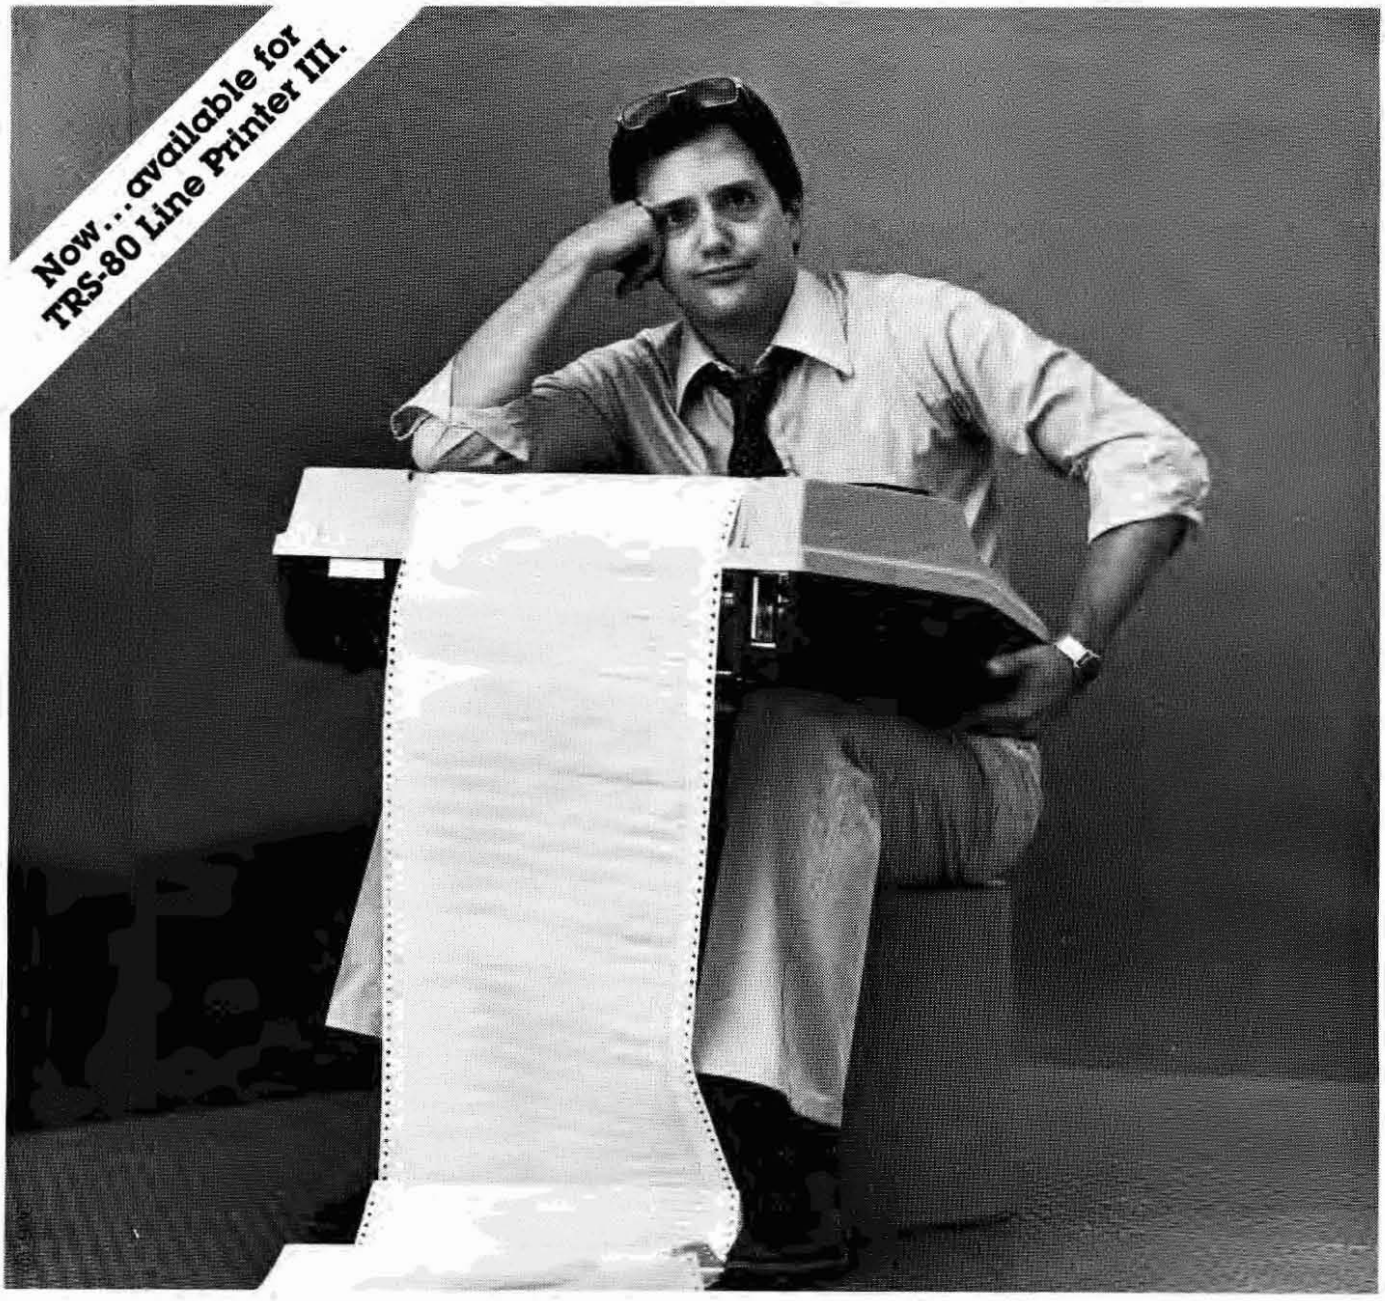
Generally, entering a zero exits you from most routines. If you attempt in this section to place on account in a space already filled, the computer asks permission before removing it. The program generally is built around double checks such as this to avoid simple entry errors that can wreck a log.

Computer Logging of Accounts

The "specified times" section is only for accounts that must be logged within specified time periods, as opposed to the previous section where the account had to be aired at a specific time. Any number of time periods can be required for any one account, but one time period for one account must be finished before you proceed to the next.

The computer will guide you step by step through this section by asking you the beginning and ending of one time period and the number of commercials for that client to be logged within that period. The time period will be converted to log positions, and the computer will still have 48 positions per hour, even if you "locked out" some or most of these positions.

When you have entered all accounts that must be logged within specific time periods, enter a zero for the next account number. If a particular time period becomes crowded, you can run out of log positions for individual carousels within that

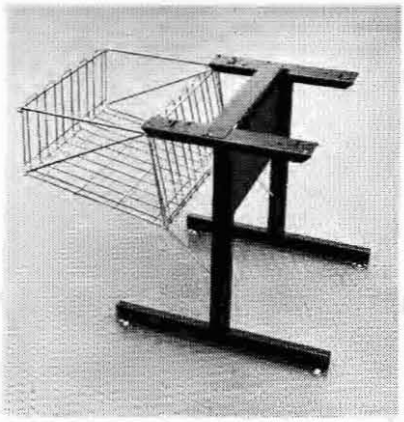


When you don't have a stand to sit on.

Trimm's universal printer stand can get you up and running for just $94.95. Our stand is as rugged as they come and as attractive as you want. It has a large chrome rear-mounted paper basket, plastic cushioned leveler feet and textured black baked enamel finish.

Take delivery within days of your order. Trimm ships immediately.

The Trimm stand comes packaged and ready for immediate assembly and mounting of your printer. Please specify your printer model when ordering.



$94.95 (or less, when you want more. Distributor inquiries invited.)

Trimm stand fits:

period. The computer informs you of the lack of available positions within that period with a query if other periods are available. If you can expand the time period for that account to include even one more cluster, answer "yes," and you will be given the opportunity to do so.

All remaining accounts will be entered under "general accounts." Everything entered in this section spreads throughout the broadcast day on a more-or-less even basis. The major difference in this routine and previous ones is that you were asked immediately if the entry was correct; now you conclude all entries before you get a chance for corrections. The reason for this is that in all routines prior to this the accounts were actually logged as you fed them into the computer. All remaining accounts are logged as a group.

When you have entered the last account, enter a zero. All the accounts are now displayed for you for individual correction. All accounts entered under the "specified" routines show a zero for number of spots. This means they are logged and don't need corrections.

To correct an entry, state "no"—the entries as they stand are not correct. Enter the account number of the incorrect entry, and you get an opportunity to reenter all the data. The display then begins again at that account. Once you verify that all entries are correct, the final logging process begins. It should conclude in a matter of minutes.

During the logging process you get "comfort" displays of what the computer is doing to assure that it *is* doing something.

This is important in initial runs or after modifications to see if some program error has caused you to "hang up." If entered correctly, the program cannot hang up during the logging process. During logging the display informs you which carousel is being logged and where each account is being placed. The computer does not require your attention during this process.

At the conclusion of the logging process you get a choice of five displays:

Account List
Account Logging
Log Analysis
Re-log
Completed Log

Account List merely displays each account number and any commercials that can't be logged. If any were not logged, you might be oversold for the commercial minutes you allowed, or had more of one product code than you had clusters.

Account Logging shows you where any account you select is

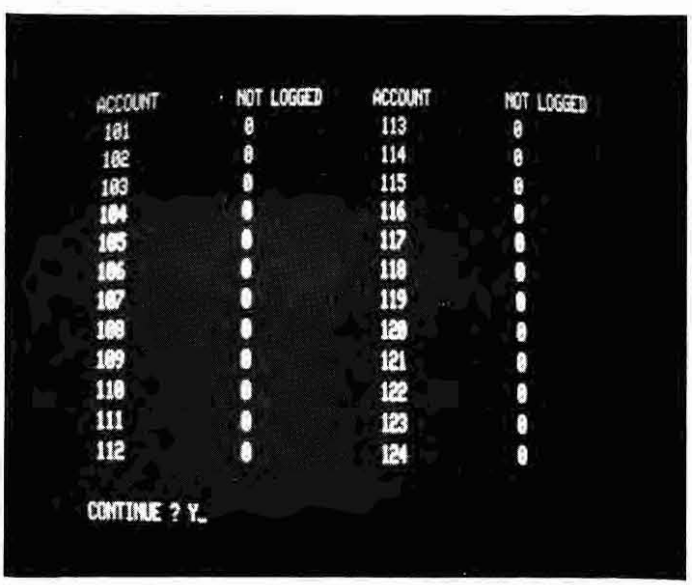

Photo 7. Account List display indicates that all accounts in this carousel are logged.

logged. This is good for spot-checking the spread of the general accounts or that a specified time account is logged within the time periods specified.

Log Analysis merely displays the total commercial minutes logged within each hour of the broadcast day. If you declared any minutes at the beginning of the program not logged through the computer, these would be included in this display.

The Re-log program is your opportunity to tell the computer you do not like the log positions selected for any given account and to do that account over again with new positions. You cannot specify the time periods of a re-logged account. If you tell the computer to re-log an account you logged within specified time periods, the computer will warn you and give you an opportunity to reconsider. If you continue, that account may be placed anywhere on the log where vacancies occur. You may re-log an account any number of times.

The final display, Completed Log, shows you one hour of the log at a time beginning with the hour you specify. If you specify an hour before sign-on or after sign-off, your request is ignored. The display moves in sequence through each hour as long as you tell it to continue until it reaches sign-off. If you wish to look only at a specific hour and return to the menu, you may.

Each log position (1-48) for the hour is shown with the account number logged at that position. Where no account is logged a zero is displayed. We tried the display with simply a blank space when no account was logged; but for some reason, our logger found it easier to copy with the zeros present.

Program Embellishments

Naturally there are error traps throughout the program to catch the most obvious entry errors. I don't claim perfection, just reasonable performance.

Remarks spaced throughout the program aid you in understanding points that are most likely candidates for modification of confusion. I added these remarks specifically for this article, they are not a part of our running program. You will have memory available for many more routines if you eliminate these remarks from your running program.

The account arrays for product codes, length and number of commercials are identified for you in lines 9410-9430.

For 24-hour stations, the computer must have a sign-on and and sign-off time. Enter 100 for sign-on, 2500 for sign-off.

If you have sign-on and sign-off times that never vary, you

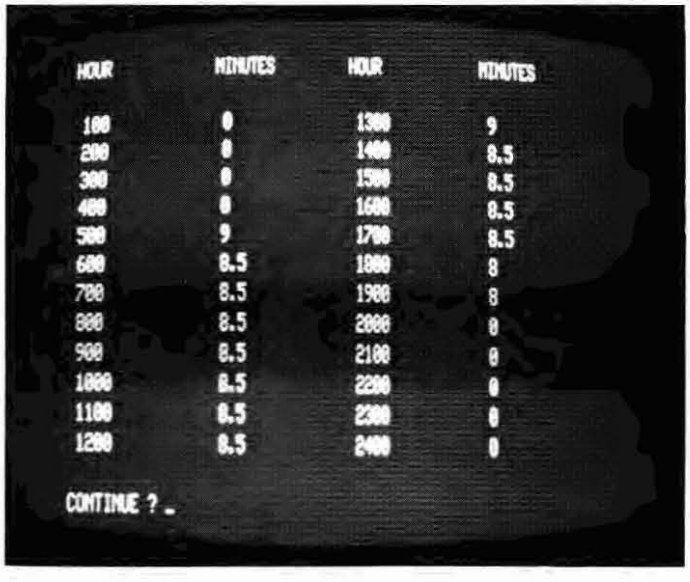

Photo 8. The commercial time logged in each hour of the broadcast day including any minutes declared at the beginning of the program.

↙Reader Service index—see page 194

may prefer to eliminate the first section altogether and just enter a line in the program that sets F (sign-on) to your first log position and G (sign-off) to your last log position. A good line is 170. I used this to establish a basic parameter to give the subroutine a place to start. You can then simply eliminate lines 200-220.

On the same order, if you have the same commercial minutes to declare during the same hours over a long period of time you can include some lines between 500 and 510 that automatically declare these commercial minutes without your having to enter them.

You can handle protected positions the same way in lines 700-760 if you have certain positions within an hour on every log. I suggest you place your line between 700 and 710. In each case, simply remember to use the L array and the first figure for the hour, the second figure for the log position within the hour. In keeping track of the commercial minutes for each hour, we use log position zero since it is a valid array but not a valid actual log position.

Similarly, in the "special logging" section you can add a fixed line for fixed events on every log. We use such a feature to automatically log all of our weather, headlines and newscasts. During periods of automation we also use it for scheduling our announce carts, jingles and station promos.

A further word about the sign-on/sign-off conversion to log position and within the specified time routine. These assume the clusters are spread evenly around the hour. If your clusters do not, you will be forced to rewrite the time-to-event subroutine in lines 9000-9070. Don't bother. Simply change the entire routine so that instead of entering the times you actually enter the log positions. The computer operator can simply have a time wheel in front of the operating position with the clusters clearly outlined as to their occurrence within each hour. This also provides more flexibility in changing your format, or if you use a variety of formats on differing hours.

As for the rest of the program, I am sure you will have little difficulty figuring out what I did, using your list of variables supplied at the beginning. ■

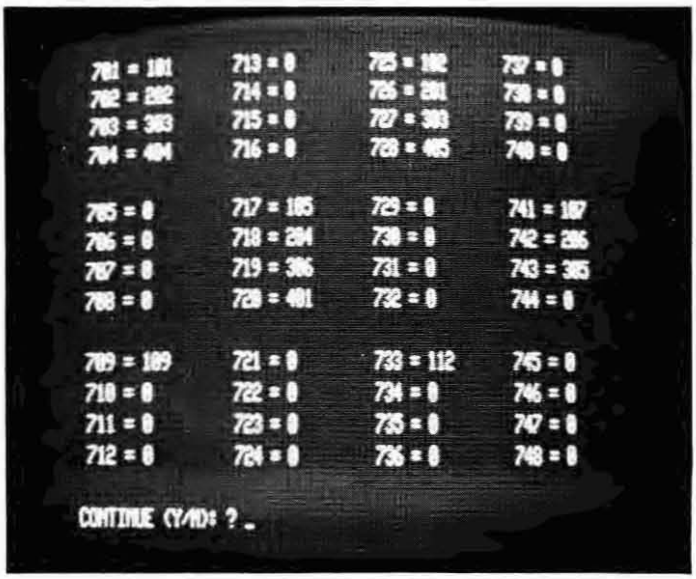

Photo 9. Sample log page. This is the 7 AM log. Note 12 clusters with four events in each, 48 events total. The events do not describe the broadcast time but represent only the commercial position within an hour. Commercial positions are determined by your programming.

PROGRAMMING TOOLS FOR YOUR TRS-80™

INSIDE LEVEL II

The Programmers Guide to The Level II ROMS

INSIDE LEVEL II is a comprehensive reference guide to the Level II ROMs which allows the machine language or Basic programmer to easily utilize the sophisticated routines they contain. Concisely explains set-ups, calling sequences, and variable passage for number conversion, arithmetic operations, and mathematical functions, as well as keyboard, tape, and video routines. Part II presents an entirely new composite program structure which loads under the SYSTEM command and executes in both Basic and machine code with the speed and efficiency of a compiler. In addition, the 18 chapters include a large body of other information useful to the programmer including tape formats, RAM useage, relocation of Basic programs, USR call expansion, creating SYSTEM tapes of your own programs, interfacing of Basic variables directly with machine code, a method of greatly increasing the speed at which data elements are stored on tape, and special precautions for disk systems. INSIDE LEVEL II is a clearly organized reference manual. It is fully typeset and packed with nothing but useful information. It does not contain questions and answers, ROM dumps, or cartoons. INSIDE LEVEL II.....$15.95

PROGRAM INDEX FOR DISK BASIC

Assemble an alphabetized index of your entire program library from disk directories. Program names and free space are read automatically (need not be typed in) and may be alphabetized with a fast Shell/Metzner sort by disk or program. The list may also be searched for any disk, program, or extension; disks or programs added or deleted; and the whole list or any part sent to the printer. Finally, the list itself may be stored on disk for future access and update. "The best thing since sliced bread" (January issue of '80 Microcomputing). One drive and 32K required. INDEX.....$19.95

SINGLE STEP THROUGH RAM OR ROM WITH STEP80

STEP80 allows you to step through any Basic or machine language program one instruction at a time, and see the address, hexadecimal value, Zilog mnemonic, register contents, and step count for each instruction. The top 14 lines of the video screen are left unaltered so that the "target program" may perform its display functions unobstructed. STEP80 will follow program flow right into the ROMs, and is an invaluable aid in learning how the ROM routines function. Commands include step (trace), disassemble, run in step mode at variable step rate, display or alter memory or CPU registers, jump to memory location, execute a CALL, set breakpoints in RAM or ROM, and relocate to any page in RAM. The display may also be routed to your line printer through the device control block so custom print drivers are automatically supported. STEP80.....$16.95

MACHINE LANGUAGE FAST FOURIER TRANSFORM

This complete package includes 3 versions of the machine language FFTASM routine assembled for 16, 32, and 48K machines, a short sample Basic program to access them, a 10K Basic program which includes sophisticated interactive graphing and data manipulation, and a manual of instructions and examples. The machine language subroutines use variables defined by a supporting Basic program to make data entry and retrieval extremely fast and easy for custom implementation. They perform 20 to 40 times faster than their Basic equivalent (256 points in 12.5 seconds), and require less than 1550 bytes of memory. FFTASM.....$49.95

4 SPEED OPTIONS FOR YOUR TRS-80!

The SK-2 is the most versatile clock modification available for the TRS-80. Speeds may be switched between normal, an increase of 50%, or a 50% reduction; selectable at any time without interrupting execution or crashing the program. Instructions are also given for a 100% increase to 3.54 MHz, though the TRS-80 is not reliable at this speed. The SK-2 may be configured by the user to change speed with a toggle switch or on software command. It will automatically return to normal speed any time a disk is active, requires no change to the operating system, and has provisions for adding an LED to indicate when the computer is not at normal speed. It mounts inside the keyboard unit with only 4 necessary connections for the switch option (switch not included), and is easily removed if the computer ever needs service. The SK-2 comes fully assembled with socketed IC's and illustrated instructions. SK-2.....$24.95

RAM SPOOLER FOR PARALLEL OR SERIAL PRINTERS

This program is a full feature print formatting package featuring user defineable line and page length (with line feeds inserted between words or after punctuation), screen dump, and printer pause control. The serial version allows baud rate selection from the keyboard. In addition, printing is done from a 4K expandable buffer area so that the LPRINT or LLIST command returns control to the user while printing is being done. Ideal for Selectric or other slow printers. Allows printing and processing to run concurrently. Please specify PARALLEL or SERIAL (RS-232 interface) version. SPOOLER.....$16.95

DUPLICATE SYSTEM TAPES WITH "CLONE"

Make duplicate copies of ANY tape written for Level II. They may be SYSTEM tapes (continuous or not) or data lists. The file name, load address, entry point, and every byte (in ASCII format) are displayed on the video screen. CLONE.....$16.95

RAM TEST FOR LEVEL II

This machine language program is a very thorough test for several types of RAM errors. A complete test of each individual bit in a 48K machine takes just 14 seconds. Includes a separate test for power line glitches. RAMTEST.....$9.95

FOR THE MODEL II

LYNC

from Midnight Software

High level data communications for Model IIs with CP/M. LYNC will send and receive any file with automatic error checking and retries. Either end may initiate transfers, and multiple files may be sent with wildcard filenames and direct or indirect listing. Remote or local directories may be called from within the program. Features full protocol, non-protocol file transfer, and real-time conversation modes. May be used over phone lines at 300 baud or direct to another computer at up to 9600 baud. Also available for other CP/M computers. LYNC....$95.00

MUMFORD MICRO SYSTEMS

ORDERING: Complete satisfaction is guaranteed or a full refund will be made. All programs are shipped on cassette unless $5 is included for a formatted (no system) disk. Include $1 postage and handling. California residents add 6% sales tax. Visa, Mastercharge and COD orders accepted.

Box 435-E Summerland, California 93067 (805) 969-4557

Reader Service index—see page 194

Use this program to keep track of your tapes.

Tape Librarian

Raymond J. Herold
8363 Shady Grove Drive
Manassas, VA 22110

Computer tape libraries are born in a black hole of chaos.

You start your collection simply, with perhaps a Radio Shack Blackjack/Backgammon tape. Then, you buy a few programs from ISI. Once you learn the ropes, you write some of your own. Other tapes come to you from friends and neighbors.

Before you know it, you've begged, borrowed, bought or stolen several dozen tapes—and they're laying around in disarray.

Some tapes probably don't have labels. Others probably have several programs back-to-back. Where's the data file you were working on last month? Sound familiar? You need help. You need a tape library management system.

Little Maintenance

Tape management systems range in complexity from the hand-entered log records of control clerks to sophisticated online cataloging modules. The one I describe here is specifically for the microcomputer owner. Fifteen minutes of file maintenance every several weeks will index all of your programs and data files.

The system stores up to 48 tape entries on a TRS-80 Level II with 16K and allows up to five file entries for each tape. You can index up to 240 programs and files.

The information stored for each tape consists of its number, its name and a description. Data stored for each file comprises its name, date created, type of file and tape counter position.

WE WILL NOT BE UNDERSOLD

16K MEMORY UPGRADE KITS — $54
for TRS-80*, Apple II, Sorcerer (specify)

PRINTERS

NEC Spinwriter
Letter Quality High Speed Printer
Includes TRS-80* interface software, quick change print fonts, 55 cps, bidirectional, high resolution plotting, graphing, proportional spacing — $2689
With Tractor Feed — $2889

DIABLO 1650 — R.O. $2890 — KSR $3285

779 CENTRONICS TRACTOR FEED PRINTER — $969
Same as Radio Shack line printer I

737 CENTRONICS FRICTION & PIN FEED PRINTER — $839
9 × 7 matrix

730 CENTRONICS FRICTION & PIN FEED PRINTER — $639
7 × 7 matrix Same as Radio Shack line printer II

P1 CENTRONICS PRINTER — $269
Same as Radio Shack quick printer

PAPER TIGER (IP440) — $939
Includes 2K buffer and graphics option

TI-810 Faster than Radio Shack line printer III
Parallel and serial w/TRS-80* interface software — $1575
with upper and lower case and paper tray — $1665

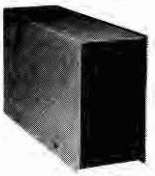
OKIDATA Microline 80 Friction and pin feed — $559
Tractor Feed, friction, and pin feed — $679

EATON LRC 7000 + 64 columns, plain paper — $349

ANADEX DP-9500 — $1389

CAT MODEM Originate and answer same as Radio Shack Telephone Interface II — $148

LEEDEX MONITOR Video 100 — $129



DISK DRIVES — $314
More capacity than Radio Shack 35 Track (80 K Bytes) drives. Fully assembled and tested. Ready to plug-in and run the moment you receive it. Can be intermixed with each other and Radio Shack drive on same cable. TRS-80* compatible silver enclosure.
90 DAY WARRANTY. ONE YEAR ON POWER SUPPLY.

FOR TRS-80*

CCI-100	5¼", 40 Track (102K Bytes) for Model I	$314
CCI-200	5¼", 77 Track (197K Bytes) for Model I	$549
CCI-800	8" Drive for Model II (½ Meg Bytes)	$795
For Zenith Z89		
CCI-189	5¼", 40 Track (102K Bytes) add-on drive	$394
Z-87	Dual 5¼" add-on drive system	$995

DISK OPERATING SYSTEMS

PATCHPAK #4 by Percom Data — $ 8.95
CP/M for Model I, Zenith $145 • for Model II, Altos — $169.00
NEWDOS Plus — with over 200 modifications 35track — $ 89.00
and corrections to TRS-DOS 40 or 70 Track — $ 99.00

SOFTWARE FOR THE TRS-80* (Software w/Manual / Manual Alone)

CCI-INVESTMENT PORTFOLIO MANAGER: This is what investors have been waiting for! This powerful program was developed by security analysts working with software designers. It comes on one cassette — 16K LEVEL II BASIC on one side, 32K DISK BASIC on the other. Store and report data; Review your portfolio; Produce detailed status, value, gain, and security analysis; Compare alternatives **$49.95/$10**

INTELLIGENT TERMINAL SYSTEM ST-80-III BY LANCE MIKLUS: Enables a TRS-80* to act as a dial-up terminal on any standard time sharing network. Provides a TRS-80* with control key, ESC Key, Repeat Key, Rub Out Key, Break Key, full upper and lower case support, selectable printer output and program selectable transmission rates **$139/$10**

CCA-DATA MANAGEMENT SYSTEM: Automate your information processing tasks. You can create a file of customer information; quickly and easily add, delete or update records; search a file; keep a file in order of the value in any field; and print records and labels in any desired sequence or from just a part of a file. Requires 32K TRS-80 and one drive. **$74.95/$10**

CSA-MAILIST SYSTEM: Creates, maintains and efficiently utilizes a name, address and telephone number file. 400 individual name/address entries can be maintained on a single density mini-floppy, and are manipulated directly by record number (direct access file method). Sorts can be performed, name + address combinations can be coded. Listing directories and labels can be printed. A conversion facility is provided to convert most sequential name, address file formats into direct. Requires 32K TRS-80 and one drive. **$49.95/$10**

S & M SYSTEMS
INSEQ-80™: Indexed Sequential Access Method (ISAM) for the TRS-80 Model I. A must for anyone writing business programs. Eliminate wasted disk space from direct record processing. Split second access to any record. Access data records instantly via alpha/numeric "key" eg. Part NR, zip code or sequentially in ascending key sequence. Add/modify records in any order. Access up to three files per program — Files may be spread over multiple disks. Machine language processing from your basic program. Utility program to convert direct files to INSEQ-80 format. **$49.95/$10**

FULLY INTERACTIVE ACCOUNTING PACKAGE: ISAM (INSEQ-80) based. Includes General Ledger, Accounts Payable, Accounts Receivable and Payroll. System runs "stand alone" or "co-ordinated G/L" at users option. Based on Osborne accounting method. Requires 32K, TRS-80, 2 or 3 drives. N/A CA.

General Ledger	**$99/$10**
Accounts Receivable	**$99/$10**
Accounts Payable	**$99/$10**
Payroll	**$99/$10**

Osborne books: Req'd as additional documentation $20 ea

INVENTORY Requires 32K, TRS-80, 1 drive. **$125/$10**
INSORT-80: Callable form BASIC via USR. Sorts "Random" Disk Files. "Disk" to "Disk" sort times — 350 records in 35 secs, 1000 records in 6 minutes, 3500 records in 12 minutes. Machine language processing. Up to 35 sort keys ascending/descending. Utility to build BASIC program. Runs under NEWDOS. **$49.95/$10**

ACCESSORIES
HEAD CLEANING DISKETTE: Cleans drive Read/Write head in 30 seconds. Diskette absorbs loose oxide particles, fingerprints, and other foreign particles that might hinder the performance of the drive head. Lasts at least 3 months with daily use. Specify 5¼" or 8". **$20 ea/$45 for 3**

FLOPPY SAVER: Protection for center holes of 5¼" floppy disks. Only 1 needed per diskette. Kit contains centering post, pressure tool, tough 7-mil mylar reinforcing rings. Installation tools and rings for 25 diskettes. **$11.95**
Re-orders of rings only: **$ 7.95**

CP/M BASED SOFTWARE for Zenith, Altos, Radio Shack, Apple (Software w/Manual / Manual Alone)

MICROSOFT
BASIC-80: Disk Extended BASIC ANSI compatible with long variable names, WHILE/WEND, chaining, variable length file records. **$325/$25**
BASIC COMPILER: Language compatible with BASIC-80 and 3-10 times faster execution. Produces standard Microsoft relocatable binary output. Includes MACRO-80 Also linkable to FORTRAN-80 or COBOL-80 code modules. **$350/$25**
FORTRAN-80: ANSI 66 (except for COMPLEX) plus many extensions. Includes relocatable object compiler, linking loader, library with manager. Also includes MACRO-80 (see below) **$425/$25**
COBAL-80: Level 1 ANSI '74 standard COBAL plus most of Level 2. Full sequential, relative and indexed file support with variable file names. STRING, UNSTRING, COMPUTE, VARYING/UNTIL, EXTEND, CALL, COPY, SEARCH, 3-dimensional arrays, compound and abbreviated conditions, nested IF. Powerful interactive screen-handling extensions. Includes compatible assembler, linking loader, and relocatable library manager as described under MACRO-80. **$700/$25**
Z-80 SOFTCARD FOR APPLE: Your key to future software expansion. Get the best of both worlds. Apple's 6502 and CP/M Z-80. Plug in the card and get a Z80. Supports Apple language card and all Apple peripherals. Comes with set of three manuals. **$339/$75**

CCI-TELNET VERSION 5: A communication Package which enables microcomputer users to communicate both with Large Mainframes and other microcomputers. Extensive commands make it useful in many applications where communication between computers is necessary. Powerful terminal mode enabling user to save all data from a session on disk. Completely CP/M compatible. Multiple communication protocols supported. Able to transfer files in both directions without protocol where the other machine does not support any protocol. Extensive ON-SCREEN help. Source code provided. **$149/$15**

MICROPRO-WORD-STAR: Menu driven visual word processing system for use with standard terminals. Text formatting performed on screen. Facilities for text paginate, page number, justify, center and underscore. User can print one document while simultaneously editing a second. Edit facilities include global search and replace. Read/Write to other text files, block move, etc. Requires CRT terminal with addressable cursor positioning. **$399/$40**

BDS 'C' COMPILER: Supports most features of language, including structures, arrays, pointers, recursive function evaluation, and overlays. Package contains: compiler, linker, library manager; sample source files include games, a terminal emulator with disk I/O plus the source for many standard library functions; BDS C User's Guide; Book - The C Programming Language by Dennis Ritchie and Brian Kernigham. Requires at least 24K of RAM **$125/$20**

CONFIGURABLE BUSINESS SYSTEM BY DMA: CBS is a data management system that allows true transaction processing. Custom accounting systems for payables, receivables, inventory control, order entry, and general ledger can be set up without using any programming languages. CBS can be used to define an application such as an inventory control system by specifying master files to describe the inventory, customer and vendor files. Transaction files can then be used to describe activities such as purchases and sales. An extremely easy-to-use data entry program is used to enter information about customers, vendors, inventory, sales and purchases. After data entry is complete, an update program can process the transactions against the various master files, updating account balances and inventory quantities. The system features a screen menu generator and a comprehensive report generator which can be used to produce invoices, purchase orders, re-order reports, mailing labels or other special reports specific to the application. Good documentation and a demonstration inventory system supplied. Requires at least 48K memory. Does not require any support language. **$295**

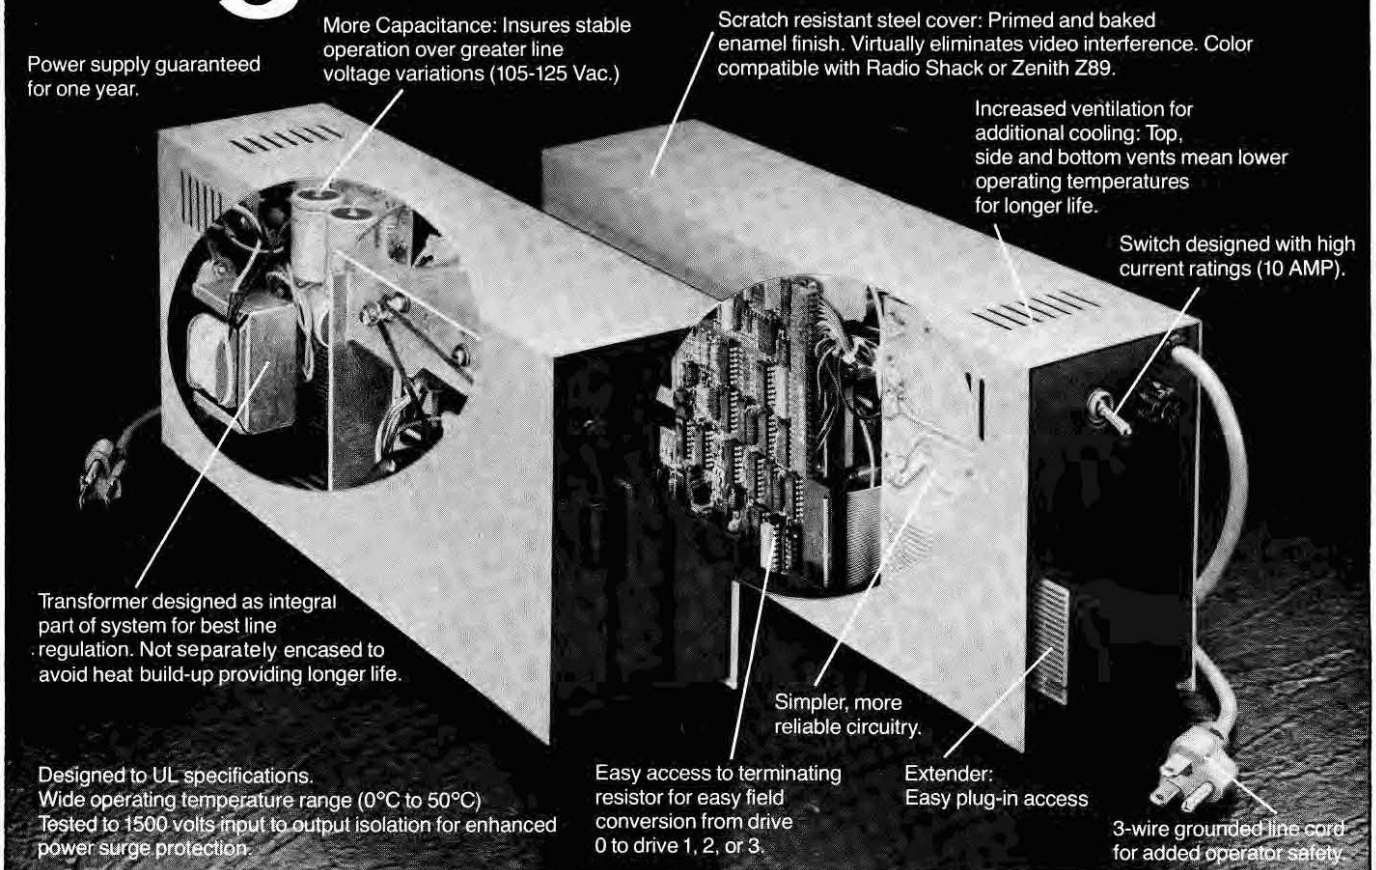
Precision Engineered Drives...



With the number of disk drives on the market increasing, more and more people are beginning to ask what's underneath that cover.

The CCI™ series of disk drives have been designed for long life and ease of operation. The features shown above are what set our CCI drives apart from the rest. With a CCI drive you get an integrated professional design!

If you're still not convinced that you get the most for your money with a CCI drive, just ask for our complete specifications sheet. Then, compare our disk drives to anyone else's.

5¼" DRIVES

CCI-100	40 Track (102K Bytes) for TRS-80* Model I	**$399.00**
CCI-189	40 Track (102K Bytes) for Zenith Z89	**$499.00**
CCI-200	77 Track (197K Bytes) for TRS-80* Model I	**$675.00**

8" DRIVES

CCI-800	77 Track (1/2 Meg Bytes) for TRS-80* Model II	**$895.00**

All CCI drives are also available for 220 Vac (50Hz) operation.

Operating Systems

NEWDOS Plus for 5¼", 40 and 77 Track Drives—with over 200 modifications and corrections to TRSDOS **$110.00**
CP/M for Model I, Zenith **$150.00**
CP/M for Model II, Altos **$199.00**

Software by S&M Systems

INSEQ-80™—Indexed Sequential Access Method (**ISAM**) for the TRS-80 Model I.

Four machine language programs that can be called from your BASIC program via USR functions to access records either sequentially or randomly. The INSEQ-80 programs maintain all indexes and chains for you. Includes reorganization utility to consolidate files. **$49.95**

Professional Business Software using INSEQ-80 for the TRS-80* Model I and Zenith Z89.

Accounts Payable, Accounts Receivable, General Ledger, Payroll — per package **$99.00**
Inventory — per package **$125.00**

For example, you may have a cassette on which you put Santa Paravia, Space Trek, Airmail Pilot and Golf. The tape name, therefore, is ISI Games. The description is Instant Software Games. You have one file entry each for Santa Paravia, Space Trek, Airmail Pilot and Golf, containing creation date, file type (BASIC) and tape counter positions.

When you begin program execution, you can create a new TLMS file, or read and update an existing one. Tapes must be numbered from one. The options (Fig. 1) available once a TLMS file is established are:

List File Entries: This lists the first 24 tape numbers and names on the monitor (Fig. 2). From this screen you can list the remaining 24 tapes; list all data for a specific tape (Fig. 3); control or return to the main menu.

Add Tape# Entry to File: This lets you add more tape entries to an existing file. Error detection stops you from inadvertently writing over an existing entry.

```
TAPE NUMBER..... 10
TAPE NAME.....ISI GAMES
TAPE DESCRIPTION.....INSTANT SOFTWARE GAMES

++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++

      X: 10 50 100"
```

Update Selected Tape: This lets you add to files, or delete them from a tape entry. You can also update a file.

For example, if you have a version of Startrek III that you replaced on a tape with an updated version, you can change the file entry accordingly. You need only to enter the information to be changed. For all other data fields, such as title and file type just press the enter key.

The add function places the file entry in the next available slot, up to a limit of five. For example, if two entries exist, and you add one, it will be tagged File 3.

The delete function compresses your files. Suppose your entries for tape 10 are those listed in Table 1a. By deleting Space Trek IV the result is shown in Table 1b.

Delete Tape Entry: This will delete a tape entry and all of its files. This slot will then be blank in subsequent tape lists. You can now add a tape with this number.

List File Entries on Printer: If you have a line printer available, this produces a hard-copy of your TLMS file.

Save File on Cassette: This saves a new or updated TLMS file for later use.

Error-Trapping Features

The tape library management system program also contains complete edit and error-trapping features. The data prompts are straightforward, and the screens are easy to read. With a few minutes of practice, you can master the program.■

BUSINESS CONTROL PROGRAMS

☐ PAYROLL ☐ GENERAL LEDGER ☐ ACCOUNTS PAYABLE ☐ ACCOUNTS RECEIVABLE

These business systems are designed with the business manager in mind. Major changes in your current bookkeeping methods are not necessary to make these programs work for you. Data may be entered into any one of the systems either directly or through subprograms, so that duplicate data entry is not required. This avoids mistakes.

Accurate reports of financial activity may be obtained on a scheduled basis or at irregular intervals.

The systems require CP/M and CBASIC. Customization, installation and training are available at additional cost. WRITE FOR SAMPLE REPORT AND TRIAL DISK — $25.00 (credited toward purchase price).

- **A Totally Linked Single Entry Accounting System**
- **Completely Screen Oriented Systems Provide User Prompting for Each Entry**
- **User Assignable Account Numbers**
- **Flexible, Reliable and Efficient**
- **Installation and Training Available**

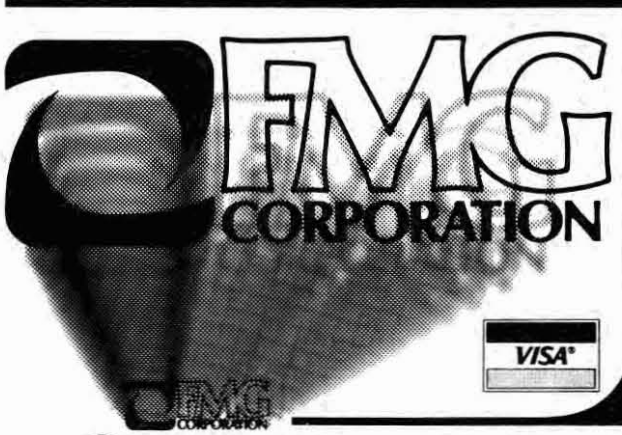
CP/M 2.2 Control Program for Microcomputers Enabling You to Run Software Published for CP/M 1.4 on the TRS-80 Model II (Including Communications Programs)

CP/M®2



CP/M is considered the industry standard disk operating system because it gives you the hardware-independent interface you need to make your computer work for you. FMG CORPORATION NOW OFFERS THE CP/M 2.2 FOR THE TRS-80 MODEL II. The latest in the evolution of a reliable and efficient software system, CP/M 2.2 features an enhanced upward compatible file system and powerful new random access capabilities. From minidisks and floppy disks, all the way to high-capacity hard disks (when available), the flexibility of CP/M 2.2 makes it a truly universal operating system. The package includes an 8" system disk, editor, assembler, debugger and communication software for the TRS-80 Model II. Special utilities not available with other CP/M systems are also included in FMG's CP/M 2.2

(CP/M is a registered trademark of Digital Research Corp. TRS-80 is a registered trademark of Radio Shack)

$200.00

From the ORIGINATOR of the **TRS-80® PROJECT**

THE PASCAL/MT As Low As $250.00

PASCAL/MT™, a native code PASCAL compiler designed for 8080/8085 and Z80 microcomputer systems, provides an efficient development cycle as well as efficient execution of object programs.

- Compiler executes under the CP/M operating system in as little as 32 K bytes of RAM
- Interactive Symbolic Debugger which enables the programmer to examine variables, set a breakpoint, and trace procedure calls interactively at run time
- Compiles at the rate of 600 lines per minute on a 2 MHZ 8080
- Programs Execute up to 10 TIMES FASTER than popular interpretive Pascals
- The code generated is 8080 object code which is ROMable with a minimum run time overhead of 1.5K bytes
- Interrupt procedures allow the programmer to write interrupt drivers for I/O and other real time tasks in Pascal/MT
- Bit manipulations of variables may be performed with the built-in procedures: SETBIT, CLRBIT, TSTBIT, SHL, SHR, SWAP, LO, HI.
- Assembly language subroutines may be called from Pascal/MT
- Business arithmetic version of Pascal/MT is also available
- Pascal data structures supported are: ENUMERATION AND SUBRANGE TYPES, RECORD, ARRAY, REAL, INTEGER, CHAR, and BOOLEAN
- Not implemented are: SETS, GOTO, GET, PUT

PASCAL/MT™ includes compiler and a real time symbolic debugger. The system requires 32K minimum and 2 mini disks or one 8" disk.

Hide your passwords from prying eyes.

The Invisible Password

Michael A. Conley
Los Angeles, CA 90046

Have you ever needed to load a password-protected program and wished you could keep those nearby from seeing the password? Here's a simple, short program that will do the trick nicely!

It's written for the TRS-80, Disk BASIC, using the Apparat NEWDOS operating system—but it can easily be modified for whatever your particular system requires. The real advantage of NEWDOS is that it allows single-step boot and load of this program. The program then calls and displays the disk directory without exiting from BASIC.

How It Works

By using the INKEY$ function to input the password, you won't display the characters on the screen. A loop allows you to input up to eight characters as a password. The ENTER key, however, can be used at any time to terminate the input.

The display next asks for the program name. A similar loop allows us to INKEY$ up to 12 characters (remember those file extensions) but this time, the input is echoed to the display (Example 1).

Once the input is completed, line 270 attempts to load the program. If an error is encountered, such as an invalid password or an incorrect file name, an error-trapping routine restarts the invisible password allowing the user another attempt.

```
FILE DIRECTORY --- DRIVE 0      HOPMAC    -- 09/16/79

PAYFORM   P          DISKDUMP/BAS   P     TVLABEL    P
RADINST   P          DIRCHECK/CMD   P     INVNTORY/PCL   P
RCV/DAT   P          RADLABEL   P         CREWPAY    P

        ENTER PASSWORD:

        WHAT PROGRAM NAME:  PAYFORM
```

Example 1.

```
100 REM            ***  THE INVISIBLE PASSWORD  ***

Program Listing.

A Word of Caution

The Apparat NEWDOS system is sold with its password function disabled, but the documentation explains a simple procedure to re-enable its password protection.

If you're using this program under TRSDOS 2.2 or 2.3, you'll have to change or eliminate line 130, which calls the directory under NEWDOS. But that won't stop you from using the program.

Using the AUTO command under NEWDOS, simply boot the disk and type, AUTO BASIC RUN "PWDINVIS" (or whatever filename you give this password program when you save it to disk). Then, when you boot the system, NEWDOS automatically loads BASIC, loads the program, the display, the directory and then prompts you to input the password.

And those prying eyes won't have a chance of stealing your secrets! ■

Reader Service index—see page 194

Make sure you know your O's from your zeros with this machine code subroutine.

Slash Zero

Robert M. Richardson
Drawer 1065
Chautauqua Lake, NY 14722

The uppercase Os and numeric zeros on many printers appear virtually identical unless closely scanned with a magnifying glass. The following assembly language program will let your printer slash its zeros, even if it's not equipped to do so.

The source code program in Program Listing 1 was written using the TRS-80 Editor/Assembler (either Radio Shack cassette version or Apparat NEWDOS + version—both are excellent) and printed on a Western I/O Selectric Printer terminal that does not have the slash-zero type.

Assembly Language

For those readers unfamiliar with assembly language programming, a few words about source and object codes and what they accomplish are in order.

After grasping the basics of Level II, the next step is to begin studying how to converse with your TRS-80's Z-80 microprocessor in its own language. It speaks Zilog machine language, which is somewhat easier to learn than Russian, and, for many, almost on a par with learning Latin when only a few hundred words of vocabulary are required.

It is much quicker to speak to someone in his own language than it is to use an interpreter (BASIC).

Machine language programs invariably run 300 to 400 times faster than a program in BASIC, Fortran or Cobol high level languages. Furthermore, machine language programs require only 1/10 the memory of a program written in a higher level language, perhaps 1/7 the memory, if you use Pascal.

The TRS-80 editor/assembler allows you to write assembly language programs in source code that uses the Zilog standard mnemonics (LD = load, CP = compare, RET = return, etc.) rather than in 8-bit binary or its decimal equivalent.

After the source code has been written (see Listing 1), the editor/assembler program (originally written by Zilog) then makes two passes through the program, both editing and assembling it after the "A" command, ENTER. The obvious errors are printed out as well as the object code for the program, illustrated in Program Listing 2.

The left column is the memory position in hexadecimal and is keyed on the number you input in line 100 of the source program. The second most left column is the complete instruction (opcode + operand) translated into 1, 2 or 3, but rarely 4, bytes of object code in hex which will be loaded into your TRS-80's memory in binary format.

The first two-digit hex number in the second column is the opcode. There are 157 fundamental opcodes, or instructions, for the Z-80 and 547 additional variations for a total instruction set of 694.

If you were a real masochist, you could manually load each object code hex byte, after converting the hex into decimal, via the BASIC POKE instruction.

Program Flow

The REMarks section of Listing 1 briefly explains each line's function, but for those who wish to run through the program flow in detail, be seated, just like you were in Assembly Language 101 class.

We started the print zero subroutine in line 140 at memory location 32533, so that another small print subroutine allowing the user to set the line at any number could be tacked on later. Print zero only requires 53 bytes of memory (7F41 – 7F15 = 53 decimal), so it may be set exactly at the high end of your TRS-80's memory minus 53, if desired.

If you are using disk and have plenty of memory, it would be wise to place it about 200 bytes from the top, since some disk operating systems use the top few bytes for sundry purposes.

The address may be in decimal (32533) or hex (7F15H) as the assembler will automatically change any number not ending in H to hex. Just remember, any hex number beginning with a letter—A, B, C, D, E or F—must be preceded by a zero, or an error will be printed when you assemble the program.

Line 150, the START label, be-

```

Program Listing 1.

gins the subroutine. Modifying the line printer control block's driver address in memory locations 16422 and 16423 (is actually accomplished in lines 440 and 450).

The opcode, PUSH instructions from line 150 to 180 merely store, but do not change the values of your AF, BC, DE and HL registers in the stack. PUSHing all of them into the stack is unnecessary in this particular subroutine, but is a good habit when writing any subroutine. If critical data from your main program resides in any of the registers used in the subroutine, it will be lost. Saving the contents in these lines and restoring them in lines 290-320 is a most worthwhile habit.

The opcode LD and operand A,C transfers the contents of register C to register A, the accumulator in line 190. It just so happens that during any LLIST (list program output to printer) operation, register C contains the value of the NEXT character to be printed.

The opcode CP in line 200 and operand 30H (ASCII zero = 48 decimal = 30 hex) subtract 30 hex from the contents of the accumulator (next character to be printed) and set the Z-80's status flags accordingly. The result of the subtraction is discarded. If the result is zero, as when the next character to be printed is a zero, then the next instruction executes a jump to the line with the label ZERO, line 230.

The JP opcode followed by operand Z, ZERO in line 210 is exactly the same as the BASIC IF-THEN-GOTO statement. If the result of the simple binary subtraction in line 200 is not zero, the program falls through to the next statement in line 220, just as in BASIC. This line's unconditional JP says GOTO the line with the label FINIS (line 290).

In lines 290 to 320 the program restores the original values to the registers. Line 330 returns to the ROM program, memory location 58D hex = 1421 decimal. This is where the line printer control block driver addresses (16422 and 16423) told the program to go before being modified in lines 440 and 450.

Time Factor

How long a time period has the subroutine used to examine each non-zero character before returning to the regular printer routine? You have used 13 instructions, which at an average execution time of 4 cycles = 52 cycles. With a TRS-80 clock of 1.7 MHz, each cycle takes .5637 microseconds times 52 or approximately 29 microseconds. Does an 29 microsecond delay slow down our 15 character per second printer? No, at this subroutine speed the printer does not even know you are there.

If the result of the subtraction in line 200 is a zero, line 210 jumps to 230. The CALL opcode is exactly the same as a BASIC GOSUB with the place to go in the operand, TEST, line 340. The RETURN, which must terminate every GOSUB, is RET in line 430.

In lines 340 to 430, the program knows the next character to print is a zero and introduces a short delay.

After the I/O Selectric has completed a character and is ready for the next one, it places a 3F hex = 63 decimal = ASCII ? into memory location 14312 = 37E8 hex. It is saying, "OK, I printed what you sent me. What next?"

Line 340 then loads the value from memory location 37E8H into the accumulator. Line 360 subtracts 3F hex from it. In line 370, because the result is zero, the program falls through to the next line: another IF-THEN statement, just as in BASIC. The program uses a jump relative (JR) here, because it saves one byte of memory and can move 128 positions back or 127 forward, more than enough for our purposes.

Lines 380 to 420 provides a 20 millisecond delay that allows our Selectric printer time to settle down from the bone shaking that occurs when we backspace the device while printing multiple zeros.

The first two lines in Program Listing 3 show the program without this delay. The last three lines illustrate the 20 millisecond delay.

In line 410 the program returns to the line following the CALL, line 240. Line 240 loads the ASCII slash = 2FH = 47 decimal into the accumulator. (See page C/2 of the Level II Manual for ASCII codes in decimal and enter the hex equivalents next to each.)

Lines 250 and 260 place 2FH (the /) into memory location 37E8H (14312), which is the line printer's PRINT address and then awaits the line printer's "handshake", saying, "I printed the slash, and I'm ready for another character via the CALL TEST in line 260."

When the printer is ready, the program falls through to line 270. The accumulator is loaded with ASCII 8H, the backspace signal, while line 280 sends the slash to the printer.

Line 330 gives the instruction GOTO original print routine and print that zero on top of the slash, which was what this subroutine was all about!

As mentioned earlier, the subroutine's starting address is put into the line printer control block driver address at 16414 and 16415 by lines 440 and 450.

Conclusion

This mini-subroutine will certainly enhance any program listings you wish to print and give them a professional appearance when using a printer without the slash-zero typeface.

Before assembling the source code, remember to give it a name. This subroutine has been tested with Level II BASIC, DOS 2.1, DOS 2.2 and NEWDOS+ and works fine with all of them. ■

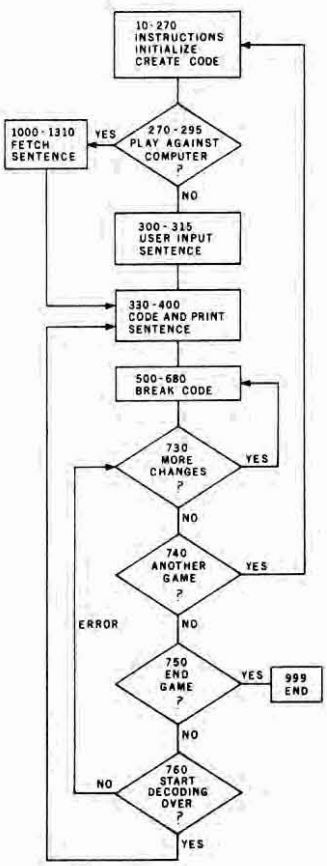
Delve into the dark secrets of cryptanalysis.

Code Cracker

James P. Morgan
2386-B Ash Creek
Scott AFB IL 62225



General Flow Chart

On the morning of August 1, 1943 a bomber force of 178 American Liberators departed a Libyan airfield en route to the huge oil field complex at Ploesti, Rumania. To ensure safe passage over Allied defenses, a coded message was sent to units throughout the Mediterranean which identified the force as friendly.

Within minutes after takeoff, German cryptanalysts in Athens had intercepted and broken the coded message. The Ploesti air defenses were alerted and fifty-three American Liberators were shot down.

The secret war waged by the code clerks from back rooms once again influenced the outcome of a military operation.

The first use of code for military operations is credited to Julius Caesar. He devised the coded alphabet which worked on the principle of one-for-one direct letter substitution. You will find his code used in the cryptograms published in newspapers and periodicals to this day. It is still known as the Caeser Alphabet and is formed as shown in Fig. 1.

The standard alphabet is thus transposed randomly by direct substitution of a new, coded alphabet.

Moving from the days of the Roman legions to modern cryptography, a most significant development has been the introduction of the computer as the code-maker's and code-breaker's most powerful analytical tool.

I have set my micro to the task of creating and breaking codes and the following program may help you to discover yet another enjoyable application for your home computer.

Developing the Program

When I program, I find it most useful to establish a specific outline of the program's requirements. Each requirement is then developed and fulfilled separately, tested and merged into an overall program. My outline follows:

1. Develop a method of computer-created random Caesar alphabets.
2. Provide computer or user input of messages to be coded.
3. Computer coding and display of the coded message.
4. Provide user interaction with the computer in breaking the coded message.
   a. Input trial letter substitutions.
   b. Display results.
   c. Allow for further modification.
   d. Continue until solved with update every cycle.

What seemed at first glance a relatively easy programming task turned out to be quite difficult.

Program lines 10 through 100 print a general introduction to the program. The CLEAR 500 statement in line 20 reserves the string space required by later sections of the program.

Line 110 DIMensions the arrays which will store the codes at various stages. The A$(X) array holds the Caesar Alphabet. The J$ array is filled with the coded sentence. The K$ array is used to store the user's code-breaking efforts.

Lines 120 through 230 satisfy the first requirement of my outline. These lines automatically create the code. Line 120, the C$ string, sets the normal alphabet used for comparisons throughout the program. Lines 130 through 150 initialize the A$(X) at 0.

A random number is selected by line 160. Assume the number selected is five. A looping routine starts at line 170. The first time through, with an X value of one, line 180 fails the test, eg., A$(1) = 0 and MID$(C$,B,1) = E since B = 5.

Line 190 also fails the IF test since A$(1) equals 0 and the program drops to line 200. At line 200, A$(1) is assigned the value of the letter E. Line 210 counts N = 1 and line 220 sends the program back for another random

FROM PROGRAMMA
HI-RESOLUTION GRAPHICS FOR THE TRS-80®

LOWER CASE
The 80-GRAFIX board includes two sets of lower case characters at no additional cost.

INVERSE VIDEO
The 80-GRAFIX board allows you to do inverse video to high-light your screen displays.

DEMONSTRATION PROGRAMS
The 80-GRAFIX board is supplied with a Character Generator software and several demonstration programs.

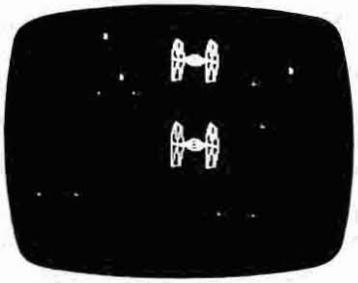
FINALLY, AT LAST. . .

HI- RESOLUTION GRAPHICS is available for your TRS-80 computer system. The 80-GRAFIX board from PROGRAMMA International, Inc. gives your TRS-80 high resolution capability that is greater than the Commodore CBM/PET or even the revered APPLE II.

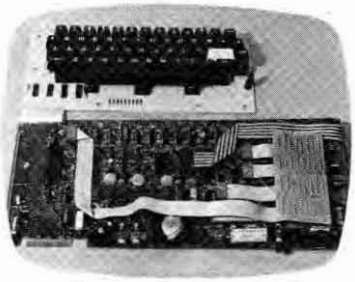
80-GRAFIX gives the TRS-80 an effective screen of 384X192 pixels, versus the normal 127X192 for the TRS-80, 80X50 for the CBM/PET, or the 280X192 of an APPLE II. As an added feature, 80-GRAFIX offers you lower case characters at no additional cost. Of course, you can also create your own set of up to 64 original characters using the supplied Character Generator software.

The 80-GRAFIX board is simple to install (note that this voids your Radio Shack warranty), and programming is done through BASIC. 80-GRAFIX opens up a whole new realm of software development and excitement never dreamed of for the TRS-80!

CHARACTER GENERATOR
The supplied character generator software allows you to create your own character set of up to 64 original characters.

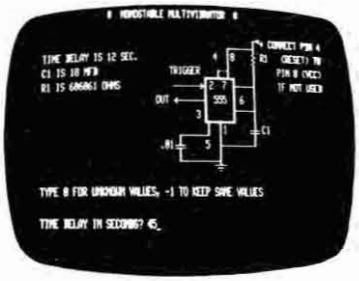


REAL-TIME GRAPHIC GAMES
With the 80-GRAFIX board you can write exciting real-time games using BASIC.

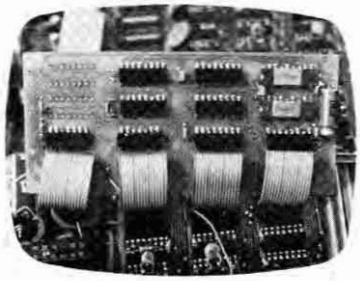


EASY INSTALLATION
The 80-GRAFIX board is simple to install and fits inside the TRS-80 case.

GRAPHICS GALORE
The 80-GRAFIX board and the supplied Character Generator allow you to become an artist.



ELECTRONIC DESIGN
The 80-GRAFIX board has unlimited application in Electronic design and Education.



80-GRAFIX HI-RESOLUTION
Finally, the only means to protect your computer investment is to order an 80-GRAFIX board TODAY!

EXCITEMENT & FUN
Open up a new realm of software development with the 80-GRAFIX board.

Available exclusively through PROGRAMMA at the cost of $149.95

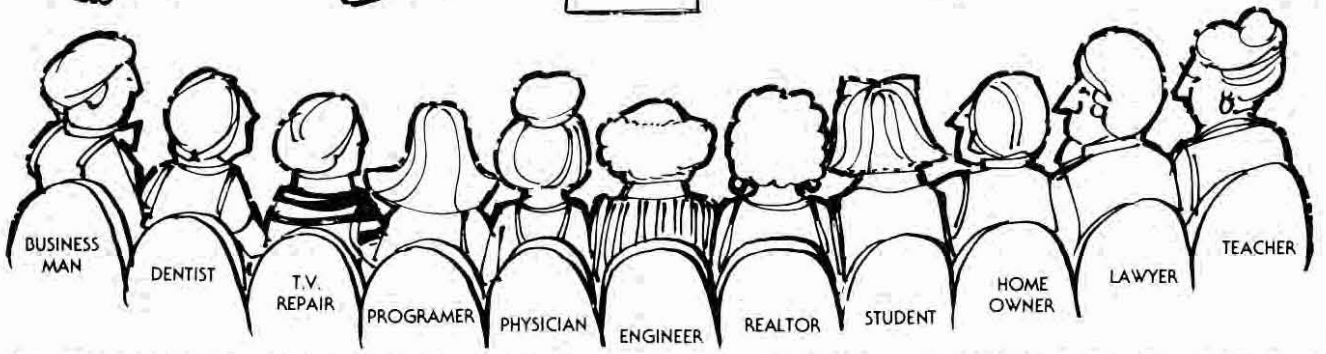
The MICROCONDUCTOR™

the ultimate database manager for your TRS-80® and Apple®

Compose Any Software Program
By simply answering the questions,
YOU Describe the file layouts
YOU Specify the print formats
YOU Design the update functions.
The CONDUCTOR DOES THE WORK!!!



The MICROCONDUCTOR™ directs your computer to compose, organize and summarize all information you need to solve your software and business problems.

With The MICROCONDUCTOR™, your computer will be able to compose any record-keeping software you need. In the office, The MICROCONDUCTOR™ can help with anything from accounts receivable to property management. You'll find that The MICROCONDUCTOR™ is ideal for the shop too. Let it take care of your inventory records, sales analysis, price lists, and more.

The MICROCONDUCTOR™ is not just a file manager but a true Data Base Management System suitable for both the novice and professional users.

Some of the modules of this masterpiece are:

DATA FILE—One step file creation. Just set it, and forget it.
MAINT.— Manipulate your data files with ease; add, delete, modify, scan, relocate, and more.
SORT— Sort any number of fields, in any sequence, ascending or descending order.
UPDATE— Single or dual file report and update utility.

Introductory Prices

TRS-80® Model I	**$249**
Apple®	**$299**
TRS-80® Model II	**$399**

The MICROCONDUCTOR™ is power at your fingertips! Power to set up, maintain, sort, report, and update data files at whim. Just imagine: with the MICROCONDUCTOR™, you can establish a custom mailing list system in 30 minutes, accounts receivable in 2 hours, a complete business system in only a few working days. Never before has your computer been given such power!

DATA FILES—No limit on the number of records a file can have.
FIELDS—Any type (string, interger, single, double). Eight entry modes (including defaults, counting, and suppress).
REPORTS—Four ways to generate reports. Total numeric column(s). Print on any paper in any format (statements, labels, etc.).
SORT—Any field(s) in any combination (i.e. multiple-key sort). Any size file, numeric or ASCII. Ascending or descending.
MAINT.—Command anticipation. Record duplication. Direct access and sequential search.
UPDATING/MERGING—Add, subtract, multiply, divide fields. Combine results from previous calculations. Test for any condition and take action.

NEWDOS80

A new enhanced NEWDOS for the TRS-80.

The most powerful Disk Operating System for the TRS-80, designed for the sophisticated user and professional programmer who demands the ultimate.

NEWDOS/80 is the planned upgrade from NEWDOS 2.1. Some of the features are:

- New BASIC commands for files with variable record lengths up to 4095.
- Mix or match drives. Use 35, 40 or 80 track 5" disk drives or 8" disk drives, or combo.
- Security boot-up for BASIC or machine code application programs.
- New editing commands.
- Enhanced RENUMber that allows relocation.
- Command chaining.
- Device handling for routing to display and printer simultaneously.
- DFG function; striking of D, F and G keys allows user to enter a mini-DOS without disturbing program.
- Compatible with NEWDOS & TRSDOS.
- Machine language Superzap/80 2.1 utilities and enhanced debug and copy.

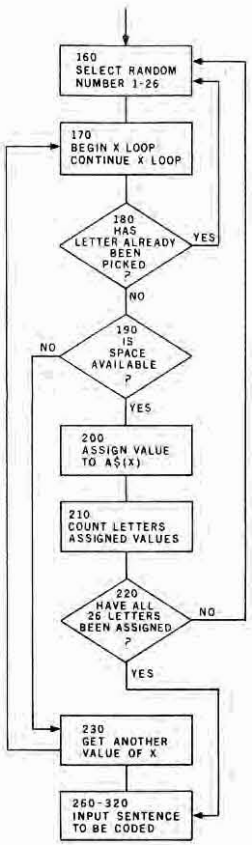
Print Sentence in Code



Create Code

number.

Assume the next random number selected is the number 3. A$(1) = E which fails the IF test at line 180 since 3 is the MID$(C$,B,1) value. At line 190, A$(1) is not 0 so the line branches to line 230 and then to line 170 where an X value of 2 is generated. Lines 180 and 190 fail the IF tests so the value of A$(2) becomes the letter C.

This section continues to select random numbers and loop through values of X until all 26 A$(X) values have been assigned random letters of the alphabet. This array now holds the code.

The Sentence

Lines 270 through 320 give the user the option of either manually entering a sentence to be coded or letting the computer select a sentence at random.

At line 330, the length of the sentence, including spaces between words, is derived from the M = LEN(D$) statement. The K$(Y) array is then set to " " or empty spaces for the entire length of the sentence.

Lines 340 through 400 print the sentence in code. This is done in the following manner.

At line 340 the Y counter selects the first position in the sentence. Line 350 selects the first X value and line 360 tests if the position in the D$ sentence string is a space. If not, the program goes to line 370 where the X value in the C$ is compared to the Y value in the D$. The X counter continues to loop until a match is made.

Let's assume the first letter in the sentence D$ is a C. The match occurs when X reaches a value of 3, since the third letter in the C$ string is C. The program jumps upon a match to line 390. The value of A$(3), which is a letter in the coded alphabet, is printed and also assigned to the J$(1) position. The coded sentence is thus built up letter by letter and stored in the J$(Y) array.

The program so far has created a code and applied that code to a sentence. All that remains is to provide a system of breaking the code. This is accomplished in lines 500 through 770. The user examines the coded sentence and determines potential substitutions. For example, a letter by itself is usually an A or an I.

At line 520 the coded letter to be changed is input as O$. The letter to be substituted is then input at line 535 as N$. The counter at line 540 sets up a scan of the entire coded sentence. At line 550 each value of J$(Y) which corresponds to the letter the user wants changed is flagged and sent to line 580. This line reassigns the value of K$(Y) to the new (N$) letter.

After each letter of space in the sentence is checked by the Y counter, the program then prints the results with lines 600 through 670. The IF statements at lines 630 and 660 cause the program to print a line of coded sentence, a line of changes, then two similar lines below.

Lines 700 through 770 provide for user options at each run through of the code-breaking attempts. Lines 1000 through 1410 store the computer generated sentences.

Conclusion

The program has gained instant popularity with family and neighbors alike. Once a person gets hooked as an amateur cryptanalyst, it is extremely hard to keep him away from the computer.

Although the code system used is not as complex as the one broken by the Germans during the Ploesti raid, it will provide a challenge to all who use the program. ZCCA FYPQ WOA GOXCN! ■

A fine component interface for your television set.

Cheap Video

Paul C. Fowler, Jr.
Inland Motor IDD
609 Rock Road
Radford, VA 24141

Dennis J. Murray
1005 Chestnut Drive
Cristiansbury, VA 24075

A few months ago I bought a TRS-80 mainframe, hooked a video modulator to my old black and white and found at 64 characters per line I had only hieroglyphics. At 32 characters per line I could decipher words and letters satisfactorily.

After the initial excitement of having my own computer wore off, I needed to do something about my 64 characters per line problem, so I said good-bye to the indistinct world of modulators and found myself in the fuzzy world of direct video interface.

With a commercial direct interface device the resolution of 32 characters per line was just fine and 64 characters per line was readable but uncomfortable.

Nothing was wrong with my $25 interface device, but with all those capacitors and things in my video section my TV's slew rate was too slow. So, what to do? Break down and buy a monitor? There's got to be a better way. There is . . . ! And it's simple too.

After a lot of talking and experimenting, the co-author and I came up with the circuit in Fig. 1a.

How the Circuit Works

Transistor Q1 serves as an emitter follower whose quiescent state (and thus the white level) and relative gain is determined by the setting of R1, which interacts somewhat with the set's contrast and brightness controls.

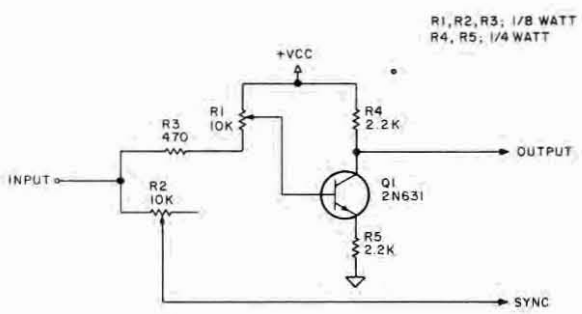

Fig. 1a

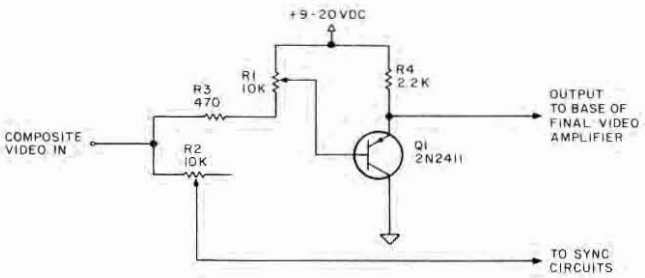

Fig. 1b

Potentiometer R2 adjusts the signal level passed to the TV's sync circuits avoiding synchronization problems caused by overdriving those stages.

Beautiful! Only five components to scrounge and the resolution is excellent. There is one drawback: The TV must be isolated. But one can buy an isolation transformer for just a few dollars and overcome this problem.

If an inverted video signal is desired, replace Q1 with an NPN and series its emitter to ground with a 2.2K resistor (Fig. 1b). Almost any small signal transistor will do.

A typical set is shown in Fig. 2. As good TV sets and good monitors are not usually compatible, I am assuming that this monitor will never again be a television.

Disable everything upstream from X1 and X2. Insert the interface output at X1, and the sync at X2. Vcc should be somewhere between 9 and 20 volts (I used 12 VDC on my Sony Model #TV-1104). You can tap this from one of your set's biasing supplies. Set P1 and P2 to the center positions and inject the composite video into the interface. Also, set your horizontal control and brightness controls for good definition.

To fine tune the picture, fill the screen with zeros. Adjust the height and vertical linearity controls until the characters are all equal size and they fill the screen from top to bottom.

You may find that the data lines do not properly fit on your TV's screen—either the lines are too short or too long. This can be remedied in several ways; if you are lucky you have an adjustable horizontal frequency coil in your set. Adjust it carefully with an insulated alignment tool until you reach a satisfactory line width. If you are unlucky your set has no ad-

justment.

Don't panic! Your horizontal oscillator must have some frequency determining network and it can be changed. Usually it is an L-C arrangement, although R-C networks aren't uncommon. By altering either one or both of those components, your scan frequency, and thus the line width, can be changed.

Another alternative is to change the horizontal scan frequency by changing the horizontal output stage time-constant. This is accomplished by adding or subtracting capacitance until the picture reaches the desired width (Fig. 3).

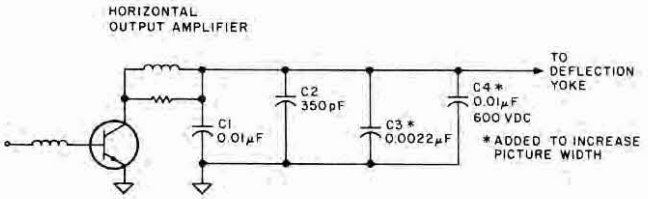

Fig. 3

Conclusion

Get a SAM'S PHOTO-FACS for your TV. Not having one is like exploring a cave in the dark. Use coax cable for all signal runs. To reduce stray capacitance, keep components as close together and as small as possible. I recommend using dual 10K pots in the 8 Pin Dip Package. Q1 is any moderate gain PNP transistor whose reverse breakdown voltage is greater than Vcc.

Finally, and most importantly —DON'T OPEN UP YOUR SET without some knowledge of what's going on inside. If you don't know how a TV works, get someone to help you. Otherwise, you may shake hands with the high voltage rectifier and see hieroglyphics for some time. ■

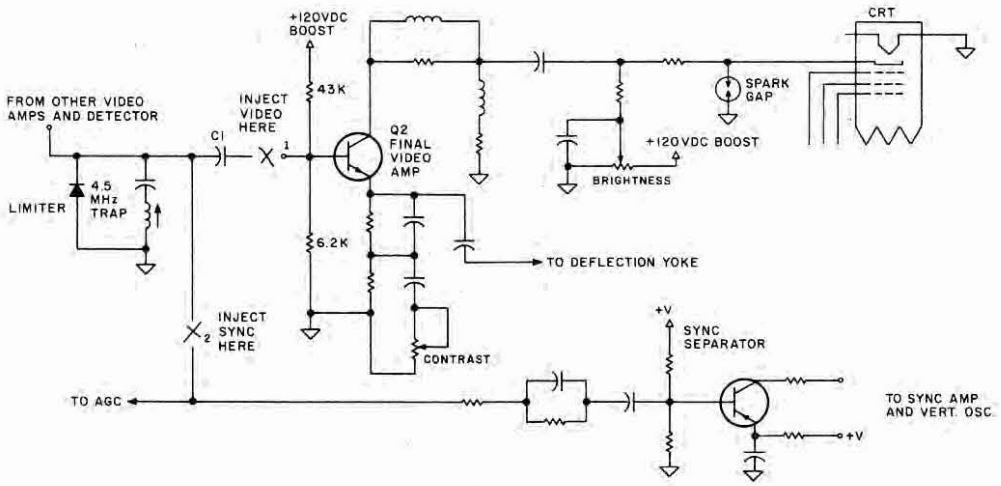

Fig. 2

Limit access to your machine code subroutine, with this software combination lock.

Software Lock

M. D. Kelleher
79 City View Way
San Francisco, CA 94131

For those TRS-80 users who enjoy working with machine language (and enjoy a little software intrigue on the side), this article describes a short utility subroutine that provides restricted access to your own machine language programs through the use of a predefined user code.

The subroutine, SOFTPROT, is written for 32K DOS and is automatically loaded into memory on power-up or reset using the TRSDOS AUTO function (Listing 1).

Software Theory

The theory of SOFTPROT is as simple as a James Bond movie. A user code (top secret, of course) is requested as the first step in each machine language program from which the SOFTPROT subroutine is called. This code request must be answered with the proper keyboard characters, and in the proper sequence, before the subroutine loop can be broken and the main program routines accessed.

Should the wrong code be entered, or the correct code be entered out of sequence, the SOFTPROT loop continues. (This should be frustration enough for even the most devious arch-criminal, if a complex code is used.)

SOFTPROT uses a three-level code requiring the input MDK, however, the routine can easily be expanded to accommodate any number of code levels. Once the correct code sequence is entered, SOFTPROT returns control to the user's machine language program by way of the assembler instruction RET.

The program is initialized at hex address BE00 but can easily be reconfigured for a 16K TRS-80 by assembling the subroutine with a hex starting address of 7E00.

In either configuration, make sure that the machine language program using SOFTPROT does not extend beyond hex BDFF in a 32K machine or 7DFF in a 16K machine. If so, SOFTPROT will be wiped out!

Here are the procedures for setting up SOFTPROT, depending upon your TRS-80 hardware configuration:

In a 32K DOS system, assemble the program using the editor/assembler and save the object file (the machine language code itself) to disk under the filename "SOFTPROT/CMD". Now, using the TRSDOS or NEWDOS+ AUTO function, enter this command:

```
AUTO LOAD SOFTPROT/CMD
```

from the DOS mode. Each time you power-up or reset the TRS-80 using this diskette, SOFTPROT will automatically be loaded into memory beginning at hex address BE00.

With a 16K DOS system the only changes you must make to SOFTPROT itself are in the first and last program lines (the ORG and END instructions). Change the addresses at these lines to hex 7E00. The remainder of the program uses relative jumps so that you may relocate it anywhere convenient in memory.

Putting SOFTPROT into Action

Once you have SOFTPROT assembled and ready to run, the rest of the operation is a piece of cake. To use SOFTPROT, add the following command as the first executable program statement of any machine language program:

```
CALL 0BE00H (for 32K machines)
or
CALL 07E00H (for 16K machines)
```

The result of this command is to call SOFTPROT before accessing the remainder of your machine language program. Once SOFTPROT is called, the proper user code must be entered from the keyboard before execution of the main program begins.

Experiment with SOFTPROT and you will find several ways in which to use it. Here are a few suggestions:

1) Try calling SOFTPROT from your BASIC programs by using the DEFUSR function. A typical Disk BASIC program might begin like this:

```
10 CLS
20 PRINT "SAMPLE PROGRAM"
30 DEFUSR 0 = &HBE00
40 X = USR 0(X)
```

This same format can be used in Level II machines by changing the DEFUSR statement address to the proper decimal equivalent for your version of SOFTPROT. If you're really wild about user codes, you can even find some very esoteric ways of hiding lines 30 and 40 with the ASC or STR functions of DISK or Level II BASIC.

2) Alter the required user code in different versions of SOFTPROT to match the particular machine language program you will be using it with.

3) Experiment with access codes using SOFTPROT. For example, establish a 5 or 6 level code (ABCDEFG) where the correct entry of, say, one half of the code allows access to a portion of your program; whereas, only the full code complement allows total program access.

4) And here's a finale for you 007 freaks. How about using SOFTPROT in such a way that a

certain character input from the keyboard cleared all memory locations occupied by your machine language program and then did a "self-destruct" on SOFTPROT itself. A sort of "Good morning, Mr. Phelps" operation.

At any rate, you should be able to come up with fascinating innovations between spy novels. If nothing else, SOFTPROT is an interesting introduction to the intrigue of machine language programming.

Good afternoon, Mr. Phelps. ■

Now In Stock And Ready For Delivery
NEW TOYS FOR YOUR TRS 80* MICROCOMPUTER

SHORT MEM™

ADD 1K OF MEMORY TO YOUR COMPUTER THAT DOESN'T FORGET. (AS LONG AS YOU KEEP SHORT MEM™ PLUGGED IN) THIS READ/WRITE MEMORY IS A GOOD PLACE FOR YOUR UTILITIES OR IMPORTANT VARIABLES IN AN UNTOUCHABLE LOCATION.

FEATURING

- EXTERNAL PLUG IN MODULE (KEYBOARD OR EXPANSION INTERFACE) STARTING ADDRESS (3000 HEX)
- INSTANT ACCESS TO MEMORY CONTENTS UPON POWER UP
- USES UNASSIGNED AREA OF MEMORY (NO CONFLICT WITH OTHER OPERATING SOFTWARE)
- COMPATIBLE WITH EITHER LII OR DISK OPERATING SYSTEMS
- NO BATTERIES TO RUN DOWN OR HAVE TO REPLACE

SAVE

★ INTRO SPECIAL $123.95 ★ REGULARLY $150.00 ★

THIS UNIT WILL PLUG INTO THE BACK OF THE LEVEL II KEYBOARD OR E.I. WITH NO EXTRA PARTS NEEDED. COMES COMPLETE WITH IT'S OWN AC POWER ADAPTER.

OTHER NEW ITEMS FROM LEVEL IV

8-4116 MEMORY CHIPS FOR KEYBOARD OR INTERFACE - LIMITED SUPPLY ..... AS LOW AS $60.00
SHUNTS & INSTRUCTION - ADD $5.00
MONSTERS LAIR ADVENTURE (FULL GRAPHIC MACHINE LANGUAGE) ..... $19.95 DISK $14.95 CASSETTE
LP SPOOLER $39.95
SINGLE POWER SUPPLY AND CASE FOR DISK DRIVE WITH EXTENDER CABLE CUSTOM MADE FOR US FOR THE B 91 AND B 51 MPI DISK DRIVES (DEALER INQUIRIES INVITED ON THE UNIT) $75.00
MPI B91 (80 TRACK) WITH POWER SUPPLY AND CASE (AND IF IT IS READY OUR 80 TRACK OPERATING SYSTEM (AT LEAST I'M HONEST)) I'LL GIVE YOU A HINT (A MODIFIED TRS-DOS) *$650.00
DISASSEMBLED HANDBOOK VOL 1 (TRS ROM) $10.00
DISASSEMBLED HANDBOOK VOL 2 (EXTENTION OF ABOVE) $15.00
BOTH FOR ONLY $19.95
RESET BUTTON (STOP USING THAT PENCIL) ..... $ 3.99
MICRO LINE 80 PRINTER *$699.00
TRACTOR WHEN ORDERED WITH PRINTER *$100.00
CABLE FOR ABOVE TO E.I. *$30.00
*THESE PRICES MAY BE HIGHER IN OUR RETAIL STORES

SOFTWARE:

MATCH BOOK FOOTBALL WITH SOUND ..... $ 9.95
CRUSHBUGG WITH SOUND $14.95
INVADERS PLUS 4K LEVEL I AND UP WITH SOUND $19.95
INVADERS PLUS DISK WITH STEREO SOUND $24.95
SOUND AMPLIFER $10.95
BOSS SYSTEM UTILITY $29.95
PINBALL BY ACORN (SUPER PROGRAM) $14.95
PINBALL DISK $20.95
IRV (THE SUPER KEYBOARD) $24.95
SARGON II DISK $34.95
CASSETTE TAPES THAT NIXON WON'T LIKE (OURS HAVE NO DROP OUTS) $1.00 EA OR 10 FOR $7.50 (THESE ARE THE TYPE RECOMMENDED FOR THE TC-8 (POOR MAN'S FLOPPY))
HARDSHELL CASES FOR THE ABOVE TAPES THE GOOD ONES ..... .20 EA
SYSTEM RELOCATOR FOR THE POOR MAN'S FLOPPY. RELOCATES THE SYSTEM FOR ANY MEMORY SIZE. PERMITS THE USE OF ANY MACHINE LANGUAGE PROGRAMS ABOVE IT. $14.95

A soft approach to LC generation.

Lowercase With Strings Attached

Milan D. Chepko, M.D.
119 Belleville Crt.
Thief River Falls, MN 56701

The original TRS-80 system uses only uppercase letters, which can be somewhat restrictive when typing text. The keyboard can generate the lowercase letters by using the shift key, but the screen and the Centronics 779 printer can display only the uppercase form, even though the ASCII code for the lowercase letter is stored in memory. That is why shifted letters can cause so much trouble in a program listing.

Some of the other line printers on the market can handle the lowercase code and produce acceptable text without any hardware modification. Unfortunately, it becomes confusing when you try to enter any significant amount of text, since you have to key it in just the opposite of a regular typewriter.

This simple subroutine eliminates at least some of the difficulty. In essence, it accepts a string from the keyboard, then inspects each of the characters to see which ones have been typed with the shift key. It then unshifts the shifted ones, and shifts the unshifted ones. If that sounds strange, remember that the TRS-80 considers any key typed without the shift to be an uppercase letter, while any key typed with the shift becomes a lowercase letter. This routine just reverses the process.

```
10000 '*** SUBROUTINE TO GENERATE LOWER-CASE CHARACTERS
10010 'BY MILAN D. CHEPKO, M.D.
10020 'THIEF RIVER FALLS, MN
10030 '
10040 'SUBROUTINE USES THE FOLLOWING VARIABLES:
10050 '  X$----CONTAINS THE STRING VARIABLE AS INPUT FROM THE KEYBOARD
10060 '  0$----CONTAINS THE STRING VARIABLE ON RETURN FROM THIS SUBROUTINE
10070 '  A-----THE NUMBER OF CHARACTERS IN THE INPUT STRING
10080 '  C-----USED TO HOLD EACH ELEMENT OF THE STRING SEQUENTIALLY
10090 '  B-----COUNTER
10100 '
10110 A=LEN(X$):0$="":IF X$="" RETURN
10120 FOR B=1 TO A:C=ASC(MID$(X$,B,1))
10130 IF C>64 AND C<91 THEN C=C+32:GOTO10150
10140 IF C>95 THEN C=C-32
10150 0$=0$+CHR$(C)
10160 NEXT B:RETURN
```

Subroutine to Generate Lowercase Letters.

Because it is written in BASIC, it tends to be a little slow, and you may notice a slight delay before the prompt appears for the next line of input. Also, be careful to select variables that don't appear in the program text, or you may lose data accidentally.

Be sure to CLEAR enough space for the extra strings at the beginning of the program. Call the subroutine with a GOSUB just after you INPUT X$, and, on returning, the modified string will be in 0$.■

Make your Editor/Assembler do the things you want it to—with this modification.

Custom EDTASM

John T. Blair
122 Dumont Ave.
Norfolk, VA 23505

This article explains how to incorporate several changes in the Editor/Assembler from Radio Shack. I'll be talking about: An auto line and form feed option for printers using a 37E8H printer interface; how to change the "lines per page reference"; incorporating Small System Software's TRS-232 printer driver; adding a form feed routine to the TRS-232 printer program; letting EDTASM honor "protected memory"; changing the EXIT from EDTASM so BASIC is reentered without going to memory size; how to reenter EDTASM and maintain your source program text.

To modify the EDTASM you will need a monitor, such as RSM-1 or RMS-2D, MON3 or T-BUG. One caution: You must **not execute the EDTASM program if you are loading it to insert a modification**. There are two ways of modifying EDTASM.

First, you can load the EDTASM program using the SYSTEM command and then load your monitor. Since the monitor is the last program entered, when you type "<ENTER>", you will be in your monitor and ready to make any of the modifications.

Referring to the source listing of the modifications you wish to implement, delete (fill with zeros, 00H) the sections of the programs that are to be changed. Try the "Zero" command in your monitor. This will let you see easily where you are working or if you have run out of room. Enter the hex code for the desired modification. After inserting the new program, save the modified EDTASM program using the PUNCH command. The starting point for EDTASM is 4300H, its ending address is 5520H, and the entry point (cold start) is 468AH.

An alternative method is to write the various programs using the EDTASM and to save the source and object codes. Then, using the SYSTEM command, load the EDTASM program. Load the object code for the patch. (Because of the ORG statements, the modification will overwrite the required sections of coding.) Finally, load your monitor and PUNCH a copy of the modified EDTASM.

The Secret of Gaining Control

To modify any of the I/O routines (i.e., keyboard, video or printer) you must first take control of the EDTASM's old driver. Control can be taken from the old driver and linked or patched to the new routine by changing the address in the Device Control Block (DCB).

The EDTASM has its own DCB's, and its own CRT, keyboard and printer driver routines. The DCB's are located at:

1) 4300-4307H Keyboard
2) 4308-430FH Video
3) 4310-4317H Printer

The various drivers routines are located at:

1) 43EF-445FH Keyboard
2) 4460-45A9H Video
3) 45AA-45F5H Printer

The Device Control Blocks tell the system:

Byte	Description
0	Whether the DCB is an input or output function,
1-2	Address on the driver for that function,
3-5	Scratch pad memory for that function,
6-7	The ASCII name of that device (i.e., PR = printer).

These various Device Control Blocks are used by the routines in the EDTASM. As in BASIC, a General INPUT/OUTPUT driver, located 43CE-43EFH in the EDTASM and 03C2-03E3H in BASIC, saves the registers (EXCEPT the DE), then gets the address of the driver from the DCB, and jumps to the driver.

So by changing the address contained in the DCB the driver can be changed.

37E8H Printer/Interfaces

The biggest problem here is in the printer driver routine which does not insert a line feed after a carriage return, nor does it output a "top of form." In BASIC, a OCH can be outputted to give a top of form, but not in the EDTASM.

The printer driver which resides from 45AA to 45F5 (see Listing 1), is identical to that in ROMs. If you are using a printer interface which is located at 37E8(H), you can insert a line feed after a carriage return with a simple modification (see Listing 2).

Referring to Listing 1, if the character to be printed is a 0DH, <CR>, the program jumps to the "Output Character" (OUTCHR)

Listing 1. Dissembled Printer Driver.

section. After every character is printed OUTCHR is checked to see if a <CR> was sent. If not it returns to the calling program. If the last character is a <CR> then the line counter is incremented. This is where a Jump (JP) to the patch will be inserted (the "LINK" section in Listing 2). Next a block of unused memory is needed in which to store the line and form feed patch.

Unfortunately, there is no spare memory in the EDTASM. Consequently, the space must be generated. Since the keyboard routine (43EF-445FH) is also located down in ROM, the EDTASM's can be zeroed. Because the EDTASM calls the keyboard driver, a Jump to the keyboard is used. (See Listing 2, Keyboard Driver Patch.) All that remains is to insert the line and form feed patch. (Refer to Listing 2, Line Feed Patch.)

There are two form feed routines provided. The first is manual, and outputs line feeds using the top of form coding in the EDTASM printer driver. This is for printers that do not recognize a form feed (0CH). The second is an automatic routine for printers that recognize a <FF>, and simply outputs a 0CH to the printer.

Number of Lines to a Page

To change the number of lines to a page using the manual form feed above, the contents of 4313H must be changed. It is preset to 66 in the EDTASM program. Using the monitor examine the contents of 4313H and change it to the desired value.

The auto form feed outputs a 0CH command to the printer. Therefore, consult the printer manual for instruction on how to change the length of a page.

TRS-232 Interface

For the readers still thinking about a printer and interface, let me say a word about the TRS-232 interface by Small System Software. It is designed to be plugged into the audio output cable from the TRS-80, and drive a slow, RS-232, serial input printer, like a model 33 teletype. It sells for about $50 ready to run with cassette for the software.

Because of its simplicity,

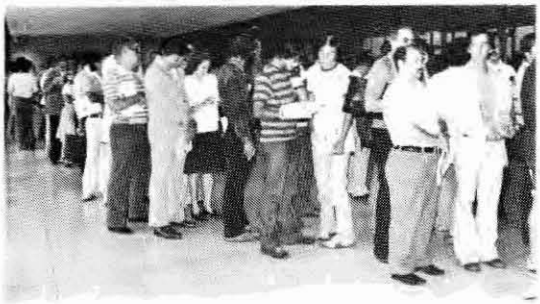
"THE ORIGINAL"

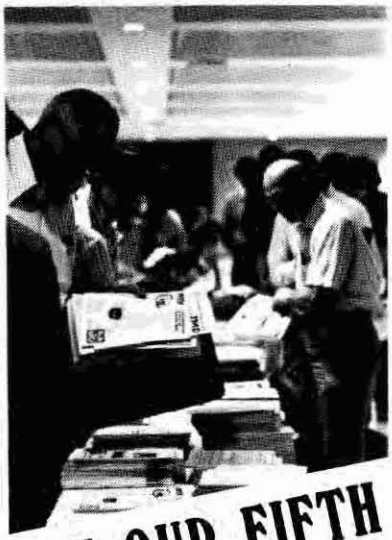
Personal Computing 80

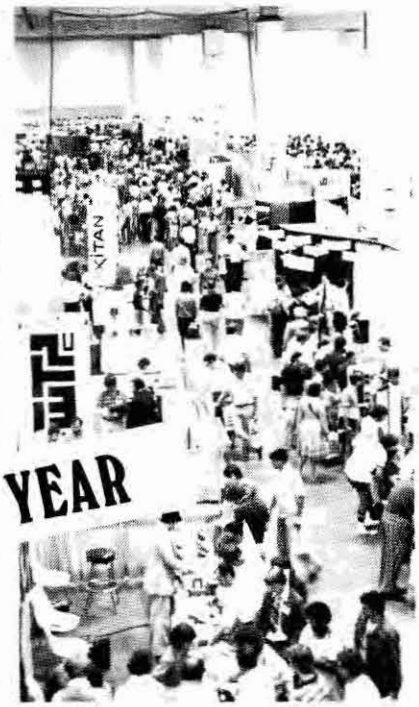
Presents:

Personal Computing and Small Business Computer Show

The Largest Personal Computing Show in 1980







NOW IN OUR FIFTH YEAR

August 21, 22,23, 24th at the Philadelphia Civic Center

- **Major exhibits by the industries leading companies**
- **Thursday, Aug. 21st, Dealer Day ——— 12 Noon to 6 P.M.**
- **Friday and Saturday, Aug. 22, 23rd ——— 9 A.M. to 6 P.M.**
- **Sunday, Aug. 24th ——— 10 A.M. to 5 P.M.**
- **Free Seminars • Robotics Contest • Antique Computer Display**
- **Special Seminars and Tutorials about Computer Music,** Saturday, Aug. 23rd
- **3rd Annual Computer Music Festival,** Saturday Evening, Aug. 23rd
  (Computer Music Festival is sponsored by the Philadelphia Area Computer Society-Tickets on sale at show)
- **Computer Visual Arts Festival,** Sunday, Aug. 24th

Advanced Registration Saves Time & Money

☐ Send_____Dealer-Retailer (4 days) Registrations at $10. each, $12. at door for Thursday-Sunday, Aug. 21, 22, 23, 24

☐ Send_____Regular Registrations (3 days) at $8. each, $10. at door for Friday-Sunday, Aug. 22, 23, 24 only.

Advanced Registrations will be mailed late July - early August. No Advanced Registrations accepted after Aug. 8th.

☐ Send Exhibitor information or Phone 609-653-1188

there is no handshake between the printer and the TRS-80. This means that if the baud rate gets too high, the printer misses data during the head-retract. (NOTE: This article was written, and so were the listings, using Electric Pencil, EDTASM and the TRS-232 interface at 600 baud.)

The interface is housed in a small box with a power cord to a transformer which plugs into an AC outlet and a DB-25 connector to attach to your printer. The interface consists of an OP-AMP used as a level shifter from Transistor Transistor Logic (TTL), 0 to 5 Volts DC, to RS-232, +12 to −12 Volts DC. The parallel to serial conversion is performed with a software driver, which honors the LLIST and LPRINT commands in BASIC, and resides in high core memory. However, the EDTASM does not honor Protected Memory, and consequently the TRS-232 software must be jammed into some area of the EDTASM program.

As before, the EDTASM's keyboard routine is deleted to

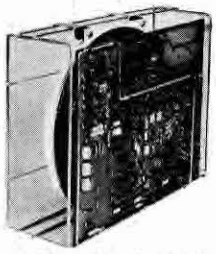
PRIAM Hard Disks Now Available from SIRIUS SYSTEMS!



PRIAM's high-performance, low-cost Winchester disc drives speed up throughput and expand data storage from 20 megabytes to 154 megabytes. And a single controller can be used to operate 14-inch-disc drives with capacities of 33, 66, or 154 megabytes or floppy-disc-size drives holding 20 and 34 megabytes. So it's easy to move up in capacity, or reduce package size, without changing important system elements or performance.

- *Fast, Linear Voice Coil Positioning*
- *10 ms track-to-track positioning*
- *Fully servoed head positioning*
- *Dedicated servo tracks*
- *DC Power required only!*
- *Simple, parallel Interface*
- *Optional SMD Interface*
- *50 ms Average Positioning time*
- *90 ms Maximum Positioning Time*
- *6.4 ms Average Latency*

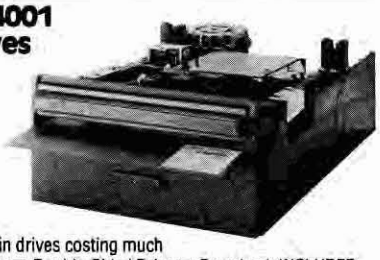
THE PRIAM LINEUP

Model/Disc Size	Capacity	Size	Weight	Price
DISKOS 3350 (14")	33Mbytes	7" × 17" × 20"	33 lbs.	$2995
DISKOS 6650 (14")	66 Mbytes	7" × 17" × 20"	33 lbs.	$3749
DISKOS 15450 (14")	154 Mbytes	7" × 17" × 20"	33 lbs.	$4695
DISKOS 2050 (8")	20 Mbytes	4.62" × 8.55" × 14.25"	20 lbs.	$2995
DISKOS 3450 (8")	34 Mbytes	4.62" × 8.55" × 14.25"	20 lbs.	$3745
DISKOS 570	5.3 Mbytes	floppy-size	(low)	(low)
DISKOS 1070	10.6 Mbytes	floppy-size	(low)	(low)

All PRIAM DISKOS Drives have a Transfer Rate of 1.03 Mbytes/Sec.
Optional SMD interface available for $150.

SIRIUS SYTEMS offer cases and enclosures for all PRIAM Hard Disk Drives. All 14" Winchester Drives will mount in our 14" Standard Case. The 8" Winchesters have two alternatives: a single drive case and a dual drive case. All SIRIUS SYSTEMS Winchester drive cases include Power Supply, internal cabling, switches, fan, extra AC outlet (not switched, but fused) and possess very adequate ventilation. Drive addressing is done on the rear of the Case and not on the drive iteself to provide ease of use during operation. All WINCHESTER DRIVE Cases are Warranted for a full year and come in our standard blue-black color scheme. Consult us for current availability and pricing.

Remex RFD 4000/4001 8" Floppy Disc Drives Double sided . . . Double density!!



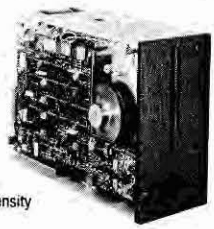
$549.95

RFD 4001, $569.95

Offers quality and features found in drives costing much more! ■ Single or Double Density ■ Double-Sided Drive ■ Door Lock INCLUDED ■ Write-Protect INCLUDED ■ 180 Day Warranty ■ Compatible with Shugart 850/851 ■ Low Power Operation ensures LONGER LIFE!! ■ Model RFD 4001 offers Data and Sector Separator

RFD 4000/4001 Technical Manual **6.95**
Connector Set #3 (AC, DC, Card Edge) . . **10.95**
Connector Set #4 (AC and DC) **2.95**
RFD 4000C/B Cabinet (for use with Power Modules) **29.95**

Remex 1000B . . . If you've been looking for a less expensive floppy disc drive, but not wanting to sacrifice quality — this is it!



$419.95

You get both in the Remex 1000B! For only $419.95 look at what you get: ■ 8" Floppy Drive ■ Single or Double Density ■ Hard or Soft Sectoring ■ Media Protection Feature ■ Single Density Data Separator ■ 180 Day Factory Warranty

Door Lock Option **$19.95**
Interface Adapter (REMEX-to-Shugart) . . . **$14.95**
Write Protect Option **$19.95**
Connector Set #1 (AC, DC, & Card Edge) . . . **$10.95**
RFD 1000B Technical Manual **$5.95**
RFD 1000B CASE (for use with Power Modules) **$29.95**

SIRIUS 8" DISK POWER MODULES

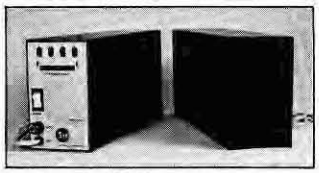
The Single and Dual Drive Power Modules are designed to provide DC and (switched) AC power for one (the Single Drive Power Module) or two (the Dual Drive Power Module—the DDPM will power three RFD 4000s or 4001s) 8" Floppy Disk Drives. Many features are included for safe and reliable operation and the Power Modules come with our standard 180 day WARRANTY (the Open Frame Power Supply warranty is for 2 years). All Power Modules will work with either the RFD 4000C/B or RFD 1000B case (color schemes match also).

Dual Drive
Power Module (DDPM) **$139.95**

Single Drive
Power Module (SDPM) **119.95**

SIRIUS 80+

Perfect Add-Ons for Your Computer System!



The SIRIUS SYSTEMS 80+ Series of Floppy Disk add-ons are designed to provide unmatched versatility and performance for your computer. Consisting of four different add-ons, there is a 80+ Series Floppy Disk to meet your need. All 80+ Series Floppy Disk are compatible with the TRS-80* and come ready to plug in!

COMMON CHARACTERISTICS

- *5 ms track-to-track access time*
- *Auto-eject*
- *180 day WARRANTY*
- *Exceptional speed stability — 1½%*
- *Single density (FM) or double density (MFM/M²FM)*
- *Ultra high reliability*
- *2 year Power Supply Warranty*
- *Mix any or all 80+ Series on the same cable!*
- *Includes user accessible plugboard for drive reconfiguring*

SPECIFIC CHARACTERISTICS

The **SIRIUS 80+1** is a single sided, 40 track, highly reliable Floppy Disk add-on. Offering 5 more tracks than the Radio Shack model, it cost $140 less! Formatted data storage is 102K/20K bytes single/double density.

SIRIUS 80+1 . . . . . **$359.95**

The **SIRIUS 80+2** is a dual sided, 70 track (35 per side), highly versatile Floppy Disk unit. It appears to the TRS-80* as TWO 35 track drives, yet COST LESS THAN HALF THE PRICE! Even greater savings result, since data is recorded on both sides of the media instead of only a single side. Using the plug board, it may be reconfigured for other computer systems! (The 80+2 operates as Drive 0 and any of the other three addresses (with the sandard Radio Shack Cable) or as any of four drives (with the SS Standad Cable).) Formatted data storage is 80.6K/161.2K bytes single/double density.

SIRIUS 80+2 . . . . . **$449.95**

The **SIRIUS 80+3** is a single sided, 80 track, "Quad" density Floppy Disk unit. Offering 2⅓ times the storage of a Standard Radio Shack drive, the 80+3 greatly reduces the need for diskettes correspondingly. Additionally, because of the increased storage and faster track-to-track access time, the 80+3 allows tremendously increased throughput for disk based programs!!! The 80+3 INCLUDES SIRIUS's TRAKS-PATCH on Diskette. Formatted data storage is 204K/40K8 bytes single/double density.

SIRIUS 80+3 . . . . . **$489.95**

The **SIRIUS 80+4** Floppy Disk add-on is a double sided, 160 track (80 per side), 5¼" monster! The ultimate in state-of-the-art 5¼" Floppy Disk technology, to 80+4 is seen by the TRS-80* as two single sided disk drives, each with 80 tracks. Thus, in terms of capacity one 80+4 is equivalent to 4⅔ standard Radio Shack drives — a savings of over 73% (not to mention diskettes!!!). (With a double density converter, the available memory is huge!) The 80+4 is similar to the 80+2 in that it arrives configured as Drive 0 and any of the other three addresses (with the standard Radio Shack Cable) or as any of four drives (with the SS Standard Cable). The 80+4 INCLUDES TRAKS-PATCH on Diskette. (The plug board is also included.) Formatted data storage is 408K single density or 816K bytes double density.

SIRIUS 80+4 . . . . . **$624.95**

All 80+ Series Floppy Disk add-ons operate a 5 milliseconds track-to-track access time (eight times faster than the SA 400) but are Expansion Interface Limited to 12 milli-seconds for the TRS-80*.

*TRS-80© Tandy Corp.

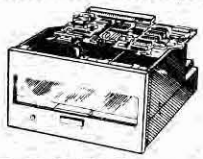
MPI 51/52 . . .

A Great Reliable Mini-Drive!

- *Fast! 5ms track to track access*
- *Exclusive Pulley-Band Design*
- *Unique Door/Ejector Mechanism*
- *Reliable 1½% Speed Stability*
- *Single/Double Density Operation*
- *Industry/ANSI Standard Interface*

MPI 51
(Single Head, 40 tracks, 120K/240K bytes Single/Double Density**) **$259.95**

MPI 52
(Dual Head, 70 tracks, (35/side), 218.8K/437.5K Single/Double Density**) **$349.95**



MPI 91/92 . . . NEW STATE-OF-THE-ART DISK DRIVE!

MPI 91
(Single Head, 80 tracks, 240K/480K Single/Double Density**) **$389.95**

MPI 92
(Single Head, 160 tracks (80/side), 480K/960K Single/Double Density**) **$499.95**

**Unformatted data storage*

Introducing the Versatile, Low-Cost OMEGA Series Controller

As new technological advances bring down the cost of fast, reliable mass data storage, the need for an inexpensive, versatile controller have become greater and greater. To meet this need, SIRIUS SYSTEMS' OMEGA Series Controller was designed.

The SIRIUS OMEGA Series Controller Module utilizes an **on-board microprocessor** to mediate data transfer to a wide variety of peripherals from an equally wide variety of host computer systems. Up to four Winchester Hard Disks (8" or 14"), four 5¼" Floppy Disks Drives and/or up to eight 8" Floppy Disk Drives may be **in use at one time.** Host systems interfacing is accomplished via a parallel or a serial interface. With the additon of a Personality module, the OMEGA Series Controller Module is directly **compatible with many popular computer systems** (among them the TRS-80*, Apple, Heath, and others). Provision is made for the addition of a streaming tape drive, also.

SPECIFIC HARDWARE FEATURES INCLUDE:

- *Control of up to twelve Floppy Disk Drives (eight 8" and/or four 5¼")*
  - *8" and/or 5¼" Disk Drive Utilization*
  - *Single (FM) or Double (MFM) density data storage*
  - *Hard or Soft sectored diskette usage*
  - *Utilization of "Quad" density (96 tpi) 8" or 5¼" Disk Drives*
- *Control of up to four WINCHESTER type PRIAM DISKOS Disk Drives*
  - *8" or 14" may intermix on the same cable*
  - *Accommodates 8" and/or 14" drives of 5.3Mbytes to 154Mbytes*
  - *Ultra-Fast data transfers*
- *Extremely flexible host-controller interfacing*

SPECIFIC SOFTWARE FEATURES INCLUDE:

- Dynamic format modifications via command words
- Extremely flexible format acceptance for unusual data storage formats
- Easily interfaces to standard operating systems (TRS-DOS*, CP/M***, etc)
- Operates in either get/put sector mode or data string mode
- Performance parameters may be changed by EPROM replacement or Dynaminic Reprogramming

Dedicated systems cards are also available on a limited basis for the STD-BUS and the S 100. These cards feature shared memory also (again, software selectable) in addition to the regular OMEGA Series Controller Module features. Consult SIRIUS SYTEMS for current price and availability for the entire line of OMEGA Series Memory Units and Controllers. **Dealer inquiries are invited.**

TO ORDER CALL (615) 693-6583

Phone Orders Accepted 9AM-7PM (ESDT)

We accept **MC, VISA, AE, COD** (requires Certified Check, Cashier's Check or Cash) and **Checks** (personal checks require 14 days to clear). **SHIPPING AND HANDLING:** $7.00 per Floppy Disk Drive or 80+ Module ■ 5% for other items (any excess will be refunded) ■ **Foreign Orders** add 10% for Shipping & Handling. Payment in U.S. currency ■ Tennessee residents add 6% Sales Tax ■ **VOLUME DISCOUNTS AVAILABLE**

give you the needed memory area for the TRS-232 printer driver. A Jump to 03E3H is inserted at 43EF as the first instruction of the EDTASM keyboard routine (Listing 3). This transfers the program flow down to the ROMs for the keyboard driver.

Now comes the hard work. Enter the object code for the TRS-232 printer driver routine starting at 43F5H. Don't forget to insert the proper hex code for your desired baud rate from the hex table on page 5 of the TRS-232 manual. You should have three bytes of 00H at 43F2-43F5H and one byte at 445FH that are still NOPs (00H). Boy, that was close.

All that is left to do is link the new driver routine to the printer routine in the EDTASM program.

To link the new printer driver to the old one in the EDTASM, zero the old printer driver. It resides from 45AA-45F5H. Examine 45AB-45ADH and replace the 00Hs with a jump to 43F5: C3 F5 43.

Now that wasn't so bad, he said, as the sweat rolls off his forehead. All that is left to do is save a copy of this modified version of EDTASM, using the PUNCH command of your monitor.

The only shortcoming of this modification is that it cannot generate a form feed.

Form Feed for EDTASM/TRS-232

A program that gives you a form feed can be located where the EDTASM's original printer driver was located. Refer to Listing 4 for the source of this modification.

Again, as in all modifications, you must link from the main program to the patch. This is accomplished by the LINK section, by replacing the CP CR and the JRZ,NULLS instructions with a jump to the form feed patch.

The first two instructions in the form feed routine must be the two instructions we replace by the LINK. If the last character printed is not a <CR>, the program flow is transferred back to the TRS-232 program. If the last character is a <CR>, the line counter (established at 4029H,

Listing 4. Form Feed for TRS-232.

```

the L.C. for the ROM printer driver) is incremented and checked against a constant.

This constant controls the number of printed lines on the page. In the source listing it is set to 54 lines per page. If the end of page is not reached, program control returns to the TRS-232. When the end of a page is reached, line XXXX controls the number of line feeds sent to space between pages.

After the top of form has been executed the line counter is reset. This completes the printer modifications to the EDTASM.

EDTASM and Protected Memory

The ENTRY point (cold start) to EDTASM is 468AH, and the execution of this coding checks the memory, sets up the stack and some of the pointers (See Listing 5).

The text buffer, where text can start, is the first item taken off. It is 5CF9H and this value is stored in cell 4115H. The memory test resides at 4693-469FH, and the end of memory

Listing 6. EDTASM and Protected Memory.

pointer is cell 4113H. As you can see, the EDTASM uses the reserved section of RAM, but unfortunately the pointers for BASIC are 40B1/40B2H and 40D6/40D7H.

To get the EDTASM to honor protected memory, you must delete its memory test, 4693-469FH. (Normally, this is not a very good idea, but when the TRS-80 is powered up the ROMs do a memory test.) Then insert the patch in Listing 6. All this routine does is copy the contents of 40B1 and 40B2H into 4113 and 4114H.

Reentering BASIC

When the B key is entered in the EDTASM, the program jumps to the address contained at cells 4930 and 4931H. Since, the warm start, reentry point, for BASIC is 1A19H, all that is required is to change the contents of 4930 to 19 and the contents of 4931 to 1AH. (Remember that the Z-80 CPU always reads the first byte of an address as the Least Significant Byte.)

If you are using a monitor and wish to work on the EDTASM, then Jump back to your monitor, instead of reentering BASIC at 4930 and 4931H, insert the starting point of the monitor.

Reentering EDTASM

Have you ever accidently jumped out of the EDTASM, or gotten a power glitch and returned to "MEMORY SIZE"? This is frustrating especially after working for an hour or more on a program. Wouldn't it be nice if you could reenter EDTASM and still have your text?

EDTASM's warm restart is located at 46DAH. At this point the only pointer that is reset is the STACK, therefore, all of the text pointers are intact. To reenter EDTASM from BASIC, enter SYSTEM <ENTER>, then after it prompts " *? " enter /18141<ENTER>.

From monitor, use its GO (G) or Jump (J) instruction and jump to 46DAH. If you did not enter the program in Listing 6, you can replace EDTASM's memory check with the program in Listing 7. This program will load the SYSTEM entry pointer (40DF and 40E0H) with the warm re-

	EDTASM	BASIC	Description
1.	4318H	01D9H	Baud rate generator
2.	4338H	01F8H	Turn off cassette
3.	433DH	0215H	
4.	4346H	021EH	
5.	4354H	022CH	Flash asterisk
6.	435DH	0235H	Input 1 byte
7.	4369H	0241H	
8.	4389H	0264H	Output 1 byte
9.	43A9H	0284H	Turn on cassette
10.	43B8H	0293H	Find leader & sync byte

start vector. Now any time you exit EDTASM to BASIC, enter SYSTEM, and after the prompt " *? " enter / <ENTER>.

EDTASM's Device Control Block

1) 4300-4307H Keyboard
2) 4308-430FH Video
3) 4310-4317H Printer

The various driver routines are located at:

1) 43EF-445FH Keyboard
2) 4460-45A9H Video
3) 45AA-45F5H Printer

To replace all of the drivers, change the contents of 4615H to C2 and 4616H to 03. All of the coding between 43CEH and 45F6H can now be replaced by NOPs, leaving about 512 bytes for other modifications.

To gain another 400 bytes the cassette routines can also be deleted by calling the ROMs. This will require a little more work and a monitor with a Find (F) or Word (W) command. These commands search memory and find a 2-byte sequence. The calls to the various cassette routines must be found and replaced by the respective calls to ROM. The EDTASM to BASIC cassettes calls are:

The EDTASM routines that call the above starting addresses have to be found. Then the corresponding BASIC addresses have to be substituted.

Once the D.C.B.s and the CRT keyboard and printer drivers are replaced by ROM calls, the memory from 4300H to 45F5H can be deleted and is available for further EDTASM modifications.

The old cliché "Necessity is the Mother of Invention" is so very true. I use all the routines just described in some form or another. I have both a Datel 1030 IBM-based Selectric and a Heath H-14 printer on line to my TRS-80. Both are RS-232, serial printers.

The Datel is driven by a homebrew printer interface that provides both line feed on carriage return and adjustable head retract delay time.

The H-14 is presently driven by a TRS-232 interface. Although these printer programs don't cure all the printer ills, they sure go a long way to provide hard copy from the EDTASM. ■

Use a BASIC program to take some of the pain out of machine code programming.

AUTOPOKE

Jasper E. Kump
PO Box 108
Pyatt AR 72672

One of the many advantages of TRS-80 Level II BASIC over Level I BASIC is the ability to use machine-language routines in conjunction with BASIC routines. Although it is a relatively easy language in which to write programs, in some cases, BASIC is inconveniently slow. On the other hand, machine-language routines will run fast enough for almost any purpose, but it is a much more difficult language to use.

In most programs the good features of both can be taken advantage of by combining the two. You can write the major part of the program in the much easier BASIC, using the much faster machine-language only for what would be, in BASIC, the time-consuming sections. I found that this system works very well. A few problems had to be solved first though.

Loading Machine Language

Normally, a machine-language program must be loaded using the SYSTEM command, but using both loaded methods would have been inconvenient. So I devised a loading method to load the machine-language routines with a BASIC routine and avoid the necessity of using the SYSTEM command. It would have been inconvenient also to have to load the T-BUG program every time I wanted to check and perhaps change a few locations in memory or write a machine-language routine.

The PEEK and POKE commands are too slow and cumbersome for this purpose. Besides, converting Z-80 instructions from hex to decimal for more than a number or two is a chore. I wrote the AUTOPOKE program as a solution to this problem and as an aid in writing the loading routine.

The method of loading machine-language routines with a BASIC routine requires writing data strings, which are prone to error. The second part to AUTOPOKE provides samples of what the data strings should look like—exact in the location of every letter, number and punctuation mark so that when you are writing a data string using the sample as a guide it is easy to spot some types of errors.

For example, if the last character on your line does not

```
64000 PRINT"    ALL ENTRIES IN THIS PROGRAM MUST BE IN
      HEXIDECIMAL NOTATION EXCEPT THE LINE NUMBER OF THE
       FIRST DATA STRING."

HALF A MILLION TAX RETURNS CAN'T BE WRONG!
(OR THEY HAD BETTER NOT BE)

INCOME TAX SYSTEM
FOR TRS-80* MODEL I OR II

Our system, which prepared 500,000 1979 returns, features the following:

1. Full interactive user control, **in tax-form language only,** line-by-line.
2. Screen display of full 1040 and all schedules, prior to printout.
3. Change of a single amount item automatically changes and re-computes entire return.
4. All printout formats IRS and state approved.
5. Stores Preparer's Identification for automatic printing at bottom of page 2.
6. Built-in Validation Check tests entire system, hardware and software.
7. Special Printer Adjustment routines, Line Length, etc.
8. Selection of closed or open output formats—for standard Form 1040 or open name-box types.
9. **Software control of text position on page.** Makes forms-alignment simple. Permits use with non-adjustable printers.
10. Fills in pre-printed Forms or you can use overlays. Your choice.
11. Automatically computes: Tax - SDI Overpayment - Wages Total from W-2's - Earned Income Credit - Income Averaging - Maximum/Minimum Tax - Least Tax Method - All Percentage of Income Limitations - All Fixed Limitations - many, many more.
12. Full support through the tax season — no charge.
13. Inexpensive yearly updates in accordance with tax-law changes.
14. Modular construction — lets you order only the type and size system you need.

PRICING STARTS AT $189.95 (1040 & SCHEDULE A)

25-PAGE DESCRIPTIVE MANUAL $7.50 (Refunded on Order)

MINIMUM SYSTEM REQUIRED: MODEL I, 32K, 1 DISK DRIVE

*TRS-80 IS A TRADEMARK OF TANDY CORP.

match the last character on the corresponding line of the sample, you will know immediately that an error has been made. This will not detect a mistyped number, naturally, but it does detect errors of omission and keybounce. To check for mistyped numbers, stop the program after the machine language loading routine and then use AUTOPOKE to run through what was loaded and check it against your listing.

Two other pieces of information you will need for the loading routine are also supplied by AUTOPOKE. They are the decimal starting address of the routine and the number of bytes in the routine. Example 1 illustrates how to write the BASIC routine for this loading method.

The object code for the routine, in decimal form, is written in one or more data strings. The FOR-NEXT loop on the next line reads the data strings and pokes the object code into its proper place.

There is a handy by-product of this method of loading. If you were using the normal method of loading a machine-language routine, such as T-BUG or AUTOPOKE, and one or more bytes had to be inserted into the routine, every byte from the point of the insertion to the end of the routine would have to be retyped to relocate it. Not with this loading system!

All you have to do is insert the additions into the data string at the proper place and increase the number of bytes to be read by the FOR-NEXT loop. The next time the routine is loaded, your additions will be loaded into their addresses and the remainder of the routine will be automatically relocated according to the number of bytes that were added. The only other thing you have to do is take care of any jump or call addresses that might have been affected.

I have used the word "routines" a number of times. The Level II BASIC manual says that there is only one USR call allowed unless you have Level II Disk BASIC. Although this is true, it does not limit you to one machine-language routine! It only limits you to one address that you can call with the USR command. If, at that one address, you have a routine to jump to the starting addresses of other routines according to some sort of coding, you can use as many machine-language routines as you need. Example 2 shows how such a routine might be written. Immediately before each USR call in your BASIC program, POKE into address 7D01 (32001 decimal) the number of the routine you want to use at that time.

I hope you find the AUTOPOKE program and this method of loading machine-language routines as helpful as I have.■

```

Utilize the unused ICs in your TRS-80 and turn it into a half duplex terminal.

300 Baud Terminal

Timothy Loos
50 Depot St.
Athens OH 45701

It's easy to add I/O to the TRS-80 using its unused ICs: just cut a few foils and add a few jumpers. This will give you a single input and output port. Big deal, you might say, but with a little software they can be used as serial input and output ports. To illustrate what can be done with serial I/O, this article will tell you how to turn your TRS-80 into a 300-baud half-duplex terminal. The best part of this project is that no extra hardware is needed; there is no need for a fancy and expensive interface unit.

The schematic for the I/O ports is given in Fig. 1. (For more information about the internal workings of the TRS-80 refer to the TRS-80 *Microcomputer Technical Reference Handbook*, RS catalog no. 26-2103.)

You must first carefully take apart your TRS-80 and expose the main PC board. Find ICZ60. All the ICs are well marked. Photo 1 shows the bottom of the main PC board. The small board on the lower right is the Level II ROM board. It is covering up half of ICZ60. Unsolder Z60 and cut the foils connecting pins 12,14,15 together to ground. Now is a good time to put in a socket for ICZ60. (Molex pins are actually preferable, since they enable you to get to the foils under the IC.)

Next, cut the foils on ICZ7 that connect pins 10,11,12,13 together to ground. The foils are on the bottom side of the PC board so that you do not need to unsolder the IC.

Make the following connections on the bottom side of the PC board (i.e., the side the ICs are not on):

1. Connect pins 1,10,13 of Z7 together.
2. Connect pins 13 of Z24 to pin 11 of ICZ7.
3. Connect pin 11 of Z44 to pin

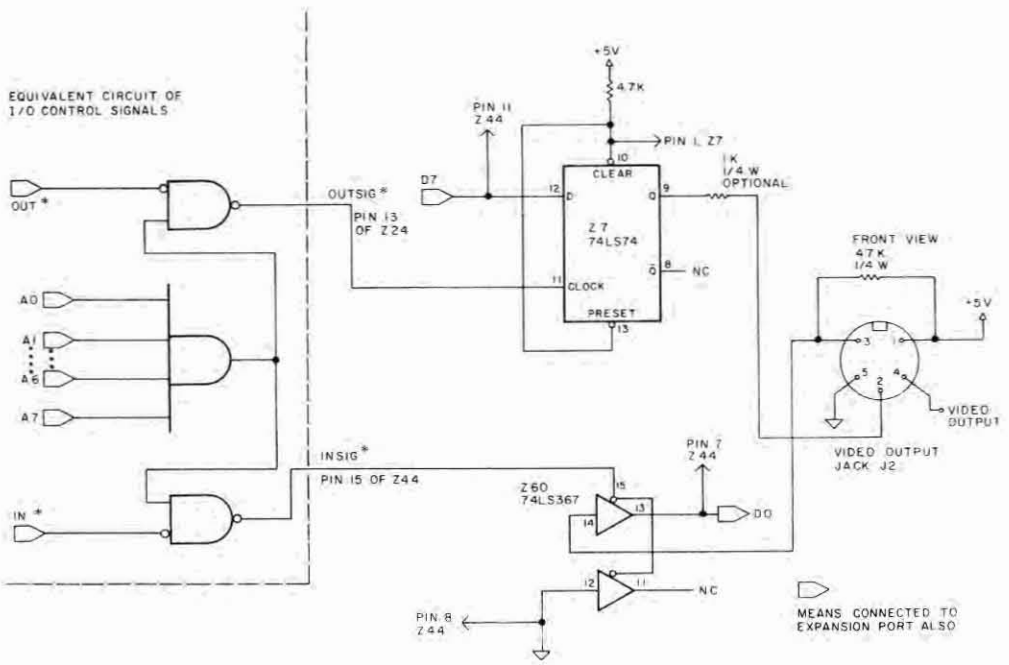

Fig. 1. TRS-80 input/output port schematic.

Program listing.

12 of Z7.

4. Connect pin 9 of Z7 to pin 2 of the video output jack, through a 1k ¼ Watt resistor. (Omit resistor and direct connect if you are going to use LSTTL circuitry instead of the optoisolator circuitry given in Fig. 2.)
5. Connect pins 1 and 3 of the video output jack together through a 4.7k Ohm ¼ Watt resistor.
6. Connect pin 14 of Z60 to video output jack pin 3.
7. Connect pin 15 of Z60 to pin 15 of Z44.
8. Connect pin 13 of Z60 to Z44 pin 7.
9. Connect pin 12 of Z60 to pin 8 of Z44.

Phew . . . you are now finished. Reassemble the TRS-80.

The last thing you must do is make extra connections on pins 2,3 and 5 of the DIN connector that plugs into the video output jack. Pin 2 is the port output. Pin 3 is the port input and pin 5 is ground. Be careful with all connections, since it is possible to short out the +5 supply (pin 1) and the video output (pin 4). If you have the Radio Shack video monitor you might have to buy another DIN connector, since they are premolded assemblies and might be hard to take apart. Radio Shack stores sell DIN connectors.

Controlling the Ports

To read the input port in Level II BASIC, use the statement Y = INP(225). The lowest bit, D0, of Y will be the input port bit. In machine language, use the command IN FF, fol-

```

Underside of the TRS-80 main PC board, showing the locations of ICs and the video output jack.

lowed by AND A immediate with 01. This will input D0 into the A register.

The output port is controlled by the BASIC statements OUT 255,0 to output a 0 and OUT 255,128 to output a 1. Note that setting bits D0 and D1 under the OUT 255 command activates the cassette output, setting bit D2 activates the tape relay and D3 activates the double-sized characters. Therefore, make sure you set bit D7 only. The machine language commands are LDA 80, OUT FF to output a 1 and LDA 00, OUT FF to output a 0.

Fig. 2 shows an optoisolator circuit that can be used with the input and output port. The circuit provides isolation between the TRS-80 and the external circuitry. This circuit is optional, but I think that it is a good idea to have such a circuit since your TRS-80 is isolated from your I/O external circuitry. If your external device accidently shorts out or applies the wrong voltage, your TRS-80 will be safe. It also helps eliminate ground loops, etc.

UART Program Description

The software necessary to operate the input and output port as a 300 baud serial input and serial output port is listed in Table 1. This program is adapted from Dan Stogdill's article, "Experiments in Software" (May, 1978 *Kilobaud*, p. 44). For a Level II, 4K system the program is stored in memory at location 116-000 octal. The program is designed to be called using the USR(n) function of Level II BASIC. Alternately, it can be run by typing SYSTEM followed by /20157, the decimal starting address of the machine-language program.

The program is divided into five routines:

Routine A—The output UART

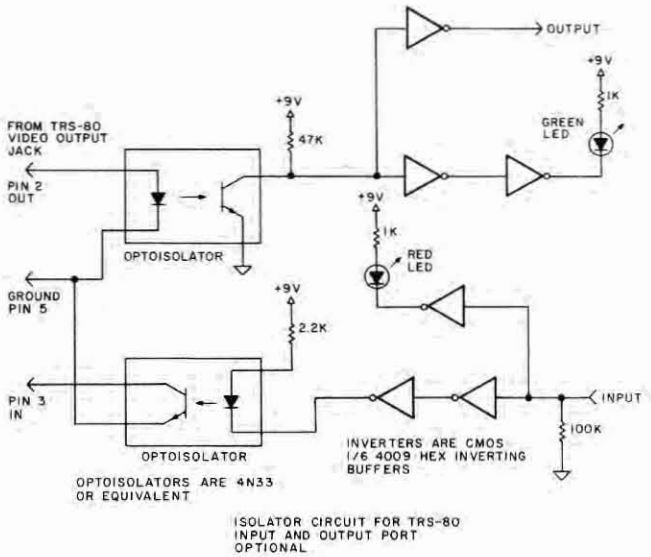

Fig. 2. An optional isolator circuit for TRS-80 input and output port. Optoisolators are 4N33 or equivalent. Inverters are CMOS 1/6 4009 hex inverting buffers.

Introducing the one printer worth buying on reliability alone.

Epson.

What do you want from a printer for your TRS-80? Speed? Graphics capability? Reliability?

Consider this: of the first several thousand Epson TX-80 printers sold in Europe, less than 1% came back for service. *No one* else can match that record of reliability. And if you own a TRS-80, you can add the remarkable printing capabilities of the TX-80 right now. Today.

We'll give you a full 96 ASCII and 64 graphic characters at the rate of 125 CPS in 80 columns of clean, easy-to-read 5x7 dot matrix. And a jeweled print head with a life expectancy of 100×10^6 characters. And our optional GRAFTRAX bit plot graphics capability. And one more thing. A very low price. Because we make more printers than anybody, we can afford to sell each one for a little less. So you can have a TX-80 for your very own starting at about $710.

The TX-80 is the very high quality, very affordable printer you've been waiting for. Wait no longer.

Write to us, and we'll tell you where to get one.

✓Reader Service index—see page 194

subroutine starts at 116-000. This routine serially outputs seven bits in the A register, adding start, stop and parity bits.

Routine B—The input UART routine starts at 116-100. A 7-bit word is read in from the input port and returned in the A register.

Routine C—The input UART program—driver subroutine starts at 116-200. This routine displays received characters on the TV screen of the TRS-80. If the character is a DC1 control character (you might want to change this character for your particular application), this signifies the end of the transmitted message and a machine language RETURN is executed.

Routine D—The program starting at 116-275 is the entry point from BASIC that puts the TRS-80 into the terminal mode. Whatever you type at the keyboard is displayed on the screen and transmitted serially from the output port. When you type ENTER (i.e., carriage return), the TRS-80 goes into the listen mode (subroutine at 116-200 is executed) and the output is displayed on the screen until a DC1 is received, causing the program to go back into the transmit mode. If a character is received while transmitting, the program automatically goes into the listen mode. If you type a shift arrow (↑), the program will return to BASIC.

Routine E—The routine starting at 116-240 allows Level II systems to use the LList and LPRINT line printer commands to output to the serial output port and to the TV screen. This implementation directs the TRS-80 into the listen mode waiting for a DC1 control character after it transmits a carriage return before it can print the next line. The routine requires that 160 be POKEd into memory at 16442 and 78 at 16443. This sets the line printer driver address (i.e., the program that the line printer commands call) equal to the Routine E starting address.

Program A.

Modifications

The program listing is used with a Level II, 4K system. Make sure to reserve memory for the program by typing 19967 when asked for the memory size. Also make sure to POKE the starting address of the program in locations 16526 and 16527 decimal (low-order byte in 16526). For Level II 16K systems, the program should be relocated to a starting location of 175-000 in order to make use of the extra memory available. Memory size 31999.

For Level I systems you must relocate the program and change the entry points for the keyboard-scan routine and the display to screen. The program must also run under a monitor similar to T-BUG. If you have a Level II system, you can load the machine-language program under BASIC. The instructions in octal can be stored in DATA statements, converted to decimal and then POKEd into memory. Program A illustrates how it is done.

The advantages of serial I/O are many, but the best part is that you do not need extra hardware or parts . . . only a few for the optoisolator circuit. Also, you only need three lines from the TRS-80 to the external device.

If you need the serial data from the TRS-80 converted into parallel data and the data from the external device converted into serial data, refer to "Build a Serial to Parallel Converter" (November 1978 *Kilobaud*, p. 84). This article describes an easy circuit to do just that. ■

The next logical step.

Towards Machine Language

Allan S. Joffe W3KBM
1005 Twining Road
Dresher, PA 19025

Sooner or later you will have had your TRS-80 long enough to feel comfortable with BASIC. When this plateau is reached, the urge to explore machine language is not too far behind.

If you take a look at the instruction set for the Z-80, you might decide that BASIC is better than ever. Still, you know that machine language is fast and the mastery of some of its mysteries has got to make you a more complete programmer.

What You'll Need

Before you tread the maze of this new discipline, face the fact that hexadecimal is a necessity and learn or relearn it. You'll need a monitor program, which allows you to communicate with your computer at its gut level. There are a number of different monitors around, my own choice being T-BUG by Radio Shack. It's both flexible and easy to use.

Also you'll need a guide book that gives you machine language fundamentals. I can recommend *TRS-80 Assembly-Language Programming* by William Barden, Jr. for its clarity.

If you can possibly get hold of the Z-80 instruction manual by Zilog you will have a much more informative map of the instruction set.

Your window to the world of the TRS-80 innards is going to be memory locations 3C00 to 3FFF, the video memory.

I'm going to assume that you have bought a copy of T-BUG and the Barden book. One of its sample programs on page 77 takes a character, loads it into a register and makes the character appear in the center of your monitor.

```
4A00    3E31
4A02    32203E
4A05    C3054A
```

To RUN this program you would execute a J4A00.

This program works like a charm and locks itself tightly into a loop that can only be broken by RESET.

The problem is in the third line, a LOOP instruction. We can make a simple change, 4A05 C38043, which will make the program run as before, but will return to the start of T-BUG. This avoids your having to use the RESET button and go through the T-BUG entry routine each time you run a change.

To phrase a computer happening in Capitol Hill overtones, the C3 instruction in memory location 4A05 is "the moral equivalent of a BASIC GOTO command".

BASIC Parallels

If you wrote in BASIC, 10 GOTO 10, you would have created a parallel situation, namely a loop. The same is true for any number of machine language codes. Thus C9 is a RETURN, C3 is a JP NN where JP stands for JUMP (or GOTO) and the NN represents the address to be JUMPed to in hex notation.

Let's go back to the little program and examine certain notation conventions and peculiarities that can give the machine language tyro a case of the "undecideds."

Taking one memory cell at a time 4A00 3E is an LD A,N instruction which can be read: Load the A register with N, N being a hex value for the desired character, in this case 31H which will produce the numeral 1 on the screen.

Notice that while we are only delineating the memory cell value for the first entry, that by convention it is understood that 4A00 3E 31 is placing the 3E in memory location 4A00 and that memory location 4A01 gets the value of 31 placed into it. This saves writing many location numbers, if indeed, you know what is being done. This may sound simple, but I have yet to see the person born with the proverbial silver spoon of machine language in his or her mouth.

If you wanted the letter A instead of the numeral 1, you would substitute 41H and the character on the screen becomes an A.

4A02 32 20 3E now begins to make a bit more visual sense when you realize that these items represent the contents of the next three memory cells in the program.

The contents of memory location 4A02 is a 32 instruction—LD(NN),A—that can be read: LOAD location in memory specified by NN with the contents of the A register. Now we have to specify into what memory locations the information in the A register is to go.

The program defines this location as 20 3E, which brings up a bit of a sore point. Your TRS-80 window to the world is the part of memory dedicated to lighting the monitor screen. This runs from 3C00H to 3FFFH. You have guessed that 203E must fall within this window, but something does not look right.

If you remember that the lowest part of the address goes in first and the highest part of the address goes in last, then mentally you can turn 203E into 3E20, which is how the computer visualizes it.

When you do this, a little calculation will show you that 3E20 is just about in the middle of the window range of 3C00H to 3FFFH. The decimal value of 3C00H is 15360 and the decimal value of 3FFFH is 16383.

4A05 C3 8043 starts to make a bit more sense. The C3 JUMP instruction is followed by the address to jump to and once more we see the last first, first last, reversal of the address. The real address is 4380, which is the start of T-BUG.

F3 42	These are the program "pointers."
0A 00	This is the line number in hex which is entered in last-first, first-last style. In actual human terms it is 000A which translates to 10.
B2	This is the compact code used for all of the TRS-80 reserved words. They are all 80H and higher. B2 is PRINT,80 is END,81 is FOR . . etc.
20	This is the ASCII code for the space between the T in PRINT and the " preceding the X.
22	This is the ASCII code for the " preceding X.
58	This is the ASCII code for the letter X
22	This is the ASCII code for the closing " after X

Example 1.

Now if you run this program and execute a J4A00 using T-BUG, everything rolls up off the screen, and you are left with a clean display with a numeral 1 in the center of the screen and the # sign in the upper left hand corner, indicating T-BUG is standing by, ready to execute your orders.

Using T-BUG

You can go from T-BUG back to BASIC with a J 1A19, which will bring up the READY that you are used to seeing when BASIC is hot to trot. Remember this fact of life. When you write a BASIC program in the usual fashion, the first memory location that this program uses is 42E9H or 17129 decimal.

T-BUG starts at 4380H or 17280 decimal, so if T-BUG is in residence you don't have many memory locations between the start of BASIC and the point where a BASIC program would be busy wiping out the T-BUG program.

It would have been nice, if the folks who created T-BUG would also have rewritten a version that resided in high memory. This would free RAM in low memory for BASIC programming.

Another small housekeeping hint when clearing a screen full of data. You have at least two options. You can execute a J 4380 or a J 40A4 with T-BUG, either of which will clean up the screen leaving you with the # sign in the upper left hand corner.

Before going on to another machine language program let us examine a line of BASIC programming using T-BUG, which may provide you with some answers and certainly raise many more questions about this new vista of machine language.

Assume that you have loaded T-BUG into your TRS-80 and then have executed a J1A19 that gets you back to BASIC. Clear the screen, and type in this line: 10 PRINT "X". Now return to T-BUG, and using the M command, we find the items in memory locations 42E9 to 42F1 inclusive in Example 1.

Machine Code LISTING

There is a world of information to be learned on just how and in what form your TRS-80 does its thing. It's annoying that Tandy Corporation makes it so hard to come by this information. It is tough to figure why any information that makes a product easier to use by its purchaser is so cloaked in proprietary secrecy.

Using T-BUG, punch in this series of commands starting at memory location 5000: CD # F6 F6 04 3E 31 32 20 3E 76.

Now jump to J 5000. Interesting, isn't it?

All of the information on the screen is in the large print format. What you have done is call an instruction in the ROM, which is located at memory location 04F6, and, presto, you have a very handy routine. There are literally hundreds of these "instant" machine language routines locked away in your Level II ROM. All you need to know is their starting address and their functions.

To help your programming make up a card that shows you which CPU register is which, when you use the R command of T-BUG to display the contents of these registers. It will make life simpler

Block Transfer

Let's examine one of four very

Table 1. Codes for List of Reserved Words in Level II Manual.

nice Z-80 processor commands that come under the general heading of block transfer, a series of commands that move existing information in one part of memory to another quickly and easily.

Let's look at LDIR. Think of it as Load, Increment and Repeat. Three sets of registers have to be initialized. The instruction must know where the data is in memory that you want moved; to where you want it transferred; and, finally, just how many bytes of data are to be transferred.

The HL registers, used as a coupled pair, are loaded with the starting address of WHERE THE DATA IS COMING FROM (source).

The DE registers, used as a coupled pair, are loaded with the starting address of WHERE THE DATA IS TO GO (destination).

The BC registers, used as a coupled pair, is loaded with a hex value that gives the total byte count that you want to move.

Here is a simple demonstration program of the LDIR command.

Starting with memory location 5000, load the following:

```
11 20 3E 21 00 60 01 0C 00 ED B0
```

Let's examine what this series of memory contents is to do.

- 11 loads the DE register pair with the hex values 203E. This address is in the middle of the video memory window.
- 21 loads the HL register pair with the hex value of the address where the information is stored. In this case the value is 00 60, which, in human terms, is 6000.
- 01 loads the BC register pair with the value 0C00 which translates to 000CH or 12 in decimal. This is the total number of bytes we are going to transfer.

The final two bits of information, namely EDB0, are machine code for "execute the block transfer, please." Now, all we

have to do is put the planned 12 bytes of data into the memory location we have designated, which starts at location 6000H.

Again using T-BUG, load the following memory information starting at 6000H.

```
44 41 4E 20 49 53 20 53 4D 41 52 54 C3 80 43
```

This simple message reads: DAN IS SMART and appears in the middle of your screen when you execute a J5000. All the values with the exception of the last three (C3 80 43) are ASCII values that represent the letters making up the message. The numeral 20 is the ASCII code for a space.

The C3 80 43 is the command that sends the program back to the start of T-BUG after running the program. In this manner you are ready to re-program, if you wish, without having to break out of a loop which you might need to hold the message on the screen.

Conclusion

Naturally, you are not limited to alphanumerics here. The graphics character set corresponds to ASCII codes 81 through BF (hex, naturally), so if you replace the 12 bytes in the 6000 section of memory with any of the ASCII graphics symbol codes, you will see them displayed on your screen.

When you get ambitious, you will want to move many more than 12 bytes, but if the move is into the video memory window don't "over-byte" outside the window limits or you will find your computer doing strange things. You will have transgressed into dedicated memory areas.

Machine language is worthwhile, if, for no other reason, than to learn to admire all the people who worked so hard to develop it. If you are interested in speedy graphics, then it is a must. Just remember to be logical and not paint yourself into a corner. ■

Switching from Model I to Model II.

Rites of Passage

Dan Keen
Dave Dischert
RFD 1 Box 432
State Highway 83
Cape May Courthouse, NJ 08210

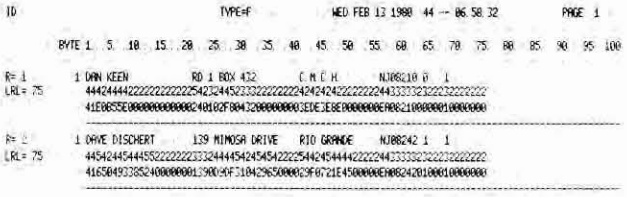

Fig. 1.

Model I owners, hold on to your hats. With the advent of Radio Shack's TRS-80 Model II, there are new things to learn and old habits to break.

Just sit down at the Model II keyboard to get started. Surprise! The backspace, @, (,), ", *, and : are in different positions because the keyboard is laid out like a standardized typewriter.

Other key changes include a TAB which replaces →. The ESCape key is substituted for SHIFT plus ↑ to exit the line EDIT mode. There's a repeat key which is another useful editing tool. Hold down the space bar or backspace in conjunction with the repeat key and you speed across a line.

SHIFT and LOCK keys are provided for typing all capital letters. The LOCK is important when you enter DOS commands, since they require uppercase. BASIC isn't so fussy; upper or lowercase commands are both valid.

In both BASIC and DOS the CLS command is used in place of the CLEAR key of the Model I. Instead of holding SHIFT plus @, a new key, HOLD, stops scrolling of a display listing.

Besides these key changes, several commands have been altered. Most of the commands and functions for the Model II are the same as Model I's TRSDOS, so it's a fairly smooth transition. For instance, EDIT is the same, and the CMD command has merely been renamed SYSTEM. Other commands and changes have been more radical.

Using LIST on the Model I requires contents to be SAVEd in ASCII. With the Model II, you no longer have to worry about storing your program in ASCII. You also have an option to LIST the data on the screen or on a printer. The Model II LIST displays each byte position in the buffer, the character, the hexadecimal number and other parameters such as record number or LRL. Fig. 1 shows a LIST of a file from a short mailing program.

DIR gives you a whole screen of information: file name, creation date, ATTRB (password protection status), number of logical records in that file, number of extents (how many segments have been added to the file), space allocated and space used, number of sectors and end of file byte (the starting position in the last written sector).

SET and RESET are not supported by the Model II. Instead there is a shape table and graphics are drawn using CHR$. To position graphic shapes or any character on the screen you can use PRINT @ as before, or the (x,y) coordinates. For example, PRINT @ (X,Y),CHR$(159).

Different ASCII characters are used to turn the flashing cursor on and off to determine upper and lowercase and to create graphics.

There are dozens of supervisor calls, which would take several articles to cover. It's worth mentioning that some of these cover the functions of Model I's PEEK and POKE.

Several DOS commands have been added. A synopsis of some of them follows: AGAIN tells DOS to re-execute the last command. If you only have one drive and have to check the DIR of several disks by swapping them around, this command will save you steps.

BUILD could be described as a superior AUTO command. With it you can make a file of many DOS commands that will automatically be executed with a DO command.

PURGE makes it possible to delete files en mass. You specify the type of files you want deleted: system, machine language, data or all. It can be dangerous in the wrong hands.

Getting DIR from BASIC

Now let's shoot down to Disk BASIC. To accomplish this you must go through a pain-in-the-neck sequence: Type BASIC, a space, –F (for FILES), and the number of files you want open.

One great improvement is the ability of this Disk BASIC to execute some DOS commands. You can get a DIR listing from BASIC, just like you can with Apparat's NewDOS + for the Model I. And typing NEW doesn't clear the screen.

Since there is no ROM, power up requires waiting for the machine's brains to be loaded from disk to the RAM. You're used to DOS READY coming up pretty fast on our Model I, but this takes a while.

Apparently the disk directory is stored in RAM until you are done, when you must type I, and the directory data writes on the disk. A Radio Shack newsletter warns that to change any diskette to another drive requires the I TRSDOS command. If you don't use I, disks will have the wrong directory and it is possible that you will write over programs and data.

We are extremely pleased with the Model II. There are only a few negative things that

the electric pencil II™

for the TRS-80 Model II* Computer

The Electric Pencil is a Character Oriented Word Processing System. This means that text is entered as a continuous string of characters and is manipulated as such. This allows the user enormous freedom and ease in the movement and handling of text. Since lines are not delineated, any number of characters, words, lines or paragraphs may be inserted or deleted anywhere in the text. The entirety of the text shifts and opens up or closes as needed in full view of the user. Carriage returns as well as word hyphenation are not required since each line of text is formatted automatically.

As text is typed and the end of a screen line is reached, a partially completed word is shifted to the beginning of the following line. Whenever text is inserted or deleted, existing text is pushed down or pulled up in a wrap around fashion. Everything appears on the video display screen as it occurs thereby eliminating any guesswork. Text may be reviewed at will by variable speed or page-at-a-time scrolling both in the forward and reverse directions. By using the search or the search and replace function, any string of characters may be located and/or replaced with any other string of characters as desired. Specific sets of characters within encoded strings may also be located.

When text is printed, The Electric Pencil automatically inserts carriage returns where they are needed. Numerous combinations of Line Length, Page Length, Character Spacing, Line Spacing and Page Spacing allow for any form to be handled. Right justification gives right-hand margins that are even. Pages may be numbered as well as titled.

the electric pencil

—a Proven Word Processing System

The TRSDOS versions of The Electric Pencil II are our best ever! You can now type as fast as you like without losing any characters. New TRSDOS features include word left, word right, word delete, bottom of page numbering as well as extended cursor controls for greater user flexibility. BASIC files may also be written and simply edited without additional software.

Our CP/M versions are the same as we have been distributing for several years and allow the CP/M user to edit CP/M files with the addition of our CONVERT utility for an additional $35.00. CONVERT is not required if only quick and easy word processing is required. A keyboard buffer permits fast typing without character loss.

	CP/M	TRSDOS
Serial Diablo, NEC, Qume	$ 300.00	$ 350.00
All other printers	$ 275.00	$ 325.00

The Electric Pencil I is still available for TRS-80 Model I users. Although not as sophisticated as Electric Pencil II, it is still an extremely easy to use and powerful word processing system. The software has been designed to be used with both Level I (16K system) and Level II models of the TRS-80. Two versions, one for use with cassette, and one for use with disk, are available on cassette. The TRS-80 disk version is easily transferred to disk and is fully interactive with the READ, WRITE, DIR, and KILL routines of TRSDOS.

TRC	Cassette	$ 100.00
TRD	Disk	$ 150.00

deserve comment.

The initialization seems a bit long. On top of that, every time you reboot you have to re-type a lot of information (BASIC, number of files, time, date, etc.); and only time will accept ENTER as a default. This is really aggravating to the person who is writting or debugging a program by line and must Ping-Pong between DOS and BASIC or reboot frequently.

A big fat reset button is located precariously close to the keyboard – just asking for trouble. And since there appears to be no way to restore your BASIC program (BASIC * is not supported), there is constant fear of loosing the current version of a program. You must SAVE frequently – even when you've made the smallest of modifications.

There are some good, detailed graphic characters, but we wish Tandy could have incorporated more.

There is no cassette hookup, only disk.

After paying several thousand dollars, we think the operator is entitled to a few words when the machine runs into an error. But not Tandy: It's back to the manual to find error codes again, just like Level II before DOS.

We miss the clear key. If you've ever written a game using string packing techniques (like Android Nim), you know what a mess it is to list on screen because control characters within the packed string cause scrolling, carriage returns and the like. The clear button was handy for this application allowing you to list several lines at a time without overprinting previously listed lines, giving you a screen full of unintelligible characters.

Conclusion

This is a well-designed, slightly heavy unit. The keyboard disconnects from the main section via a small cable. The system is more portable than Model I since everything is housed in one cabinet, except for the keyboard.

The keyboard is comfortable to the touch and it responds very quickly.

Radio Shack must have been in a hurry to get their machine on the market because shortly after its appearance there was already a new version of DOS (1.2). Along with the disk came a thick stack of pages to be added to the loose-leaf owner's manual. About 90% of these pages were for the utility section.

The Model II is a well-priced machine, capable of all that Radio Shack claims. We highly recommend it. ■

How to connect up a SWTPC printer to your system.

PR-40 Printer Interface

John W. Hise
67727 SR 13
Millersburg IN 46543

When something with the impact of the TRS-80 comes along—so different in physical make-up and software requirements from the typical hobbyist's S-100 system—it is difficult to explore state of the art hardware and software without purchasing a new system.

Because of all the interest generated by the TRS-80 I had decided to buy a Level II unit with 4K of RAM which I have since raised to 16K, and the expansion interface. With some work, I could interface the many peripherals I already owned—a 22-slot IMSAI, a North Star disk system, two video terminals, a teletype and a PR-40 printer.

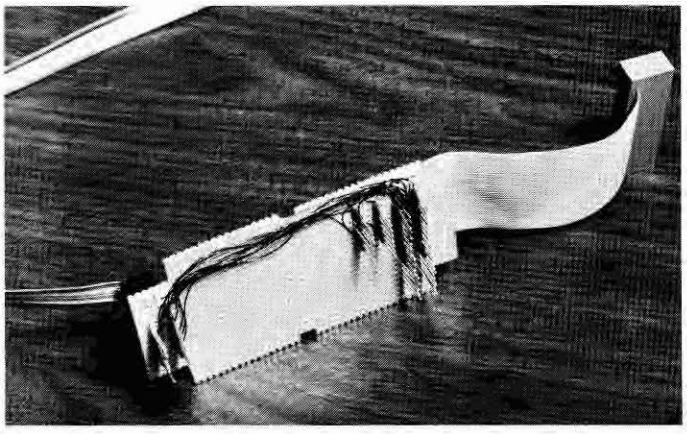

Photo 1. Underside of the connector interface showing wirewrap connections.

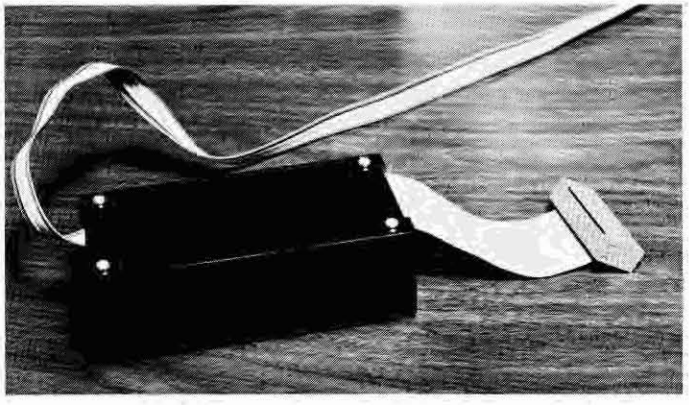

Photo 2. Finished interface cable in its enclosure.

What's Missing?

One of the first things I missed as I began to explore the TRS-80 was hardcopy output. However, an inexpensive printer of non-Radio Shack manufacture provided a solution. This article describes the trials and tribulations of interfacing the SWTPC PR-40 printer to the TRS-80. I hope my experience is valuable to others who, like myself, cannot afford a one to 2,000 dollar printer.

Either hardware or software can resolve incompatibility between an expansion interface output port and a printer input port. To keep everything simple, I would have liked to connect a cable from the printer to the TRS-80 and seen everything take off and run properly just by entering LPRINT or LLIST statements. But it dosen't work that way.

The South West Technical Products Corp., or SWTPC (219 W. Rhapsody, San Antonio, TX 78216), PR-40 is a five by seven dot matrix impact printer that prints the 64 character uppercase ASCII set. It prints up to 40 characters per line (as opposed to the Radio Shack printer's 132) at a rate of 75 lines per minute, on readily available 3-7/8" rolls of adding machine paper.

A line is printed when either the internal 40 character line buffer is full or upon receipt of a carriage return. The PR-40 accepts data as fast as one character per microsecond. All inputs and outputs are TTL compatible and interface via a 12 pin nylon connector.

The signals expected by the printer are D0-D6, representing ASCII data and an input data strobe signal. The printer will then send a status signal to the TRS-80 when it's time to send data. Hardware inside the printer decodes a carriage return, ODH, and prints when it is received with data. A line feed is automatic whenever a carriage return is forced or decoded.

PR-40 timing is shown in Fig. 1. All signals represent positive logic; +5 VDC is equivalent to a one.

At point A on the descending edge of the signal the printer looks at the data, D0-D6, to see if a carriage return, ODH, is present.

At point B on the rising edge of the strobe pulse data, D0-D6, are parallel loaded into a 40-character line buffer. At C a control character, ODH, has been detected. The status signal goes low until the carriage return is physically completed. At D the status signal remains low indicating that the printer is busy.

MARK GORDON COMPUTERS

SORT-80

Produced exclusively for Mark Gordon Computers by SBSG

TRS-80* disk files may be sorted and merged using SORT-80, the general purpose, machine language, sort program. Written in assembly language for the Z-80 microprocessor, it can:

- Sort files one disk in length
- Sort Direct Access, Sequential Access and Basic Sequential Access files
- Reblock and print records
- Recontrol files from disk
- Be executed from DOS
- Be executed from BASIC
- Be inserted in the job stream
- Allow parameter specification
  - input/output file specification
  - input/output record size
  - lower/upper record limit
  - print contents of output file
  - input/output file key specifiers

The minimum requirement is a 32K TRS-80* Level II computer with one disk drive or a single drive Model II computer. It will operate on 35, 40 and 77 track drives, and has been tested on TRSDOS 2.1, 2.2, 2.3, NEWDOS 2.1, 3.0, and VTOS 3.0.1. It is compatible with most machine language printer drivers. Sort time is fast; for example, a 32K file will sort in approximately 40 seconds. **$59**.

PCS

Program Catalog System from SBSG

This menu driven system provides the TRS-80* user with a computerized method to keep track of all programs and data files. The idea is to build and maintain on a file a disk detailing each program including program name, size, creation date, and a brief narrative as to function. Programs are provided to:

- create, update, or display
- print in disk number order
- print in alphabetical order
- print file listing
- create a file automatically

With a 32K system you can catalog 150 programs; with a 48K system you can catalog 300 programs; or you can catalog 650 programs without sort. **$29**

*TRS-80 is a registered trademark of Radio Shack, a division of Tandy Corp.

InfoBox

The information manager

InfoBox is the easiest-to-use information manager available for the TRS-80*. It's ideal for keeping track of notes to yourself, phone numbers, birthdays, inventories, bibliographies, computer programs, music tapes, and much more. This fast assembly language program lets you enter free-format data, variable length items and lets you look up items by specifiying a string of characters or words that you want to find. You can also edit and delete items. Items entered into InfoBox can be written to and read from cassette and disk files. All or selected items can be printed on a parallel or serial printer. InfoBox occupies 3K. Specify cassette or disk version. Special introductory price **$24.95** until June 15; **$29.95** after.

DBUG+

The ultimate monitor/disassembler

Compare the features and price of **DBUG+** with other monitor/disassembler programs. It offers nine true, single-byte breakpoints, single step program execution, hex and decimal arithmetic including multiply and divide and conversions, ASCII dump that distinguishes all 256 codes, disassembly to screen and printer in full Zilog mnemonics, and register set command. It also has the usual port I/O, hex and decimal memory dump, change, move, copy and exchange memory features offered by others. Ideal for the user who wants to experiement with assembly language or to write subroutines to call from BASIC; essential for the serious programmer. Special introductory price **$24.95** to June 15; **$29.95** after.

FMS

File Management System by SBSG

This menu driven program allows you to define and create files for your own use. You can:

- sort these files in:
  - ascending order
  - descending order
  - on up to 3 seperate fields
- scan the files
- summarize any numeric or dollar data fields
- print the field records
- create, add to or delete field records

$49.00

Model II versions of SBSG software available. Dealer inquiries invited.

↙Reader Service index—see page 194

The pinout of the 12-pin connector, J-4, shown in Fig. 2 is the link to the TRS-80.

Parallel In/Out Port

The TRS-80 expansion interface has an eight-bit parallel output port. This memory-mapped output port that is addressed like a software memory element, is located at 37E8H, 14312D. To output to this port, an eight-bit byte of data is written to the address.

Also located at this address is a memory-mapped four-bit input port. Data is input to this port by reading memory location 37E8H. The four bits of data read in D4-D7, are used to indicate the following:

D7—printer busy
D6—printer out of paper
D5—unit selected?
D4—fault condition

Data elements D0-D3 are not wired up in hardware and can only be input as ones. Of the above signals, most applications will require only D7 to indicate if the printer is ready to receive data. Inputs D4-D6 must be terminated, if not used, to be compatible with the Radio Shack line printer software routine.

Each time a byte of data is sent to memory address 37E8H, the MWRITE pulse generates the data strobe pulse for the printer. The data strobe pulse is a one microsecond pulse to ground.

The parallel output port can be written to or read from at least three different ways. First, you can write and enter a machine language program that manipulates memory location 37E8H.

A second way uses the BASIC statements—POKE to output data and PEEK to input data. For example, POKE 14312,255 enters a binary 1111 1111B into memory location 37E8H (in reality the line printer output port latch). Any data, 0-255D, can thus be POKEd.

Similarly, to input this port, A = PEEK(14312) returns the printer status data, the four upper bits, D4-D7, as the value of A. Remember that the lower four bits, D0-D3, are not supported in hardware and are always input as ones.

The third way to utilize this port is via the LLIST and LPRINT statements. Enter LLIST and a carriage return. The status bits are input at 37E8H and bit D7 is checked to see if the printer is busy. If not, the status bit D7 will be low - indicating the printer is ready for data. See Fig. 3.

If no printer has been hooked up, D7 will be high, indicating the printer is busy, and the TRS-80 will lock up. There is no termination provided in the expansion interface.

Fig. 4 shows the connections, required by the printer of the expansion interface.

Constructing a Cable

With the signal timing and voltage relationships in hand, we can construct cable with the 34 pin expansion interface connector on one end and the 12 pin PR-40 printer connector on the other (Photo 1).

In order to connect the cables easily and keep the printer compatible with my IMSAI, I used the 16 pin dip header and plug. The perforated board also allowed me to wire any required hardware circuit. (See Parts List.)

To install the 34 pin Alpha connector, I carefully attached the 34-ribbon wire to the connector. I then put the connector into

Please note: Our CRT SCREENS have been purchased by thousands of individuals, the Department of the Navy, several government agencies, and dozens of the country's top corporations and universities.

- Give your CRT the luminous green characters found on the very expensive computer systems.
- Add a professional look to your system and your programs.
- Dramatically improved contrast for easier reading and improved graphics.

We manufacture an optically correct, 1/8" plexiglas* screen that mounts easily over the CRT on your video monitor. This is a quality accessory that enables your TRS-80* monitor to produce the luminous green characters identical to those found on expensive terminals. For business applications this means enhanced appearance and reduced eye strain, for the hobbyist, graphics are brighter and bolder. The screen may be easily removed – no modification to monitor.

Computers & Gambling Magazine*

PRESENTS:

PROBABILITY HANDICAPPING DEVICE I

A 16K BASIC PROGRAM FOR:

HORSE RACE HANDICAPPING!

This amazing program was written by a professional software consultant to TRW Space Systems and is being introduced by the publishers of Computers and Gambling Magazine. "PHD-1" is a large complex basic program requiring a full 16K. It is carefully human factored for easy use. PHD-1 is a comprehensive horse racing system for spotting overlays in thoroughbred sprint races (less than 1 mile). You simply sit down with your computer and the Racing Form the night before the race and answer 5 or 6 questions about each horse's past performance. Your computer then accurately predicts the win probability and odds-line for each horse allowing you to spot overlaid horses while at the track. The users manual contains a complete explanation of overlay betting.

Statistics for thousands of horses were used to develop this handicapping system. The appendix of the manual contains a detailed tab run of a 100 consecutive race system workout showing an **amazing 45% positive return** (45¢ for each $1.00 wagered). A graph is also included showing PHD-1's close fit to the ideal predicted probability vs. actual win percentage curve.

This program features: ☐ Win probability and odds for each horse ☐ Verification display of each horse's parameters prior to entry for easy error correction ☐ Bubble-sort routine for final display ☐ Facility for line printer output ☐ Cassette ARCHIVE routine to store PHD-1's output for later analysis ☐ Complete users manual.

The user's manual may be ordered seperately for your purusal for $7.95 and will be credited if you purchase PHD-1

Whether you are experienced or just beginning in assembly language programming you will recognize the need for at least three types of programming aids: an editor/assembler, a monitor and a disassembler.

DISK*MOD will read in your Radio Shack editor/assembler, modify it, and write the improved version to disk. This new E/A will not only allow you to display the directory on the screen but gives you the disk space used by each file and the remaining free granules. DISK*MOD can display the number of bytes used by your text buffer and how many remain free. You can kill a file from a mounted disk. All cassette operations remain functional. DISK*MOD improves manual scrolling by allowing a full fifteen lines of text to be displayed instead of only seven as in the original E/A. The 'DEFM' output is altered to 8 bytes per line instead of only one. Output to the prin er is paged at 56 lines per page with optional paper change prompting. The 'B' command branches to any address you choose instead of 0000H. The symbol table is sorted alphanumerically and output five across. You can protect high memory for monitors, drivers, et cetera and recover from reboots with your text buffer intact. You can move blocks of text which will allow you to keep and use a library of subroutines on disk. The global change feature becomes highly desirable when you have a disassembler which generates symbolic labels.

The next tool a programmer needs is a monitor to examine, modify, and debug programs. **TUTIL** has many useful features. You can display memory simultaneously in ASCII and HEX. Output can also be directed to the printer. Blocks of memory may be compared byte for byte or a search might be done for a particular sequence of bytes. The Z-80 registers can be displayed and altered. You can fill blocks of memory with a given byte or change a single byte. Alphanumeric data can be entered directly into memory from the keyboard. Blocks of memory can be moved, breakpoints set or reset, and addition and subtraction done in hexadecimal. You can load SYSTEM tapes into memory, execute or verify them, and punch out new SYSTEM tapes. The best part is that an E/A modify program for tape users is also included in the TUTIL package. Although not providing all the features of the DISK*MOD, it does allow you to protect memory and recover from resets. Since BASIC's pointers are not destroyed you may go back and forth to the E/A without having to reload it or your source text. **DUTIL** has all the above commands plus the ability to scroll through a disk drive sector by sector, load and save sectors from a buffer and enable/disable interrupts.

The third tool is a disassembler. **DISASSEMBLER 1.2** not only disassembles to video or printer but also outputs to tape in a format compatible with E/A. Now you can take apart someone else's code and modify it for your needs. The real beauty of DISASSEMBLER 1.2 is the symbolic labels and equates that this two pass program produces. DISK*MOD users can easily change all the Z1A19 labels to BASIC, for example. Output to printer is 50 lines per page with optional paper change prompting. A source file may be written to disk with **DISASSEMBLER 2.0**.

DISK*MOD (32K+ DISK)	$20
DISASSEMBLER 1.2 (16K+)	$15
DISASSEMBLER 2.0 (32K+ DISK)	$20
TUTIL (16K, 32K & 48K)	$15
DUTIL (16K, 32K & 48K DISK)	$20

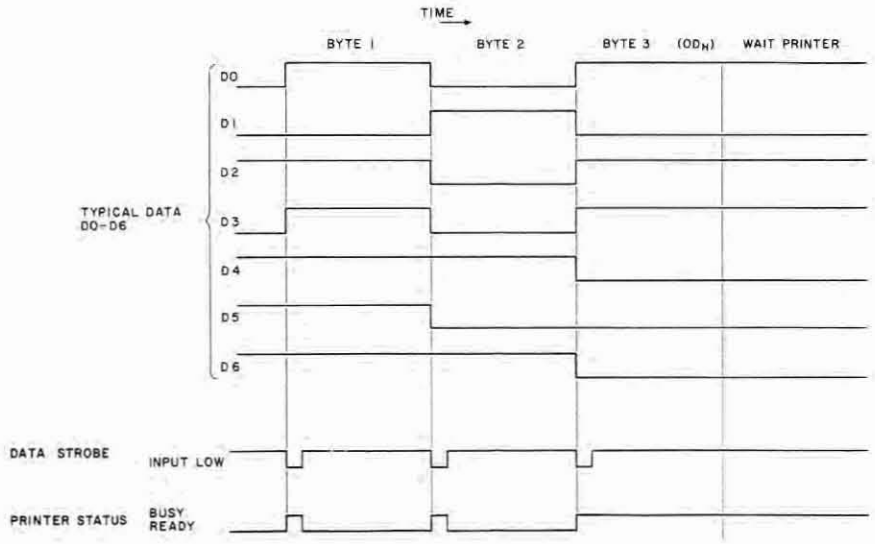

Fig. 3. TRS-80 signal output specifications and expected status signal.

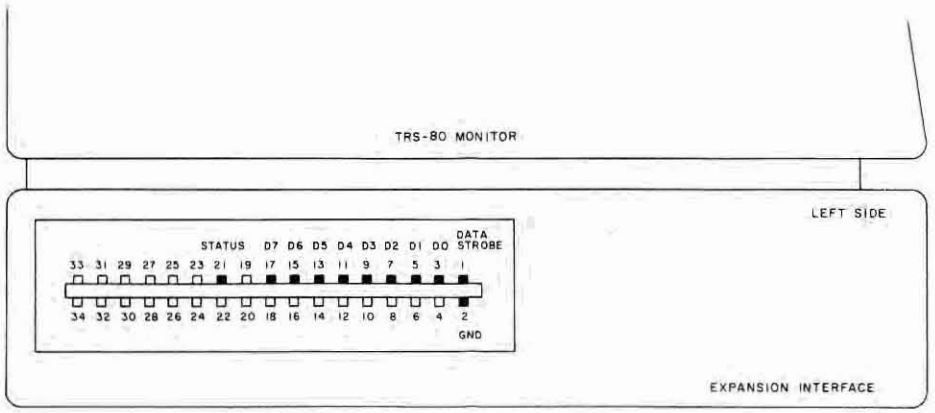

Fig. 4. Circuit card pin designations on expansion interface.

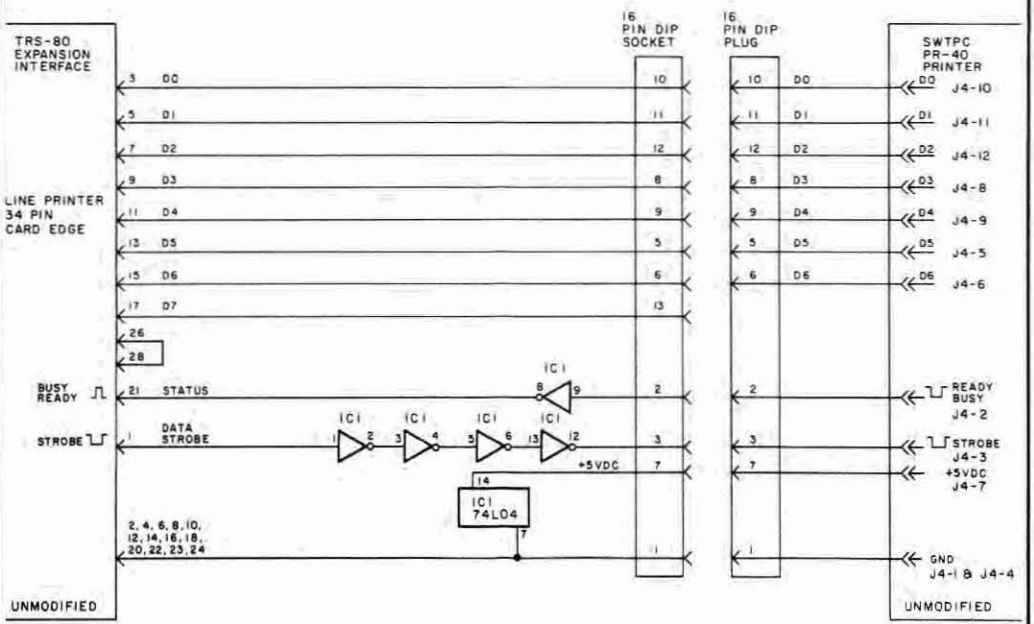

Fig. 5. Interface schematic-hardware method.

a bench vise and completed the crimp.

With a hardware interface the PR-40 printer will electrically resemble a Radio Shack line printer.

Fig. 5 and the signal timing diagrams for the PR-40 and the TRS-80 show that the status (busy) signal of the PR-40 is the opposite of what the TRS-80 expects.

Inverter IC1, wired into the status signal, corrects that situation and provides the TRS-80 software with the expected signal.

This would seem to be all that is needed. However, when only this is done and the LLIST statement is utilized, all carriage returns in the program listing are ignored. Careful study of the Radio Shack printer manual and the PR-40 circuit description finally revealed the problem.

The PR-40 recognizes control codes (like the carriage return) on the falling edge of the strobe pulse (Fig. 1), while the TRS-80 data to be output, D0-D7, is not valid on the falling edge (Fig. 3).

However, in Fig. 6 (from the Radio Shack printer manual), the specifications indicate the falling edge of the strobe pulse should occur a minimum of one microsecond after valid data is present on data lines D0-D7. If the TRS-80 had output data to the printer per its own specifications instead of those in Fig. 3, there would have been no problem. (Alphanumeric data isn't affected because the printer recognizes it one microsecond after it is valid on data lines D0-D7 on the rising edge of the strobe pulse.) But since ODH, a carriage return, is a control character, it will never show up as valid data at the right time during the TRS-80 line printer output cycle.

The strobe pulse had to be delayed just long enough for valid data to exist on lines D0-D7 before the strobe pulse went to ground. I did this by using four inverters in series as shown in Fig. 5. This was no problem as the IC was needed to invert the printer status signal anyway.

I used a 74L04 to provide maximum signal delay per gate—about one-half as fast as a

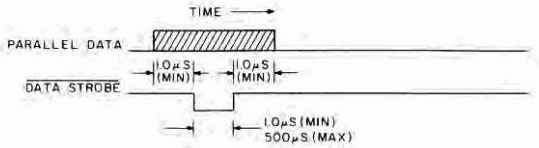

Fig. 6. Required timing of the parallel data and strobe pulse.

regular 7404 inverter. At approximately nanoseconds delay per gate, the strobe signal is delayed .1 to .2 microseconds, enough for the PR-40 to act on the control characters.

The IC1 needed +5VDC, so I decided to get it from the PR-40 via unused pin #7 in the J4 connector, as shown in Fig. 7.

The finished cable is shown encased in Photo 2.

Software Interface

One of the intriguing aspects of microprocessors is that there are many ways to do any one thing. An equally successful way to interface the TRS-80/PR-40 is to wire the two units together as shown in Fig. 8. Note that IC1 is totally eliminated by using software.

The machine language routines that actually drive the lineprinter are found by PEEKing memory locations 16422D and 16423D for the hex address, —058DH. These driver routines contain the desired output byte in the C register.

The busy signal from the printer must be checked by inputting the status bits at memory-mapped location 37E8H to see if bit D7 is high. If it is, the printer is busy and the TRS-80 goes into a loop. If bit D7 is low, the data is written to 37E8H along with a strobe signal to the printer. A carriage return signals the completion of the printed line.

By changing the machine language driver address at 16422D and 16423D to some other RAM address near the top of memory, a new driver routine can allow for the inverted busy signal and eliminate the strobe pulse timing problem. The rapid strobe pulse, encountered in the hardware interface, can be solved by sending two carriage returns to the PR40. Though the printer always misses the first return because of the timing problem, the code is latched at the output port. The second carriage return now finds stable data when the strobe pulse goes to ground.

The assembly language code for this line print driver is shown in Table 1. Written in Z-80 code, it can be located anywhere in RAM. Since the end of RAM in my 16K system is at decimal 32767, the 18 byte assembly language program, should be located in 32750D to 32767D. A BASIC program that changes the line print driver address to RAM locations 32750D to 32767D is shown in Listing 1.

Changing line 10 enables other TRS-80 RAM configurations to use the same program.

4K system use	10M = 4
16K system use	10M = 16
32K system use	10M = 32
48K system use	10M = 48

Enter the following, appropriate to your memory size, after power up:

4K system enter	20460
16K system enter	32748
32K system enter	49132
48K system enter	65516

The system is now ready for the LLIST and LPRINT commands. When outputting control codes to the printer via CHR$( ) or POKE, all are ignored except 10D and 13D. To manually force a carriage return enter either LPRINT or POKE 14312,13. CHR$(10) or CHR$(13) imbedded in the LPRINT statement forces a carriage return/line feed within the statement in addition to the one at the end of the statement. For example if A = 2 and B = 3:

```
LPRINT A;CHR$(13);B;CHR$(13);
"TOTAL A + B = ";A + B
```

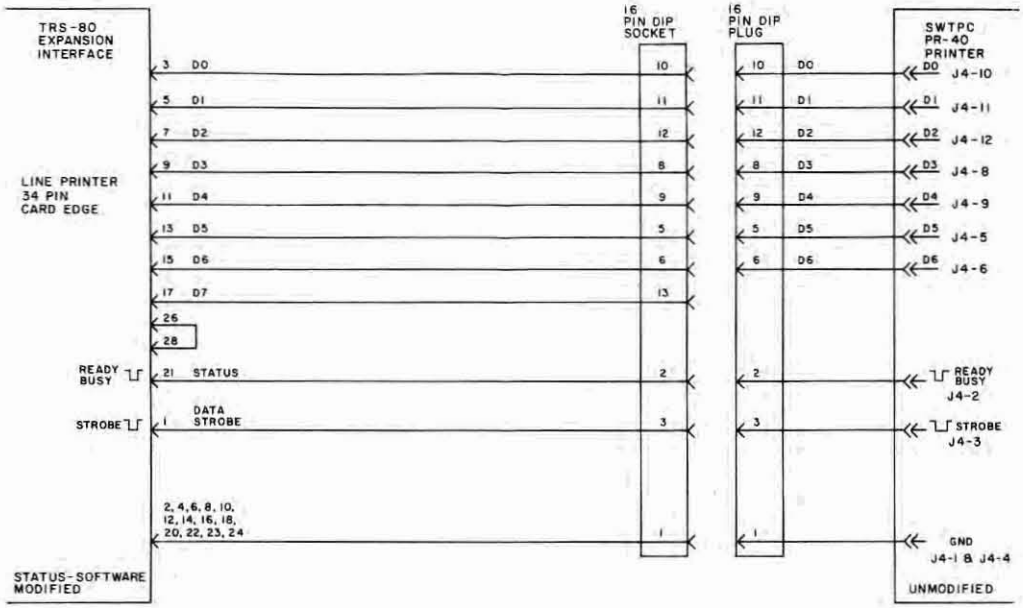

Fig. 8. Interface schematic-software method.

The following would be output on the line printer when ENTER is depressed:

0
0

Total A + B = 5 ■

Program Listing.

U. F. Racine
2520 S.E. Alexander Drive
Topeka, KS 66605

When programming on the TRS-80, I utilize graphics as often as possible.

However, when displaying an outline map of the U.S. or a Lunar Lander with string or POKE graphics, I am faced with the task of assembling strings or computing the proper POKE locations. Whenever I am working on a display, I find myself shuffling several pieces of paper, a video display worksheet, a scratch pad and a sheet with POKE locations.

Finally, I let my TRS-80 do the work for me. After all, that is what computers are designed to do!

I call the following program Graphics Coder. It's a video display worksheet. While it still requires a hand listing, unless you have a printer, it speeds up the development of graphic displays.

Cursor and Pseudo Cursor

The program uses the → and ← cursor keys and the upward linefeed ↑ and downward linefeed ↓ to position the pseudo cursor. When the program runs, the pseudo cursor is initially located at the home position, 0,0. At the bottom of the screen, print location 960, the current print location and tab number of the pseudo cursor are displayed.

INKEY$ directs the cursor and edit functions. When the appropriate arrow key is pressed, the cursor moves one print position left or right, up or down.

When the cursor is in the location where you wish to place a graphic character, depress the space bar. The program then prompts the user to enter the appropriate graphic code. For instance, if you enter 191, the entire graphic block at that print location is turned on.

While I wrote the program to accept code-based TRS-80 graphics, you can enter and display any ASCII code. Both text and graphics can be assembled.

The ASCII codes are found in section C/2 of the *TRS-80 Level II User's Manual*. If you are not familiar with TRS-80 graphics codes, refer to the book *Introduction to TRS-80 Graphics* by Don Inman (dilithium Press, 1979).

Conversion

You will need to convert from hexadecimal to decimal. Begin-

ning with the first character, number from 129 to 191. An alternative source of information can be found in William L. Colsher's article *"Getting the Most out of Your TRS-80"* in the July, 1979 issue of *Microcomputing*. The characters are printed, but in a much smaller version.

Once the code is entered, the program clears the screen and displays all the code stored to that point. The cursor is also moved one position to the right.

The program has two editing features. Firstly, if you enter the wrong code or want to change the code in a location, return the cursor to that location, press the space bar and enter the new code. The program changes the code for that location.

Secondly, if you wish to delete a character and not replace it with another code, return the cursor to that position and press the D key. The program substitutes a space for that code (CHR$(32)().

After editing the display, reset it by hitting the R key. This function clears the video display, prints all the characters stored and places the cursor one position to the right of the last print location containing a character.

At any point during the program run, the print locations, graphic or ACSII codes and tab locations can be displayed in blocks of 14 by pressing the Q key. It is then a simple matter either to write down the information or print it out.

After listing the display data currently stored, the program asks the user if he wishes to continue. If the input is yes, the user can retain the stored code or begin a new display.

The program can be modified to include the line number, if it is necessary:

```
20 Y = 15360: A = 0 : H = 1
1010 IF A>63 THEN H = INT(A/64):
B = A – (64*H): H = H + 1
```

Add H to the print statements in lines 40, 140, 200, 210, 220, and 230. The lines should read: PRINT@960,A;B;H;:GOTO. ■

Keep your files safe with this simple utility.

Disk File Protection

Dan Keen
and
Dave Dischert
RD 1, Box 432
State Highway 83
Cape May Court House, NJ
08210

One of the problems with TRSDOS version 2.1 is the frequent overwrite on disks. Radio Shack has since released a new version, 2.2, and this problem appears to be solved.

But for those very critical times when you want to leave nothing to chance, structure your programs around this control routine and put your mind at ease.

Using the Program

The routine uses a sequential file to tell the computer where to put the random file information. The sequential file keeps track of where the last random file data is where new material will be put on disk. There is never any overwrite.

```
 0 CLEAR200
 5 REM * TEST PROGRAM FOR USING SEQUENTIAL AND RANDOM FILES
 10 ONERRORGOTO1000
 20 OPEN"I",2,"INDEX":INPUT#2,RX,SRX:CLOSE
 30 ONERRORGOTO0

    AS A$(X):NEXT
 50 IF(SRX=0)AND(RX=1)GOTO100
 60 IFSRX-1<0THENGET1,RX-1:B$=A$(4):GOTO80
 70 GET1,RX:B$=A$(SRX-1)
 80 PRINT"B$=";B$
 90 PRINT"LAST RECORD WAS #";RX-1:PRINT"LAST SUB REC WAS #";
    SRX
100 INPUT"ENTER NEW WORD";B$
110 LSET A$(SRX)=B$
120 SRX=SRX+1:IFSRX=5THENSRX=0:PUT1,RX:RX=RX+1:GOTO150
140 PUT1,RX
150 OPEN"O",2,"INDEX":PRINT#2,RX,SRX:CLOSE:END
1000 RX=1:SRX=0:OPEN"O",2,"INDEX":PRINT#2,RX,SRX:CLOSE:RUN
```

Program Listing.

First, let's define record and subrecord. A record is 256 bytes, one full buffer. A subrecord is a section of a record. Several subrecords make up a record. R percent is the variable used for the record number, and SR percent for the subrecord.

The number of subrecords per record is established in the fielding (line 40). Lines 60 and 120 must have proper values which match up with the number of subrecords.

In the control program, we have chosen five subrecords to fill up one record. Fielding is setup as usual, as described in the TRSDOS owners manual on page 7-72. Use PH$ as PHONEY$ to position the subrecord within the buffer. The manual calls it STARTHERE$.

The array in line 60, A$(4), holds the last subrecord data in the previous record. The number four would be changed if you use other than five subrecords. By the same token, IF SR% = 5 in line 120 would also need modification.

The first thing the computer tries to do is input data from a nonexistent file (line 20). The ONERROR routine sends execution to 1000 where the file is created. RUN terminates the error and it will not occur again. RESUME is not needed. Line 30 keeps the machine on the lookout for usual blunders.

An error would occur in line 60, if the program were allowed to get there. (Line 60 tries to get record number 0, which is not a legal record number.) But line 50 sees that this won't happen.

The last of the data entered are retrieved in either 60 or 70, depending on the values of the record and subrecords. The subrecord numbers and record number, if need be, are incremented in line 120. Information is then put in the proper random file. The new R percent and SR percent values are stored in line 150.

In Conclusion

It's easy to make errors when incorporating this routine into your programs. If trouble occurs, check the values in lines 40, 60 and 120.

The DISKDUMP/BAS utility provided on the TRSDOS disk is a powerful aid in debugging this type of program. With DISKDUMP you can see exactly what went on the disk, and determine if the problem lies in the writing or reading section of your program.■

INTEGRATED KEYPLUS UTILITY PACKAGE

Keyplus is a collection of utilities that can be enabled directly from the keyboard of a Level II TRS-80. Seven different keyboard entry modes include BASIC shorthand (2 modes), direct graphic character input (3 modes), typewriter style input and standard TRS-80 entry.

Keyplus supports auto-repeat, lowercase video (optional hardware modification required), restoration of lost programs, keyboard debounce, single key stroke user definable strings and more!

Designed for ease of use, Keyplus routines may be enabled or disenabled in two key strokes.

The Level II version of Keyplus is available for $14.95 and a more powerful disk version (32 or 48K) sells for $19.95. Pennsylvania residents add 6% sales tax.

TRS-80 is a registered trademark of TANDY CORP.

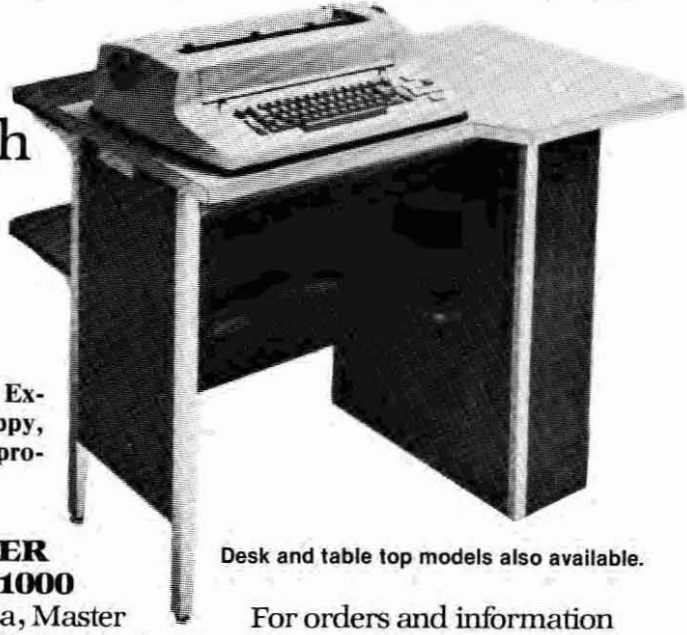
The DATA-TRANS 1000

A completely refurbished **IBM** Selectric Terminal with built-in **ASCII** Interface.

***FOR YOUR TRS-80 WITH OR WITHOUT EXPANSION INTERFACE.**



Features:

- 300 Baud
- 14.9 characters per second printout
- Reliable heavy duty Selectric mechanism
- RS-232C Interface
- Documentation included
- 60 day warranty - parts and labor
- High quality Selectric printing Off-line use as typewriter
- Optional tractor feed available
- 15 inch carriage width

Also works with Exatron's Stringy Floppy, for fast loading of programs.

Desk and table top models also available.

HOW TO ORDER DATA-TRANS 1000

1. We accept Visa, Master Charge. Make cashiers checks or personal check payable to:

See how your 80 sorts data, graphically.

Graphic Sort

C. A. de Zoysa
P.O. Box 170
Keyport, NJ 07735

Using a lot of paper, arranging and rearranging arrays and subscripted variables, I was helping a friend learn about computer sort methods. Through this maze of subscripted variables we managed to get an idea of how the computer carried out its process of sorting. It occurred to me to write a simple program which would graphically demonstrate the sorting process on the video display terminal.

The sort technique I have used is one that most beginners go through. Although it is not the most efficient method of sorting, it adapted itself very well to graphic display.

The BASIC Sort

The program was written for a TRS-80 Level II. The data statement is restricted to eight items, which eliminates the need for DIMensioning and permits the data to be displayed in single lines.

Only one subscripted variable is used. Other variables have been kept to a minimum.

The program should run on most microcomputers with little or no program modification provided the video display terminal can handle 64 characters per line.

The graphics display program listed (see Program Listing 1)

A —Array element
I —Dummy variable for keyboard input
L —Flag to check if switch takes place
J —Subscript—inner loop
N —1. Subscript during read
—2. Subscript—outer loop
T —Variable for temporary storage during switches
Q —1. Tab counter when printing headings
—2. Line counter during output
X —1. Array element indicator when printing headings
—2. Array subscript during output

Table 1. List of Variables.

```
10 FOR N = 1 TO 8
20 READ A(N)
30 NEXT N
40 DATA 254,-12,101,567,45,0.123,33,309

NEW DISC DRIVES FOR TRS—80* "FLIPPY"—250K bytes/disc FAST—5ms Track to Track Access

REAL VALUE

AEROCOMP offers the best value in microcomputer disc drives on the market today! Reliability, features and cost tough to beat. We deliver...and we stand behind our products, as evidenced by the only FREE TRIAL OFFER in the industry. Examine your systems needs and order today!

MYSTERY REMOVED

There appears to be some confusion in the terminology used to describe disc drives and their features. Here's what we mean:

***FLIPPY** Allows the use of both sides of a diskette with a single-headed drive by simply turning the diskette over (Model 40-1).

***TRACK DENSITY** specified in tracks per inch (TPI). Refers to the number of tracks per radial inch on the diskette. Typically 48 TPI=40 usable tracks and 96 TPI=80 useable tracks.

***DOUBLE DENSITY** refers to recording density in bits per inch (bpi). Typically single density means data can be recorded up to 2,938 bpi; double density means data can be recorded up to 5,876 bpi.

***DOUBLE-SIDED** refers to number of read/write heads. Single-sided is one head, read/write one side only; double-sided is dual heads allowing read/write operations on both sides of the diskette. A double sided drive appears as two separate drives to the controller.

***CAPACITY** unformated capacity is the total amount of storage space available on a diskette. Typically 125K bytes on a 40 track 5.25in. diskette. Formated capacity is the total USABLE storage space on a diskette. Typically 102K bytes on a 40 track 5.25in. diskette.

***ACCESS TIME** the time required for the head to move from one track to the next. Typically 5 to 40 milliseconds (ms).

FREE TRIAL OFFER

Order your AEROCOMP Disc Drive and use it with your system for up to 14 days. If you are not satisfied for ANY REASON (except misuse or improper handling), return it, packed in the original shipping container, for a FULL REFUND. We have complete confidence in our products and we know you will be satisfied! ORDER TODAY!

WARRANTY

We offer you a 90 day unconditional warranty on parts and labor against any defect in materials and workmanship. In the event service, for any reason, becomes necessary, our service department is fast, friendly and cooperative.

100% TESTED

AEROCOMP Disc Drives are completely assembled at the factory and ready to plug in when you receive them. Each drive is 100% bench tested prior to shipment. We even enclose a copy of the test checklist, signed by the test technician, with every drive. AEROCOMP MEANS RELIABILITY!

ORDER NOW

MODEL 40-1 **DISC DRIVE $339.95ea.** Single-sided, "Flippy", 48TPI. (40 track; single density unformated 125K bytes/side; double density unformated 250K bytes/side).

MODEL 80-2 **DISC DRIVE $439.95ea.** Double-sided, 48TPI. (80 track/40 per side; single density unformated 250K bytes; double density unformated 500K bytes).

MODEL 80-1 **DISC DRIVE $439.95ea.** Single-sided, "Flippy", 96TPI. (80 track; single density unformated 250K bytes/side; double density unformated 500K bytes/side).

MODEL 160-2 **DISC DRIVE $595.95ea.** Double-sided, 96TPI. (160 track/80 per side; single density unformated 500K bytes; double density unformated 1 megabyte).

All models are capable of single or double density and are complete with power supply and silver enclosure. Send for information on AEROCOMP 2- and 3-drive systems available in 40 and 80 track.

SELECT EITHER A 2-DRIVE OR 4-DRIVE CABLE FOR USE WITH YOUR DRIVE(S):

2-DRIVE CABLE (for use with 1-or 2-drive systems) **$24.95ea.**

Dallas, TX 75224

✓Reader Service index—see page 194

sorts a group of eight numbers in ascending order. Both decimal and negative numbers have been included in the data for a more vivid demonstration.

To sort in descending order, change the < sign in line 100 to >.

The program uses two nested FOR-NEXT loops. As the loops are executing, their subscripts, N for the outer loop and J for the inner loop, are displayed at the left of the screen. After each iteration, the array is displayed in the center of the screen.

If two elements are switched, their subscripts are displayed at the right, so you will know when a comparison has caused a change in the position of array elements. Hitting ENTER keeps the program executing.

Two Subroutines

The sorting process is carried out by lines 80 to 180. Two subroutines are used. One prints the headings and the other displays the array and subscripts after each iteration. Table 1 lists all the variables and their functions.

You may substitute your own data in line 40, but the number of items should be restricted to eight. Each item should be no longer than four places including signs and decimal points. PRINT statements should be entered exactly as listed for properly spaced output. Note that some PRINT statements have two semicolons at the end. These are necessary.

After you have studied the operation of the program, its efficiency may be improved by inserting the following program lines:

```
85 C = 0
135 C = 1
175 IF C = 0 THEN 190
```

These lines prevent further loop iterations after the desired sort. ■

I love my serial interface.

Pencil RS232 Driver

Dick Kinsey
5754 Thompson Rd.
DeWitt, NY 13214

The Electric Pencil by Michael Shrayer was intended to be used with either one of two printer interface options: the Radio Shack expansion interface with a parallel printer or the Small Systems Hardware TRS232 serial printer interface. Unfortunately, it does not support a conventional RS-232-C interface.

If this presents a problem, you can solve it in one of three ways: Buy the disk version of the Electric Pencil ($150), as it supports an RS-232-C interface and is also usable on a cassette-only system, buy a Small Systems Hardware TRS232 board ($50) to use in place of your RS-232-C interface; or, modify the cassette Pencil ($0). I chose the last approach.

Software Modification

The Electric Pencil loads into low memory and clears it from address 21224 to the top of your memory. Any I/O driver program previously loaded in high memory is thereby erased.

To protect the driver software required by an RS-232-C, I changed the Pencil program so that it fetches the memory size from reserved RAM and clears memory only to this point. It is written as a subroutine which is called from the two places in the program that do a clearing operation. The coding for this portion of the software change can be seen in Table 1.

All that remains is to connect the driver program you previously loaded into high memory. Table 2 gives the coding for this patch.

The patch is general, so you can specify any memory size you desire and locate your driver program anywhere in the now protected high memory area.

For anyone who recently increased memory to 32K, to POKE or PEEK an address above 32767, use desired address −65536 and not the formula given in the *Radio Shack Level II Reference Manual.*

BASIC Changes

If you don't have a monitor program that locates in high memory, you will have to make the Electric Pencil software changes described above using the POKE command. I have written two BASIC programs to accomplish this painlessly.

Running the first CLOAD relocates the pointers for BASIC source statements just above the area of memory that Electric Pencil occupies. PENCIL is then loaded under SYSTEM, and the

Use the first program on your tape to keep track of the tape.

Cassette File

James Tallman
3468 S.E. Roanoke
Hillsboro, OR 97123

If you want to store more than one program for your TRS-80 on a particular tape, a method of keeping track of the beginnings of each program is useful.

The CTR-41 tape recorder has a tape counter that can indicate where a program is saved on the cassette. To maintain a record of which program begins at what counter reading, simply jot down the tape count indication and program name.

However, if a written log is lost, you have no easy way of recovering the information. You can write a program to store the tape directory as the first file on any cassette. Such a program stores the information in DATA statements.

The program begins by clearing the screen and printing a heading (lines 110 and 130). For Level II machines an extra statement is required, because of an error in Radio Shack's ROMs. (See my note attached to the Program Listing.)

Statement 140 reads the program's name as A$ and three numbers, A, B and C. They are expected to be the tape counter's start of three copies of the program in A$. You can modify this if you want only one or two copies.

Any negative value read for A ends the program (line 150). I usually put a −1 value at the end of the program to indicate this.

The program then prints out A$ and the three starting counter locations of each of the three copies of the program. Control goes back to line 140 for another read and checks for a negative A. The program ends when either the negative value for A is read or the list of data is exhausted.

It's important to set the counter to zero at the start of the tape for the counts to be reliable. Also, I use the next-to-the-last line to indicate the next available place on the tape to save a subsequent program.■

```
100 REM CASSETTE FILE PROGRAM
110 CLS

Instant Software™ New Releases

EXECUTIVE EXPENSE REPORT GENERATOR

How often have you returned from a long, successful business trip and dreaded facing that ugly beast, THE EXPENSE REPORT?

Before you left, you firmly resolved to note every expense in a little black book. It all worked fine for about two days. Now, you stare disgustedly at a pile of crumpled bills and scraps of paper, which you've dug out of various jacket pockets.

This program will take away that pain. No, it won't tell you how to cheat on that expense report! It will simply tell you how to play the game using established rules.

The jumble of figures you attempted to add could drive you up the proverbial wall. No matter what you try to do, the grand total refuses to equal the original cash advance for the trip.

However, when you supply your tale of woe to this program, your answer will be a clear expense layout, plausible and quickly done. (The program has hard-copy capability; you'll need a printer.) You'll be able to present a reasonable and credible expense sheet.

Gone are the desperate guessing games; now you can start your next business trip with an easy mind because you've got the Executive Expense Report Generator.

For the TRS-80 Level II 16K. **Order No. 0135R $9.95**

ENERGY CONSUMPTION

The Energy Consumption program will record your utility bills for up to a five year period. All you have to do is supply data for the following six categories, which will be stored on a data tape:

1. GAS$$ – Dollars spent on natural gas.
2. CCF – Hundreds of cubic feet of natural gas used.
3. H20$$ – Dollars spent on water.
4. GAL – Gallons of water used.
5. PWR$$ – Dollars spent on electricity.
6. KWH – Kilowatt hours of electricity used.

These six monthly averages and unit costs will be calculated upon your request. The statistics section allows immediate retrieval of all information. You can compare data for a single month, or for multi-month periods in *any* combination.

The program is ideal for the following applications:

A. Comparing your costs versus the rising costs of energy.
B. Examining the seasonal effects upon your energy consumption.

C. Analyzing the effectiveness of any conservation measures you may have undertaken.

For the TRS-80 Level II 16K. **Order No. 0132R $9.95**

ENHANCED BASIC

Enhance the power of your TRS-80 Level II microcomputer with the Enhanced BASIC package. This package gives you many functions found in Disk BASIC plus other new features, without having to add a disk drive system.

You can have:

1. Enhanced string handling capabilities.
   A. An INSTR search function for finding strings within strings.
   B. Edit strings by replacement of portions of strings with sub-strings.
   C. Input a whole line of characters into a string variable with your own prompts.
2. Build your own functions.
   A. Use this routine as a shorthand for repeated, complex relationships.
   B. Use your own function names.
3. Use hexadecimal and octal constants directly.
   A. Avoid the hassle of hex-to-decimal manipulations.
   B. Use numeric and strings forms.
4. A decimal-to-hexadecimal conversion function.
   A. Use it directly in program or calculator mode.
   B. Convert from variables or constants.
5. Use up to ten user defined machine-language subroutines.
   A. Define the entry points with a new statement.
   B. POKE in machine-language subroutines with this easy to use feature.
   C. Use this to create faster graphics routines.
6. Simulate keyboard INPUT from the cassette recorder. This powerful feature will allow you to run a "keyboard" session from tape.
   A. Record programs, commands, and input responses on tape.
   B. The programs can RUN and operate exactly as if you were at the keyboard.
7. A keyboard debounce routine

The package documentation includes detailed instructions, with listings of sample programs, that will have you practicing and using Enhanced BASIC in no time at all.

So stretch the limits of both your imagination and your TRS-80 with the Enhanced BASIC package.

Order No. 0077R (cassette version) $24.95

Instant Software™ New Releases

THE WORDSLINGER

When you think of word processors for the TRS-80, you think of multi-disk systems with lots of expensive RAM and peripherals. The Wordslinger system changes all that.

The Wordslinger is an economical word processing program that was designed for the individual user or small business. It's ideal for personal or business correspondence. The program has automatic formatting for letterhead stationary and envelope addressing. You can write and edit business letters, reports, forms, even schoolwork. Text is stored on cassette tapes for fast, inexpensive retrieval. Once you've used The Wordslinger, you won't want to go back to your typewriter.

One of The Wordslinger's major advantages is that you don't need disk drives or an Expansion Interface. The minimum system required is the TRS-80 Level II with 16K of RAM and an appropriate printer (you may need an Expansion Interface if your printer can't operate with just a printer interface cable, such as Radio Shack's part #26-1411 or 26-1416).

Complete text editing is yours for the asking, just ask for The Wordslinger.

Order No. 0129R $29.95.

THE RUSSIAN DISK

Scholars and diplomats know that in order to understand a foreign culture, you must know its language. In today's international politics and commerce, one of the most valuable languages to know is Russian. The Russian Disk can put you well on the road to mastering this vital language.

This package will give you on-screen displays of the Cyrillic letters of the Russian alphabet, detailed instructions of their proper pronunciation, plus exercises to aid you in recognizing and speaking simple Russian words.

This package not only teaches you the words but also presents you with a quiz. You pick the words upon which you wish to work, then the computer will score you on your progress in learning the lesson.

You can even practice typing in Russian. The program will allow you to type letters, or words, using the complete Cyrillic alphabet, so that you can practice writing hotel names, tourist attractions and street addresses.

This program is excellent for students, businessmen, scientists, and anyone who is interested in learning the Russian language.

This package requires the following minimum system:

1. A TRS-80 Level II 16K.
2. An Expansion Interface with 16K RAM.
3. A single disk drive.
4. Any compatible Disk Operating System.

Order No. 0212RD $24.95

DLDIS

DLDIS is a three-pass, label-assigning disassembler which assigns labels (where appropriate) to routines in a machine language program to give an output which is identical to a hand-assembled source code. Using DLDIS, you have options which enable you to send the disassembly to either a lineprinter (Radio Shack parallel port) or to tape (for subsequent reassembly by Apparat's extension of Radio Shack's EDTASM™). Because of the use of labels, it is a simple matter to change any object code program by disassembling, and then making changes to the resultant source without losing track of jump/load addresses. DLDIS even has a comments column to display any ASCII characters used in a LD or CP opcode.

Since DLDIS works only on in-memory programs, it has been made relocatable so that you may move it around in memory to avoid the program you wish to disassemble. As an added option you may also jump to memory locations and transfer control between DLDIS and other utility programs in your computer.

This package requires the following minimum system:

1. A TRS-80 Level II with 16K RAM.
2. An Expansion Interface.
3. A single disk drive.
4. Any compatible Disk Operating System.

Order No. 0231RD (disk-based version) $19.95.

SALES ANALYSIS

If your business is sales, whether as a salesperson or salesmanager, you're faced with some unique problems. How do you keep track of your day-to-day work, in what areas can you improve your sales technique, and how can you determine who your best prospects are? The Sales Analysis package is the answer to all these problems and more.

This package is divided into several modules:

The **Sales Analysis** module is designed to provide guidelines for determining an individual's sales performance, to analyze this performance and show you where it can be improved.

The **Data Storage** module allows you to store data in an automated processing ledger.

A **Management Analysis** module can take all the sales records for your group and show you who your best salespersons are, who needs more training and in what areas, and give you a sales forecast based on the projected improvement of your group's sales techniques.

Finally, the **Market Analysis** module, combined with the marketing data you supply, can show you where determined sales efforts can produce the most success.

If your specialty is sales, then the Sales Analysis package is what you need. For the TRS-80 Level II 16K.

Order No. 0131R (cassette-based) $24.95

How to incorporate machine code into your BASIC programs.

Machine Code USR

Larry McDonald
4130 Ferrarra St.
Jacksonville, FL 32217

The major advantage that a machine language program has over a BASIC interpreter program is the speed of its execution. This proves very useful for long running programs or when producing high-speed graphics.

Program Listing 1 is a BASIC program that branches to a short machine language subroutine and uses this subroutine to paint the screen white. Control returns immediately to the BASIC program where we delay several seconds and then print a message.

Before you try Listing 1, try the two test programs below and time them for comparison.

Test 1 . . 10FORX = 0TO127:FORY = 0TO47: SET(X,Y):NEXTY:NEXTX
Test 2 . . 10FORX = 15360TO16384:POKE X, 191: NEXTX (191 in POKE is ASCII code for white graphics byte.)

Test 1 requires approximately 47 seconds from the time you hit the ENTER key until the word READY is displayed. Test 2 runs much faster and only requires about seven seconds to completely paint the screen.

Whiting Out the Screen

Now that you've made these comparisons, enter Listing 1. The first portion loads the machine language program (Example 1) and waits for the ENTER key to be depressed before actually executing the subroutine.

For comparison purposes, begin timing when you press ENTER and count until the screen is completely white. When you run this program, you should find that the screen is completely white before your finger has been lifted from the ENTER key (one second or less).

You can really appreciate the meaning of the term microsecond when you realize that this simple program performed over

```

Example 1. Machine Language Subroutine.

a thousand operations in the time it took us to press and release the ENTER key.

Program Listing 2 is a hexadecimal dump program. The BASIC program obtains the desired starting address. This address is then converted to hexadecimal and inserted into the subroutine via the POKE command. The starting location of the machine language routine is then POKEd into memory locations 16526 and 16527.

At this point, I use a statement containing the USR(0) function (for instance, X = USR(0)) which causes control to

pass to the memory location loaded into bytes 16526 and 16527.

The machine language routine handles the actual conversion and display of the dump. This program displays eight lines of sixteen bytes per line (32 characters). It also displays the starting location for each line as the first four characters on the line.

The time required to convert and display each screen (eight lines by 16 bytes) is usually about one second. When the machine language subroutine is completed, control is returned to the BASIC program by means of an unconditional return (RET).

At this point, the BASIC pro-

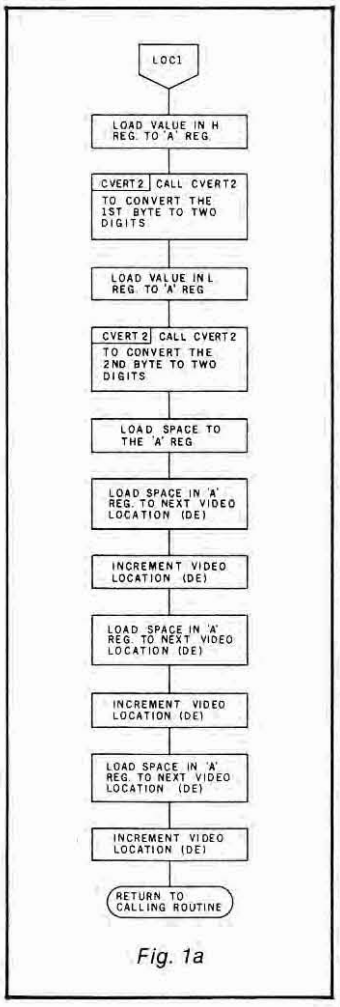

Fig. 1a

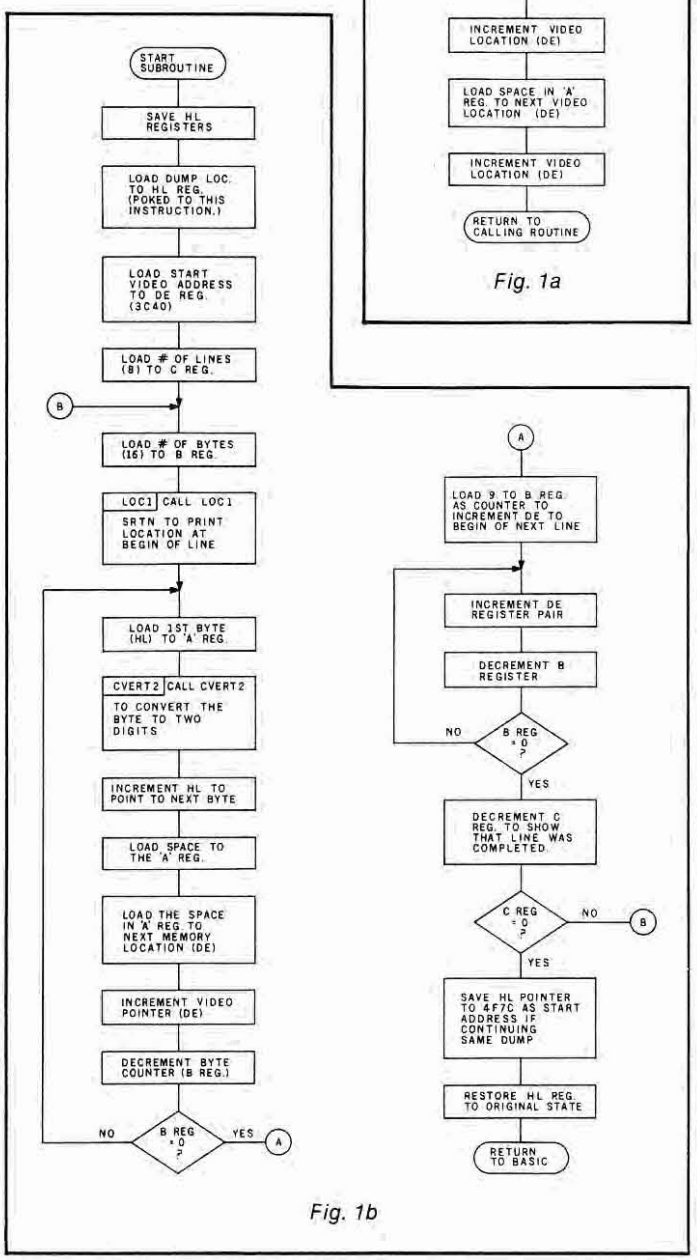

Fig. 1b

gram gives you three options. If you enter a one, the next consecutive eight lines will be displayed. If you enter a two, you are allowed to specify a new dump location. A three ends the program.

Program Listing 3 is the machine language subroutine. Although the format is similar to an assembler's output, it was manually entered.

When actually entering the data (via T-BUG), you use only the first two columns. The first column identifies the memory location, while the second column contains the actual hexadecimal values.

The program can be saved on tape with T-BUG (suggested name = HEXDMP), and the BASIC program can be saved immediately following it.

When you power up your Level II, answer the 'MEMORY?' statement with 20340. The subroutine loads via the system command, and then the main program loads and executes in the normal manner.

Comments have been added to Listing 3 to identify the various program functions.

Easier Loading

Since it is a short routine, it may be easier for you to load the machine language subroutine as part of the BASIC program, using the POKE statement. Adding the statements shown in Example 2 to Program Listing 2, eliminates a separate load of the subroutine.

```
32 DATA 229,33,122,79,17,64,60,14,8,6,16,205,171,79,126,205,198,79
33 DATA 35,62,32,18,19,5,194,136,79,6,9,19,5,194,151,79,13,194

35 DATA 198,79,62,32,18,19,18,19,18,19,201,0,0,0,0,0,0,0,0,0,217
36 DATA 79,217,203,63,203,63,203,63,203,63,205,225,79,18,19,217,121
37 DATA 217,230,15,205,225,79,18,19,201,198,48,254,58,250,234,79
38 DATA 198,7,201
```

Example 2. Additions to POKE Machine Language Subroutine.

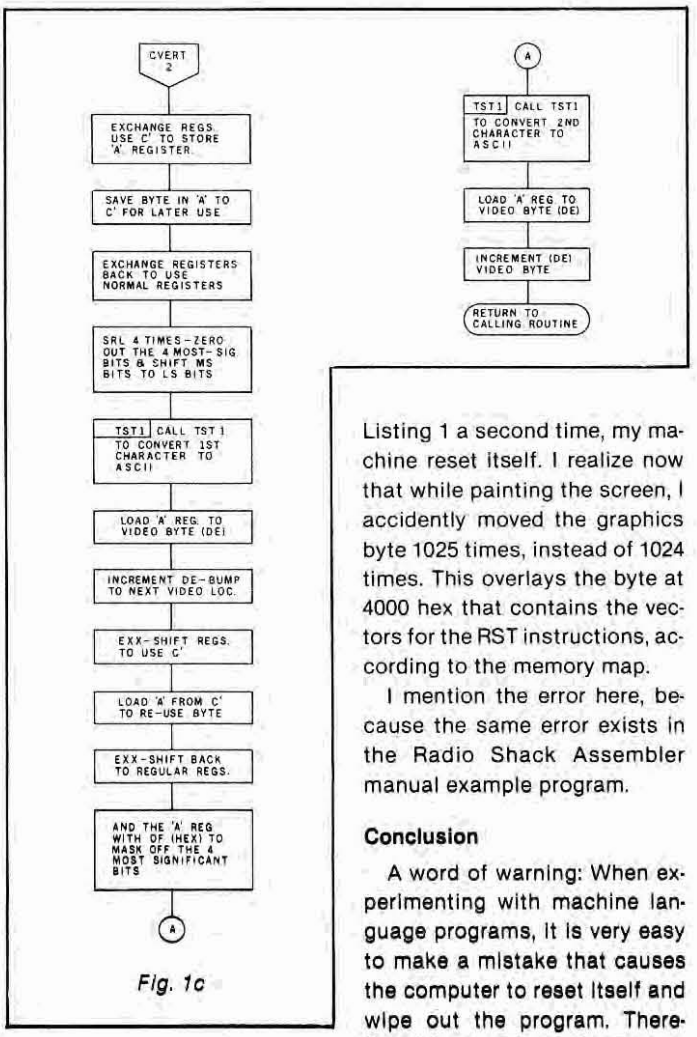

Fig. 1c

For those interested in delving into machine language programming, a flowchart of the subroutine logic is included as Fig. 1.

While experimenting with the USR(0) function, you might encounter one or two idiosyncrasies. The first is that you have to save the HL registers (PUSH HL) as the first part of the subroutine and then restore these registers (POP HL) before returning to the BASIC program. Failing to do this causes the program to dump the program location only, instead of dumping the location you specified. Apparently, the USR(0) function transfers the address from 16526 and 16527 to the HL registers.

The second idiosyncrasy is the result of a programming error of mine. You might make the same. Initially, if I ran Program Listing 1 a second time, my machine reset itself. I realize now that while painting the screen, I accidently moved the graphics byte 1025 times, instead of 1024 times. This overlays the byte at 4000 hex that contains the vectors for the RST instructions, according to the memory map.

I mention the error here, because the same error exists in the Radio Shack Assembler manual example program.

Conclusion

A word of warning: When experimenting with machine language programs, it is very easy to make a mistake that causes the computer to reset itself and wipe out the program. Therefore, it is a good practice to save the program before you attempt to run it. If you encounter any problem with these two sample programs, check carefully to see that you have the right numbers in the right places for the data statements, and that the POKE statements are as shown. ■

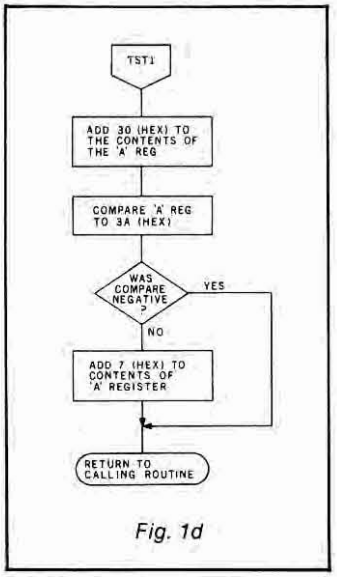

Fig. 1d

THE HUMAN ADVENTURE!

The Human Adventure is the ultimate in educational game simulations. The entire human body is mapped into a complex maze that allows exploration of **all** major organ systems. As you travel through the body, your progress is mapped on the CAT-scan in the lower portion of the screen. Status reports, command input, energy levels, and full descriptions of all organs, veins, and arteries are displayed at all times and updated as you move.

Will you merely explore? Or will you race against time to save a patient from cancer? Can you maintain sufficient energy levels to allow laser defense against white cell attacks? Will your immune defense screens hold? Will your supply of interferon hold out? What difficulty level do you dare choose?

Service Technologies will pay all shipping and handling.

---

accounts receivable

This program was developed for our family business. The goal was an orderly transition from hand-kept books to computerized bookkeeping. Accounts receivable including sales tax was the most time consuming, thus the beginning. Time spent on accounts receivable has been cut in half. More detailed statements sent earlier have decreased the outstanding receivables.

This program is designed for business people, not computer or accounting experts. All inputs are structured for fast and efficient operation. If a math check is required, extensions and totals are checked faster than with a calculator. If a math check is not required, only the amount of sale, less any tax, is entered. The program stores sales tax information on all customers and will display the proper tax, if any is required. Non-taxable customers making a taxable purchase, customers from a tax district other than the place of business, picking up at the place of business are easily handled by the program. Amount of tax and taxable sales are compiled and stored for up to 100 sales tax districts.

Every entry can be edited at any time. If an incorrect or missing transaction is found after statements are printed, the corrections can be made and the statement reprinted. Sales tax and monthly data in disk files are adjusted by this process.

Rate of service charge and customers to receive service charge are selected by the user.

Overview and Sample Reports	**$5.00**
Documentation	**$25.00**

For the computer neophyte, find out what a TRS-80 can do.

The TRS-80

Alexander MacLean
WA2SUT/NNN0ZVB
18 Indian Spring Trail
Denville NJ 07834

Only one small computer system is designed for home consumption, assuming little or no backgrcund in either computer programming or electronics—the Radio Shack TRS-80.

Once it is set up, which takes about 10-15 minutes the first time, you are ready to begin with the Level I manual which lives up to its reputation for being one of the best introductions to the computers and their language. Once you start playing with the computer you enter a mental state known as manic-keypressive. You won't want to stop until you get through the book as quickly as you can.

Flaws Along the Way

There are areas where I would fault the manual, especially since it's intended for a beginner.

While there are few obvious errors, I should have known there was going to be trouble when one of their examples referred to "Watts law."

Often you have to refer to the answer pages to solve a problem and find that their solution requires information you were not given.

Some problems, they don't even mention. There is an information storing line, called a data line, which they say can appear in any part of the program—beginning, middle, end or wherever. What they don't tell you is that data lines must be in the proper order among themselves or there will be trouble.

Imagine a list of quantities such as volts, ohms and amperes. The data for these catagories can appear at any point in the program, but the information must be in the order of the headings, thus the volts data must be before the ohms data which is before the amperes data.

Their graphics section in particular lacks explanation. You are shown examples of graphics procedures, but you are left to figure out exactly what is happening. You can imitate the manual, but you do not get a really firm grasp of what you are doing and why.

It will probably take you about one to two weeks work (at several hours per day) to go over all of the material in the instruction part of the manual.

The Next Plateau

That is where the next plateau begins. What can I do with the computer? That is where the Radio Shack manual, like others lets you down rather badly. There is an information gap between learning the various mechanical computer functions and developing working programs based upon your own information and needs.

There are a few sample programs in the back of the manual. Some are more than novelties, but even if studied they really only give you bits and pieces of information. Your learning depends on your ability to analyze.

There is an additional Level I BASIC instruction course available from Radio Shack for about $13, consisting of eight taped lessons to be played on your computer. Each lesson contains two to four parts.

One salesman told me that the lessons were meant for people who weren't going to learn the manual, another said they were supplemental information to the manual. I tried the course to see what it did. It took several hours to cover what in actuality was very little information.

For the material covered I think they could have done better with a small paperback costing a buck rather than a set of tapes costing much more.

You will get better with experience and there is no substitute for working with the computer. You'll start thinking in computer terms and find that you can build longer programs from your own information.

This still leaves unanswered the question of what you can actually do with your computer.

There is potential in the Level I 4K, but it has limitations. Much depends on how well you can take the individual language elements and combine them to do work.

While you can store data or do record keeping with it, it takes computer memory that you don't really have.

What the machine does best is manipulate numbers repetitively. Let's take a simple example, ohms law: $E = IR$. This elementary formula can solve many problems.

If we assume 10 volts and 10 ohms we can solve for current (I) by the use of $I = E/R$. For one value we can do it easily with a pocket calculator or even pencil and paper. In what Radio Shack calls the calculator mode, you can use your computer as a pocket calculator. But a TRS-80 is more expensive.

But suppose you wanted to know the current as you varied both the voltage and the resis-

Let Your TRS-80® Teach You ASSEMBLY LANGUAGE

Tired of buying book after book on assembly language programming and still not knowing your **POP** from your **PUSH**?

REMSOFT proudly announces a more efficient way, using your own TRS-80®, to learn the fundamentals of assembly language programming --at YOUR pace and at YOUR convenience.

Our unique package, "**INTRODUCTION TO TRS-80® ASSEMBLY PROGRAMMING**", will provide you with the following:

- Ten 45-minute lessons on audio cassettes.
- A driver program to make your TRS-80® video monitor serve as a blackboard for the instructor.
- A display program for each lesson to provide illustration and reinforcement for what you are hearing.
- A textbook on TRS-80® Assembly Language Programming.
- Step-by-step dissection of complete and useful routines to test memory and to gain direct control over the keyboard, video monitor, and printer.
- How to access and use powerful routines in your Level II ROM.

This course was developed and recorded by Joseph E. Willis and is based on the successful series of courses he has taught at Meta Technologies Corporation, the Radio Shack Computer Center, and other locations in Northern Ohio. The minimum system required is a Level II, 16K RAM.

BRING YOUR TRS-80 KEYBOARD TO LIFE!

More than a year ago we used this headline to introduce AUTOK and QEDIT, the keyboard autorepeat and quick edit utilities for Level II BASIC. They've been very popular, but we couldn't resist working them over anyway, in response to customer suggestions. The result? **KEYEDIT**, a vastly improved AUTOK, QEDIT, and a few things more.

With **KEYEDIT** and your Level II or Disk BASIC system, you get:

- Debouncing. No need to use Radio Shack's KBFIX!
- Autorepeat on every key. Just hold a key down, and after a half-second delay, the character repeats about eight per second.
- Single-keystroke keyword entry. Hold down SHIFT, hit a letter key, and an entire BASIC keyword is spelled out at once. Plus, you can assign any keyword to any key!
- Keyboard macro facility. Any frequently-typed pattern can be defined and later invoked in a single keystroke. You just fill in the blanks. Takes the drudgery out of repetitive keying.
- Screen-oriented editing. **KEYEDIT**'s cursor moves anywhere in a displayed program listing for instant insertions and deletions. Plus, whole statements can be copied to other parts of the program or combined to form longer ones, without retyping the text. Makes BASIC's EDIT function obsolete!
- Easy loading. **KEYEDIT** loads from cassette using CLOAD (even though it's written in machine language), and may be saved on disk. Features can be deleted selectively just by deleting lines. Once RUN, **KEYEDIT** protects itself in memory and links into BASIC, where it unobtrusively awaits your command.
- Thorough documentation. Each feature is explained in detail along with instructions for user modifications.

KEYEDIT will save you hours of effort in BASIC program development. So why waste another minute? Bring your keyboard to life today with **KEYEDIT!**

KEYEDIT Level II cassette and instructions: **$19**

tance, say 10 to 100 volts in ten volt steps with the resistance changing at each voltage level from 1 to 10 ohms in one ohm steps.

This takes 100 separate calculations. It would take some time to work out with the pocket calculator or using the computer in its calculator mode. But you could write a short program to solve it. The computer takes off on RUN and you have the answers in a few seconds.

Now suppose you wanted to know the power for each set of values. We have 100 values which means 100 more calculations for the power formula. This takes only a few extra lines added to the program. Now you have twice as much information.

Let's get real mean. Suppose you had a precision requirement and needed to know the values from 1 to 100 volts in 1 volt steps and 1 to 100 ohms in 1 ohm steps. The program would be just about the same length. Just a few numbers would change. But you would be talking about 10,000 calculations, plus another 10,000 for the power formula.

Try that on your pocket calculator or with pencil and paper. On a computer, it might take some time to run, but it would.

Three Salesmen

Now let's look at another operation. Let's assume we have three salesmen, as in Table 1. Smith, Jones and Rogers each earn so much in sales, spend so much to make it and have a total earnings and percentage figure.

We would like the computer to list names and figures and then do calculations based upon the data. Here is where we run into computer problems.

The basic computer will not give you a list of names and figures like that. However, the computer can take the earnings and costs and figure the net earnings and the percentage earned.

Notice that these figures appear across the line. In that form the computer will do these calculations on each person.

Now look at the bottom figures. These are the overall totals for the earnings and expenses. This requires the computer to figure from top to bottom. But a Level I cannot read or manipulate the data in that form.

There are programs that will perform some of the calculations but they require high level programming skills. All the data has to be typed into the program in the correct form and only limited answers are available.

This does not mean that the computer can't be used for some form of data processing, but you will have to break the job up into smaller sections.

Even prepared 4K programs are limited in scope. An inventory program I saw, allowed only 100 items with cost and inventory.

	GROSS	COST	NET	PERCENTAGE
Smith	10,000	2,500	7,500	75%
Jones	10,000	3,000	7,000	70%
Rogers	9,000	500	8,500	94.44%
	29,000	6,000	23,000	79.31%

Table 1. While the computer figures across the lines, Level I cannot add columns or handle the names in any convenient manner.

A Learning Tool

By now it should be clear that what you really do with the Radio Shack TRS-80 is learn with it. It is an effective introduction to the computer. You will have to work at finding your own path into the computing world beyond, but help is out there: clubs; stores; magazines; night schools. Good luck! ■

"HEAD TO HEAD" ELECTRONIC FOOTBALL

Two ways to play, against the computer or against a friend, and two levels of skill, semi-pro and pro. This versatile computerized game will provide hours of fun with authentic football action. Complete offense and defense control, pass block, run and kick/punt. LED statistical display and electronic sound effects. Batteries not included. Wt. 10 oz.

Cat No. 2404 **$54.95**

NEWDOS + TRS 80 DOS

Contains NEWDOS, DIRCHECK, DISASSEM, EDTASM, LEVEL I in LEVEL II, LMOFFSET, and SUPERZAP

NEWDOS provides fixes for many of TRS DOS 2.1's problems. Many enhancements to BASIC have been added, including built-in renumbering, some abbreviated commands, scrolling of listings up or down, screen printing (dumps contents of screen to printer), clears up keyboard bounce, direct call to DOS without leaving BASIC (display directory etc.), display all occurrences of variables used, etc.

With NEWDOS you also get DIRCHECK, which tests and lists disk directories, DISASSEM, which is a disassembler, EDTASM, which allows you to use your Radio Shack Editor-Assembler on disk with disk I/O Level I in Level II allowing you to use or create Level I programs and save or retrieve them from disk. Using LVIDSKSL, LMOFFSET helps save and load machine language tapes from disk even if in same memory as DOS. Finally, SUPERZAP, which allows you to display, print and modify memory or disks. Comes with over 30 pages of documentation and presumes ownership of TRSDOS 2.1 and the Radio Shack Editor-Assembler.

Cat No. 1549 **TRS-80, Level II, 16K w/disk** **$99**

SSM VB2 VIDEO BOARD

I/O controlled video interface board. With a TV monitor, the VB2 becomes a video terminal! No other I/O card is required for keyboard input and video display. The cursor, linefeed, carriage return, backspace and clear screen are hardware controlled. The display is 64 X 16, all upper case and is selectable for white-on-black or black-on-white.

Produces a clear, bright display, and features adjustable picture size and character width. Circuitry is provided to drive a speaker for beep tone.

Cat No.	Description	Price
1438	VB2 kit	$169.00
1439	VB2 A&T	$234.00

TRS-80 CP/M

At last, CP/M is available for the TRS-80! Long a standard for software development and interchange for all the "other" 8080/Z80 computers on the market, CP/M will now provide the same environment for the TRS-80.

CP/M is a file-oriented disk operating system that provides a common set of utilities for program development and operation. There are six built in commands plus utilities called in from disk. CP/M will run on a TRS-80 with as little as 16k of memory and one disk drive. Comes complete with six manuals. CP/M is a registered trade mark of Digital Research.

Cat No. 1679
TRS-80 Level II 16k-w/disk **$149.95**

MICROPOLIS® DISK DRIVES

Imagine a 5¼" floppy disk system with all the storage capacity of an 8" floppy system, and more!

Micropolis can give you more storage because they pack more data onto every disk. Ordinary 5¼" floppies provide just 35 tracks per drive and store 70 to 130 K bytes of data. Instead, Micropolis uses 77 tracks-each with 16 sectors of 156 bytes to yield an incredible storage capacity of 315k bytes per drive.

And that's not all! Reliability doesn't just happen by accident. At Micropolis reliability is engineered into each step of manufacturing. For example, most 5¼" floppy disks cut costs by using a plastic cam or cam follower to position the read/write head. Micropolis chose to use the strength and durability of an all steel cam and cam follower. Sure, it costs more, but it gives you more accurate tracking over a significantly greater lifespan which adds up to a lower cost per byte with use. Software from Micropolis includes a comprehensive DOS, (disk operating system), and disk Extended Basic designed for 8080/Z80 microcomputer systems. The DOS is complete with an assembler, editor, file management functions and disk utilities. Micropolis BASIC is a complete, powerful programming tool for developing, testing, executing and maintaining basic programs.

The model 1043 MOD II is a single floppy disk with 315k bytes storage and includes the S-100 disk Controller board. If you need more storage, or simply want to save even more money, then order the model 1053 MOD II dual disk system with 630k bytes storage capacity and S-100 Controller board. Micropolis DOS and disk extended BASIC are standard with both units.

Cat No.	Description	Weight	Price
2563	Model 1043 mod II single drive	9 lbs	$1145.00
2564	Model 1053 mod II dual drive	18 lbs	$1895.00

MINI 8100 TRS-80 to S-100 BUS ADAPTOR

Mini size, mini price, maxi performance. A complete adaptor/motherboard for the TRS-80.

Cat No.	Description	Price
1905	Kit, all parts, 1 S-100 connector	$115.00
1906	A & T with 4 S-100 connectors	$155.45
1907	Kit, with S-100 size bd, plugs into mainframe	$90.00
1908	A & T as above	$125.00

SSM SB 1 MUSIC SYNTHESIZER BOARD

- *Plug compatible with the S-100 bus!* **$199 Kit**
- *Software uses 4K of RAM*
- *Uses standard ASCII notation for music encoding*
- *Easy to write and correct music!*

Wave form synthesizer, designed to interface with the S-100 bus. Can be programmed to play a monophonic solo in an instrumental voice that is controlled by the software. Software includes a timer for definition of tempo and time signatures. Music can be heard immediately after the notation has been typed in. Multiple cards can be used to produce chords and harmonies.

Cat No.		
1408	Kit with software	$199.00
1409	SB1 assembled and tested	$279.00
1410	SB1 bare board	$45.00

ATARI® HOME VIDEO SYSTEM

The nation's best selling home entertainment center is here! Currently supports a library of 25 video game cartridges with over 1300 variations and options. This system comes with interchangeable joystick and paddle controllers, realistic sound effects, produces bright & crisp colors on your TV screen and special circuits to protect your home TV. Also includes ATARI's "Combat" game with 108 variations and options.

CAT NO.	DESCRIPTION	WT.	PRICE

Leedex VIDEO 100 12" MONITOR

- *Compatible with TRS-80 (no interface required)*
- *Compatible with many home computers!*

Now from LEEDEX . . . One of the most popular low cost, yet high resolution (650 line) monitors currently available. These units compare favorably with monitors costing twice as much. Because of the fact that standard composite video input is utilized no RF modulator is needed. An extremely sharp and stable picture is achieved. The video bandwidth is 12 mhz + / − 3db with a 75 ohm input impedance.

Cat No.			
1204	Video 100 Monitor	Wt. 18 lb.	$139.00
1937	TRS-80/Leedex cable kit	Wt. 6 oz.	$3.00

16K MEMORY ADD-ON KIT $59.95

Everything you need to upgrade your TRS-80, Apple or Exidy! An additional 16K includes illustrated instructions, RAMS and preprogrammed jumpers. No special tools required. Wt. 4 oz.

CAT NO	DESCRIPTION
1156	TRS-80 Keyboard Unit
1156-A	TRS-80 Exp. Interface (prior to 4/1/79)
1156-B	TRS-80 Exp. Interface (after 4/1/79)
1156-C	for Apple II
1156-D	for Exidy

CCS 7811B ARITHMETIC PROCESSOR

Assembled & tested, adds advanced arithmetic power to your Apple II. AMD AM 9511 based. 16 and 32 bit fixed point, 32 bit floating point operation. Float to fixed and fixed to float conversions. Trig and inverse functions, square roots, logs, exponentiation. Interrupt daisy chain, DMA daisy chain, and much more. Wt. 2 lbs.

Cat No. 1635 **$399.95**

NOVATION "CAT" ACOUSTIC MODEM $179.00

The first compact modem designed for the small computer user. Transmits data over standard telephone lines. Exchange data or program with other systems. Data transfer rate up to 30 char/sec. Complete and ready to use! Requires 110 VAC. 60 Hz.

Cat No. 1480 **Wt. 3 lbs.**

DISKETTE DRIVE HEAD CLEANING KIT

Diskette drive heads need periodic maintenance to assure efficient and error-free operation. Unlike other peripheral devices, the read/write head(s) on diskette drives are extremely difficult to clean without partially disassembling the drive. The diskette drive head cleaning kit allows the user to clean the heads in just minutes, without disassembling the drive. Available in 5½" or 8", both single and double sided. Kit contains 2 cleaning diskettes, 4 oz. bottle of CS-85 cleaning solution and an easy pour dispenser.

Weight 12 oz.

CAT NO.	DESCRIPTION	PRICE
2499	8" Disk Drive Cleaning Kit	$30.75
2534	5¼" Disk Drive Cleaning Kit	$30.75

TRS-80 SERIAL I/O

• Can input into basic • Can use LLIST and LPRINT to output, or output continuously • RS-232 compatible • Can be used with or without the expansion bus • On board switch selectable baud rates of 110, 150, 300, 600, 1200, 2400, parity or no parity odd or even, 5 to 8 data bits, and 1 or 2 stop bits. D.T.R. line • Requires +5, -12 VDC • Board only $19.95 Part No. 8010, with parts $59.95 Part No. 8010A, assembled $79.95 Part No. 8010 C. No connectors provided, see below.

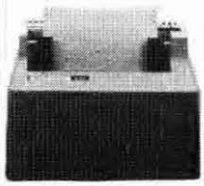
EIA/RS-232 connector Part No. DB25P $6.00, with 9', 8 conductor cable $10.95 Part No. DB25P9

3' ribbon cable with attached connectors to fit TRS-80 and our serial board $19.95 Part No. 3CAB40

COMPUCRUISE

$129.95; with cruise control $169.95

PAPER TIGER



Prints address labels, multicopy invoices and legal-size reports. Adjust the tractor width from 1-3/4 to 9-1/2 inches. 8 switch-selectable forms lengths. Print 6 or 8 lines per inch. Add the software-selectable full dot plotting graphics option to print illustrations, block letters, charts, graphs. Part No. 162172 $899.95 • with graphics option Part No. 162173 $1099.95

GAME PADDLES & SOUND

Includes: 2 game paddles, interface, software, speaker, power supply, full documentation including: schematics, theory of operation, and user guide; plus 2 games on cassette (Pong and Starship War). $79.95 Complete Part No. 7922C

DIGICOM DATA PRODUCTS INC. Series 312 Acoustic Coupler

300 BAUD Originate, Part No. AC3122, $219.95. 300 BAUD Answer, Part No. AC3122, $219.95. 300 BAUD Answer/Originate, Part No. AC3123, $229.95.

IBEX LIGHT PEN

Comes with Backgammon and Tic-Tac-Toe on tape with full documentation and program listing. Requires 9v. battery. Part No. IBEX $19.95

SYSTEM EXPANSION from LNW Research

• Serial RS232C/20 mA I/O • Floppy controller • 32K bytes memory • Parallel printer port • Dual cassette port • Real-time clock • Screen printer bus • Onboard power supply • Software compatible • Solder mask, silk screen. PC board and user manual, Part No. LNW80, $69.95.

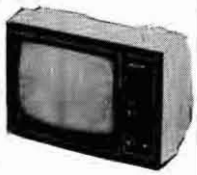
DISKETTES

Box of 10, 5" $29.95, 8" $39.95. Plastic box, holds 10 diskettes, 5" - $4.50, 8" - $6.50.

16K RAMS

For the Apple, TRS-80 or Pet $8 each Part No. 4116/2117.

LEEDEX MONITOR

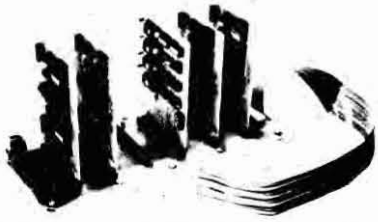


12" Black and White • 12 MHz Bandwidth • Handsome Plastic Case • $139.00

S-100 INTERFACE

AN S-100 bus Adapter—Motherboard for the TRS-80. Kit, Part No. HUH81DLXK, $295.95. Assembeled, Part No. HUH81DLXA, $375.95.

NOW! A FULL SUPPORT SYSTEM FOR TRS-80



• 32K of RAM • EPROM firmware • Disk control • Data acquisition • Parallel I/O • Serial I/O • Plug into GPA's Motherboard. GPA's quality design includes • 6-44 pin edge connectors • +5V, -5V, +12V, -12V external power supply required • Active termination. The Motherboard, Part No. GPA80, is only $149.95.

TAKE ADVANTAGE OF GPA-EXPANSION CARDS FOR THE GPA80

Memory cards: Now with Fortran compilers available for your TRS-80, additional expansion memory is a must! Card with sockets only, Part No. GPA801, $119.95. Card with 16K of 4116 Dynamic Ram, Part No. GPA802, $224.95. Card with 32K of 4116 Dynamic Ram, Part No. GPA803, $329.95. All cards come equipped with sockets to accomodate 32K of Ram.

EPROM firmware card. Put those valuable subroutines in firmware. Don't waste time loading and unloading tapes and disks. For 2708 or 2716 EPROMS, Part No. GPA806, $79.95.

Serial I/O card. Here's what you've been asking for, a full serial terminal interface, with RS-232C or 20 mA. Current loop. Input/output capabilities. Part No. GPA807, $79.95.

Parallel I/O Card. Control functions in the outside world, monitor and store real time events. Two parallel output ports. Dip switches select ports (0-254). Part No. GPA808, $79.95.

FLOPPY DISK STORAGE BINDERS

Three ring binder comes with ten transparent plastic sleeves which accommodate either twenty, five-inch or ten, eight-inch floppy disks. Binder & 10 holders, Part No. 810B—$9.95 • Extra holders, Part No. 810—69¢ each.

Three-ring binder with ten 5 1/4 inch jackets Part No. 510B—$9.95• Jackets only, fits standard 3-ring binders, Part No. 510—69¢ each.

DIGITAL CASSETTE

5 min. each side. Box of 10 $9.95. Part No. C-5.

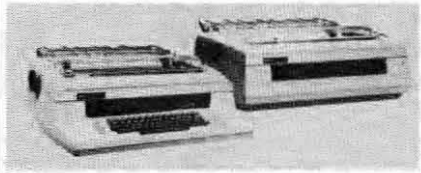
TRENDCOM PRINTER

TRENDCOM 200, Part No. TRC0200 $495.95. **Interface** for TRS-80, Part No. T80A $49.95, For Apple II, Part No. TRCALL, $75.95. For PET, NO. TRCP2, $79.95. For Scoccerer, TRCSR1 $45.95.

SARGON: A Computer Chess Program

Features the complete program that won the 1978 West Coast Computer Faire Tournament. Part No. 00603 — TRS-80 Level II; Part No. 00604 — Apple II (24K). $19.95

SPINWRITER MODELS 5510 and 5520



Features—EIA RS-232C/CCITT V.24 Interface Standard • 55 Characters Per Second Maximum Print Rate • Impeccable Print Quality (OCR Quality) • Microprocessor Electronics • High Resolution Plotting/Graphing • Lowest Operating Noise Level • Self-Test Printing • Operator Engineered Control Panel • Prints Original and up to Seven Copies • NEC Information Systems new Model 5510 Receive Only and Model 5520 Keyboard Send/Receive SPINWRITER terminals are microprocessor controlled serial, impact terminals designed for remote printing applications where impeccable print quality is required. Model 5510 RO, Part No. NECA30759 $2795.95 • Model 5520 KSR, Part No. NECA30762 $3095.95

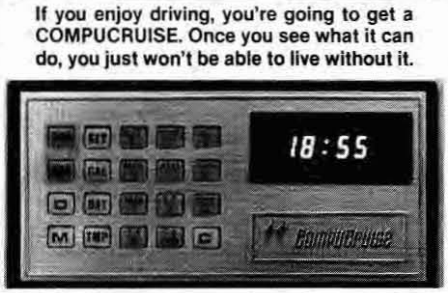
AN EGYPTIAN TREASURE HUNT THROUGH A NEWLY UNCOVERED PYRAMID COMPLETE WITH ANCIENT CURSE
Order #SA008T for TRS Level II 16K, #SA008S for Sorcerer 16K, #SA008A for Apple 24K—$13.45 each, on cassette

If you enjoy driving, you're going to get a COMPUCRUISE. Once you see what it can do, you just won't be able to live without it.



COMPU CRUISE
MODEL # 41
$127.95

This gadget fits into most dashboards . . . no strain even in a tiny sports car like the Mazda RX-7 . . . and once you have it, every trip is like flying a 747. The darned thing tells you the time, how fast you're going, how far you've been on this trip or since the last regassing, how many miles per gallon you're getting, either at the instant or the average on the trip . . . or gallons per hour at the moment or for the trip . . . temperature outside . . . inside (or coolant temperature, if you prefer) . . . oh, it has an elapsed time for the trip, a stop watch, lap time, an alarm . . . how much further for your trip, how many gallons more the trip will take, how much longer for the trip at your present average speed . . . yes, it gives you your average speed for the trip. You prefer it in metric, no strain . . . liters remaining, etc. Did we mention that it also has cruise control either at a speed set on the control board or at whatever speed you are traveling? The Compucruise will keep you busy and entertained during any trip . . . telling you more than you will ever want to know.

The Compucruise is not difficult to install . . . though it does connect to everything except the cigarette lighter. Until you've tried computerized travel, you haven't found out how much fun driving can be. It will work on any car not having fuel injection . . . and there is a front-wheel drive accessory gadget available for only $4.40-#P001 (regularly $5.50).

The price for the Compucruise is regularly $199.95 . . . and a bargain at that price. We'll sell you one of these fantastic gadgets for $159.95 with cruise control (Model 44-#P002), and $127.95 without (Model 41-#P003).Send money . . . and start having fun!

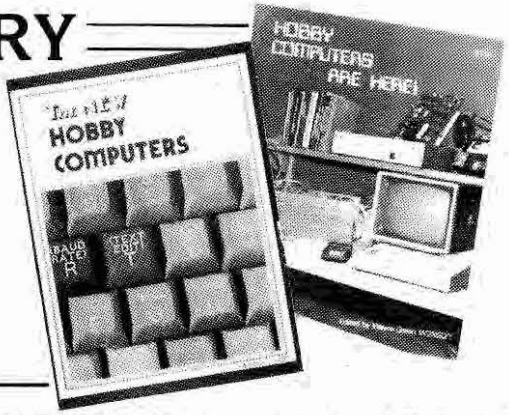
80 microcomputing™ bookshelf

2 new books from the editors of KB & 80 Microcomputing

● **40 COMPUTER GAMES**—BK7381—Forty games in all in nine different categories. Games for large and small systems, and even a section on calculator games. Many versions of BASIC used and a wide variety of systems represented. A must for the serious computer gamesman. $7.95*

● **UNDERSTANDING AND PROGRAMMING MICROCOMPUTERS** – BK7382 – A valuable addition to your computing library. This two part text includes the best articles that have appeared in 73 and Kilobaud Microcomputing magazines on the hardware and software aspects of the new microcomputing hobby. Well known authors and well structured text helps the reader get involved in America's fastest growing hobby. $10.95*

INTRODUCTORY



● **HOBBY COMPUTERS ARE HERE!**—BK7322—If you (or a friend) want to come up to speed on how computers work . . . hardware and software . . . this is an excellent book. It starts with the fundamentals and explains the circuits, and the basics of programming. This book has the highest recommendations as a teaching aid for newcomers. $4.95.*

● **THE NEW HOBBY COMPUTERS**—BK7340—This book takes it from where "HOBBY COMPUTERS ARE HERE!" leaves off, with chapters on Large Scale Integration, how to choose a microprocessor chip, an introduction to programming, low cost I/O for a computer, computer arithmetic, checking memory boards . . . and much, much more! Don't miss this tremendous value! Only $4.95.*

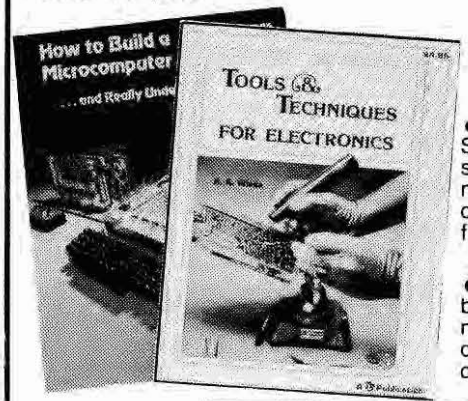
INTRODUCTION TO MICROCOMPUTERS (VOL. 0→III)

● **AN INTRODUCTION TO MICROCOMPUTERS, VOL. 0**—BK1130—The Beginner's Book—Written for readers who know nothing about computers—for those who have an interest in how to use computers—and for everyone else who must live with computers and should know a little about them. The first in a series of 4 volumes, this book will explain how computers work and what they can do. Computers have become an integral part of life and society. During any given day you are affected by computers, so start learning more about them with Volume 0. $7.95.*

● **VOL. I**—BK1030—**2nd Edition completely revised.** Dedicated to the basic concepts of microcomputers and hardware theory. The purpose of Volume I is to give you a thorough understanding of what microcomputers are. From basic concepts (which are covered in detail), Volume I builds the necessary components of a microcomputer system. This book highlights the difference between minicomputers and microcomputers. $12.50.*

● **VOL. II**—BK1040 (with binder)—$30.00* —Contains descriptions of individual microprocessors and support devices used only with the parent microprocessor. Volume II describes all available chips.

● **VOL. III**—BK1133 (with binder)—$20.00.* Contains descriptions of all support devices that can be used with any microprocessor.



● **HOW TO BUILD A MICROCOMPUTER – AND REALLY UNDERSTAND IT** – BK7325 – by Sam Creason. The electronics hobbyist who wants to build his own microcomputer system now has a practical "How-To" guidebook. This book is a combination technical manual and programming guide that takes the hobbyist step-by-step through the design, construction, testing and debugging of a complete microcomputer system. Must reading for anyone desiring a true understanding of small computer systems. $9.95.*

● **TOOLS & TECHNIQUES FOR ELECTRONICS**—BK7348—is an easy-to-understand book written for the beginning kit builder as well as the experienced hobbyist. It has numerous pictures and descriptions of the safe and correct ways to use basic and specialized tools for electronic projects as well as specialized metal working tools and the chemical aids which are used in repair shops. $4.95.*

*Use the order card in the back of this magazine or itemize your order on a separate piece of paper and mail to 80 Microcomputing Bookshelf • Peterborough NH 03458. Be sure to include check or detailed credit card information. No C.O.D. orders accepted. All above add $1.00 handling. Please allow 4–6 weeks for delivery. Questions regarding your order? Please write Customer Service at the above address.

80 microcomputing T.M. bookshelf

Z80 BOOKS

● **TRS-80 DISK AND OTHER MYSTERIES** – BK1181 – by Harvard C. Pennington. This is the definitive work on the TRS-80 disk system. It is full of detailed "How to" information with examples, samples and in-depth explanations suitable for beginners and professionals alike. The recovery of one lost file is worth the price alone. $22.50.*

● **PROGRAMMING THE Z-80** – BK1122 – by Rodnay Zaks. Here is assembly language programming for the Z-80 presented as a progressive, step-by-step course. This book is both an educational text *and* a self-contained reference book, useful to both the beginning and the experienced programmer who wish to learn about the Z-80. Exercises to test the reader are included. $14.95.*

● **Z-80 ASSEMBLY LANGUAGE PROGRAMMING** – BK1177 – by Lance A. Leventhal. This book thoroughly covers the Z80 instruction set, abounding in simple programming examples which illustrate software development concepts and actual assembly language usage. Features include Z80 I/O devices and interfacing methods, assembler conventions, and comparisons with 8080A/8085 instruction sets and interrupt structure. $12.50.*

● **Z-80 SOFTWARE GOURMET GUIDE AND COOKBOOK** – BK1045 – by Nat Wadsworth. Scelbi's newest cookbook! This book contains a complete description of the powerful Z-80 instruction set and a wide variety of programming information. Use the author's ingredients including routines, subroutines and short programs, choose a time-tested recipe and start cooking! $15.95.*

● **INTRODUCTION TO TRS-80 GRAPHICS** – BK1180 – by Don Inman. Dissatisfied with your Level I or Level II manual's coverage of graphics capabilities? This well-structured book (suitable for classroom use) is ideal for those who want to use all the graphics capabilities built into the TRS-80. A tutorial method is used with many demonstrations. It is based on the Level I, but all material is suitable for Level II use. $8.95.*

BASIC

● **LEARNING LEVEL II** – BK1175 – by David Lien. Written especially for the TRS-80, this book concentrates on Level II BASIC, exploring every important BASIC language capability. Updates are included for those who have studied the Level I User's Manual. Sections include: how to use the Editor, dual cassette operation, printers and peripheral devices, and the conversion of Level I programs to Level II. $15.95.*

● **THE BASIC HANDBOOK** – BK1174 – by David Lien. This book is unique. It is a virtual ENCYCLOPEDIA of BASIC. While not favoring one computer over another, it explains over 250 BASIC words, how to use them and alternate strategies. If a computer does not possess the capabilities of a needed or specified word, there are often ways to accomplish the same function by using another word or combination of words. That's where the HANDBOOK comes in. It helps you get the most from your computer, be it a "bottom-of-the-line" micro or an oversized monster. $14.95.*

● **MY COMPUTER LIKES ME...WHEN I SPEAK BASIC** – BK1039 – An introduction to BASIC...simple enough for kids. If you want to teach BASIC to anyone quickly, this is the way to go. $3.95.*

● **ADVANCED BASIC** – BK1000 – Applications, including strings and files, coordinate geometry, area, sequences and series, simulation, graphing and games. $9.65*.

● **BASIC BASIC (2ND EDITION)** – BK1026 – by James S. Coan. This is a textbook which incorporates the learning of computer programming using the BASIC language with the teaching of mathematics. Over 100 sample programs illustrate the techniques of the BASIC language and every section is followed by practical problems. This second edition covers character string handling and the use of data files. $9.45.*

● **SIXTY CHALLENGING PROBLEMS WITH BASIC SOLUTIONS (2nd Edition)** – BK1073 – by Donald Spencer, provides the serious student of BASIC programming with interesting problems and solutions. No knowledge of math above algebra required. Includes a number of game programs, as well as programs for financial interest, conversions and numeric manipulations. $6.95.*

*Use the order card in the back of this magazine or itemize your order on a separate piece of paper and mail to 80 Microcomputing Bookshelf ● Peterborough NH 03458. Be sure to include check or detailed credit card information. No C.O.D. orders accepted. All above add $1.00 handling. Please allow 4–6 weeks for delivery. Questions regarding your order? Please write Customer Service at the above address.

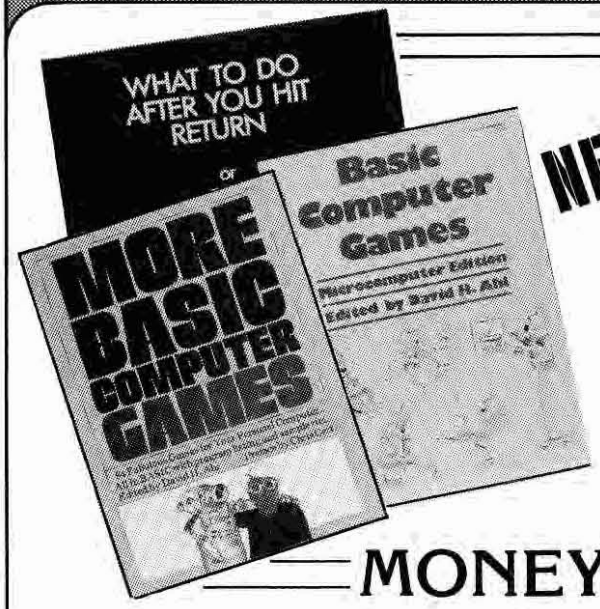
80 microcomputing™ bookshelf

GAMES



NEW!

● **MORE BASIC COMPUTER GAMES** – BK1182 – edited by David H. Ahl. More fun in BASIC! 84 new games from the people who brought you *BASIC Computer Games*. Includes such favorites as Minotaur (battle the mythical beast) and Eliza (unload your troubles on the doctor at bargain rates). Complete with game description, listing and sample run. $7.50.*

● **WHAT TO DO AFTER YOU HIT RETURN** – BK1071 – PCC's first book of computer games . . . 48 different computer games you can play in BASIC . . . programs, descriptions, many illustrations. Lunar Landing, Hammurabi, King, Civel 2, Qubic 5, Taxman, Star Trek, Crash, Market, etc. $10.95.*

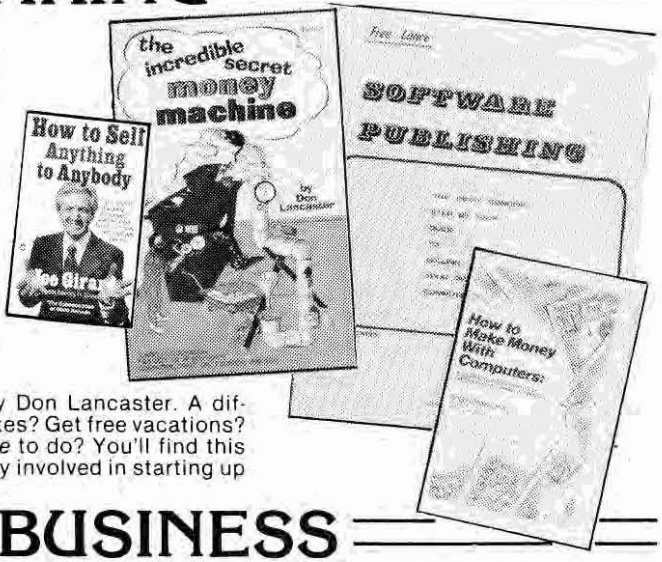
● **BASIC COMPUTER GAMES** – BK1074 – Okay, so once you get your computer and are running in BASIC, then what? Then you need some programs in BASIC, that's what. This book has 101 games for you from very simple to real buggers. You get the games, a description of the games, the listing to put in your computer and a sample run to show you how they work. Fun. Any one game will be worth more than the price of the book for the fun you and your family will have with it. $7.50.*

MONEY-MAKING

● **HOW TO MAKE MONEY WITH COMPUTERS** – BK1003 – In 10 information-packed chapters, Jerry Felsen describes more than 30 computer-related, money-making, high profit, low capital investment opportunities. $15.00.*

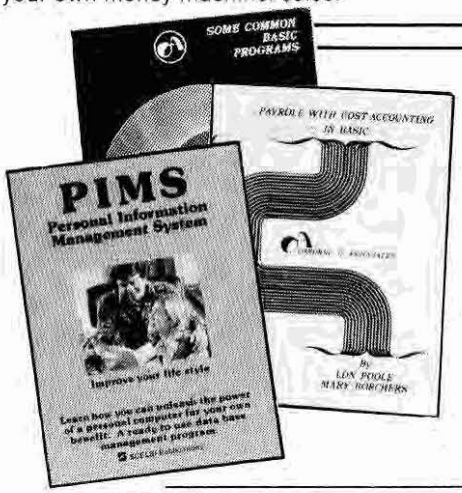
● **HOW TO SELL ANYTHING TO ANYBODY** – BK7306 – According to *The Guinness Book of World Records*, the author, Joe Girard, is "the world's greatest salesman." This book reveals how he made a fortune – and how you can, too. $2.25.*

● **FREELANCE SOFTWARE PUBLISHING** – BK1179 – by B. J. Korites. "This book is about money and how to make it by writing and selling computer programs," (author's foreword). If you have the skills to write a saleable program, you now need to acquire the skills to sell that program. This compact book comprehensively covers the entire publishing process and many aspects of software salesmanship. $14.95.*



● **THE INCREDIBLE SECRET MONEY MACHINE** – BK1178 – by Don Lancaster. A different kind of "cookbook" from Don Lancaster. Want to slash taxes? Get free vacations? Win at investments? Make money from something that you *like* to do? You'll find this book essential to give you the key insider details of what is really involved in starting up your own money machine. $5.95.*

BUSINESS



● **PAYROLL WITH COST ACCOUNTING – IN BASIC** – BK1001 – by L. Poole & M. Borchers, includes program listings with remarks, descriptions, discussions of the principle behind each program, file layouts, and a complete user's manual with step-by-step instructions, flowcharts, and simple reports and CRT displays. Payroll and cost accounting features include separate payrolls for up to 10 companies, time-tested interactive data entry, easy correction of data entry errors, job costing (labor of distribution), check printing with full deduction and pay detail, and 16 different printed reports, including W-2 and 941 (in **CBASIC**). $20.00.*

● **SOME COMMON BASIC PROGRAMS**—BK1053—published by Adam Osborne & Associates, Inc. Perfect for non-technical computerists requiring ready-to-use programs. Business programs, plus miscellaneous programs. Invaluable for the user who is not an experienced programmer. All will operate in the stand-alone mode. $12.50 paperback.*

● **PIMS: PERSONAL INFORMATION MANAGEMENT SYSTEM** – BK1009 – Learn how to unleash the power of a personal computer for your own benefit in this ready-to-use data-base management program. $11.95.*

*Use the order card in the back of this magazine or itemize your order on a separate piece of paper and mail to 80 Microcomputing Bookshelf ● Peterborough NH 03458. Be sure to include check or detailed credit card information. No C.O.D. orders accepted. All above add $1.00 handling. Please allow 4–6 weeks for delivery. Questions regarding your order? Selling Lobo Drives Disk Memory Systems makes a lot of 'cents'.

Yes, becoming a LOBO DRIVES Dealer can make a lot of sense. For one thing, the demand for disk drive memory systems is growing . . . and will continue to grow for the next several years. Let LOBO DRIVES help you get your share of this expanding market.

- **DEALER DISCOUNTS** – LOBO offers a discount schedule that lets you increase your profitability.
- **DEALER SUPPORT** – LOBO backs its dealers with leads generated by national advertising; local, regional, and national trade shows; special promotions; outstanding documentation; quick response to phone calls; and delivering a quality product at a fair price, on time.
- **1 YEAR WARRANTY** – LOBO is so confident in the quality of its drives, it offers your customers a 1 year 100% parts/labor warranty. How's that for a selling point?
- **LARGE FAMILY OF PRODUCTS** – Only LOBO offers you a large selection of 5.25- and 8-inch floppy disk drives, and Winchester hard disk drives for TRS-80, APPLE and S-100 bus computers.
- **TECHNOLOGY LEADERSHIP** – All LOBO products represent the latest in the state-of-the-art technology. When there is something new in disk drive technology, LOBO will be the first to have it.

USING LOBO DRIVES MAKES GOOD SENSE...SELLING LOBO DRIVES MAKES MORE...
