# modem-ao

THE TRS-80\* DATA COMMUNICATIONS SYSTEM FOR THE EIGHTIES

- Direct connects to your home telephone jack
- Installs in a minute
- Program swapping mode plus terminal mode
- All software included

 No RS232C interface is required

INCULURIES WELCOME

Lowest price ever

The MODEM-80 and your TRS-80 Model I Level 2 disk or tape system make the perfect combination to maximize your data communications capabilities.

This direct connect, auto dialing/answering modem will transmit programs and data between MODEM-80 equipped TRS-80 systems. In addition, it will transform your computer into a full-function intelligent terminal. And, no RS-232C interface is required, so tape-based systems do not need an expansion interface. The result is the lowest priced data communications system of its type available anywhere.

Program-swapping with your friends is a snap with the MODEM-80. Both machine-language and BASIC programs can be easily exchanged over the telephone line. And, accessing your favorite computer club bulletin board or any other Bell 103-type compatible time-sharing facility is no problem either.

The TRS-80 to TRS-80 software, included with the MODEM-80, extends your system's BASIC language with 8 new communications-related functions. These can be easily incorporated into your own BASIC programs allowing, for example, "computer vs. computer" competitions. BASIC programs are also provided which support disk, tape and memory transfer of programs and data, including automatic line error detection and re-transmission. This approach combines function with flexibility, reliability and ease-of-use. When operating in the intelligent terminal mode, you have over 35 functions from which to choose. These include 8 user-definable function keys, baud rate selection from 25 to 300, forward and backward buffer scrolling, parity control, full and half-duplex operation, disk and tape file load and save, automatic dialing, parallel printer support...the list goes on and on.

You can install a MODEM-80 on your system in one minute. The ribbon connector plugs into the back of your keyboard or expansion interface. Power is provided by your computer's power module so no additional 110 V outlets are needed. An extension cable with standard miniature phone plugs is included for direct connection to the telephone line and there is even a spare jack to plug in a phone, if desired. Since the TRS-80 bus is extended through the MODEM-80, you can leave the unit permanently connected and still plug in other devices as you expand your system.

The MODEM-80 complete with all software and User Guides is only U.S. \$219.00\*\* plus U.S. \$5.00 for shipping, handling and insurance. We accept money orders, VISA and MasterCard. The MODEM-80 hardware has a 90 day manufacturer's warranty.

# MODEL II FOR \$175.00

Yes, double density is here! Two 40 track drives give you 368K of storage. And if thats not enough, four 80 track drives will give you 1.4 megabytes of on line storage. All this with the added speed of double density operation, not to mention 80% more storage per diskette.

No loss of your software library or conversion of your single density diskettes is necessary. DOSPLUS 3.3D reacts to the diskette. It will read single or double density with equal ease. It is not JUST a double density operating system, it is a double AND single density system. It is the first of it's kind. No one can offer you what we can! To change a disk to double density you need only format a double density disk, and then ONE command (TRANSFER), will bring over all your files. Very simple to use, but not necessary, because DOSPLUS will read them as they are now. Just insert single density diskettes and run (with our operating system). The machine will know what you are doing without having to be told ANYTHING!

If you want your computer to **chain functions**, then you need DOSPLUS 3.3D (for example, from powerup you could have your machine call another computer, scan a data base for appointments, recording any that appear on your printer; and then load in our new BASIC, setting files and mem/size, and start your program so your secretary can go right to work). With our BUILD, DO and AUTO, all of the preceding would be child's play. By the way, you could have also set the time and date, looked at the directory of all your drives as well as checked the free space map (which tells you not only how much space you have on a diskette, but also where it is and what it is used for) DOSPLUS is a truly intellegent, easy to use operating system that gives you all your computer is capable of delivering.

You probably guessed that for \$175.00 what we are doing is turning your Model I into a Model III. It's so easy **anyone can do it in 10 minutes!** Why spend \$2,500.00 for a Model III when you can get the same computing power, with our kit, and NO SOFTWARE CONVERSION, for only \$175.00. Don't throw away your Model I, let us expand it! Move up to the world of double densitu.

You will reap the benefits of our **error-free software.** No mirades, just plain hard work and a lot of testing by experts and novices alike. Test us and judge yourself. We guarantee you will be 100% satisfied. If you are the first to find a legitimate "BUG" in our software you will be rewarded with a brand new \$100 dollar bill.

**Your systems disk will come complete** with an all new single/double density disk editor called DISKZAP, and a BASIC program compressor called CRUNCH. Also included is PURGE, a utility to make the mass removal of unwanted files from a diskette easy, and RESTORE, a program that makes recovering a dead file as easy as typing in a command line. TRANSFER is just as it sounds, a program that moves all files (except systems) from one diskette to another. Single density to double or vice versa. CLEARFLE is used to zero data files on a diskette for a "clean slate". DISKDUMP is a new machine language sector display/modify program that works with filespecs instead of tracks and sectors. Used in conjunction with DISKZAP, you will have more disk editing power than ever before, with less frustration than was ever thought possible.

You will now be able to use all your **DOS commands from our new BASIC** with the CMD feature. And how about variable length records that really work, first time, EVERY time! This will allow you to use the ISAM programming technique for vastly improved handling of large data bases and lightning speed unheard of in BASIC. (ISAM stands for Indexed Sequential Access Method).

You can create programs that will run on MOD III DOSPLUS, yes, 100% compatability.

If inflated computing power without an inflated price tag is what you're after, contact us at the address below.

dress of the first character to be printed, and that the last character be a 00H. OUTSTR gets the character pointed to by the HL register and compares it to 00H. If it is not a 00H, the ROM printer driver is called to output the character. When a 00H character is encountered, a return from the subroutine is executed without printing that character.

The page number is stored as a hexadecimal value at address 402AH, which is an unused cell in the printer DCB. The ROM hex. to ASCII conversion routine is used to convert the page number to a printable value. It is assumed a program listing is less than 255 pages, so only one byte is needed for the counter. The HL register is loaded with the hex value to be converted which is then stored at 4121H. The hex to ASCII routine converts the value stored at 4121H and stores the results somewhere in memory. However, the HL register contains the address of the most significant digit converted. After the conversion, OUTSTR is again called to output the page number

Another feature included with the page headers is incorporation of the date. When the DOS is booted, enter the date into the system by using the Date command. Then when EDTASM is loaded, it will convert the date to ASCII and store it in the header message. This is done in the initialization section.

Finally, we need some way to reset the page counter and possibly produce a top-of-form. To accomplish this, the B command (return to Basic) is replaced in the command lookup table by an @. Then the reset address of 0000H is changed to the start of the form feed routine. Again, this is accomplished during initialization.

### Initialization

The initialization section has many functions. One important one is its ability to move ED-TASM down to 5500H where Apparat intended it to run. This is accomplished by lines 1960-2020. Next, the date is calculated and stored in the page header message area of memory by lines 2060 and 2080.

Replacing Apparat's sign-on message is handled by lines 2110-2200. Apparat uses AOH as their end of string terminator, so the HL register is loaded with the starting address of their message. The accumulator is loaded with AOH and then stored at the address pointed to by the HL register. This pointer is then bumped, and the DE register is loaded with the starting address of the page header message. HL and DE are exchanged, to conform to the requirements of the LDIR instruction, and BC is loaded with the number of bytes to be moved. The LDIR instruction actually moves the message into the old sign-on area. Finally, the B command and its associated jump address are replaced with the @ sign and the formfeed routine's address, and the printer driver's address in the DCB is replaced.

### Labels

Many labels in the program have an offset of 2B00H because EDTASM was moved from 5500 to 8000H to enable us to work on it, save EDTASM and the patches. If it were left at 5500H, any return to DOS would have overlaid another program. The program must be moved up to 8000H by using the LMOFF-SET program in NEWDOS. It will attach a short routine to the end, like the one in lines 1810-1850, followed by the jump in line 2210. The coding between lines 1850 and 2210 is not required for the printer pre-driver and will then be written over by EDTASM after it is executed.

Once the program has been written and saved to disk, you must merge the two programs. Use LMOFFSET to move ED-TASM to 8000H, and resave it to disk. Then return to DOS. Use Load to put program into memory (do not execute either program). Next load Tapedisk into memory, and save the programs from 8000H to A260H, with the entry point at Entry or A1B9H. I named the modified version of EDTASM ASM2 to avoid confusion as to which EDTASM is loaded.

### Do your own taxes like an expert with TAX/SAVER."

Copyright 1981

## TAX/SAVER.<sup>™</sup> The tax help program for the layman and the professional.

- · Privacy.
- Built in tax aids. Answers questions like "Is my father my dependent?" and "Are my deductions reasonable?"
- Tax regulations programmed in by our team of accountants. Type in your figures and you've done your own tax return.
- · Output to video or lineprinter. (Overlays available.)
- Tax deductible.
- Optional text: help for novices speed for professionals.
- Manual: Tax information, lists of deductions, tax glossary.
- **TAX/SAVER**<sup>\*\*</sup> **I**: completes long and short forms, itemized deductions, interest, dividends, income averaging and maximum tax, tax calculation (all filing statuses in one run).
- TAX/SAVER<sup>T\*</sup> II: all features of TAX/SAVER<sup>T\*</sup> I pius business income and capital gains.
- Discount on yearly updates.

## Star Colony

Air Force. The band's music,

harsh and tinny in your ears,

blares across the allo-concrete.

Your chiefs and aides stand

stiffly erect, impatient with all

hand-shaking and well-wish-

ing. When the farewells are

done, you and your men board

the shuttle. The craft launches

and swiftly climbs to space

where it mates with your enor-

mous starship, the first to be

At last the music ends. There

the usual round of

this pomp and circumstance.

is

John Beringer 2729 West Sahara #2 Las Vegas, NV 89102

The morning is bright and clear. A few clouds dot the sky at the higher altitudes. It is a perfect day for a launch.

To commemorate this great occasion, the Corps band has been borrowed from the World

334 • 80 Microcomputing, October 1981

built in a long time since the Great War, Interstellar War I, the war against the D'nim (see Star Guard in an earlier issue).

It is only reasonable that humanity should make the long crawl back into space, you reflect during docking procedures. What is tragic is that it took so long for the Earth to recover from the ravages of IWI. Triumphant, yet with all her colonies lost, Earth has had a hard time pulling herself up to her former level. Your ship (you have the privilege of naming it) is a gigantic vessel, built solely for exploration and recolonization. You are to guide her in reopening the space lanes and reestablishing the footholds Earth once had.

### **Object of the Game**

The object of this game is to colonize and explore as many star systems as the player can in the time alloted to him. (The time is randomly determined at the start of the game.) Upon departure, you have 100 per cent operation power and a full stock of supplies, along with 5000 prospective colonists in stasis. As power and supplies diminish, it will become necessary to replenish them. There are two methods of doing this. You can mine explored systems for radioactive fuel elements and raw materials for supplies, which takes away from mission time (with the poorer systems yielding less and requiring more mining time than the richer systems). A decision may be made as to whether or not the player should resupply completely. Also, fuel and supplies will be used up during the years that mining and refining are taking place.

Another way to restock the ship is to revisit an established colony. If the colony is doing well, the members will gladly give you the supplies you need. A word of warning—if you take too much from the colony, you could tax the colony severely and cause it to fail. Obviously, the colonies to revisit are those which have high-yield concentrations of raw materials.

To establish a colony in a newly explored star system, the proper number of colonists (decided upon by the Captain) are brought out of stasis and sent down to the most hospitable planet available. They are given supplies, and then left on their own. A return visit will show how the colony is faring. Any colony that has a population of 500 or more members is considered thriving and able to aid in resupplying the ship. Some star systems are so poor

in materials that they should be bypassed and not even considered for colonization. Setting down colonists on these systems will be useless since they have almost no chance to survive and grow.

If you run out of time, the game ends. If you run out of fuel or supplies, your crew may toss you out the air lock, as there is no rescue available from Earth. If you last to the end of your mission, your performance will be evaluated and

your superiors on Earth will decide how to reward you (or punish you!).

#### How To Play

There are four general commands available to you: Map, Scan, Jump, and Status. Different options are available within each command.

Map displays all the star systems within the range of your starship. Any attempt to explore outside the designated area will result in the starship becoming lost or even destroyed in some cases. An option of this command is the History subcommand. If selected, all explored stars will be shown as an E and all colonized systems will be shown as a C. The starship is shown as an up arrow (†). This display allows you to see which stars you have visited and colonized.

A second option of the Map command is called the Rangefinder. With this option. you can pinpoint a particular star on the map. By using the keyboard arrows, you move the rangefinder, "+", onto a selected star. Then the spatial co-ordinates (x, y, and z) may be displayed, as well as the star's distance from your starship.

Scan enables you to explore a star system, discovering such information as the number of planets in the system, the number of habitable (Terratype) planets, the grade of raw materials available and floral/ faunal evolutionary levels rang-

distance for jumping.) Jumping beyond this there is the danger of becoming lost by jumping to a random point in space along with blowing your ship's engines. In these situations, you will have to limp along as

best you can until your engineers can repair the damage. Status indicates in percen-

tiles your reserve of supplies and fuel remaining, colonists left in stasis, and years left in the mission.

#### The Mission Begins

them unreceptive to a return

After the decision of col-

onization has been settled, you

have the option of mining and

refining the system's resources

your ship to travel instan-

taneously from one point in

space to another without cross-

ing the intervening distance.

This is the same method of

travel that was used in "Star

Guard." (Seven and a half

lightyears is the maximum safe

The command Jump allows

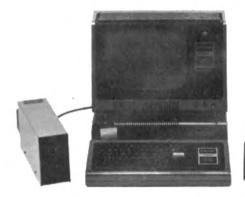

for future supplies.

visit.

You feel a low rumble through the soles of your feet. Your shuttle has docked. As you wait for the air to cycle into the docking bay, you almost feel the weight of the entire world settling onto your shoulders. So much depends on your success! Grimly, you vow not to waste supplies or colonists. You are determined to explore and colonize as many of the best star systems as you can. The mission has begun.

## THE NEW LAREDO LS525. WHEN YOU'RE READY TO GET DOWN TO BUSINESS.

Laredo Systems, Inc. introduces the LS525 five megabyte rigid disk memory system for TRS80 Models I and III. Laredo's LS525 rounds up a Seagate ST506 Drive, LDOS Operating System by Logical Systems, and Laredo's own LSI

On-board data separator, micro-code diagnostics and write-precompensation.
Increased disk media reliability and data integrity with automatic defect block allocation and extended ID fields.
Versatile CPU compatibility provided by separate host adaptor.

Introductory Offer To TRS80 Users.

Now through October 1, 1981 buy the LS525 for the OEM/dealer price of \$2990, a savings of \$760 off the usual suggested retail price of \$3750.

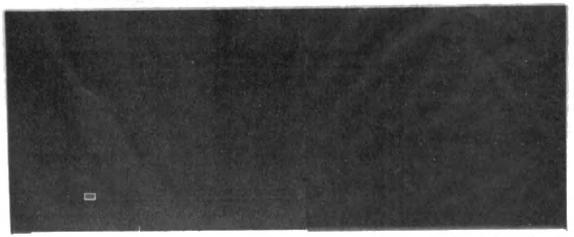

LDOS Operating System with manual and diskette available for \$149.

500 Series Controller into a single-board controller that emulates the famed IBM 3370 disk system, complete with:

• Improved read/write/seek access time through full block buffering and variably tuned interleave.

For more information about the LS525 Memory System and the LSI 500 Series Controller, contact: Laredo Systems, Inc.  $\sim 26$ 

2264 Calle de Luna, Santa Clara, CA 95050 408-988-0315

## Loan Sharp

Walter J. Atkins, Jr. Ph.D. Qtrs 4410A USAF Academy, CO 80840

A ave you ever wondered what the monthly payment on a new car would be, or doubted that a salesman was quoting you the true interest rate? The Pocket Computer can help you.

I selected three programs ideally suited for the TRS-80 Pocket Computer from my collection of financial programs for my Model I. The first program finds the term of a loan. The second finds the loan payment amount. The third finds the true annual interest rate. I have combined these into one Pocket Computer program. Each of the program modules can also be used alone.

The Pocket Computer has a defined program mode that allows any of several programs in memory to be run by pressing two keys. If the computer is put into the defined program (DEF) mode, pressing Shift A runs the module that finds the term of a loan. Pressing Shift B runs the payment amount module, and Shift C runs the interest rate module.

### The Program

The program takes about 800 steps and uses half the Pocket Computer's memory. The program is 40 lines long; it should be obvious to those of you who do not yet have a Pocket Computer that it can easily handle some very serious computing tasks.

| I-Annual interest rate in percent          |
|--------------------------------------------|
| J-Last interest rate guess                 |
| K-Interest rate increment                  |
| N-Loan term in months                      |
| P-Amount of loan                           |
| Q-Monthly payment                          |
| R-Computed payment in interest rate module |
| Y-Loan term in years                       |
| Z-Minimum monthly payment                  |
| Table 1. Variables                         |

The loan program is divided into three parts. Lines 10-70 find the time required to pay off a loan of a certain amount when the interest rate and amount of monthly payments are known. There is a minimum payment that must be made to pay off a loan. If a monthly payment of less than that minimum is made, the interest will exceed the payment and the loan will never be paid off. If a monthly payment less than the

minimum is entered in the program, the Pocket Computer indicates an error when it tries to evaluate the LOG function in line 55. I have included lines 35-45 so the computer calculates and displays the minimum payment before it asks you to enter your monthly payment.

Lines 100-180 calculate the monthly payment required to pay off a loan of a certain amount in a specified period at a given interest rate.

Lines 200-350 calculate the annual interest rate. This section uses an iterative technique to determine the rate. First it assumes an interest rate of 10 percent. It then calculates the payment necessary to pay off the loan at that interest rate. If the calculated payment is higher than the monthly payment you entered, it assumes a lower interest rate and repeats the process. If the calculated payment is lower than your monthly payment, it assumes a higher interest rate

and repeats the process. After a few iterations, the computer zeroes in on the true interest rate. The iteration process can take several seconds, so in line 260 I have the computer print out the message "COM-PUTING..PLS..WAIT" after each iteration. ■

Harry and Ken Keairns 920 La Plante Sioux City IA 51109

hile friends with expansion interfaces and disk drives enjoyed full error messages, we struggled with the two letter abbreviations characteristic of Level II Basic. After almost wearing out the Basic Reference Manual, we set out to find a way to develop longer messages on our system, without spending the money for a disk system.

Our first effort produced the Basic program in Program Listing 1. We generally loaded this before we started developing a program, and after the program was debugged, replaced it with an error handling routine. While it served our initial purpose, it

thru 1A1EH), with remarks on the portion we will be changing. The link location (41A6H) normally contains a Return statement, but provision was made

for a three-byte Jump command to another location in memory. We will use this provision to replace the ROM routine with one of our own design.

Replace the first 16 bytes of the ROM routine, and use the balance of the routine to send the remainder of the message (i.e., "Error in line nn").

The first section of Program Listing 3 is a short routine that replaces the Return statement at 41A6H with a jump to the start of our routine. After loading the object code tape, entering a start point of 32292 initializes the new subroutine. This will have to be repeated in the event of a system crash, but can be protected by answering the memory size question with 32291 when you first bring the '80 to life.

The second section defines the messages to be sent to the screen in place of the two-letter abbreviations. Note that the messages end with a CHR\$(34). as the ROM routine used to get the message to the screen looks for this as a delimiter. When it finds a quotation mark (or a zero byte), it knows the message is complete.

The next section is a table of the addresses for the messages previously defined. This approach is similar to the approach used by the ROM routine, and it solves the problem of messages of unequal length.

The final section selects the message, sends it to the screen, and then completes the message using the original ROM routine.

The actual selection is handled by loading the HL registers with the first address in our twobyte address table. The ERR code is then added, and the HL registers are pointed at the proper message. Make use of the DE registers to retrieve the address-save their contents with a PUSH instruction. After loading the address bytes, exchange DE and HL, as the routine expects to find the address there. Restore DE with a POP and the message is ready to be sent to the screen.

Now make a CALL to 28A7H, the location of a ROM routine that displays a string on the

Store source and object code on disk with this Microsoft program.

## Modifying EDTASM Plus

Arne Rohde Pilevej 31 7600 Struer Denmark

ne of the main problems with converting from a tape-based TRS-80 to disk drives is that many programs use tape for data storage. Conversion is usually no problem with Basic programs, since the user has access to the source code and relocation is handled by the Basic interpreter. System programs are often more problematic. Relocation is complicated, if the source code is not available, and is desirable, if DOS facilities are needed and the program storage area conflicts with the DOS storage area.

The common solution is to move the program in memory so it can be loaded with DOS, then move it to its correct location, destroying the DOS. The DOS facilities, such as data storage on disk, are no longer available, and the user is forced to continue to use tape for this purpose.

#### **Microsoft Editor/Assembler Plus**

Microsoft's Editor/Assembler Plus is tape-based. It was intended to replace Radio Shack's EDTASM and T-Bug, offering more facilities at a lower price. The disadvantage is that no modification is available allowing it to be used on a disk-based system to store source and object code on disk.

Apparat Inc. has made a modification to Radio Shack's EDTASM which allows it to be used with TRSDOS or NEWDOS. It comes with NEWDOS/80, but the user must purchase the Radio Shack version to obtain the documentation. There are still advantages to using the Microsoft version, such as a macro facility, the ability to generate code directly into memory, and the option of leaving the source in memory while the program is debugged with Z-Bug.

I have used both and prefer the Microsoft version for most purposes, even though it lacks a cross-reference listing facility. The program itself uses almost 12K storage when all modules are resident, so the sheer size of the task puts relocation out of the question for me. However, relocation is the only way to store source code on disk. If the Dump command could be used to move the source to disk and Load used to reload it into memory before the assembler is moved into position, the source code need not be stored on tape. Since object code can be generated directly into memory (as long as it does not conflict with the assembler), Dump can also be used to store the object code on disk. In certain cases it may be necessary to write the object code to tape, and then copy it to disk with TAPEDISK or similar utility.

#### Modifying EDTASM/Plus

I have not been able to find any free memory within ED-TASM/Plus, so the modifications must be made by removing commands and using up the resulting space by appending the utility onto the end of the code and forcing the program to regard this as reserved memory or by locating the utility at the high end of memory and forcing the program to avoid this area.

I rejected the first approach, since none of the commands seem dispensable. The third approach requires different procedures for different memory sizes and restricts the routines which can be located in this area. I chose the second approach, even though it has one major disadvantage-quashing the assembler or Z-Bug destroys the modification. However, if quashing is necessary, the advantages of having all three routines available simultaneously would no longer apply. Since I have 48K available (over 32K free), large programs can usually be written without a need to quash.

EDTASM/Plus occupies the area from 4380H - 7265H, but source code is written from 71C9H, the remainder being one-time code. I use the area from 7266H - 72FFH, allowing the source code to begin at 7300H. I also use the area normally used by the Quash command. When I store programs such as EDTASM/Plus on disk, I save more memory than is necessary in order to recreate the original program environment as closely as possible without leftovers from DOS. I do this by storing the contents of reserved memory from 4000H to the beginning of the program, together with the program itself. The modifications shown in the Program Listing can be applied by using the following sequence, using RSM2D as the monitor.

1. Load RSM2D.

2. Reset with the break key held down.

3. Answer the memory size question with a specific value.

4. Type System.

5. Load EDTASM/Plus.

6. Enter RSM2D by typing/entry address.

7. Type in the changes shown in the Listing. (You must supply the hex values of the text strings.)

8. Move the area 4000H-7305H to 5200H-8505H.

9. Press reset to load the DOS. 10. Dump the area from 5200H - 8505H to disk, with either 84F0H or no transfer point. 11. If DOS transfer is used, Dump 8500H - 8505H, and transfer 84F0H as a dummy source module.

The procedure for initiating the assembler (assuming DOS entry point) is now as follows:

1. Type EDTASM (if EDTASM /Plus is stored as EDTASM/ CMD).

2. Type the name of the source file to be loaded.

If 84F0H is used as transfer point for EDTASM, Load must be used for EDTASM when a source file is to be loaded immediately afterward.

When a source file is to be saved on disk, command Q is used (for Quit, instead of Quash) to move the source in memory and to display the values to be used for the Dump statement. Note these values since the screen will be erased as soon as the space key is depressed. The Dump command should be used as soon as DOS has been loaded. The source files are not directly transferable to other assemblers, although a conversion program could easily be written. The source could also be transferred via cassette tape.

### Comments

The modifications may need a

few comments. I found that the Q command resides in the area 646CH - 64B3H. The command table address starts at 4659H, with one byte for the command code and two bytes for the address of the corresponding routine. These values should be checked before the modifications are applied. I used the ED-TASM/Plus warm entry point (4383H), since source code is present on entry. This entry skips the check for the end-ofmemory address (normally all memory is used with no check for reserved memory), so this address must also be set up. I use this opportunity to reserve memory to advantage. I have a driver for an RS232 printer resident here, so it may be used with ED-TASM/Plus. Also, I leave room for RSM2D or other code as required.

The source start and end addresses are stored together with the source code in the four bytes at 8500H. When command Q is used, the source code and addresses are moved in memory, but no check is made for memory overflow. A check could be made that the new end address does not exceed the address in location 4236H, though it should

be obvious from the values in the displayed message. The initial values stored at 7300H are used to initialize the source program area if no source program is to be loaded; they will be overlaid if a source program is loaded before executing the assembler.

The solution I chose is not ideal for converting programs to run on DOS systems, but it is reasonably easy to implement. The alternative would be to purchase a more expensive macro assembler and forget all about Z-Bug or to attempt both a relocation and a modification of EDTASM/Plus to allow it to be resident with DOS. With those alternatives, you can easily live with a few shortcomings!

I implemented the modifications using NEWDOS/80 and RSM2D, but I can see no reason why they should not work with TRSDOS as well. In fact, the format of the message with the Dump parameters has been coded in the TRSDOS format rather than the NEWDOS/80 format, which, incidentally, is much simpler.

The principles of these modifications are also applicable to other programs; I have converted Tiny Pascal to work with disk storage for source and P-code. It is now much faster and it is much more reliable than using tape.

# Not all Spelling Checkers are the same. MICROPROOF Maintains stands out!

EASY TO USE: Prepare your text on any Z-80 based microcomputer, using any of a number of popular word processing programs. When you are finished, enter the appropriate command, and MICROPROOF proofreads your document, displaying misspellings and typos on the screen. Then correcting MICROPROOF can display each error separately, requesting you to enter the correct spelling for each. You are also given the option of displaying errors in context or adding words to MICROPROOF's 50,000 word vocabulary. Finally, MICROPROOF corrects your document. All in less than a minute.

#### SELECT APPROPRIATE RESPONSE:

| RESPONSE:   |               |                         |

### Correcting MICROPROOF Screen Display

- **SPEED** is the single most important factor in a dictionary program. All dictionary programs will find your potential errors but if the program is too slow, you are not likely to use it. MICROPROOF's speed is outstanding. It can proofread a several page letter in 20 seconds.
- LOW PRICES: Standard MICROPROOF is available for either \$89.50 (TRS-80® Models I or III) or \$149.50 (CP/M®, TRS-80® Model II and all others). The optional correction feature can be added at any time for an additional \$60.00. Optional patches to integrate MICROPROOF into your word processing software can also be added at any time for an additional \$35.00. (Integration patch not needed for Wordstar®.)

### MICROPROOF'S FULL 50,000 WORD VOCABU-

LARY saves you time and allows you greater confidence in the lists of potential errors that MICROPROOF identifies. The mini-dictionary programs, with their 10,000 and 20,000 word vocabularies, have many correctly spelled words omitted from their vocabularies. Consequentially, they identify as potential "errors" many words that are actually spelled correctly; five to ten times as many such words as does MICROPROOF. So, when you use MICROPROOF you will have far fewer extra words to evaluate, a major time savings. There will be less need to look up words in order to verify that they are in fact spelled correctly. The extra 30,000 words in MICROPROOF's vocabulary assures you confidence in the error lists that MICROPROOF generates.

There are other proofreading programs available to choose from. Since MICROPROOF became available in December of 1980, a number of companies have announced programs with small dictionaries. It took us almost two years to develop MICROPROOF. During that time we were able to compress our full 50,000 word dictionary into a manageable size (fits on one single density 5¼ inch disk). And we were able to design a proofing program which operates remarkably fast. The chart below illustrates the comparative advantages of MICROPROOF.

### ADVANTAGES OF MICROPROOF

See your local microcomputer dealer or write to:

**CORNUCOPIA SOFTWARE** 

Post Office Box 5028, Walnut Creek, California 94596 • (415) 893-0633 - 378

Prizes: Grand Masters win two hours of free time on CompuServe.

> Runners-up win a CompuServe Adventure T-shirt (Grand Masters win this too.)

Everyone who enters can, on request, receive a large poster of the Gray Morrow art on the opposite page in full color. We'll charge your account \$2.00 for postage and handling.

- When? Starting at 6 PM local time on Friday, October 30, running through 5 AM on Monday, November 2.
- How? Since this will be our first nationallyadvertised tournament, we may have to make some last minute changes following our "in-house" tournament on Labor Day. So check the "What's New" section of the CompuServe Information Service for details preceding the contest. So enter. Collect treasures. Slay dwarves. And practice, practice, practice. How else will we be able to afford the T-shirts?

## CompuServe ----

5000 Arlington Centre Blvd. Columbus, Oh 43220 Information Service Division (800) 848-8990

### If you're not already a member of the country's largest personal computer network, get on-line now!

### How does it work?

Your computer talks to our computers. You need a modern and some special software. Software for the TRS-80\* and Apple II\* computers are available at many Radio Shack\* outlets and all Radio Shack\* Computer Centers. Atari<sup>®</sup> users can access the system via Telelink™ software. Persons owning other brands of computers or terminals can also purchase the CompuServe Information Service through Radio Shack\*. In more than 260 U.S. cities you can reach the CompuServe Information Service via a local phone call. The cost is \$5 per hour, billed in minutes, to your charge card, for service between 6 PM and 5 AM local time on weekdays and all day on Saturday, Sunday and most holidays. Limited daytime access is available at a higher rate.

### What do I get?

There are more than 175 topics listed in the on-line index. Most first-time users are interested in:

- News, weather, sports. We offer the electronic editions of many of the major daily newspapers and the AP news and sports wires.
- 2. CB simulation. "Talk" to other computer users anywhere in the country. We also offer electronic mail.
- Games. Many, including the multi-player Space War, Star-Trek, four Adventure games.
- Finance. Again, a wide variety for both historical and current data on stocks, bonds and commodities.
- Computer user groups (including national bulletin boards) and computer manufacturers' newsletters.
- 6. Home information. Family Service. Government publications. Aviation news. Energy-saving tips. And more.

When you are ready, CompuServe Information Service can provide you with a lot of big mainframe computer power. But see a demonstration at Radio Shack<sup>\*</sup> right away so you can get on-line before the tournament.

Radio Shack and TRS-80 are trademarks of Tandy Corporation. ATARI and Telelink are trademarks of ATARI, Inc. Apple is a trademark of Apple Computer, Inc. An easier way for data entry.

## Formatted Screen Input

F. Christian Byrnes 83 Fairmount Ave. Hackensack, NJ 07601

Entering moderate volumes of data into the TRS-80 can be frustrating. A Basic program displays a prompting message which requests the input of one or more fields of data. If more than one field is to be input, the operator must know to use a comma between them.

Terminals attached to large systems enjoy the advantage of formatted screens. The operator sees the screen as being divided into headings or titles and input fields. Data corresponding to each heading is entered following its heading and the cursor jumps from one field to the next as the data is entered. All of the headings remain unaltered in place until all of the data for that screen have been entered.

Initially the TRS-80 does not appear to allow us the luxury of a formatted screen, but a little fancy footwork can change the operator's view of the computer drastically.

### Overview

This program listing is an example of the formatting and input routines imbedded in a driver program to demonstrate how they may be used. Screen formatting is performed by the routine in statements 1100 and 1110 using arrays OS and OS\$. Array OS contains, in element zero, the number of field headings in this screen. Each element of the array thereafter contains the screen starting position of a heading. The elements of array OS\$, starting with element one, contain the text corresponding to the positions specified in OS.

Input is accepted by a call to the routine at statement 900. This routine selects the next element from array OM and calls the subroutine at statement 1000 to position the cursor and read the keyboard. Array OM has two dimensions. Each element pair consists of a starting position and length for an input field. Element (0,0) contains a count of input fields for this screen. The accepted data is returned in variable OB\$. Variable OE contains a pointer to the next element of OM.

### Logic

The example program shows how to use these subroutines. Line one dimensions the required arrays. Line 10 and 20 load these arrays from data statements. In a disk system this information could easily be read from a file.

Line 30 calls the screen formatting subroutine. Upon return all of the headings have been placed in their proper positions on the screen.

Line 35 calls the screen input procedure at line 900. Line 910 tests variable OE. The number of the next array element of OM to be used as location and length of the input field is contained in OE. The calling program could change this value prior to a call in order to skip or repeat a field. If such a function is to be used, a device such as T-Beep would be needed to alert the operator to the change.

Lines 920 and 930 set internal variables XP and XL equal to the referenced elements of array OM and are followed by a call to the subroutine at line 1000. This method was chosen so multiple format and input tables could be used within a single program. Modified versions of lines 900 to 960 could be coded in a single program, each for a different screen format, and all could call line 1000 for input.

 1000 begins the keyboard input routine.

1001 sets OB\$ to null.

Spelling Errors? Does your TRS-80\* wordprocessor need help?

### CAN SPELL rendezvous AND mnemonic AND OVER 38,000 OTHER WORDS

Now let TRS-80 and Proofreader by Aspen Software Company check your Scripsit\*, Electric Pencil, or other documents for spelling and typographical errors. It has all the features needed to meet your proofreading requirements.

- Checks every single word of even your biggest document in under 5 minutes.
- The 38,000 word dictionary is one of the largest available.
  Dictionary can be easily extended to add more

words such as technical terms or names.

- All unknown words are listed on the screen and can be saved on a file for printing.
- Works with almost any TRS-80 wordprocessor including Scripsit and Electric Pencil.
- Comes with complete and easy to understand User's Manual.
- · Proof-Edit \*\*, optional interactive corrections feature for Model I/III

## GRAMMATİk™

### **BEYOND SPELLING CHECKING**

A spelling checker may not be enough! This paragraph contains a number of common errors (indicated by underlining) that will be discovered by Grammatik that would <u>seldom ever</u> be caught by a spelling checker. FOr example, Grammatik checks for improper word usage as identified by a number of writing style manuals (such as <u>"seldom ever</u>). Grammatik will check for the presence of certain words such as jargon or sexist terms. it also checks for consistant punctuation, capitalizAtion, balanced quotation marks and parentheses, and and repeated words. In addition, it will produce a list of all unique words found in your document with the number of times each was used. Grammatik comes with a dictionary of commonly misused phrases and a dictionary of sexist terms. It also includes a complete set of utilities to build., sort, and merge phrase and jargon dictionaries of your own. Works with Scripsit, Electric Pencil, and other standard TRSDOS text files.

Aspen Software programs are professional quality software tools developed for the TRS-80 by a Ph.D. in Computer Science. Other tools include:

- SOFT-SCREEN<sup>TM</sup>. a powerful, state of the art full screen text editor. Over a year in development, Soft-Screen is compatible with all TRS-80 programming languages, including BASIC, FORTRAN, MACRO, Ratfor, and COBOL. Easy to use, comes with tutorial and full documentation.

- RATFOR, a structured language preprocessor for Fortran developed at Bell Labs. Aspen Software Ratfor provides a number of extensions, including "case" and "string". Includes complete manual with all the information needed to learn and write Ratfor programs. Requires FORTRAN.

- PP-RATFOR, a pretty printer for use with Aspen Software Ratfor. Automatically formats and indents Ratfor source programs.

## "The standard TRS-80 method of accepting input from its operator is about as efficient as punched card input."

• 1002 turns on the cursor in the first position of the input field.

• 1004 counts the number of characters input up to the maximum field length.

• 1005 accepts one character.

• 1010 is used if the character is a backspace. Go to the subroutine at 1050 (see below), then go to 1005.

• 1012 is used if the character is a forward arrow; turn it into a space and continue.

• 1015 is used if the character is the enter key, then the field is complete, so make the field length equal the maximum field length and then go to line 1030.

• 1019 is used if the character is neither alphabetic nor numeric; discard it and accept the next character by going to line 1005.

 1020 appends the character to the previously accepted characters and displays it on the screen.

• 1030 repeats until the maximum field length is achieved, then turns off the cursor and returns to line 950.

Line 950 increments OE to point to the next element of array OM in preparation for the next call to this routine. It then returns to the calling program with variable OB\$ containing the requested input string.

The subroutine at line 1050 is called from line 1010 if the input character is a backspace. Line 1055 handles a backspace from the first position of a field and prevents the cursor from moving into the title field. Lines 1060 and 1065 handle all other backspace conditions followed by a return to the input processing in the middle of line 1010.

#### Usage

In this example the calling program consists of lines one through 90 and provides no function other than data accumulation of a single screen. Rudimentary validation of the contents of OB\$ between calls to the input array driver at line 900 is possible, but more extensive processing could cause the operator to overrun the input capabilities of the program. Any delays caused by input/output should be isolated to the time between screens or even better, after all input is complete. This, of course, will depend upon available storage.

#### Summary

The structure of these rou-

tines was chosen to facilitate their usage in as many programs as possible. This building-block approach will help to speed development of future programs. In keeping with this design technique, we have designated certain variables as belonging to common routines. The letters O and X are the initial letters of all variables within these routines. Additionally, although this listing does not demonstrate it, we have reserved variables starting with the letter Z for binary flags (ves/no).

Data collection is an important part of many applications. The standard TRS-80 method of accepting input from its operator is about as efficient as punched card input. These routines could speed up file building. ■

Complete Business System includes: 48K TRS-80<sup>™</sup> Model III, Disk III<sup>™</sup> 2 Drive System, TRSDOS and Manual.

## Thoughts on For . . . Next

Richard Amyx 994 North Second St. San Jose, CA 95112

A while ago I was tinkering with a little game I'd found in a book, the gist of which was to keep tabs on a nine-element array and to toss out array elements as certain conditions were met. The listing was relatively short and had no terribly complicated statements, so I keyed it in without paying much attention to what was going on within the program.

The routine was query/response, next query/response, and so on, with virtually no time lag between my responses and the next query—until the fifth or sixth response, at which point the program appeared to take off into outer space. After waiting a reasonable length of time I broke out of the program and proofread my keypunching around the break—no errors.

So I tried again and got the

| Upper<br>Limit | Total<br>Iterations | % of<br>Maximum |
|----------------|---------------------|-----------------|
| 9              | 7380                | 100.0           |
| 8              | 4680                | 63.4            |
| 7              | 2800                | 37.9            |
| 6              | 1554                | 21.1            |
| 5              | 780                 | 10.6            |
| 4              | 340                 | 5.6             |
| 3              | 120                 | 1.6             |
| 2              | 30                  | 0.4             |

same result. But this time I decided to wait the machine out. When I eventually returned to the computer, I found that the program had indeed gone on as it should have. Why, I wondered, the sudden quantum leap in time between response and query?

I then looked at the program more closely where I'd broken out of it the first time, and found that the break had been in the middle of a sequence that looked like this:

| 10  | FORI = 1TO 9   |
|-----|----------------|
| 20  | FOR J = 1 TO 9 |
| 30  | FORK = 1 TO 9  |
| 40  | FOR L = 1 TO 9 |
|     |                |
|     |                |
|     |                |
| 100 | NEXTL          |
| 110 | NEXT K         |
| 120 | NEXT J         |
| 130 | NEXTI          |
| 140 | GOTO XXX       |
|     |                |

It didn't take too much button-punching to learn that if this nest of For loops went all the way through it would require 7380 (9 +  $9^2$  +  $9^3$  +  $9^4$ ) total iterations. Combine that with a couple of If statements in the middle, and you can bet you're going to have to wait for a response.

Then looking at the program even more closely, I decided that it would require very little housekeeping to reduce the length of the array, and hence the upper limit of these For statements, as the game progressed. I wondered how much time could be saved if this one change were made. The givens were that the For loops would remain four deep and that the equation for the total number of iterations required was Y =  $N + N^2 + N^3 + N^4$ , where N was the upper limit of the For loop. A little more buttonpunching yielded the numbers in Table 1.

The numbers of iterations themselves ought to be impressive—certainly they're big enough—but what's even more important are the differences between them and the percentage of maximum time those differences represent. This is

### **PUBLICATIONS for the TRS-80<sup>1</sup> Model III** Mystery of the DISKETTE

### Mystery of the ROM

Mystery of the DOS

\$19.95 each

Must additions to the computer library of the serious programmer as well as the casually interested. Written in a technical, yet easy-to-read and understandable style. Each book includes:

- detailed tables of contents and indexes, alphabetical and numerical tables with numerous cross references.
- register setup going into routines.
- register results coming out of routines.
- detailed explanations on all routines, structures, codes, etc.; and not just a few ambiguous comments.
- Numerous summaries for ease of book use.

### Special . . . all three \$49.95

#### SORT / CMD

- multi-key (to 14 fields): Multi-tag (to 14 more fields)
- sort any combination of variable type
- integrates easily into any existing program
- \$19.95 each Disk or non-disk; Model I or III; 32K or 48K

### PATCHES

- to allow operation of many Model I programs on the Model III: LM OFFSET/CMD, Superzap/CMD<sup>2</sup>
- RSM 2D/CMD 10K, 32K, 48K<sup>3</sup>
- Big Five Software Games (all games)4

\$5.95 each Many more ... send for brochure!

### DISK DIRECTORY INDEX PROGRAM (Model III only)

- Maintain a master directory listing and file all diskettes.
- Index size limited only by diskette space available
- and number of diskettes on which the index will be maintained
- Summary by file name, diskette, or extension.

### Direct/BAS \$14.95

Direct/CMD \$24.95 (enhanced, more powerful, faster)

most strikingly illustrated by a graph (see Fig. 1).

As you can see, once you get past an upper limit of six you're going to be making some very powerful time trade-offs for every increment in the upper limit of the loops.

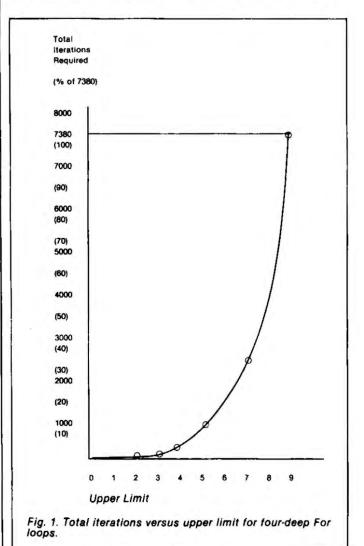

Getting back to the game, it appeared that the program usually wouldn't get into the heavy looping sequence until at least the third response, which meant that the upper limit could have been reduced from nine to seven and that a 62 percent saving in time might be realized. The next step, of course, was to test my hypothesis.

To do this, I wrote a short program just like the example sequence shown, filling in the dots with a couple of donothing if statements to increase overall execution time and thereby reduce the effect of my own reaction time on the stop watch. The results I got were (N again representing the upper limit of the loop index):

> N = 9, t = 46 sec N = 8, t = 29 N = 7.1 = 17

This was close enough to prove the theory. The execution of a very slow portion of the program could indeed be speeded up by at least 62 percent just by indexing the upper limits of the four For loops.

The rule is simple: The amount of time it takes to execute nested For...Next loops increases by the power of the depth to which the loops are nested-two-deep loops, time squared; three-deep loops, time cubed; and so on. Obviously, the best solution is not to nest For loops any deeper than absolutely necessary, but if you must nest them deeply, then pay very close attention to the ranges of the loop indices.

### PROGRAMMING TOOLS FOR YOUR TRS-80<sup>TM</sup> MODEL I AND MODEL III

### **INSIDE LEVEL II**

### The Programmers Guide to the TRS-80 ROMS

INSIDE LEVEL II is a comprehensive reference guide to the Level II ROMs which allows the machine language or Basic programmer to easily utilize the sophisticated routines they contain Concisely explains set-ups calling sequences and variable passage for number conversion arithmetic operations and mathematical functions, as well as keyboard tape and video routines. Part II presents an entirely new composite program structure which loads under the SYSTEM command and executes in both Basic and machine code with the speed and efficiency of a compiler. In addition, the 18 chapters include a large body of other information useful to the programmer including tape formats RAM useage relocation of Basic programs. USR call expansion creating SYSTEM tapes of your own programs interfacing of Basic variables directly with machine code a method of greatly increasing the speed at which data elements are stored on tape, and special precautions for disk systems. INSIDE LEVEL II is a clearly organized reference manual. It is fully typeset and packed with nothing but useful Information If does not contain questions and answers. ROM dumps or cartoons Includes updates for Model III. INSIDE LEVEL II......\$15.95

### SINGLE STEP THROUGH RAM OR ROM

STEP80 allows you to step through any Basic or machine language program one instruction at a time and see the address hexadecimal value. Zilog mnemonic register contents and step count for each instruction. The top 14 lines of the video screen are left unaltered so that the target program may perform its display functions unobstructed STEP80 will follow program flow right into the ROMs and is an invaluable aid in learning how the ROM routines function. Commands include step (trace), disassemble, run in step mode at variable step rate display or alter memory or CPU registers jump to memory location execute a CALL set breakpoints in RAM or ROM write SYSTEM tapes and relocate to any page in RAM. The display may also be routed to your line printer through the device control block so custom print drivers are automatically supported

Specify Model I or Model III. STEP80 ..... \$16.95

### **TELECOMMUNICATIONS PROGRAM**

This machine language program allows reliable high speed hie transfers between two disk based computers over modems or direct wire. It is menu driven and extremely simple to use Functions include real-time terminal mode, save RAM butter on disk transmit disk file receive binary files examine and modify UART parameters, program 8 custom log-on messages automatic 16-bit checksum verification of accurate transmis sion and reception, and many more user conveniences. Supports the printers and lowercase characters. With this program you will no longer need to convert machine language programs to ASCII for transmission, and you will know immediately if the transmission was accurate

Specify Model I or Model III. TELCOM ..... \$39.95

### PROGRAM INDEX FOR DISK BASIC

Assemble an alphabetized index of your entire program library from disk directories Program names and free space are read automatically (need not be typed in) and may be alphabetized with a fast Shell Metzner sort by disk or program. The list may also be searched for any disk, program, or extension, disks or programs added or deleted, and the whole list or any part sent to the printer. Finally, the list itself may be stored on disk for luture access and update. The best thing since sliced bread. (January issue of 80 Microcomputing) Works with TRSDOS NEWDOS and NEWDOS 80 One drive and 32K required Model I only. Model III version soon. INDEX.....\$19.95

### **4 SPEED OPTIONS FOR YOUR TRS-80**

The SK-2 clock modification allows CPU speeds to be switched between normal an increase of 50% or a 50% reduction, selectable at any time without interrupting ecution or crashing the program instructions are also given for a 100% increase to 3.54 MHz. The SK-2 may be configured by the user to change speed with a toggle switch or on software command. If will automatically return to normal speed any time a disk is active requires no change to the operating system, and has provisions for adding an LED to indicate when the computer is not at normal speed. It mounts inside the keyboard unit with only 4 necessary connections for the switch option (switch not included) and is easily removed if the computer ever needs service. The SK-2 comes fully assembled with socketed IC's and illustrated instructions Model I only. SK-2....\$24.95

### INSTANT ASSEMBLER

The INSTANT ASSEMBLER IS a De for the TRS-80. Now you can assemble directly to memory and immediately debury your program with the built in single stepping debugger. Quickly switch from assembler to debugger and back again without iosing the source code. This feature makes INSTANT

ASSEMBLER an excellent learning tool for assembly language programming INSTANT ASSEMBLER is absolutely unique among tape based assemblers in that it produces relocatable code modules that can be linked with the separate LINKING LOADER, which is supplied in two versions for loading programs into either his RAM. This lets you build long programs with small modules. INSTANT ASSEMBLER .itso features immediate detection of errors as the source code is entered, a compactly coded source format that uses 1.3 as much memory as standard source, and many operational leatures including single stroke entry of DEFB and DEFW pinpoint control of istings alphabetic listing of symbol table, separate commands for listing error lines or the symbol table block move function, and vehication of source tapes

INSTANT ASSEMBLER's debugger provides single stepping with full register displays decimal or hex entry of addresses, forward or backward memory displays disarsembly of object code in memory memory display in ASCII formal and tex to deamst or decimal to-fiex conversion. The single stepper will step une instruction at a time or at a last rate to any defined address.

INSTANT ASSEMBLER occupies less than 8400 bytes of memory. In a 16K machine leave you enough memory to write assembly language programs of around 2000 bytes. This and its module-linking feature make INSTANT ASSEMBLER ideal for users with only 16K machines. The instruction manual may be purchased separately for \$5. which will apply towards the purchase of the INSTANT-ASSEMBLER Specify Model I or Model III. INTASM.....\$29.95

### RAM SPOOLER AND PRINT FORMATTER

This program is a full leature print formatting plackage featuring user defineable line and page length (with ane leeds inserted between words or after punctuation) screen dump printer pluse control and baud rate selection. In addition, printing is done from it 4K expandable buffer area so that the LPRINT or LLIST command returns control to the user while printing is being done. Ideal for Selectric or other slow printers. Allows printing and processing to run concurrently. Output may be directed to either the 

### MACHINE CODE FAST FOURIER TRANSFORM

This complete package includes 3 versions of the machine language FFTASM routine assembled for 16-32 and 48K machines a short sample Basic program to access them a 10K Basic program which includes sophisticaled interactive graphing and data manipulation and a manual of instructions and examples. The machine language subroutines use variables defined by a supporting Basic program to make data entry and retrieval extremely last and easy tor custom implementation. They perform 20 to 40 times faster than their Basic equivalent (256 points in 12.5 seconds), and require less than 1550 bytes of memory. The FFT is useful in analyzing stock market and comodily trends as well as for scientific information Specify Model I or Model III. FFTASM ...... \$49.95

DUPLICATE SYSTEM TAPES WITH CLONE

Make duplicate copies of any tape written for Level Ir. They may be SYSTEM tapes or data lists. The file name, load address, entry point, and every byte (in ASCII format) are displayed on the video screen. Model III version allows changing tape speed Specify Model I or Model III. CLONE ..... \$16.95

### **RAMTEST FOR LEVEL II**

This machine language program is a very thorough test for several types of RAM errors. A complete test of each individual bit in a 48K machine takes just 14 seconds includes a separate test for power line glitches Model I only. RAMTEST..... \$9.95

### EDIT BASIC PROGRAMS WITH ELECTRIC PENCIL

Load Basic programs or any other ASCII data file into the disk version of Electric Pencil for editting. One command from DOS quickly modifies existing files to Pencil format One disk and 32K required Model I only. PENPATCH ..... \$9.95

### Can you say "data?"

## Datafix

A. J. Barnard, Jr. J.T. Baker Chemical Company Phillipsburg, NJ 08865

A. D. Barnard Rensselaer Polytechnic Institute Troy, NY 12181

The TRS-80 keypad can help you whenever you're entering programs with long data statements—for example, music and graphics programs, science programs or long data lines to be POKEd into machine-code routines.

The keypad, you say, only allows you to use ten digits, a period (decimal point) and the enter key. You'll still have to enter the word data, any necessary commas and minus signs from the keyboard.

Not necessarily. With the following routine, you can

|     | GOTO18                                     |
|-----|--------------------------------------------|
| 1   | ZX=PEEK(16548)+256*PEEK(16549)             |
| 2   | IF (PEER (IX) +PEER (IX+1)=0) THEN6        |
|     | ELSEIFPEER(2X+4)<>46THEN5                  |
|     | ELSE20=0: 2V=0: 2W=0                       |
|     | :FORI=IX+4TOIX+255:IPPEEK(I)=@THEN5        |
|     | ELSEIF(I=IX+5ANDPEEK(I-1)=46ANDPEEK(I)=46) |
|     | THENPOKEI-1,136: POKEI, 32: ZU=I: NEXT     |
| 3   | IF (2V=#ANDPEEK(I)=34) THEN ZV=1: NEXT     |
|     | ELSEIF (ZV=1ANDPEEK(I) <>34) THENNEXT      |
|     | ELSEIF (IV=1ANDPEEK(I)=34) THENIV=0:NEXT   |
| 4   | IF(IV=#ANDPEEK(I-1)=46ANDPEEK(I)=46)       |
|     | THENPOKEI-1,44: POKEI, 32: IW=I: NEXT      |
|     | ELSEIF(I=ZU+1ORI=ZW+1)ANDPEEK(I)=46        |
|     | THENPOKEI, 45: ZU=0: ZW=0: NEXT            |
| 1.2 | ELSENEXT                                   |
|     | ZX=PEER(ZX)+256*PEER(ZX+1):GOTO2           |
|     | PRINT, DATA STATEMENTS CORECTED. : END     |
| 1   | 8 REM * MAIN PROGRAM STARTS HERE *         |

translate two or more *con*secutive periods into the word data, a comma, or a minus sign. Datafix is a Basic routine for a Model I Level II TRS-80 that gives you the proper syntax from the keypad, using only four variables.

### Changing Code

If you enter two consecutive periods after a line number, Datafix recognizes that the line is a data statement and, by POKEs, changes the first period to the word data (internal code 136) and the second to a space (32).

At any further point in the statement, if you enter two consecutive periods, the routine changes them to a comma (44) and a space (32). If you enter three consecutive commas, the third is converted to a minus sign (45). The routine ignores any periods within quotation marks and leaves a space after the word data and between each item.

For example, you can enter the following lines, except for alphabetic and special characters, using the keypad only:

```
100..10.1..40.2
105...10.1...40.2
110..JONES..40.2
115.."BYE NOW..."...10.1
```

Upon enterning: RUN 1, Datafix converts these statements to:

```
100 DATA 10.1, 40.2
105 DATA - 10.1, - 40.2
110 DATA JONES, 40.2
115 DATA "BYE NOW...", - 10.1
```

and then advise you that the data statements were corrected.

As written, you can load Datafix before your program. You can also renumber the routine to, say, 60001-60006 and append It to a program in memory (see, for example, 80 Microcomputing, January 1981, p. 213 for the PEEK/POKE approach).

If you are entering and editing statements only once, you can delete the routine after you use it.

### **How It Works**

In Program Listing 1, we use line feeds and indents to make the logic clearer. Dropping this nicety, reduces memory requirements. Line 0 bridges the routine and returns to the main program at line 10.

Line 1 returns the decimal ad-

dress, ZX, of the first line of a Basic program.

Line 2 first checks the two bytes of the line pointer; if they equal zero, the routine goes to line 6 and ends. Line 2 also checks for a period immediately following the line number; if none exists, the line is not a data statement and the routine passes to line 5.

Finally, line 2 can also start a character-by-character PEEK of a statement to be edited. When it meets character zero, Datafix has reached the end of the line, and passes to line 5.

If line 2 finds that the first two characters of a program line are periods, the periods are changed to the codes for the word data and a space. ZU is set to the character position I.

Line 5 finds the address of the next program line and returns to line 2.

Line 3 checks for a quotation mark (code 34). If one is found, flag ZV is set and Datafix will not check for periods until either a second quotation is encountered or the line ends.

If Datafix finds two consecutive periods beyond the start of the data statement, but not within quotation marks, line 4 changes them to a comma and a space, and ZW is set to the character position I.

Then, if the routine meets a third period and confirms it as consecutive by I being equal to ZU + 1 or ZW + 1, it is converted to a minus sign.

### Are my TRS-80\* business systems really that good? Michael Tannenbaum thinks so.

## Here's what he said about my Model II systems in the August "80 Microcomputing."

On the General Ledger's ability to file and report: "...the best I have yet seen in a microcomputer system."

On the Accounts Receivable system: "...clear and simple to follow."

### "...the first time I have seen this feature in a microcomputer system."

(referring to its ability to calculate a salesman's commission)

On our policy of customizing our systems to each buyer's needs:

### "...Taranto does his customers an enormous service."

And on our systems in general:

"...a comprehensive and well-documented system, an impressive product at a very reasonable price."

### Thank you, Michael.

### The Total System Store.

### Strengthen NEWDOS 80's chain command.

## Weak Link

Steven Denholtz, D.M.D. Livingston Professional Building 114 West Mt. Pleasant Ave. Livingston, NJ 07039

Unlike its use under Newdos80, the Chain function usually exits and erases a resident Basic program, then inputs another Basic program from disk. This program, in turn, operates on a still resident set of variables and/or files that are shared by related programs. The rationale is to reduce the amount of user memory the program consumes so a larger share of memory can be used for data or variables.

In Newdos80, however, the Chain function performs an entirely different operation. A short Basic utility is provided here so you can use Chain with speed and ease not available under Newdos80.

### What is Chain?

1

Chain is a DOS library command. After a Chain command, anytime a program asks for input from the keyboard, the keyboard record will automatically be supplied from a disk chain file without any operator action. How did the keyboard answers get on the disk? How does the computer know where to look? To answer these questions, let's learn a few new terms and look at what a chain file is:

Chain File: Section0 Section1 Section2 ....>etc. til EOF

### Syntax

Each section is an independent subfile of keyboard responses. Multiple sections can share the same file name. This avoids wasting a whole granule of disk space (1.25k) for each group of keyboard responses that usually takes a few words (100 bytes maybe). Thus the chain file was designed to have sections that are really independent subfiles sharing one filespec. This saves valuable disk space. You address the section when you issue the Chain command:

2a. 'CHAIN filespec <SECTIONn>' if in Dos; or, 2b. 'CMD''CHAIN filespec

<SECTIONn>" ' if in Disk Basic.

SECTIONn is optional on the first section (0). If the chain file contains more than one section, you must specify which one you are addressing, where n is a positive integer. If SEC-TIONn is deleted when issuing the Chain command, the default naturally is the first section, SECTION0. The filespec In Fig. 2 has a default extension of JCL, (which stands for Job Control Language, but that is getting beyond the scope of this article).

| <apecial character=""></apecial> |
|----------------------------------|
| <sectionn></sectionn>            |
| keyboard record                  |
| End Of Line character (OD H or   |
| Enter)                           |
|                                  |

The special character is always one of the following:

CHR\$(128) (80 H) : start of a new Section CHR\$(129) (81 H) : display message, await ENTER before proceeding

CHR\$(130) (82 H) : chain file "remark" CHR\$(131) (83 H) : display message, no pause

The special character 128 (80 Hex) is mandatory when starting a new section, except for the first section. All other characters are strictly optional. But, after using a CHR\$(128) to start a new section, you must also put SECTIONn immediately after it so you can later address which subfile (or section) you wish to use when you invoke Chain, as shown in Fig. 2.

### **Uses of Chain**

The keyboard record is the answer that will be displayed on the screen and used as if it were actually input from the keyboard (see Fig. 3). This can supply a commonly used set of parameters to an often used utility. More often, it may be a series of System and Basic commands implementing a complex program such as shown in Fig. 5.

My diskettes include a "JCL-JCL" file to be used in an Auto boot mode—every diskette, that is, but my Newdos80 system diskette. That one has the Auto command: AUTO CHAIN JCL/JCL, but has no file named JCL/JCL. This way, whenever I use my computer, I simply place either the system diskette or my application

Tandy Corp. Trademark

#### MAIL LIST SYSTEM \$69.95 (disk only)

Our easy-to-use system will accomodate almost any "custom" requirement of even your most demanding clients. A glance below will show that we are far ahead of any other system in speed, variety of features, and sheer volume of names handled but don't let that fool you. This system can be used just as easily on one disk for a small Christmas card list.

- Maintain virtually an infinite number of disks all in continuous alph. or zip order essential for large lists.
- Sort 2320 entries (2 full 40 track double density disks) in only 32K or an incredible 4640 entires (2 full 80 track double density disks) in only 48K! Made possible with our unique date compression techniques on the Model III.
- Super fast sort by alph. or zip order (8 sec. for 1000 entries)...both orders can exist simultaneously on disk.
- High speed recovery of entries from disk...speed of sort is meaningless if retreival from disk is slow ours pulls in over 11 per sec!
- In zip order all entries with same zip code are also arranged alphabetically
- Four digit zips have a leading "O" appended on labels
- Backup data disks are easily updated as entries are created, edited, or sorted ... extremely useful!!
- Optional reversal of name about comma for that noncomputer, personalized look.
- Master printouts of your list in several formats (not just a rehash of the labels). Optionally continuous or page oriented...Your customers will want this!
- All Ø's in address labels are replaced by easier to read 0's.
- ٠ All labels optionally support an "Attn." line
- Many user defined fields with plenty of options for simultaneous purging and selecting ... even allows for inequalities powerful and easy to use!!
- Continuous screen display of how many addresses currently printed.
- Each disk entry automatically "remembers" how many mailings have been made for that particular entry. Can be tied in with purge/select.
- Primarily written in BASIC for easy modification... embedded machine code for those speed sensitive areas.
- Editing is simple and fast ... automatic search.
- Optional 9 digit zip.
- Deleted entries have "holes" on disk filled automatically and alph. order is still mainfained!
- Test label printing lets you make horizontal and vertical adjustments with ease.
- Optional "one time" mailing for some selected entries.
- Extensive use of error traps (both operator and machine induced) even recovers from a power failure during a printout!
- Extensive documentations manual available separately for \$3.95
- Hardware requirements: 32K, printer, and 1 or 2 disk drives.

Provide your customers with a CALENDAR \$19.95 printed calendar (along with standard banker's holidays) of any month of any year. Tape only for Model I or III.

Same features as Calendar SUPER CALENDAR Additionally prints out large (tape only) \$29.95 "graphics" type wall calendars with memos under each day. Use as a planning calendar with optional disk storage ... requires 16K and printer.

410 E. Roca Refugio, Tx. 78377

# Football Scouting Report (Disk only) \$89.95

How many high schools and colleges are there within a 75 mile radius of you? Did you know that each is a potential customer at the rate of from \$500-\$1000 per season? Many already subscribe to more expensive (but inferior) computer analysis services of their scouting reports. Using such a service a coach will typically have an opponent scouted several times prior to actually playing them. This series of programs was written to the specifications of a coach with two state championships to his credit. As a result, the emphasis is on producing statistics that will help in predicting what the opponent will do in a given situation. This is a sophisticated set of programs fully equivalent to that used by professional football teams.

- Separate and detailed analysis of running, passing, and kicking
- . Passing and running tendancies by field position
- Point of attack tendancies and statistics for runs
- Tendancies and statistics for wide/short side, weak/strong side, and left/right run
- Each analysis can be broken down according to formation, down, and yards to go
- Allows for up to 5 games to be analyzed simultaneously
- Convenient disk storage of plays and games
- Extensive error traps ...won't let you make an error
- Two actual games (almost 100 plays) on disk to facilitate your learning and evaluation
- Extensive documentation available separately for \$3.95 even includes some advertising and price samples to help plan your promotion. Also included are some sample printouts
- Hardware requirements... 32K, 1 disk driver and printer

Interfaces to your own basic programs sort with the speed of machine code but with the convenience of basic. You don't have to

#### FAST SORT (with multiple dim. arrays) and

ALPHABETIZER (disk only) \$19.95

know assembly language programming to use these two programs. Just use your disk to merge our short basic programs. (with embedded machine code) with your own basic program. Follow our simple instructions to poke only 2 values before making the user call from basic. The pokes will set up a sort for string, integer, single, or double precision arrays. Also ascending or descending order is controlled by a single poke. Use one of two programs to sort arrays of the form A(1) or A(Q(1))... The disk includes six simple basic programs that are ready to merge with the main sort programs. Use them for learning and evaluation... Also included is a ready to use basic program (already merged with the ORDER program) Use it to obtain a printout of alphabetized names.

#### Sample Sort Times

8 sec. for 1000 dbl prec numbers .50 sec for 5000 integers Time for alphabetizing (string sorting) is comparable but dependent on the length of the strings.

dules are a must for banks. 5 & L institutions, and accounting firms You will be

### Loan amortization sche- LOAN AMORTIZATION \$19.95 (Tape only for Model I & III)

able to charge \$5 plus per schedule. Multiply that times the number of all loans your clients make per day ... easiest money we know of!. runs in about 2 minutes and achieves pin point accuracy with a built in calendar.

Visa Specify Model I or III when ordering Mastercharge Add \$1.50 for postage and handling. C.O.D.

diskette in drive zero and hit reset. The chain file issues all commands necessary to place my computer in a state where I can sit down and set to work. This may include listing any particular program lines that I feel need further development, or placing chain file messages to remind me where I left off, and even entering the Edit mode already pointing to a troublesome line.

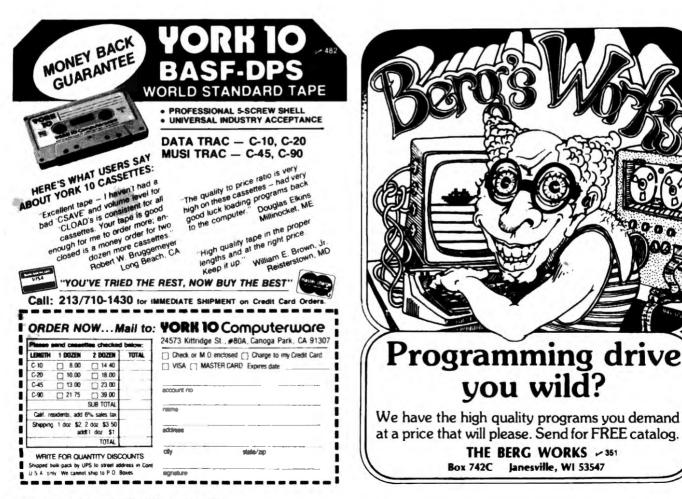

#### **Last Minute Hints**

The operator may terminate the Chain command any time by pressing the up-arrow; the operator may force a Chain pause by holding the rightarrow, and continue by pressing [enter).

An Original Utility to Create Chain Files

Program Listing 1, Makejcl/bas, creates and appends chain files with every feature described so far fully implemented. Study the program with its remarks. Type it into your system and save it on your Newdos80 system diskette. You will undoubtedly use it often and perhaps come up with your own applications. ■

# Your best Model I/III peripheral buy is a modem.

Considering expanding your TRS-80 Model I or III? Then you should know that **only one kind of peripheral** can give you all these **extra capabilities** ... in a single unit:

- Computer-to-computer data communications, for better personal or business management.
- Access to free "bulletin board" resources.
- Access to Source, Compu-Serve and other time-sharing systems.
- Services like electronic mail, instant news and financial reports.
- An almost limitless supply of new games and other enthusiast activities.

Of course, we're talking about a modern. A far more **sensible** first step in expanding than, say, joysticks, or a voice box, or a printer. And, therefore, your **best peripheral buy**.

A modem opens up a whole new world to you. A world of **thousands** of **computers** and computer people just like you, in homes and businesses around the block and across the country. A world you tap through your telephone.

But don't simply settle for any modem. For the most modem satisfaction, you need to make the **best modem buy.** 

And that's LYNX.

The new LYNX for TRS-80 Model I and Model III. It's the latest innovation from the people who are making data communications affordable. It's the best first step you can take in expanding. It makes your microcomputer a whole new animal.

# Your best Model I/III modem buy is LYNX.

The new LYNX is the ideal modem for your Model I or III. That's because it's the key element of a total directconnect telephone communications package.

This package includes all serial and computer bus interfaces, cables and terminal software... and comes to you with these remarkable features:

- SINGLE PRICE: \$299.95!
- Compatible with both Model 1
   and III.
- No separate purchases required.
- One-year warranty.
- Auto dial/auto answer.
- Works with any software, including ST-80 by Micklus.
- Active clear, break, and "control" keys.
- Half or full duplex, variable word length, parity and stop bits.
- Dial from phone, keyboard, or memory.
- Works with or without Model I expansion interface.
- Works with or without Model III RS-232 card.
- Can be placed on either side of Model III.
- · No tools needed to install.

No other modem gives you so much in a single package. And when you compare the LYNX price with the total cost of bringing any other modem on line, it could save you OVER \$100!

# A machine-code subroutine to dump memory on your display.

# Memory Window

Warren Merkey 824 S.E. 1st Avenue Gainesville, FL 32601

Now you can view any 1024byte block of memory in your Model I Levei II keyboard all 32 K. Memory window dumps memory onto the screen using a machine-code subroutine (a USR).

Here is how the program works. Line 1010 tells the computer where the USR is located and also makes all variables into integers. Line 1020 is the USR in the form of decimal data. Line 1030 loads the USR into place in high memory. Line 1040 asks the user for a place to start. Line 1050 calls the subroutine that moves memory onto the screen. Lines 1060-1080 are a loop that looks for control key input (arrow keys, Enter, and space bar). Line 2000 prints the current value of M in the upper left corner of the screen, with an arrow pointing to M. Line 9000 keeps the value of M within the first 32K of memory. Line 9010 calculates decimal POKE values. (This will be explained below.) Line 9020 POKEs the address of the memory block to be displayed into the USR and then calls the USR.

The USR consists of 12 bytes of code, in which the BC, DE and HL register pairs are loaded with the block-move parameters, which is done by the LDIR instruction. As the display scrolls the HL pair is the only one changed but the BC and DE pairs can also be easily changed. With these 12 bytes of code and some skillful POKEing, you can move any part of memory to any other location. By POKEing a 184 where there is a 176 (BO hex), you change the LDIR to LDDR. This is sometimes necessary when moving a block of memory into an overlapping area, where the direction of the move would cause memory to be overwritten before it is moved. (Refer to "Now You See It" in 80 Microcomputing, February 1981 for another application of the 12-byte LDIR subroutine.)

To use this program, respond to the Memory Size question with 32512 to protect the USR. Key in the program as listed and save it on tape before running it. The program may bomb when it scans through certain sensitive areas of memory. The four arrow keys give you scrolling in the four directions. The enter key allows you to stop and pick another starting place. The space bar causes the current memory location (and ASCII value) to be printed in the upper left corner.

In line 9010, the POKE values must be decimal, although they are related to hexadecimal. Take the value 32600 which equals 7F58 hex. The 7F is the Most Significant Byte and the 58 is the Least Significant Byte. The LSB and MSB converted back to decimal are POKE values 88 and 127. These values are POKEd into memory locations 32519 and 32520 read by the machine-code program as 7F58 hex.

Note that a hex number is translated to decimal by multi-

Program Listing

plying the values of its digits. 7F58 hex translates as 7  $\times$  4096 + F  $\times$  256 + 5  $\times$  16 + 8  $\times$  1 equals 326000. Remember that F equals 15. To reverse the procedure, you begin by dividing by 4096. The first two statements of line 9010 are long division:

| 7 = 1     | (I = INT(M/4096)) |
|-----------|-------------------|
| 28672     |                   |
| 3928 = J. | (J = M - 1*4096)) |

The third and fourth statements are long division by 256:

| 15 = K   | (K = INT(J/256)) |
|----------|------------------|
| 256)3928 |                  |
| 3840     |                  |
| 88 = 1   | (L = J - K*256)  |

The next divisor would be 16: however, as you can see, 88 is the decimal POKE value we need for the LSB. This leaves us with a seven and a 15, which we know is 7F hex, a one-byte number. If we multiply seven by 16 and add 15, we get 127, the decimal equivalent of 7F hex. This last step is expressed as H = K + 16\*1. Lines 9000-9020 are executed every time you press an arrow key. The USR reloads the entire screen with memory in the blink of an eye. giving the illusion of scrolling.

I have used the algorithms in this program to build a memory editor which works reasonably well as a word processor. At the very least, Memory Window may impart some knowledge to those of you who can grasp its principles.

# \*\*\*\*\* 4MHZ, DOUBLE DENSITY, COLOR&B/W **GRAPHICS**. THE LNW80 COMPUTER

when you've compared the features of an LMMBO Computer, you'll quickly understand why the LMWBO is the ultimate TRSBO software compatible system. LMW RESEARCH offers the wost complete microcomputer system at an outstand-ion low noise. ing low price. We back up our product with an unconventional 6 month warranty and a 10 days full refund policy, less shipping charges.

COMPARE THE FEATURES AND PERFORMANCE

#### LNW80

The LNM80 - A high-speed color computer totally compatible with the TRS-80\*. The LNM80 gives you the edge in satisfying your computation needs in business, scientific and personal computation. With performance of 4 MHz, 200A CPU, you'll achieve performance of over twice the processing speed of a TRS-80\*. This means you'll get the performance that is comparable to the most expensive microcomputer with the compatibility to the world's most popular computer (TRS-80\*) resulting in the widest software base.

- FEATURES: TRS-80 Model 1 Level 1; Software Compatible High Resolution Graphics RGB Output 384 x 192 in 8 Colors NTSC Video or RF MOD 128 x 192 in 8 Colors Black and White 480 x 192
  - 4 MHz CPU 500/1000 Baud Cassette

  - Upper and Lower Case 16K Bytes RAM, 12K Bytes ROM Solder Masked and Silkscreened

#### LNDoubler & DOS PLUS 3.3D

Double-density disk sturage for the LMM Research's "System Expan-sion" or the Tandy's "Expansion Interface". The LNDoubler<sup>TM</sup> is totally software compatible with any double density software generated for the Percom's Doubler\*\*\*. The LNDoubler<sup>TM</sup> provides the following outstanding features.

- Store up to 350K bytes on a single 5" disk. Single and double density data separation Precision write precompensation circult Software switch between single and double density Easy plug in installation requiring no etch cuts, jumpers or soldering 35, 40, 77. 80 track 5" disk operation 120 day parts and labor Warranty

\*\*\* Doubler is a product of Percom Data Cumpany, Inc.

DOS PLUS 3.30

Micro Systems software's double density disk operating system. This operating system contains all the outstanding features of a well developed DDS, with ease in useability.

#### **KEYBOARD**

| LINWOO | KEYBOARD | <b>KIT</b> |  |  |  | , |  |  |  |  |  |  | \$84.95 |

# **RELOAD 80**

Many of our readers have called with questions about Color Computer programs and LOAD80. Some wanted to know if Color Computer programs were on the tapes, others wondered if they could load the LOAD80 programs into their Color Computer, alter them and run them. This month, we'll clear the air about the Color Computer.

First, the Color Computer programs we publish in the magazine are *not* on the LOAD80 tapes. This is because the Color Computer downloads data at 1500 baud *only*. LOAD80 tapes are recorded at 500 baud so they can be used by both Model 1 and Model III users. LOAD80 tapes with programs recorded at different baud rates cannot be duplicated by our high speed duplicator.

You cannot load the LOAD80 tapes into the Color Computer

for two reasons: one, the baud rates are different, and two, the Color Computer uses two separate tone pulses to output data one to indicate a binary 1, the other to indicate a binary 0. The Models I and III use a single tone pulse that is either on or off to indicate the respective binary 1 or 0. For these reasons, the Color Computer and LOAD80 are incompatible.

Of course, you can still modify the programs in 80 Microcomputing to comply with Color Basic, and then type in the listings.

At the moment, there are plans afoot to put together a collection of the magazine's Color Computer programs in a special edition, Color LOAD80. This special edition should be available by Christmas. Check this column next month for full details.

Model II owners have been asking for a LOAD80 of Model II

programs, as well. This project is also under development and an announcement is planned for our December issue. The Model II LOAD80 will be a bit more expensive than either the regular LOAD80 or the special Color LOAD80, since it will be disk based.

The response to the LOAD80 project has been almost overwhelming. The Editors of the magazine are glad to be able to make this service available. We appreciate your feedback. Send your LOAD80 comments to this column, care of 80 Microcomputing, 80 Pine Street, Peterborough, NH 03458.

Next month, we'll delve into the mysteries of the Editor/Assembler, a subject postponed from this month because of the great number of Color Computer inquiries.

# **Do You Have Disk Errors?**

Over 90% of Disk errors are caused by two things. Bad disks and not having a data seperator. If you haven't ordered Percom's Doubler II then see our ad for details and order one now. You will not believe the improvement in your system. If you are having CRC errors, Data not found, or other errors especially in the higher numbered tracks you probably have a bad or worn out disk.

Every disk sold is certified but there is a big difference between brands. Some brands just barely pass the ANSI certification standards, others like WABASH produce disks that are far better than the minimum standards. (Wabash sells the disks that aren't good enough to put the Wabash Label on to Discount outlets that sell them as off brands and no Label disks.) WABASH Disks are certified over the entire useable disk surface. Despite repeated use and normal wear and calibration drift on your drive system, WABASH disks will continue to work reliably - long after the so called bargain brands have failed. That's why WABASH guarantees all their Disks for a minimum of 2 years.

Percom ran extensive tests during their research and design of the doubler and reached the conclusion that Wabash made the best 5% inch double density diskette.

Order some today if you don't like them for any reason return them within 30 days and we will give you a prompt refund. If you have any problems with them in the next two years return the disk and we will send you a new one. No other company can match that offer at our LOW prices.

# **FREE PRINT BUFFER!**

What's a print bufffer you ask? It is hard to describe physically it's a 8x10x4 box that has 16k memory and plugs in between the computer and the printer. The printer can only accept data a line at a time with the Epson mx-80 thats around 100 baud. The computer can send print data through the printer port at over 1000 baud. The print buffer takes the data from the computer and stores it until the printer is ready for it.

If you are using your computer for business or if your time is valuable and you hate to sit doing nothing while the printer is printing YOU NEED THIS. With the time, the buffer saves you, it will pay for itself within a few days. We are so sure that you will like it that you can use it for 30 days free. If you don't think it will pay for itself send it back for a prompt refund.

MICROCOMPATIBLE with 16K of Memory......\$290.00 Cable......\$35.00

# PERCOM'S DOUBLER II

If you haven't got a doubler for your Model I, order one now, this is the greatest thing to come along for the Model I. Since it actually reduces disk read/write errors, your system will run better with a PERCOM doubler. And you will also save both time and money by having more programs per diskette.

PERCOM'S DOUBLER II ......\$159.00

# **NEW MODEM GAMES**

Play Checkers, Chess, or Othello over your modem with your friends! Each game features full graphics, sound, and a chat mode permitting you to send messages and sounds (to get the other persons attention). Games are for two players, either one or two computers. Complete documentation. All three:

1691 Eason 

Pontiac, Michigan

New Games ● Utilities ● Business Programs WANTED

# TWO NEW ARCADE GAMES

It's been on the market for two months and has been getting rave reviews. Some of the comments are "I like it better than all of the previous dungeon games. It's got the great graphics and it's fast" "I get tired of the Big Five" arcade games as they are the same every time. Dungeon Escape gives you a different dungeon and a different ghost every game." "My favorite game." "I used to fall asleep waiting for the graphics in Hellfire Warrior", Dungeon Escape is 10 times as fast".

#### SUPER GRAPHICS \* INTERACTIVE SOUND LATEST PROGRAMMING TECHNIQUES

## SCARFMAN

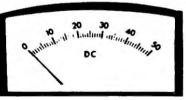

A new game by the author of Adventure Internationals Missle Attack. This is very similar to the PAC-MAN arcade game.

It has excellent graphics, with sound, and you can even use the joy sticks with this one.

# YOU MUST SPECIFY MODEL I OR MODEL III.

| 16K Tape      | \$15.95 |
|---------------|---------|
| Diskette, 32K | \$19.50 |

The biggest problem in loading tapes has been the volume control. Prerecorded tapes are produced at differing volume levels. Now finally, a device to let you set the correct volume levels for loading any tape. You will now load any tape the FIRST time. **SUPERMETER** plugs in (no cutting or soldering) between your tape recorder and the computer and lets you set the volume to the level that your computer wants.

#### Dealer Inquires Invited.

C.O.D. - certified check M.O. or cash only, Sorry, no C.O.D. over \$150.00! Most orders shipped next day. All orders must have shipping included. Please add 2% or \$2.50, whichever is higher, for shipping (unless otherwise stated). Out-of-Country orders, please add \$10.00 additional shipping and handling, balance returned upon shipment.

PHONE ORDERS WELCOME: (313) 073-2224 073-8700 Call between 8-2 E.S.T.

# 80 CALENDAR

# October

Oct. 2 and 3 A two-day conference on "Classroom Applications of Computers" will be conducted at Independence High School, San Jose, CA, by Computer-Using Educators and Santa Clara Valley Mathematics Assn. The Conference will cover mathematics, science, business, music, special education, language arts and administrative applications of computers at levels ranging from pre-school through college. Information is available from Computer-Using Educators, Independence High School, 1776 Educational Park Dr., San Jose, CA 95133.

Oct. 24 and 25 The second annual New Jersey Microcomputer Show and Fleamarket is scheduled at the Holiday Inn North Convention Center, Newark, NJ. The show will feature 75 commercial exhibitors and more than 100 outdoor fleamarket vendors and usergroup meetings for TRS-80s. Admission for the show and fleamarket is \$5; for the fleamarket only, \$3. It is sponsored by Kengore Corp., 3001 Rte. 27, Franklin NJ 08823.

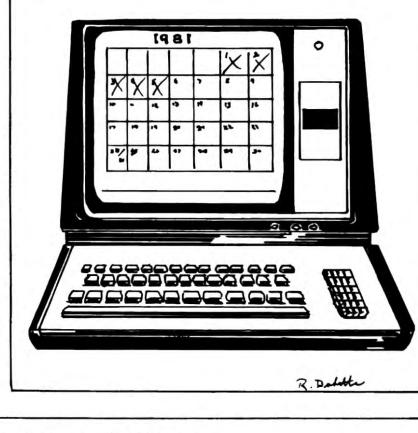

Oct. 26-Nov. 4 Virginia Polytechnic Institute and State University will conduct three workshops in October and November. Digital Electronics for Automation and Instrumentation will be Oct. 26-28; Microcomputer Design Interfacing and Programming using Z80/8085/8080 will be Oct. 29-31; and Scientific Instrument Automation, Interfacing and Programming using the TRS-80 microcomputer will be Nov. 2-4. Information is available from Dr. Lindy Leffel, CEC, Virginia Tech, Blacksburg, VA 24061.

Technical Education Research Centers, 8 Eliot St., Cambridge, MA 02138, will sponsor a series of workshops on **Microcomputers in Education**" in College Park, MD, **Oct 2–4**; Toronto, Canada, **October 22–24**; and Cambridge, MA, **Nov. 22–24**. They will include a discussion of educational issues, three microcomputer languages and laboratory and science applications of microcomputers.

The commission on Software Issues in the '80s, 1301 20th St., N.W., Suite 116, Washington, DC 20036, will sponsor the **National Conference on Software: Critical Decisions,** at the Shoreham Hotel, Washington, DC, **Oct. 5–6.** Subject areas will include education, software protection, technical issues and taxation.

The University of California, Berkeley, will sponsor a two-day course on "Bit-Slice Microprocessor Design" for engineers and engineering managers at the Marriott Santa Clara Hotel, Santa Clara, CA Oct 28–27. Fee is \$350. Interested parties can register through the Office of Continuing Education in Engineering, University of California Extension, 2223 Fulton St., Berkeley, CA 94720.

Ken Orr and Associates, Inc., 715 E. 8th St., Topeka, KS 66607, will sponsor courses and conferences on several issues in October. Subjects are: Oct.

5-7, Data Structured Systems Design Users Conference, Topeka; Oct. 8, Systems Maintenance Update Conference, Topeka; Oct. 19-23, Structured Systems Design, Kansas City, MO; Oct. 20-23, Structured Requirements Definition, Atlanta, GA; Oct. 27-29, Structured Data Base Design, Topeka; Oct. 27-30. Structured Requirements Definition, Denver, CO.

# November

The University of California, Berkeley, will sponsor a two-day course titled "Comparison of Recent Microcomputer Architectures" for design engineers, programmers and technical managers at the San Francisco Airport Hilton, Nov. 9-10. Fee is \$400. Information and registration is available through the office of Continuing Education in Engineering, University of California Extension, 2223 Fulton St., Berkely, CA 94720

The New Mexico Computer Society will host the third annual New Mexico Computer Fair Nov. 14 at the Albuquerque Civic Auditorium. Admission is free. Information is available from Ron Benninghoff, c/o New Mexico Computer Society, 515 Wyoming NE No. 2. Albuquerque, NM 87108

Ken Orr and Associates, Inc., 715 E. 8th St., Topeka, KS 66607, will sponsor several courses and conferences in November. Subjects are: Nov. 3-6 Structured Regulrements Definition, San Antonio, TX; Nov. 3-6, Structured Program Design, Boston, MA; Nov. 10, Management Overview of Data Structured Systems Development, Denver, CO; Nov. 11, Management Overview of Data Structured Systems Development, Portland, OR; Nov. 13, Management Overview of Data Structured Systems Development, Seattle, WA; Nov. 9-13, Structured Systems Design/ Structured Program Design Combined Course, St. Louis, MO; Nov. 10-13, Structured Requirements Definition, Los Angeles, CA; Nov. 16-20, Structured Systems Design/Structured Program Design Combined Course, Washington, DC.

# December

Ken Orr and Associates, Inc., 715 E. 8th St., Topeka, KS 66607 will run several courses in December. Subjects are: Dec. 1-4, Structured Systems Design, Chicago, IL; Dec. 8-10, Structured Program Design for Teleprocessing, Topeka, KS; Dec. 8-11, Structured Requirements Definition, Philadelphia, PA; Dec. 8-11, Structured Program Design, Kansas City, MO; Dec. 14-18, Structured Systems Design/ Structured Program Design Combined Course, Atlanta, GA.

Ron Balewski 412 E. Ridge St. Nanticoke, PA 18634

Even Christmas can be tedious. About a week before the last Yule, I typed some seasonal music on my TRS-80. Because most songs contain more than one verse, and Christmas tunes are no exception, I found myself typing identical data statements over and over—not something I enjoy.

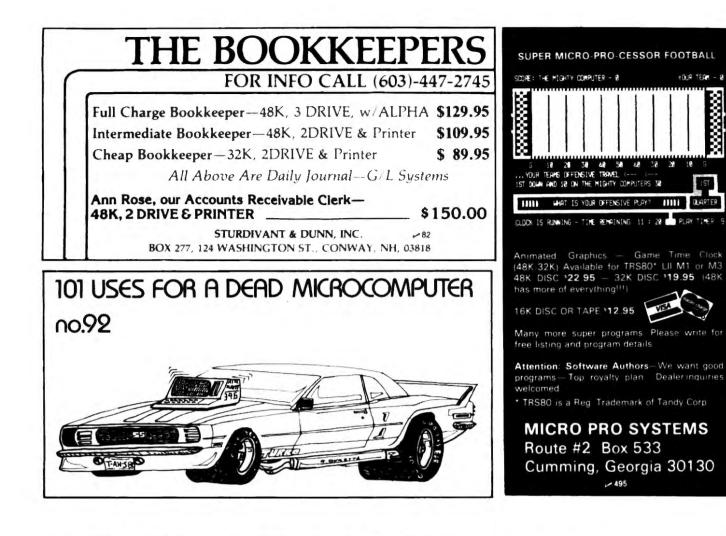

Since I had already typed the data once, I figured all I had to do was find it.

#### Copylt

I wrote a short utility (2K plus) that can save you time retyping long, tedious data statements when they are repeated in any Basic program. I call it Copyit.

Copyit lets you duplicate one line of Basic code in another. I placed it in low memory (below Basic) to eliminate the need for separate programs for 16, 32 and 48K machines. I patched Copyit into the keyboard's device control block (DCB), so that each time you strike a character, Basic calls Copyit, instead of the usual input routine.

Copyit checks a flag that indicates you need a copy of a previous data statement. If the flag says no, Copyit calls the key-

Selling 80 Microcomputing, the only major journal for the users of the TRS-80<sup>+</sup>, is a sure bet for getting the computer enthusiast into your store. Once through the door you can sell him anything.

We know "80" will make you money...it's the only magazine for the TRS-80° users and you know how many of those there are. So call today and join the dealers who make money with "80".

For information on selling 80 Microcomputing, call 603-924-7296 and speak with Ginnie Boudrieau, our Bulk Sales Manager. Or write to her at 80 Microcomputing, Pine Street, Peterborough, NH 03458.

'TRS-80 is a trademark of the Tandy Corp.

board driver.

If you pressed any character other than a shift down-arrow Basic records the character in the A register as usual.

If the keyboard driver returns the shift down-arrow, you'll activate Copyit and it will ask you for a line number. The routine converts this number to binary and searches for it. If Copyit can't find the line, it prints a message to that effect and terminates itself, until you activate it again.

If the routine finds the line number, it sets a "next-byte-tocopy" pointer to the first character of that line, turns on the copy flag, sets the A register to zero and returns control to Basic. Setting the A register to zero fools the computer into thinking that nothing has happened.

From this point on, whenever the keyboard is scanned and the copy flag is on, Copyit reads the "next-byte-to-copy" pointer. It loads this byte into the A register, and the pointer is bumped up one. Control is then returned to Basic with the character in the A register, just as if you had typed it.

Since the copy flag remains on, the entire line will be sent to Basic, character by character, until the "next-byte-to-copy" is zero. If so, Copyit has found the end of the line; it turns off the flag, and Basic resumes.

#### **Operating Instructions**

Let's take an example. To copy line 10 into line 20, type: 20 shift down-arrow. Copyit will respond with: Line Number?

You then type 10 and hit Enter. Hit Enter once again, and you have rejoined Basic.

If your machine has a new ROM, you will have to type: shift down-arrow Z to activate Copyit. You can tell if you have a new ROM, because your computer will ask you for the Memory Size while, if your computer has an old ROM, it will ask you for the Memory Size. You can change this by replacing the 26 in line 130 with the ASCII code you want to use.

any time, not just at the begin- something after copying line ning of a line. You can type a 10, but before entering the line;

statement or two before copy-You can activate Copyit at ing line 10; you can also copy

or you can copy line 10 into line 20 more than one time.

Once you see how much typing Copyit can save you, you'll

start loading it habitually before typing long data statements. Remember, you may have to move those statements.

# The DATA-TRANS 1000

# A completely refurbished IBM Selectric Terminal with built-in ASCII Interface.

\*FOR YOUR TRS-80 WITH OR WITHOUT EXPANSION INTERFACE. AVAILABLE WITH CENTRONICS TYPE PARALLEL PORT.

## Features:

- 300 Baud Serial
- 14.9 characters per second printout
- Reliable heavy duty Selectric mechanism
- RS-232C Interface
- Documentation included
- 60 day warranty—parts and labor
- High quality Selectric printing Off-line use as typewriter
- Optional tractor feed available
- 15 inch carriage width

Also works with Exatron's Stringy floppy, for fast loading of programs. (Has RS232 built in stringy)

## HOW TO ORDER DATA-TRANS 1000

1. We accept Visa, Master Charge. Make cashiers checks or personal check payable to:

**DATA-TRANS** 2. All orders are shipped F.O.B. San Jose, CA 3. Deliveries are immediate Desk and table top models also available.

For orders and information **DATA-TRANS** 

45277 Fremont Blvd., #7 -274 Fremont CA 94538

Phone: (408) 263-9246

# Listprog

#### Doug Riffel 1836 Metzerott Road #906 Adelphi, MD 20783

have always been a stickler for neat and legible program documentation. Consequently, i quarkly became frustrated at the total lack of form control incorporated in the Basic LLIST command. Even NEWDOS/80 with all its extensions to Disk Basic offers no help.

There were two basic features I wanted. I quickly found that automatically feeding the page over the perforation was not as easy as I thought it would be. I also wanted to indent the lines to provide room for three-hole punching so the program listings could be stored in binders.

I also wanted some other neat little goodies. First, the name of the program should appear prominently in the header. Second, I wanted to print the date the program 'is listed. Third, I needed page numbering and finally, double-spacing between statements to provide for pencil corrections.

All these features have been

Program Listing

incorporated in Program Listing 1, which I call Listprog. It requires Disk Basic and NEWDOS/80 to operate, and will work equally well with TRSDOS with the deletion of line 1000.

Although Listprog was written to capitalize on some of the features of Radio Shack's Line Printer IV (Centronics 737), with some minor modifications it will work just as well with other printers. The necessary modifications will be covered later.

#### Listprog

Whenever a printed line exceeds the line length of the printer, the printer logic automatically prints across a full line and then prints the remainder on the following line. When this happens, location 16425 (Basic's line counter) does not get updated. This, in essence, means total loss of form control.

A similar situation occurs if the down arrow is encountered within a statement. I use the down arrow quite frequently to print multiple lines on the screen with one statement. If the printer logic detects this character, the line up to that point is printed and the remainder is printed on the following line. Again, the Basic line counter is not updated. When a program is stored on disk in ASCII format, the first space encountered in a statement is always the separator between the statement number and the statement text.

Lines 10 and 20 of Listprog merely clear string space and set certain variables. Line 1000 (NEWDOS/80 only) examines TIME\$ to see if a date has been entered. If not, it requests the date and executes a DOS command to set it.

Lines 1010 and 1020 request the filespec and open that file.

Line 1030 examines the filespec for the presence of a slash. If a slash is present, it and everything to the right of it (the file extension) is discarded. I personally prefer to keep ASCII-formatted program files separate from the Basic program files by using the filespec extension "/TXT"; therefore, the extension on the filespec actually being printed is irrelevent.

Line 1040 prints the header which consists of the program name, printed at five characters per inch, and the date, printed at 10 characters per inch. For any printer other than the LP IV, this line should be modified accordingly.

Line 1050 turns on the 16.7 characters per inch mode (132

THE VIDEO MANAGER TIRST IN A SERIES Our Video Manager will enhance your computer's performance with these features: vertical printing on screen; forms design direct from screen to printer; send entire screen or any part to your printer; save screen to disk as a file and more. Written so you can utilize it from DOS or BASIC. Available on disk for: TRS-80,\* Mod I TRS DOS 2.3, Mod II TRS DOS 1.2 & 2.0, CP/M 2.0 or later, soon available for Mod III. For your convenience with Visa or M/C phone in your order. Please add \$2 for handling and postage.

# CONVERT YOUR TRS-80 MODEL-I INTO A DEVELOPMENT SYSTEM

Now you can develop Z-80 based, stand-alone devices such as games, robots, instruments and peripheral controllers, by using your TRS-80 as a development system. The DEVELOPMATE plugs into the expansion connector of your TRS-80 and adds **PROM PROGRAMMING** and **IN-CIRCUIT-EMULATION** capabilities to your system (with or without expansion interface).

Complete instructions and sample schematics are included to help you design your own simple stand-alone microcomputer systems. THESE SYSTEMS CAN BE AS SIMPLE AS FOUR ICs one TTL circuit for clock and reset: a Z-80, an EPROM, and one penpheral interface chip.

When the In-Circuit-Emulation cable is plugged into the Z-80 socket of your stand-alone system, the system becomes a part of your TRS-80. You can use the full power of your editor/assembler s debug and trace programs to check out both the hardware and the software. Simple test loops can be used to check out the hardware, then the system program can be run to debug the logic of your stand-alone device.

Since the program is kept in TRS-80 RAM changes can be made quickly and easily. When your stand-alone device works as desired you use the Developmate s PROM PROGRAMMER to copy the program into a PROM. With this PROM and a Z-80 in place of the emulation zable your stand-alone device will work by itself.

The DEVELOPMATE is extremely compact Both the PROM programmer and the in-Circuit-Emulator are in one small plastic tox only 32 - 54 - A line-plug mounted power supply is included. The PROM programmer has a personality module which defines the voltages and connections of the PROM so that future devices can be accommodated. However, the system comes with a universal personality module which handles 2758 2508(8K): 2716 2516(16K): 2532(32K) as well as the new elec trically alterable 2816 and 48016(16K): EEPROMs).

The COMPLETE DEVELOPMATE B1 with software power supply emulation cable TRS-80 cable and universal personality module is ONLY \$329' The PROM PROGRAMMER is available secontartery for ONLY \$329.

# NOW. . . Continuous Checks

That Can be Used With or Without Your Computer!! The Best in A Home Checking System

us Checks fan-folded in That's right Conti a 3-to-a-page desk set design And they can be computer printed, handwritten or typewritten ever suits the quantity or situation SPECIAL DESIGN

Our checks are not a high-volume business form adaptation. They're specially designed Computer/Manual Checks for the home user And they re easy to use, too. No need to change printer form width when loading Our checks are the same 9% "width as standard tractor feed printer paper. Check tear down size is the same as the classic personal-sized check issued by all banks

#### COMPLETE HOME SYSTEM

With this system you can print the bulk of your monthly checks on your computer using our program. Your checks and stubs can then be stored in our attractive Data Ring Binder Checkbook, Later, if you have a few checks to write, there's no need to load them into a Her - Just write a check at your desk as win above. And you can mail your checks in dual windowed envelopes to eliminate onnier addressing chores

#### UNIQUE

You won't find continuous checks like these anywhere And, our special small quantity printing process will give you excellent quality and appearance. Standard color-coordinated imprinting and encoding is as show

(logo can be omitted) on blue, grey, green, or buff checks PRICED RIGHT Two Hundred checks are just \$29.95 (enve-lopes \$14.95) Five Hundred checks are \$49.95 (envelopes \$27.95) Data Ring Check-books are only \$4.95.

Special "ORDER NOW" Offer So that you can start using your computer immediately to pay your monthly bills, we'll make you a special package offer. If you order directly from this ad, we can send you 200 Checks, 100 Envelopes, A Binder, and Program for \$49,95

# and Program for #49.95 — OR — 500 Checks, 300 Envelopes, A Binder, and Program for \$74.95

You II save as much as \$9.85 over the separate purchase price. And with the special separate purchase price. And with the special package you can begin your monthly check-book balancing and bill paying as soon as you receive your checks Just enclose a voided check the encoding information) with your payment (VISA - MasterCard orders must show signature, expiration date, and account number). Or, send today for samples ( MAL ADDRESS SOURCE TCH 411 migratet 1 Cls 70270.235 SYNERGETIC 4715 SHEPHERD RD DEPARTMENT M91 SOLUTIONS DEPARTMENT M91 PHONE (813) 646-6557 MULBERRY FL 33860 ------

characters per line for the LP IV) and prints the page number. This line should also be modified for printers other than the I PIV

Line 1060 returns the printer per inch, to 10 characte je and terejects the last minates Listprog \_ine 1070 is the required form ror inputting ASCII-formatted program files.

Line 1080 provides the necessary set-up information for the remainder of the program. There are really two left margins, one for the statement number and one for the statement text. The length of the printed statement text line is predetermined by the value assigned to variable PT in line 20. The left margin for the statement number is also predetermined in line 20 by variable IN. For printers with line lengths different than the LP IV, these variables may be changed; however, IN + 8 + PT cannot exceed the line length of the printer.

Other variables and their use

Π

are as follows:

•SP = Location of the space separator between line number and text •TS = Beginning of statement text

•TL = Length of statement text

•NL = Number of full PTcharacter lines to be printed •EC = Number of characters in last line if less than PT

Lines 1090-1110 search the statement text for the down arrow (CHR\$(10)) and replace it with the ASCII carat (CHR\$ (94)). If the printer you are using cannot print this character, you will want to change these lines.

Lines 1130-1170 perform the actual printing, feeding properly over the paper perforations.

Listprog has become an extremely popular program on my TRS-80 and I use it to document all my Basic programs. The program logic is quite simple and lends itself to easy tailoring for individual preferences.

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | 11                                           |

All tapes furnished with full documentation and instructions. Documentation, Instructions and Source List alone....\$15.00

All programs on tape require Level II and 16K. Frinter is required for MICRO-TYPIT and optional on all others. Do not forget to include the Model Number (I or III) with your order.

Send Check or Money Order (no COD's please) to: Coolidge & Associates

# Education = MicroComputers.

# \*to the power of Instant Software

Einstein's equation helped explain the properties of relativity, but didn't do much to speed the learning process. Instant Software's equation means individual attention and greater comprehension. Everyone knows the best student-teacher ratio is 1:1. That was a problem in years past, but now it's as easy as C.A.I. (Computer-Aided Instruction). These Instant Software programs will guide and teach each lesson with the infinite patience only a computer can provide, thus allowing students to progress at their own pace.

Einstein had the right idea, but if he'd only known then what we know now....

# REVISED Typing Teacher (for the TRS-80TM).

A complete seven-part package that guides you from familiarization of the keyboard through typing words and phrases to mastery of touch-typing. Your video monitor becomes a bottomless page for typing practice, and your own private TYPING TEACHER, ready to teach when you're ready to learn. Model I, Level II, 16K; Model III, 16K. Order No. 0099R-A14 \$12.95 plus shipping.

# Teacher's Aide (for the TRS-80TM).

Now you can have the benefit of Computer Assisted Instruction (CAI) in your own home. The Teacher's Aide program allows you to create tailor-made lessons for your child. The features of this program include the ability to review material before taking the lesson, a provision for hints to help answer questions and graphic displays as a reward for answering all questions correctly. Once you've created a lesson, you can save it and create an entire sequence of lessons.

The Teacher's Aide package is perfect for parents, teachers, and students who need the unlimited patience only a computer can provide. Level II 32K. Order No. 0214RD-A13 (disk-based) \$39.95 plus shipping.

# **Geography Explorer:**

U.S.A. (for the TRS-80TM)\*

This program allows your child to travel the country and learn vital facts about each of our 50 states. Geography Explorer offers the most fascinating way of learning yet. Learn each state's name, capitol, largest city, nickname, etc. As a bonus, this package offers the capability of light pen use. Model I, Level II 16K, expansion interface with 16K, one minidisk drive. Order No. 0071RD-A16 \$49.95 plus shipping.

# Capitalization (for the Apple<sup>TM</sup>)"

Here's the most patient grammar teacher a student will ever have ... CAPITALIZATION. It's one module among several in the English Language Series of CAI (Computer Aided Instruction) programs from Instant Software. This program introduces and exercises the twelve rules for capitalization in English. The student may study the rules in order from 1 to 12, or may single out one particular rule for study and practice. Start with CAPITALIZATION and graduate to proper grammar and a better understanding of the English language. Applesoft Basic 32K, 1 disk drive. Order No. 0339AD-A15 (disk-based) \$24.95 plus shipping.

•INTRODUCTION TO TRS-80 LEVEL II BASIC AND COMPUTER PROGRAMMING – BK1219 – by Michael P. Zabinski Written by an experienced educator, this is the book for those beginners who want to learn about computers without having to become an expert it has practical programs, useful line by line comments, excellent flowcharts accompanied by line numbers and over 200 exercises which help the reader assess progress, reinforce comprehension, and provide valuable practical experience \$10.95 \*

new

● 50 BASIC EXERCISES — BK1192— by J. P. Lamoitier This book is structured around the idea that the best way to learn a language is through actual practice. It contains 50 completely explained exercises state ment and analysis of the problem flowcharts, programs and actual runs. Program subjects include mathematics, business, games, and operations re search and are presented in varying levels of difficulty. This formal enables anyone to learn BASIC rapidly checking their progress at each step \$12.95.

• THE BASIC HANDBOOK — BK1174 — NEW, SECOND EDITION by David Lien. This book is unique. It is a virtual ENCYCLOPEDIA of BASIC While not favoring one computer over another, it explains over 250 BASIC words, how to use them and alternate strategies. If a computer does not possess the capabilities of a needed or specified word, there are often ways to accomplish the same function by using another word or combination of words. That's where the HANDBOOK comes in. It helps you get the most from your computer, be it a "bottom-of-the-line" micto or an oversized monster. \$19.95 '

● LEARNING LEVEL II — BK1175- by David Lien. Written especially for the TRS-80, this book concentrates on Level II BASIC, exploring every important BASIC language capability. Updates are included for those who have studied the Level I User's Manual. Sections include: how to use the Editor, dual cassette operation, printers and peripheral devices, and the conversion of Level I programs to Level II. \$15.95."

BASIC BASIC (2ND EDITION)—BK1026—by James S Coan This is a textbook which incorporates the learning of computer programming using the BASIC language with the teaching of mathematics. Over 100 sample programs illustrate the techniques of the BA SIC language and every section is followed by practical problems. This second edition covers character string handling and the use of data files \$10.50°.

ADVANCED BASIC—BK1000—Applications, including strings and files, coordinate geometry area, se guences and series, simulation, graphing and games \$10.75"

•SIXTY CHALLENGING PROBLEMS WITH BASIC SOLUTIONS (2nd Edition) – BK1073 – by Donald Spencer, provides the serious student of BASIC programming with interesting problems and solutions. No knowledge of math above algebra required. Includes a number of game programs, as well as programs for financial interest, conversions and numeric manipulations. \$6.95.

Peterborough NH 03458
Be sure to include check or detailed credit card information

• PASCAL—BK1188—by Paul M. Chirtian. Professor Chirlian's textbook combines a simple approach to the PASCAL language with comprehensive coverage on how a computer works, how to use a flowchart, working from a terminal as well as batch operation and debugging. Special attention is paid to idiosyncrasies of the language and syntax flowcharts abound for the convenience of the experienced programmer. Well indexed \$12.95"

eINTRODUCTION TO PASCAL — BK1189—by Rodnay Zaks. A step-by-step introduction for anyone wanting to learn the language quickly and completely. Each concept is explained simply and in a logical order All features of the language are presented in a clear, easy-to understand format with exercises to test the reader at the end of each chapter. It describes both standard PASCAL and UCSD PASCAL, the most widely used dialect for small computers. No computer or programming experience is necessary. \$14.95.

•PROGRAMMING IN PASCAL--BK1140-by Peter Grogono The computer programming language PASCAL was the lirst language to embody in a coherent way the concepts of structured programming, which has been defined by Edsger Dijkstra and C.A.R. Hoare. As such, it is a landmark in the development of programming languages. PASCAL was developed by Niklaus Wirth in Zurich; it is derived from the language ALGOL 60 but is more powerful and easier to use. PASCAL is now widely accepted as a useful language that can be efficiently implemented, and as an excellent teaching tool. It does not assume knowledge of any other programming language, it is therefore suitable for an introductory course \$12.95 \*

-GAMES-

 40 COMPUTER GAMES – BK7381 – Forty games in all in nine different categories Games for large and small systems, and even a section on calculator games Many versions of BASIC used and a wide variety of systems represented. A must for the serious computer gamesman \$7.95<sup>-</sup>

• BASIC COMPUTER GAMES—BK1074—Okay, so once you get your computer and are running in BASIC, then what? Then you need some programs in BASIC, that's what. This book has 101 games for you from very simple to real buggers. You get the games, a description of the games, the listing to put in your computer and a sample run to show you how they work. Fun. Any one game will be worth more than the price of the book for the fun your and your family will have with it \$7.50."

eMORE BASIC COMPUTER GAMES—BK1182 edited by David H Ahl More fun in BASIC<sup>1</sup> 84 new games from the people who brought you BASIC Computer Games Includes such favorites as Minotaur (bartie the mythical beast) and Eliza (unload your troubles on the doctor at bargain rates). Complete with game description, listing and sample run \$7.50 \*

•WHAT TO DO AFTER YOU HIT RETURN -- BK 1071---PCC's first book of computer games. 48 different computer games you can play in BASIC programs. descriptions, many illustrations. Lunar Landing, Hammurabi, King, Civel 2, Oubic 5, Taxman, Star Trek, Crash, Market, etc. \$10 95."  THEORY Z - BK1226 - How American Business Can Meet the Japanese Challenge - by William Ouchi. Why are the Japanese Challenge - by William Ouchi. Why are the Japanese catching up and surpassing Japanese industrial productivity? What allows Japanese industrialists to offer guaranteed lifetime employment to their workforce? This book will help you understand the Theory Z managerial philosophy and its implications for the American industrial giants already operating under Z-style management, and the impact of this style on the quality of their executives and workers is explored. A must for the alert businessman, large or small. S12.95 \*
 SO YOU ARE THINKING ABOUT A SMALL BUSINESS COMPUTER - BK1222 - by Richard G Can-

•SO YOU ARE THINKING ABOUT A SMALL BUSINESS COMPUTER—BK1222—by Richard G Canning and Nancy C Leeper For a well-organized manual on the process of selecting the right computer system for your small business, this text can't be excelled. Designed to introduce the novice in data and word processing to the real benefits of computerization, the book is filled with money, and time-saving tips, photos of equipment, lists of suppliers, prices, explanations of computer terminology, and helpful references to additional sources of information. Everyone contemplating a first computer installation should have this book \$14.00 \*

Entropological Statution of the statu

• SOME COMMON BASIC PROGRAMS—BK1053 published by Adam Osborne & Associates, Inc. Perfect for non-technical computerists requiring ready-to-use programs. Business programs, plus miscellaneous programs. Invaluable for the user who is not an experienced programmer. All will operate in the standalone mode \$14.99 paperback.

• PIMS: PERSONAL INFORMATION MANAGEMENT SYSTEM—BK1009—Learn how to unleash the power of a personal computer for your own benefit in this ready-to-use data-base management program. \$1195

# -MONEYMAKING-

eHOW TO MAKE MONEY WITH COMPUTERS— BK1003—In 10 information-packed chapters, Jerry Felsen describes more than 30 computer-related, money making, high profit, low capital investment opportunities, \$15.00.

 HOW TO SELL ANYTHING TO ANYBODY – BK7306 – According to The Guinness Book of World Records, the author Joe Girard, is "the world's greatest salesman." This book reveals how he made a fortune – and how you can. too. \$2 25 \*

•THE INCREDIBLE SECRET MONEY MACHINE-BK1178-- by Don Lancaster. A different kind of "cookbook" from Don Lancaster. Want to slash taxes? Get free vacations? Win at investments? Make money from something that you *like* to do? You'll find this book essential to give you the key insider details of what is really involved in starting up your own money machine. \$5.95 \*

No C O D orders accepted. All above add \$1.50 handling. Please allow 4-6 weeks for delivery. Questions regarding your order? Please write Customer Service at the above address.

• MICROCOMPUTING CODING SHEETS Microcomputing's dozen or so program-mers wouldn't try to work without these handy scratch pads, which help prevent the little errors that can cost hours and hours of programming time. Available for pro-gramming is Assembly/Machine Language (PD1001), which has columns for ad-dress, instruction (3 bytes), source code (label, op code, operand) and comments; and for BASIC (PD1002) which is 72 columns wide. 50 sheets to a pad. \$2.39.\*

# PROGRAMMING Z-80

•TRS-80 ASSEMBLY LANGUAGE—BK1217-by Hubert S. Howe, JI. This book incorporates into a single volume all the pertinent facts and information you need to know to program and enjoy the TRS-80 in-cluded are clear presentations of all introductory con-cepts, completely tested practical programs and sub-routines, details of ROM and RAM and disk operating systems, plus comprehensive tables, charts and ap pendices. Suitable for the first time user or more ex perienced users. \$9.95.\*

Institute users 1935.
INSIDE LEVEL III – BK1183—For machine language programmers! This is a comprehensive reference guide to the Level II ROMs, allowing easy utilization of the sophisticated routines they contain. It concisely explains set-ups, calling sequences, variable passage and I/O routines Part II presents an entirely new composite program structure which unloads under the SYSTEM command and executes in both BASIC and machine code with the speed and efficiency of a compiler Special consideration is given to disk systems \$15.95."

. PROGRAMMING THE Z-80 - BK1122 - by Rodnay Zaks. Here is assembly language programming for the Z-80 presented as a progressive, step-by-step course. This book is both an educational text and a self-contained reference book, useful to both the beginning. and the experienced programmer who wish to learn about the Z-80 Exercises to test the reader are includ edu\$14.95.1

• 2-80 SOFTWARE GOURMET GUIDE AND COOK-BOOK-BK1045-by Nat Wadsworth. Sceibl's newest cookbook! This book contains a complete description of the powerful 2-80 instruction set and a wide variety of programming information. Use the author's ingre-dients including routines, subroutines and short pro-grams, choose a time-tested recipe and start cooking! \$16.99."

• 2-80 ASSEMBLY LANGUAGE PROGRAMMING— BK1177—by Lance A. Leventhal. This book thoroughly covers the Z-80 instruction set, abounding in simple programming examples which illustrate software de-velopment concepts and actual assembly language usage. Features include 2-80 I/O devices and interfac-computed assembler conventions and compared ing methods, assembler conventions, and compari-sons with 8080A/8085 instruction sets and interrupt structure. \$16.99.

The Microprocessor Software Engineering Series by John Zarrella provides common sense descriptions of John Zarrella provides common sense descriptions of advanced computer system topics for engineers, pro-grammers and development managers. Each volume is a self-contained review of a software engineering topic, explaining fundamental concepts in easy-to-un-derstand language and describing sophisticated soft-ware tools and techniques. Detailed glossary of technical jargon is included in each volume. This series will help you find the solutions to your software problems.

•6809 MICROCOMPUTER PROGRAMMING AND INTERFACING-BK1215-by Andrew -> Staugaard. Jr. Getting involved with Tandy's new Color Computer? If so, this new book from the Blacksburg Group will allow you to exploit the awesome power of the machine's 6809 microprocessor Detailed information machine's 6809 microprocessor Detailed information on processor architecture, addressing modes, register operation, data movement, arithmetic logic opera-tions, I/O and interfacing is provided, as well as a review section at the end of each chariter. Four appen-dices are included covering the 6809 instruction set, specification sheets of the 6809 family of processors, other 6800 series equipment and the 6809/6821 Peripheral Interface Adapter. This book is a must for the serious Color Computer owner \$13,95."

# **ALL NEW—FOR 80 OWNERS ENCYCLOPEDIA FOR THE TRS-80\***

ENCYCLOPEDIA FOR THE TRS-80\*\* is the newest peripheral for your micro-computer. This ten-volume reference series contains programs and articles especially selected to extend the documentation that comes with the TRS-80. Volumes of the Encyclopedia are being issued one-at-a-time, approximately six eeks apart. This means that each new volume will reflect the latest developvolume will reflect the latest develop-ments in TRS-80 microcomputing. Encyclopedia for the TRS-80 is avail-able in two editions. The deluxe COLLECTOR'S EDITION has a handsome green and black hard cover with a dust jacket. A soft cover edition is also available.

division of Tandy Corp.

for Volume 4 for Volume 5

• UNDERSTANDING AND PROGRAMMING MICRO-COMPUTERS — BK7382—A valuable addition to your computing library. This two-part text includes the best articles that have appeared in 73 and Kilobaud Microcomputing magazines on the hardware and soft-ware aspects of microcomputing. Well-known authors and well-structured text helps the reader get involved. \$10.95\*

OME OF THE BEST FROM KILOBAUD MICROCOM PUTING — BK7311 — A collection of the best articles that have appeared in Kilobaud MICROCOMPUTING. Includ-ed is material on the TRS-80 and PET systems. CP/M, the 8060/8085/2-80 chips, the ASR-33 terminal. Data base management, word processing, text editors and file structures are covered too. Programming techniques and hard-core hardware construction projects for modems, high speed cassette interfaces and TVTs are also included in this large format, 200 plus page edition. \$10.95

Zaks. Whether you are using a computer, thinking about using one or considering purchasing one, this book is indispensable. It explains what a computer system is, what it can do, how it works and how to system is, what it can us, now it works and now to select various components and peripheral units. It is written in everyday language and contains invaluable information for the novice and the experienced pro-grammer. (The first edition of this book was published under the title "An Introduction to Personal and Business Computing".) \$7.95\*

 MICROPROCESSOR INTERFACING TECHNIQUES BK1037 — by Austin Lesea & Rodnay Zaks — will teach you how to interconnect a complete system and interface it to all the usual peripherais. It covers hard-ware and software skills and techniques, including the use and design of model buses such as the IEEE 488 or S-100, \$15.95.

• AN INTRODUCTION TO MICROCOMPUTERS, VOL.0 – BK1130 — The Beginner's Book – Written for readers who know nothing about computers – for those who have an interest in how to use computers – and for everyone else who must live with computers and should know a little about them. The first in a series of Should know a little about them. The first in a series of 4 volumes, this book will explain how computers work, and what they can do. Computers have become an in-tegral part of life and society. During any given day you are affected by computers, so start learning more about them with Volume 0. \$7.95.\*

•VOL. I-BK1030-2nd Edition completely revised. Dedicated to the basic concepts of microcomputers and hardware theory The purpose of Volume I is to and naruware theory. The purpose of Volume I is to give you a thorough understanding of what microcomputers are. From basic concepts (which are covered in detail), Volume I builds the necessary components of a microcomputer system. This book highlights the difference between minicomputers and microcomputers. \$12.99.

•VOL. II-BK1040 (with binder)-Contains descripdevices used only with the parent microprocessor Volume II describes all available chips \$31.99\*

•VOL. III—BK1133 (with binder)—Contains descrip-tions of all support devices that can be used with any-microprocessor \$21.99"

. TRS-80 DISK AND OTHER MYSTERIES-BK1181 by Harvard C. Pennington. This is the definitive work on the TRS-80 disk system. It is full of detailed "How to" information with examples, samples and in-depth explanations suitable for beginners and professionals alike. The recovery of one lost file is worth the price alone, \$22,50.\*

• MICROSOFT BASIC DECODED AND OTHER MYSTERIES—BK1186—by James Farvour. From the company that brought you TRS-80 DISK AND OTHER MYSTERIESI Contains more than 6500 lines of com-ments for the disassembled Level II ROMs, six addi-tional chapters describing every BASIC subroutine, with assembly language routines showing how to use them. Flowcharts for all major routines give the reader a real insight into how the interpreter works. \$29.50.

# SPECIAL INTERESTS

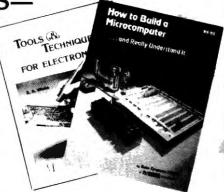

. THE CUSTOM TRS-80 AND OTHER MYSTERIES BK1218-by Dennis Kitsz. More than 300 pages of TRS-80 customizing information. With this book you'll be able to explore your computer like never before be able to explore your computer like never before Want to turn an 8 track into a mass storage unit? In-dividual reverse characters? Replace the BASIC ROMs? Make Music? High speed, reverse video, Level I and Level II? Fix it if it breaks down? All this and much, much more. Even If you have never used a soldering iron or read a circuit diagram, this book will teach you how! This is the definitive guide to customizing your 80! \$29.95.\* 801 \$29 95

• BASIC FASTER AND BETTER AND OTHER MYS-TERIES—BK1221—by Lewis Rosenfelder. You don't have to learn assembly language to make your pro-grams run fast. With the dozens of programming tricks and techniques in this book you can sort at high speed, swap screens in the twinkling of an eye, write INKEY routines that people think are in assembly language and add your own commands to BASIC. Find out how to write elegant code that makes your BASIC really hum, and explore the power of USR calls. \$29.95.\*

• THE CP/M HANDBOOK (with MP/M)-BK1187-by •THE CP/M HANDBOOK (with MP/M)—BK1187—by Rodnay Zaks. A complete guide and reference hand-book for CP/M—the industry standard in operating systems. Step-by-step instruction for everything from turning on the system and inserting the diskette to cor-rect user discipline and remedial action for problem situations. This also includes a complete discussion of all versions of CP/M up to and including 2.2, MP/M and CDOS. \$14.95\*. and CDOS. \$14.95\*

. INTRODUCTION TO TRS-80 GRAPHICS-BK1180by Don Inman. Dissatisfied with your Level I or Level II manual's coverage of graphics capabilities? This well-structured book (suitable for classroom use) is ideal structured book (suitable for classroom use) is loeal for those who want to use all the graphics capabilities built into the TRS-80. A tutorial method is used with many demonstrations. It is based on the Level I, but all material is suitable for Level II use, \$5,95.\*

Use the order card in the back of this magazine or itemize your order on a separate piece of paper and mail to 80 Microcomputing Bookshelf 
Peterborough NH 03458. Be sure to include check or detailed credit card information.

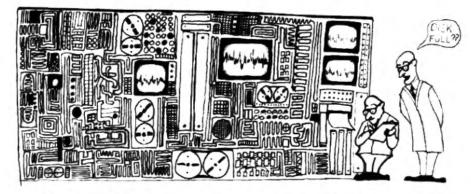

•TOOLS & TECHNIQUES FOR ELECTRONICS— BK7348—by A. A. Wicks is an easy-to-understand book written for the beginning kit builder as well as the ex-perienced hobbyist. It has numerous pictures and descriptions of the safe and correct ways to use basic and specialized tools for electronic projects as well as specialized metal working tools and the chemical aids which are used in repair shops. \$4.95.\*

HOW TO BUILD A MICROCOMPUTER-AND REALLY • HOW TO BUILD A MICROCOMPUTER—AND REALLY UNDERSTAND IT—BK7325—by Sam Creason. The elec-tronics hobbyist who wants to build his own microcom-puter system now has a practical "How-To" guidebook. This book is a combination technical manual and pro-gramming guide that takes the hobbyist step-by-step through the design, construction, testing and debugging of a complete microcomputer system. Must reading for anyone desiring a true understanding of small computer systems. \$9.95.\*

No C.O.D. orders accepted. All above add \$1.50 handling. Please allow 4-6 weeks for delivery. Questions regarding your order? Please write Customer Service at the above address.

## Memorex Flexible Discs...The Ultimate in Memory Excellence

Quality

Memorex means quality products that you can depend on Memorex means quality products that you can depend on. Duality control at Memorex means starting with the best materials available. Continual surveillance throughout the entire manufacturing process. The benefit of Memorex's years of experience in magnetic media production, resulting, for instance, in proprietary coating formulations. The most sophisticated testing procedures you'll find anywhere in the business

100 Percent Error Free Each and every Memorex Flexible Disc is certified to be 100 percent error free. Each track of each flexible disc is tested. percent error free Each track of each flexible disc is tested individually, to Memorex's stringent standards of excellence. They test signal amplitude, resolution, low-pass modulation, overwrite, missing pulse error and extra pulse error. They are torque-tested, and competitively tested on drives available from almost every major drive manufacturers. Rigid quality audits are built into every step of the manufacturers, Rigid quality audits are built into every step of the manufacturing process and stringent testing result in a standard of excellence that assures you, our customer, of a quality product designed for increased data reliability and consistent top performance.

#### Customer-Oriented Packaging

Memore's commitment to excellence does not stop with a quality product. They are proud of their flexible discs and they package them with pride. Both their packaging and their labeling have been designed with your ease of identification and use in mind. The desk-top box containing ten discs is convenient for filing and storage. Both box labels and jacket labels provide full information on compatibility, density, sec-toring, and record length, Envelopes with multi-language care and handling instructions and color-coded removable labels are included. A write-protect feature is available to provide data security

Full One Year Warranty - Your Assurance of Quality

Memorex Flexible Discs will be replaced free of charge by Memorex if they are found to be defective in materials or workmanship within one year of the date of purchase. Other than replacement, Memorex will not be responsible for any damages or losses (including consequential damages) caused by the use of Memorex Flexible Discs Quantity Discounts Available Memorex Flexible Discs are packed 10 discs to a carton and 10 cartons to a case. Please order only in increments of 100 units for quantity 100 pricing. We are also willing to accom-modate your smaller orders. Quantities less than 100 units are available in increments of 10 units at a 10% surcharge. Quantity discounts are also available. We stock a complete line of computer covers, printer ribbons, print wheels & NEC thimbles. Call us for your needs

## We built a reputation on our prices and your satisfaction.

We guarantee everything we sell for 30 days. If anything is wrong, just return the item and we'll make it right. And, of course, we'll pay the shipping charges.

We accept Visa and Master Card on all orders. COD accepted up to \$300.00. We also accept school purchase orders.

Please add \$2.00 for standard UPS shipping and handling on orders under 50 pounds, delivered in the continental U.S. Call us for shipping charges on items that weigh more than 50 pounds. Foreign, FPO and APO orders please add 15% for shipping. California residents add 6% sales tax

CP/M is a trademark of Digital Research.

Frustrating isn't it! No matter how much you speed up your program it still seems to take forever to save data onto a cassette. Wouldn't it be great if someone could design a mass storage system with the speed of a disk, but at half the cost? *Exatron* did, the *Exatron Stringy Floppy (ESF)*.

Totally self-contained, the ESF is an extremely fast, reliable, and economical alternative to cassette or disk storage of programs or data. All of the ESF's operations are under the computer's control, with no buttons, switches, knobs or levers to adjust or forget.

The ESF uses a miniature tape cartridge, about the size of a business card, called a wafer. The transport mechanism uses a direct drive motor with only one moving part. Designed to read and write digital data only, the ESF suffers from none of the drawbacks of cassettes - without the expense of disks.

Several versions of the ESF are available, for the TRS-80, Apple, PET, OSI and an RS 232 unit. Even the slowest of the units is 15 times faster than a cassette, and all are as reliable as disk drives - in fact a lot of users say they are more reliable!

excellence in electronics

exatror

To get further information about the ESF give Exatron a call on their Hot Line 800-538 8559 (inside California 408-737 7111).

If you can't wait any longer then take advantage of their 30 day money-back guarantee, you've nothing to lose but time!
