IGKE hundre ...if you can

This could be yours, but probably never will. This \$100 bill is the reward we offer for the discovery of a legitimate bug in a DOSPWS DISK Operating System. To qualify you must be:

- 1. A registered DOSPUS owner
- 2. Able to demonstrate and document a real bug, not simply a design shortcoming.

We're convinced that DOSPLUS is the fastest, most powerful, and easiest to operate system on the market. DOSPLUS works! And works right for the businessman and houbyists, the speed and simplicity cannot be beat. For the BASIC programmer, NO-ONE can offer you more than we do. And for software outhors, compatible termel systems are available for distribution.

NO-ONE ELSE can give you

•The same high level of Model I/Model III diskette and program compatibility. •True, complete BASIC program cheloing with files open and variables saved

We have it all. Features galore AND error-free Standon. If we're wrong, and you can prove it, we've got a brand new \$100 for you.

We're not conceited, we're convinced! Order yours today, a**nd s**oon you will be too!!

The Percom Peripheral

Percom's DOUBLER II[®] tolerates wide variations in media, drives

GARLAND, TEXAS - May 22, 1981 -Harold Mauch, president of Percom Data Company, announced here today that an improved version of the Company's innovative DOUBLER[®] adapter, a double-density plug-in module for TRS-80* Model I computers, is now available.

Reflecting design refinements based on both theoretical analyses and field testing, the DOUBLER 11st, so named, permits even greater tolerance in variations among media and drives than the previous design.

Like the original DOUBLER, the DOU-BLER II plugs into the drive controller IC socket of a TRS-80 Model I Expansion Interface and permits a user to run either single- or double-density diskettes on a Model I.

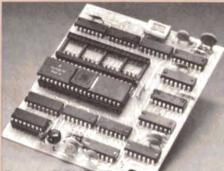

With a DOUBLER II installed, over four times more formatted data - as much as 364 Kbytes - can be stored on one side of a fiveinch diskette than can be stored using a standard Tandy Model I drive system.

Moreover, a DOUBLER II equips a Model I with the hardware required to run Model III diskettes.

(Ed. Note: See "OS-80™: Bridging the TRS-80* software compatibility gap" elsewhere on this page.)

The critical clock-data separation circuitry of the DOUBLER II is a proprietary design called a ROM-programmed digital phase-lock loop data separator.

According to Mauch, this design is more tolerant of differences from diskette to diskette and drive to drive, and also provides immunity to performance degradation caused by circuit component aging.

Percom DOUBLER

Mauch said "A DOUBLER II will operate just as reliably two years after it is installed as it will two days after installation.

The digital phase-lock loop also eliminates the need for trimmer adjustments typical of analog phase-lock loop circuits.

"You plug in a Percom DOUBLER II and then forget it," he said. The DOUBLER II also features a refined

Write Precompensation circuit that more effectively minimizes the phenomena of bit-and peak-shifting, a reliability-impairing characteristic of magnetic data recording.

The DOUBLER II, which is fully software compatible with the previous DOUBLER, is supplied with DBLDOS^{**}, a TRSDOS^{*-}

compatible disk operating system. The DOUBLER II sells for \$2,005, includ-ing the DBLDOS diskette.

Owners of original DOUBLERs may purchase a DOUBLER II upgrade kit, without the disk controller IC, for \$30.00. Proof of purchase of an original DOUBLER is required, and each DOUBLER owner may purchase only one DOUBLER II at the \$30.00 price.

The Percom DOUBLER II is available from authorized Percom retailers, or may be ordered direct from the factory. The factory toll-free order number is 1-800-527-1592.

Ed. note: Opening the TRS-80 Expansion Interface may void the Tandy limited 90-day warranty.

Grole 258 on Inquiry card.

All that glitters is not gold OS-80" Bridging the TRS-80* software compatibility gap

Compatibility between TRS-80* Model I diskettes and the new Model III is about as genuine as a gold-plated lead Krugerrand.

True, Model I TRSDOS* diskettes can be read on a Model III. But first they must be converted and re-recorded for Model III operation.

And you cannot write to a Model I TRSDOS diskette. Not with a Model III. You cannot add a file. Delete a file. Or in any way modify a Model I TRSDOS diskette with a Model Ill computer.

Furthermore, your converted TRSDOS diskettes cannot be converted back for Model I operation. TRSDOS is a one-way street. And there's no retreating. A point to consider before switching the company's payroll to your new Model III.

Real software compatibility should allow the direct, im-mediate interchangeability of Model I and Model III diskettes. No read-only limitations, no conversion/re-recording steps and no chance to be left high and dry with Model III diskettes that can't be run on a Model I.

What's the answer! The answer is Percom's OS-80⁷⁸ family of TRS-80 disk operating systems. OS-80 programs allow direct, immediate interchangeability of Model I and Model III diskettes. You can run Model I single-density diskettes on a Model III; install Percom's plug-in DOUBLER¹⁸ adapter in your Model I, and you can run double-density Model III diskettes on a Model I.

There's no conversion, no re-recording. Slip an OS-80 diskette out of your Model I and insert it directly in a Model III.

And vice-versa. Just have the correct OS-80 disk operating system — OS-80, OS-80D or OS-80/III — in each computer.

Moreover, with OS-80 systems, you can add, delete, and update files. You can read and write diskettes regardless of the

system of origin. OS-80 is the original Percom TRS-80 DOS for BASIC programmers.

Even OS-80 utilities are written in BASIC

OS-80 is the Percom system about which a user wrote. in Creative Computing magazine, "... the best \$30.00 you will ever spend."*

Requiring only seven Kbytes of memory, OS-80 disk oper-ating systems reside completely in RAM. There's no need to dedicate a drive exclusively for a system diskette. And, unlike TRSDOS, you can work at the track sector level, defining and controlling data formats — in BASIC — to create simple or complex data structures that execute more quickly than TRSDOS files.

The Percom OS-80 DOS supports single-density opera-tion of the Model I computer — price is \$29,95; the OS-80D supports double-density operation of Model I computers equipped with a DOUBLER or DOUBLER II; and. OS-80/ III — for the Model III of course — supports both single- and double-density operation. OS-80D and OS-80/III rach sell for \$49,95.

Circuit misapplication causes diskette read, format problems. High resolution key to reliable data separation

GARLAND, TEXAS — The Percom SEPARATOR[®] does very well for the Radio Shack TRS-80[°] Model I computer what the Tandy disk controller does poorly at best: reliably separates clock and data signals during disk-read operations.

Unreliable data-clock separation causes format verification failures and repeated read retries

CRC ERROR-TRACK LOCKED OUT

The problem is most severe on high-number (high-density) inner file tracks.

As reported earlier, the clock-data separation problem was traced by Percom to misapplication of the internal separator of the 1771 drive controller IC used in the Model I.

The Percom Separator substitutes a highresolution digital data separator circuit, one which operates at 16 megahertz, for the lowresolution one-megahertz circuit of the Tandy design.

Separator circuits that operate at lower frequencies - for example, two- or four-

megahertz - were found by Percom to provide only marginally improved performance over the original Tandy circuit.

The Percom solution is a simple adapter that plugs into the drive controller of the Expansion Interface (EI).

Not a kit - some vendors supply an untested separator kit of resistors, ICs and other paraphernalia that may be installed by modifying the computer - the Percom SEPARATOR is a fully assembled, fully tested plug-in module.

Installation involves merely plugging the SEPARATOR into the Model I EI disk controller chip socket, and plugging the controller chip into a socket on the SEPARATOR. The SEPARATOR, which sells for only

\$29.95, may be purchased from authorized Percom retailers or ordered directly from the factory. The factory toll-free order number is 1-800-527-1592.

Ed. note: Opening the TRS-80 Expansion Interface may void the Tandy limited 90-day warranty. Grcle 508 on inquiry card.

Artificial Intelligence— Technology and the Search For Self 103

by Chris Brown

In the early 1950s, Lucy and Ethel found themselves working on a bon-bon production line and Alan Turing published "Computing Machinery and Intelligence." The world hasn't been the same since.

And Now Artificial Intelligence

There has always been someone to put humanity in its proper place, scientists like Copernicus, Darwin and Freud. Now we have roast mules, Animal, and SHRDLU.

Godel, Escher, Bach 114 by Nancy Robertson

While the debate rages over whether or not machines can really think, a young computer scientist suggests man has jumped from the golden bough to be left swinging from a golden braid.

Mastermind—An Intelligent Program

by Duane R. Hope

When this author got bored with solo play of this popular game, he decided to create a worthy opponent inside his computer.

"Before...computer artificial intelligence ...we have to come to terms with what we mean by 'intelligence.'

Artificial Intelligence, Eh?

hat gets the same sort of snickering laugh from me that I provide the robotoriented folk. You know how to make a robot, don't you? Well, you start with a British midget...

Before we can tackle computer artificial intelligence we have to come to some terms with what we mean by "intelligence." Frankly, even with our largest computers we are still far away from anything remotely describable as intelligence. As measured by psychologists, intelligence has to do with the ability to cope with a new situation: This is the opposite of the normal computer approach. A computer can only cope with those things for which it has been designed to cope.

In addition to our brains being several orders of magnitude more complex than even our best computers, there may be other more serious obstacles in the way of creative problem solving by computers. Take the simple matter of memory---have you any Idea how your brain stores information? I hope you said no, because no one yet has even a hint as to how, or where, we store all the data we pick up.

If you add up the amount of input to the brain—from the zillions of rods and cones in the eye, at so many frames per second; from the ears, nose, touch all over the body; temperature; kinesthesia; pressure; and so on—the amount of material put into storage is incredible. We seem to forget most of this input, but under hypnosis we are able to regress and get back full perception from any time. The information is recorded; it is only our ability to contact the recordings which is a problem.

I remember when a chap first came out with the announcement that it was possible to go back in memory to the prenatal period. Boy, did he get the hee-haw. Today it is commonly accepted, complete with the ability of anyone not only to recall events but to recall voices and things that were said near one during that period of life. I've personally regressed many people to the prenatal period and had them play back their recorded memories. Often these memories have a surprising impact on present day life. Prenatal memories are unlike later ones, in that they are mere recordings of perceptions and can only be recalled under hypnosis, bypassing the conscious mind entirely. The prenatal conciousness didn't know what the sounds meant, so they were not interpreted and filed under as complex a cross index system as are later memories.

Getting back to memory, it appears we are able to store considerably more data than the brain can possibly hold. When we touch some parts of the brain certain memories are stimulated, but this may be because we have hit a switching circuit rather than a memory storage area. Removing large hunks of the brain does not always remove memory.

It may be that we are able to use a holographic type of storage system, somehow storing large numbers of memories or a few molecules. But I'm skeptical about that; in view of our ability to recall things throughout our lifetime with amazing clarity, in spite of our cells being constantly replaced, I wonder if we aren't using some outside storage medium.

If you've read much about dving and death, you are aware that we have an incredible body of evidence that there is part of our being called the spiritual which seems to continue after death. This part of us seems to retain all those memories which were supposedly buried with the body. So, there might be some sort of limitless, timeless storage system we use. Physical problems with the brain-or programming problems-can interfere with our memory access. Hypnosis and other sneaky techniques known to psychologists make it relatively simple to access even the most hidden (by programming) memories.

If I'm right about this, our electronic computers are going to have a heck of a job matching us in memory capacity, even with laser disks. And then comes the complex system of indexing we use. Perhaps you have to have done psychological work to appreciate how perfect an instrument the brain is and how invariably it will respond to a request on the unconscious level. If I get you to relax and ask you to return to a time when you were eating a ham sandwich, your mind will—infallibly—do just that. If I ask you to return to an earlier ham sandwich, it will. And I can take you back to the first ham sandwich you ever ate. It's all there, when you know how to access it. All cross-indexed beyond the wildest hopes of any computer imagined today.

That brings us back to the concept of intelligence—the ability to cope with a new situation on the basis of past information. The built-in indexing system we have can break down a new situation into extremely small parts, all on an unconscious level, and develop a scheme for meeting a completely new event. The better able the brain is to do this integration, the higher the intelligence. People with a high IQ have a better working computer system.

As one of the founders of Mensa, the high IQ society, I've met and talked with hundreds upon hundreds of people with high IQs. Yes, they have good computers, but that doesn't mean they appear very smart. Let's draw a parallel with one of our microcomputers. If we give our computer a very limited amount of data with which to work, and then we make sure that part of that data is not true, and then, just to really screw things up, we program the system with a crummy program, we can see that the computer itself is of less significance than we thought.

People are programmed, beginning with that prenatal time. If they are taught values which are not true, given data which is not factual, it really doesn't make any difference how fantastic their computer is, they will still do dumb things and be failures. I hope I will not make any additional enemies, but the truth is that the Mensa people are no more successful than anyone else. I have found no correlation between intelligence and success.

The Mensa people do seem to have a better computing system, but then, no one ever claimed that everyone was equal in any way. Some make a big deal out of being intelligent. But then, some people use their height in similar ways—or anything else they inherited which is deemed superior in our society.

I suppose that if we could build a computer system big enough to store as much as we can with our minds which had the ability to cross-index as well as we do, we

might then start talking in terms of artificial intelligence. Until then, please don't bug me.

If you want to take issue over the concepts of a spirit body, please do me the kindness to read the literature before discussing it. The same goes for reincarnation, communications with the dead, and all that occult stuff. And don't forget to come to grips with parapsychology, mental communications, ghosts and other psychic phenomena.

Regaining Our Technology

t should be no secret that Japan has passed us by in much of our electronic technology. I've written a good deal about that in the last few months, and the reason I think it became possible. Part has to do with the support the Japanese government gives their electronic industries, the tax benefits, the low cost loans, and the skilled training for their workers. But part of the problem, I'm convinced, lies in a little-known event that occurred almost twenty years ago.

In 1963 proposals were made to change the ham rules. With about 85 percent of the hams believing they would have to take the difficult FCC exams over to get back their frequencies, spirits dropped and amateur radio growth stopped dead for over ten years!

If ham growth had continued as it had from the end of WWII, we would today have over two million hams and over half of these would be engineers and technicians, working in our electronics and communications firms. Well, we lost out on about one million engineers and technicians and there is no way that the loss of that many technical people—particularly hams, who are the most rabid of the lot hasn't hurt our technology.

At the same time we stopped our ham growth, the Japanese set up a no Morse Code license and their ham population has far surpassed ours, even though they have only half our population. When I visit the computer labs in Japan I am greeted as W2NSD and known through 73 Magazine. I see hams all through their labs.

Remember, if you will, that virtually every major communications breakthrough has been discovered and pioneered by hams. FM was pioneered by hams, NBFM was too, as was sideband, RTTY, and so on.

The new generation of computer hackers may, to some degree, help us through this technician famine, but we need to do something on a national level to get interest in electronics, computers and so on into our high schools and infect our 14 and 15 year olds with the ham and computer virus. We are way behind now, so it Is going to take a lot of work to catch up. I spoke recently to the chairman of the FCC about this and there is a good possibility we may be able to get this to the White House for consideration.

One college can't turn out a million technicians, but if we can get amateur radio going again—perhaps with a version of a no-code license—and we can get schools to push computers, we could catch up to the Japanese by 1990. We're not going to do it by accident, that's for sure.

Micro Mountain

A bout a year ago I got to talking with the presidents of two local colleges about my plans for introducing microcomputer courses into their educational curriculum. Both liked the idea and we started to lay the groundwork.

Then I got a call from one of them saying he wanted to get out of the college business and wondered if Wayne Green Inc. was in any position to take on a college. We weren't at that time, but I started thinking seriously about it and looking for someone with the background to tackle the job. You don't find someone with the ability to run a college quickly, so the college was eventually sold to a Florida school.

The college was a nice one, with 800 acres and 15 major buildings, but it had drawbacks, too. It had been built in the days of cheap energy and was a bear to keep heated in the winter. The spread-out buildings meant extensive plowing after every snow storm—and so on.

Just recently we lucked into a chap with the right background to get our school started. Since then I've been giving a lot of thought to the plans and they have been growing almost daily. A recent NBC White Paper on training workers fueled the fires of imagination.

Since 80 percent of all new jobs come from small firms—particularly new firms—why not think in terms of an industrial area centered around the school? This would allow entrepreneurs to open small firms and make use of students as part of the teaching process, providing workers of outstanding intelligence and skills at a low cost.

I had been thinking in terms of a school which would have an 18-24 month course, resulting in an Associate's Degree. Part of that time would be spent learning theory and the other part doing practical professional work, either with Instant Software or with one of the other nearby commercial firms. Thus, each student would get the benefit of practical on-the-job training as well as theory and associated business courses. Could we build an eastern counterpart to Silicon Valley, calling it Micro Mountain? After talking with the people at Atari and Apple and smaller firms in the microcomputer business, there is no question in my mind about the need for skilled people: The industry needs them badly. Indeed, the lack of skilled workers has been seriously holding back growth of the field and the situation is only going to get worse.

The courses I had in mind for the school would start with an understanding of microcomputers: how they work; how to fix them; how to interconnect accessories and get them to work. We'd explain the architecture of the popular chips and the reasons for support chips. I'll bet we could get some help with these courses from chip manufacturers—they need skilled people too.

Then we would go on to printers, disk drives, and other accessories: how they work, how to fix them, and why they have been designed the way they were.

Software would come next, with introductions to all common languages and heavy emphasis on Basic and perhaps Pascal. We'd go into operating systems, machine and Assembly programming, utilities and how they simplify programming and service of systems. Then we would get into teaching about the many applications programs—how they work, what to look for, how to fix them. We'd work with as many different word processors as possible, accounting packages, and industry-specific packages.

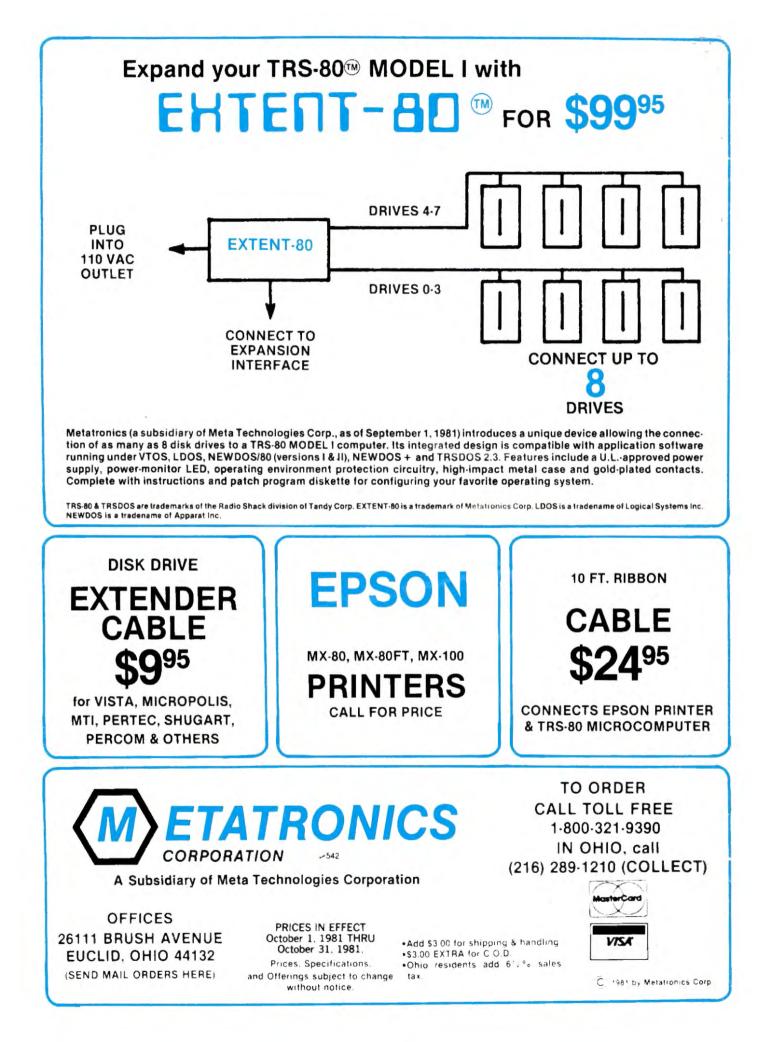

Man does not live by computers alone, so we would also teach a variety of business programs such as business law, how to buy or rent buildings, personnel management, how to apply for and get a job, finance, accounting and bookkeeping, advertising, promotion, writing, editing, printing, marketing, packaging, Z-theory, photography, and so on. We want students to be able to go to work for a firm and be qualified to proceed to upper management.

The idea seems like one whose time has come, so we'll be developing it and looking for support from the industry.

Computers and Hamming

With almost 30 percent of the active hams already into computers it is a wonder so little has been done to marry the two interests. One of my other publications, 73 Magazine (for radio amateurs), is going to take the big step and put the two together with an on-the-air ham bulletin board system.

The idea is to have one channel where

"Those of us who have been using Model IIIs...know what frustration is all about."

READY or Not...

I am writing in response to Ron Balewski's article "Never Ready" (July 1981). He stated in the article that the message string that was to be displayed instead of READY would not appear after CLOAD because it uses a different address for reentry to Basic.

But, it is possible to make this patch into the RAM location that is called upon reentry to Basic. So, I have written a very short routine to handle the flaw in the program. It only uses 5 bytes, thanks to a little ASCII character called the upward linefeed (27 decimal or 1B hex). I have never seen this character used in a program before although it seems to be a very handy character to use. This is the routine:

LD A,1BH ;Up-ward Line-feed CALL 33H ;Display at cursor

This requires the following changes in the Basic program:

30 FOR K = 32683 TO 32703:READ D:POKE K.D.NEXT K

And add the following lines:

35 DATA 62,27,205,51,0

125 K = 16821:POKE K, 195:POKE K + 1,171:POKE K + ,127

Be sure to set the memory size to 32683 instead of 32688 before running the program.

Craig Riecke Lincoln, NE

What About Level I

I have just read the June 1981 issue of 80 Microcomputing, the first subscription copy that I have received (the transatlantic postal service is not as efficient as it could be), and I must say that I was very impressed. It is fair to say that a single issue contains more information on the TRS-80 than the three leading UK microcomputer publications combined in an entire year.

But... there wasn't a single item on or program in Level I Basic. Surely some of your readers have TRS-80s equipped with Level I? I know the general idea is that Level I is OK for starting with and Level II or Model III Basic is required for serious use, but it depends on what you mean by serious. My Level I system plays Chess, Star Trek, Adventure, runs the Editor/Assembler and will shortly be doing some simple word processing, thanks to the Electric Pencil. In fact, it does everything I want a personal computer to do, so why bother upgrading to Level II? (I should add that I am fully familiar with the facilities of Level II and Disk Basic).

About a year ago I helped form the UK Level I User Group, which is dedicated to TRS-80s equipped with Level I Basic, and to making them do more than people think they are capable of. The group's main activity is the production of a bi-monthly newsletter/magazine, and fellow 80 Microcomputing readers are invited to write to me for a sample copy (free, but please enclose \$1 for postage).

Pilot Praise

The following is an open letter to Randy Hawkins, author of "Pilot—The Language of Computer Aided Instruction" (July 1981).

I've dealt with all kinds of people over the years, but never anyone who was as prompt and courteous as you. When you told me last Saturday you'd mail a fix for your Pilot program on Monday, I expected that would be the last I'd hear from you... at best it would be weeks. But this afternoon's mail brought your four-page Model III changes.

Next, don't apologize for inconveniences. Those of us who have been using Model IIIs for some time know what frustration is all about.

Now, for some items on how it's working for me. After debugging it, I found the system tape wouldn't load. I sat here staring at the ** on the screen and watching it switch to D* at the very end of the program. I made extra copies. Normally, the D* message tells me I've got a problem with volume settings, although it's mighty rare on the Model III. If it persists, I clean the heads, then normally it boots up without any trouble.

But your Pilot 80 sat there sticking its D* tongue out at me every time, no matter how I adjusted the volume. Finally, a little bell went "tinkle-tinkle" in my head. This month's *Microcomputer News* (from Tandy), mentioned that Haunted House will load in the Model III if you simply load it over itself on a checksum error. Next time around, I watched the ** change to D*, then a pause while it passed the blank portion between saves, then another series of blinking D*s, and danged if it didn't perform like a charmer!

I found when putting in the tutorial program that your suggestion to use "a" instead of "@" or the shifted "@" was of little help. It worked fine everywhere except in line 325. I went over that damned line at least 20 times; I edited it, rewrote it, deleted it and rewrote it, and no matter how hard I tried, I couldn't get that "a" to appear on the screen. It came out "A" every time. Well, you warned us that using two quotations in a line could lead to unpredictable results. Have you ever edited a line, hit L several times and saw it was letter perfect, then entered and listed it? Comes up "A".

My final attempt was to delete lines 305 to 330, name the program to the end, and then redo the missing lines, this time combining lines 320 and 325. Now I had three quotes in one line. But it worked perfectly.

I can assure you Pilot will make some of my self-imposed tasks easier, and produce neater programs when I want to create a tutorial. Even though my system is 48K and I can't make use of 16K of my RAM, I take my hat off to you for an excellent program. I have also stuck your name in the master tape where it belongs to identify your work.

> Karl H. Meyer Corpus Christi, TX

Bungled Broker

Your article "The Software Broker" (June 1981) contained many serious mistakes. The following are some that I have found. There may be more.

TRS-80 is a trademark of the Radio Shack Division of Tandy Corporation. DATALIFE is a rademark of VERBATIM. PLAIN NE, AIDS-1, AIDS-11, CALCS-111, CALCS-1V, MERGE-111 are trademarks of MTC. 1981 by Metatechnologies Corporation, Inc.

META NOTATIONS...

MTC introduces its FREE computer "bulletin board" service. Set up your terminal or terminal software for 300 baud, parity disabled, 8-bit word length, and 1 stop bit. Dial (216) 289-8689. After the connection is established. type LOGIN META. When asked for a validation code, type META. Have fun!

In a couple of months MTC will introduce the successor to AIDS-III/CALCS. It is called AIDS/P* and is based on MTC's PRIMAL® (Practical Relational Information Manage ment Applications Library), a powerful system for PRIME minicomputers. AIDS/P AIDS-III/CALCS but is probably an order of magnitude beyond it in power. It will be first made available to AIDS-III/CALCS owners (for an upgrade charge), then to the general public. Price will be in the \$200-\$300 range.

Effective September 1, 1961, Metatronics Cor-poration became a subsidiary of MTC. Metatronics will carry the complete MTC product line in addition to its own. Order pro-cessing and luifiliment departments have been combined to improve service response levels. MTC's superior software and supplies marketing, and Metatronics exceptional peripheral offerings should prove to be a tomidable combination. (Sorry guys, if you can't beat us, join us . . .)

MTC now offers a more complete selection of diskette products (ad deadlines prevented inclusion in anything but this column). New manufacturers are MAXELL and 3M. Definitely call for specific information. For example, MAXELL Brand 5% " diskettes in a PLASTIC LIBRARY CASE are only \$34.95 for a box of 10! SCOTCH Brand diskettes are comparably 10! SCOTCH Brand diskettes are comparably value-priced. MTC is also introducing its own PARAGON[™] Brand media products. The in-tent is to offer a super-high quality product at a very competitive price. For example, a box of 10 single-sided, soft-sectored, double-density, 100[™] certified diskettes with HUB RINGS is only \$24,95! A full line of products (including HEAD CLEANING KITS, etc.) will be offered. The PLAIN JANE[™] (almost 200,000 units solid) diskette line will become part of units sold) diskette line will become part of the PARAGON[™] MAGNETICS operation (but don't quote us verbatim).

Let your TRS-80[™] Test Itself With THE FLOPPY DOCTOR & MEMORY DIAGNOSTIC

by David Stambaugh

A complete checkup for your MODEL I or MODEL III. THE FLOPPY DOCTOR-Version 3 MODEL III. THE FLOPPY DOCTOR-version a completely checks every sector of single or double density 35-, 40-, 77-, or 80-track disk drives. Tests motor speed, head positioning, controller functions, status bits and provides complete error logging. THE MEMORY DIAGNOSTIC checks for proper write/read, refresh, executability and exclusivity of all ad-test locations, both diaponeties and dress locations. Includes both diagnostics and complete instruction manual.

80 INPUT

Break Solution

In reference to TRSDOS POKE (June 1981), defeat the Break key under TRSDOS 2.1/2.2/2.3, NEWDOS 21 or ULTRADOS, I use the following line: POKE PEEK (17171) + PEEK (17172) *256 + 1, 0. To turn on: POKE PEEK (17171) + PEEK (17172) *256 + 1, 1

Please note this does *not* work with NEWDOS 80, DOSPLUS nor ULTRA-II. These new systems have the ability to defeat the Break key via a system or library command.

> Vernon B. Hester 42403 Old Bridge Road Canton, MI 48188

Data Inputs Wanted

Would it be possible to complement a wonderful program ("The Software Broker," June 1981, p. 268) with a short explanation of how to prepare the data disks (mainly the stock price data and the index values)?

I don't understand how you can do it from lines 300-380 on Program Listing 1. The variable D9A will accept only numerical data—what happens to the name of the stock, for example.

In spite of the tremendous amount of space that you dedicated to this program I think it would have been very nice to have a sample of data inputs at the end of the program.

> Harold E. Lange P. O. Box 450182 Miami, FL 33145

Disappearing Act?

About a year ago I purchased a machine language program on cassette for my TRS-80, which was similar to the arcade or "Space War" game for Apple. Since that time I have searched for another copy as the tape worked twice, then would not load. In trying to track down the original supplier (I think the name was "creative software" or "creative games" or something similar) there was no phone number and returning the tape for replacement only resulted in a reply of "addressee unknown." I therefore assumed the company had gone out of business.

If anyone can supply information concerning the demise of this company, or of a new supplier, it would be greatly appreciated.

> Douglas C. McMillan 105 Burlington Beach Valparaiso, IN 46383

OM Error Fix

I'm writing in regard to my letter published in July 1981 concerning the OM error I received on loading KBEEP-FIX. The response was outstanding; I would like to thank all those who wrote to me. It appears the answer is to JP to O6CCH, rather than to 1A19. At least this gets rid of the dreaded OM error.

Now I have a new question. Is there anyone who knows of an add-on disk controller unit other than the expansion interface. (I am mainly interested in an already assembled, ready to plug in unit—not one that has to be assembled or searching for parts as in the LNW board). I would like to hear from any one who knows of a unit.

> Bernard F. Gaffney Jr. 524 Riley St. Lansing, MI 48910

POKEing Along

In reference to your column, 80 Aid, (June 1981), about the various POKEs required to disable the Break key, I have done a bit (pardon the pun) of research and created a list of POKEs for Level II and various DOSers, including TRSDOS versions 2.1 through 2.3, Apparat's NEWDOS PLUS, and Apparat's NEWDOS 80.

> Robert Churchill 2390 California St. Saginaw, MI 48601

IRV Solution

This is in response to the letter of Rev. Richard W. Beebe (March 1981) regarding problems getting IRV to work with TRSDOS 2.3. I had similar problems with NEWDOS but found a way out. I tried this solution with TRSDOS 2.1 and it works. (Sorry, but with all the well-known problems of 2.1, I never bothered to upgrade to 2.3, settling instead for NEWDOS.) I figure if anything, it will work with his TRSDOS 2.3.

His best bet is to get IRV into RAM using TRSDOS command Load IRV, then invoking Debug and pressing the Break key to activate Debug; then get into IRV by entering the Debug command GAAAA. AAAA equals the execute process on page 5 of the IRV brochure (e.g., for his 48K system it would be GFD36).

Incidently, when IRV is operational it does not work with Electric Pencil and will reboot the system when returning to DOS. It also disables the chain command of NEWDOS 80. If anybody has figured patches for these problems I would welcome them very much. IRV is a very powerful utility and I bet it has still many undiscovered uses.

And speaking of Electric Pencil and the NEWDOS-80 chain command, a DOS command file can be made by Pencil, saved on disk as filename/PCL then activated by chain filename/PCL.

> Alan H. Hyde Jaimovich, MD 440 West Foothill Blvd. Glendora, CA 91740

Printing a Disk Directory

I am looking for information on how to get a disk directory printed on a printer. I have a TRS-80 Model I, and I am using TRSDOS 2.3. It would be very helpful in organizing my disks. I would appreciate any information.

80 :NPUT

One glaring incidence is in "UPDATE/ DTA", line 1420 which reads: For P39 = 1TO 80.

This error occurs several times. I am sure that something else was meant, but what?

Another is in "STOCK/ANA," lines 170 to 180: 170 SP = ((P(A) - PZ)[2 + SP. It should probably be: SP = ((P(A) - PZ) [2 + SP). Ditto for line 190.

In the program named "BREADTH/ MKT" there is a mistake in the establishment of the value of L. I think that the problem is in lines 360–380, but not knowing what the author meant I'm not sure.

Also trading volume as written produces nothing but a series of #'s and + 's on the printer.

I am sure that there are other mistakes, but I have to get past these first. I sure do wish that these programs were tested before being published. It sure would save a lot of aggravation.

Also in the program "Real Rule of 78s" the Stop statement should not be in the program if it is to continue.

> Richard Eidmann Philadelphia, PA

Bad Listings

With the renumbering utilities around, why can't you clean up the listings you publish? S. Hunter's "Sans Disks" (April 1981, p. 186) is a case in point.

Robert McDaniel Clifton, NJ

Your point is well taken. However, renumbering programs may involve re-writing a whole manuscript so that references to the program still make sense. It's really up to program authors to submit their programs to the magazine in as tidy a form as possible.—the Editors.

Computers for the Needy

Santuary, Inc. is a non-profit, nonsectarian organization which aids youngsters who have special problems. They are placed in the home for guidance and counseling. The home is staffed by professionals dedicated to assisting young adults. The school is a public institution which is operated on what little federal funds are available and on private donations. Needless to say, the funds are not sufficient to sustain the children's needs.

I am not affiliated with the school; however, I know its director, Sister Albina Guillory, M.S.C. She has told me of their lack of educations equipment, personnel and operating funds. She has worked actively just to keep the home open. Its over-extended facilities are in need of annexation. She says that the demands on the school far exceed its capabilities.

I suggested to her that I would write a number of microcomputing magazines for assistance from its readers. You already know the capabilities of computers in education. I know that you can see the added advantages of CAI to special students who need that added patience and encouragement that few teachers are able to devote to their students on an individual basis.

If your readers would be able to help these youngsters in any way, I know that Sister Albina would be more than grateful to them. Please remind the readers that their donations are tax deductible and that the rewards of satisfaction from assisting these kids are well worth their efforts.

For those of you who would wish to send contributions of hardware, software, firmware or other assistance, please mail it to:

- Santuary, Inc.
- Eunice, LA 70535
- 1-318-546-0551

Thank you for your consideration in this matter.

Roger C. Bull Gretna, LA

Say What?

I have a few comments on "Regression and Correlation" by C. Brian Honess (July 1981).

When you fit a set of points (X,Y) to a polynomial model (i.e. $Y^1 = Eb_1 - x_1 + a$), it is normally called "polynomial regression" and is distinct from nonlinear regression. In the latter, the nonlinearity refers to the relationships among the fitting parameters, not the linearity of the model itself. Thus, any function of the form $Y' = Ef_i(X)b_i$ + a is linear in the fitting parameters (a and b). A nonlinear model that is nonlinear in the parameters is any function that cannot be formulated in this manner. For example, $Y = b_1 e^{-xb^2}$ is nonlinear in the parameters. Note, however, that this particular function can be made linear through the use of a logarithmic transformation, e.g.: log $Y = log(b_i e - x^5 2) =$ $\log(b_1) - b_2 \log(x)$.

Also, the method used to extract determinates is archaic. A much better method is to use Gauss-Jordan elimination to implement an upper triangular matrix transformation. This method is simpler, faster and easy to program. It also allows expansion to any size square matrix without rewriting the program, whereas the algorithm presented here is size dependent.

I am glad to see that your fine publication includes an occasional article that deals with mathematics. I hope this trend continues.

> Bruce Douglass Dept. of Physiology University of South Dakota Vermillion, SD

Subscript Reconsidered

Thank you very much for reviewing our Subedit/Subscript Word Processing software in the June issue. We appreciate the coverage and the encouragement you've given us, but regret that some of the inaccuracies and omissions in the article misled many of your readers and cost us a number of sales. We know this was inadvertant, and to mend some of the damage, we would like an opportunity to offer some clarification and updated information.

You indicated that Subedit/Subscript is written in Basic. However, Basic comprises less than 50 percent of that package (and only about a third of its successor, Newscript). The text formatting routines and the keyboard interface (Mininit) are in machine language. As a result, the system can keep up with any typist (2500 wpm, which is faster than the TRS-80 normally runs), and drive a 100 CPS printer at full speed most of the time. We used Basic for file I/O, storage management and printer tailoring; and machine language for speed. The combination is ideal: it makes it easy for us to distribute corrections, and easy for our customers to tailor Subscript to unusual needs. Given these speeds, there is little reason to convert the rest of the package to machine language. Since we encourage our customers to make backups, we saw no need to use machine language just to protect the code.

Of course, the original claim to fame of Subscript is its support for the Line Printer IV (Centronics 737): Subscript automatically performs right-justification of proportional font, allows inter-mixing of double- and single-width characters, performs underlining and does sub-scripts and super-scripts. It was the first TRS-80 Word Processor to offer these features, but the review article unfortunately didn't mention any of this support. We do thank you for describing how thoroughly we support Continued on page 16

Apparat's long-awaited successor to NEWDOS+ is here! This is not an enhanced version of NEWDOS, but a completely new product. Simplified DOS commands can be instantly executed from BASIC, even within a program, without disturbing the resident code. System options, such as password protection, number and type of disk drives, BREAK key enable/disable and lowercase modification recognition, can be quickly and easily changed. Five new random-access file types allow record lengths of up to 4096 bytes, and no FIELDing! A powerful CHAIN facility allows keyboard INPUTs to be read from a disk file. An improved RENUMBER facility permits groups of statements to be relocated within program code. Diskettes may even be designated as RUN-ONLY! Features all NEWDOS+ utilities (SUPERZAP 3.0, etc.) and much more! One MTC technical staff member said having NEWDOS/80 is "better than sex" (you'll have to judge for yourself!).

MODEL III VERSION

Has all the features of the Model I version plus enhancements. Allows any mix of single- or dual-sided 40- or 80-track disk drives. Most BASIC and many machine code programs written for the Model I will run without modification. Includes a utility for converting Model I single density to Model III double density.

the MX-80, and wish to mention we also support the Diablo 1620, Selectric and other similar printers. We also were the first company to offer and deliver disk-based word processing for the TRS-80 Model III.

The review did identify a characteristic of Subedit that some people found annoying: the need to hit Enter after every 255 characters. I'm one of those people, and as the author, was in a position to do something about it! The result was Newscript, with a full-screen editor modelled after IBM'S Edgar and SPF, and which takes advantage of the unique abilities of the TRS-80. By coincidence, our first ad for Newscript was run in the same issue as your review article. I'm not sure if the ad overcame the effects of the article or was discredited by it... I only wish you had looked at your own advertising before running the article, or called us to verify its accuracy.

Newscript has all 50 of the formatting features of Subscript, plus some new ones. However, most of its enhancements are in the text entry and revision areas (Editing). The Mininit keyboard interface is built-in. The Full-Screen editor (written in machine language) scrolls, has a Whoops command, opens windows, moves words to the next line of the screen, allows the cursor to be placed anyplace on the screen, and permits insertion, deletion and overlaying of data directly at the cursor position. With its standard typeahead feature, Newscript can accept over 750 keystrokes per second (that's 7500 words per minute, which is probably fast enough for most of us) without ever losing a keystroke even at the end of a line. I mention all this mostly to lay to rest any notions some people may have about the slowness of Basic or the TRS-80: properly programmed, (as we have done), it's as fast as a small mainframe computer!

> Chuck Tesler Prosoft North Hollywood, CA

Shell Sort Looped

It is said that each type of sort has its advantages and disadvantages. The Bubble sort is the slowest, however it takes the least amount of programming effort and space. The Shell-Metzner sort is one of the fastest and most practical sorts to use, but it takes a lot of program space.

I personally have found the Shell sort to be the best. I see no reason why it must take up so much space. In every book or magazine where I have seen a Shell sort listed, it is always in a longhand program style. I don't understand why no one has been creative enough to put the Shell-Metzner sort in For...Next loop form, but this routine took me a few short minutes to put together from the standard Shell sort flow chart.

> Steven Graham Forest Hills, NY

Memory Lapse

I have reached the point of pure sickness at Radio Shack. They try to get you to buy their software and hardware, but when you upgrade to disk and go to transfer the programs you have such as Pyramid, Invasion Force, and Eliza to disk they tell you you need the memory addresses, and even when you need to relocate them Radio Shack doesn't lift a finger to help you.

We trusted Radio Shack with our hardearned money for their computer, and they slapped us in the face with the used car salesman "Trust me" routine. It's time to remind Radio Shack that we are paying for their goods, and without us they'd crumble.

> Robert Rose Oakland Park, FL

OP Code Change

After reading Brian Cameron's article "Undocumented Instructions" (July 1981), I began looking through op code tables out of curiosity to verify some of the codes. They are indeed undocumented. After further researching, I found that Mr. Cameron's title of 'DUPINC' for the instruction to multiply by two and increment is actually 'SLL' (Shift Left, Logical). The other op codes he names appear correct. Just for the record. I'm 16 years old.

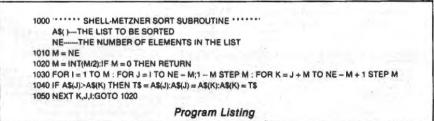

> P. Griffith Tampa, FL

Reversing Graphics

Regarding your article on graphics codes ("Unlocking the Graphics Code," June 1981), there is third application. Through a little math, a graphics pattern can be reversed—exchange black for white and vice versa. To see how this works (Model I and Model III), type in the following:

10 CLS: for X = 128 to 191: PRINT @ o.x.: POKE 15385, x 20 POKE 15370, 191 - (PEEK(15365) - 128): FORY = 1 to 300: NEXTY,X.

The contents of 15365 are reversed and POKEd to 15370. To reverse all graphics on the screen, use the subroutine: 10000 Continued on page 20

QUALITY SOFTWARE FOR YOUR TRS-80® DISK SYSTEM TO ORDER CALL TOLL FREE 800-525-7958

BIONIC BASIC

The **BIONIC BASIC** routines implement a number of useful commands and functions that are not available in regular BASIC. BIONIC BASIC appends these routines to the BASIC/CMD file so that they load automatically every time Disk BASIC is entered. The BIONIC BASIC modules will not require reserved memory, they are resident in memory whenever Disk BASIC is being used.

RESTORE data statements for reuse indivdually MOVE a block of data in memory from place to place SHIFT a string to all upper or lower case FLASH will turn a flashing cursor ON or OFF REPEAT function of the keyboard ON or OFF LOAD a BASIC program without losing variables. **GOSUB** statements execute at computed lines. SEARCH a program for occurrences of a string. LINES of a program can be moved to new locations. COMPRESS spaces, remarks from a program. SORT any array in ascending or descending order. REDIMension any array of list of arrays.

LOOKUP occurrences within arrays of special data. STARTER PACKAGE\$49.95

MTC AIDS - III

The best of Meta Technologies family of data management systems. This easy to use system allows even a novice TRS-80 user to create data files custom configured for many applications, from lists for mailing and cataloging to financial reporting and time scheduling. Easy to customize without programming, it is complete with features for adding. deleting, sorting, updating and printing. The flexibility will make it one of your most useful software purchases, Included FREE is the MTC Aids Print Subsystem (MAPS), a powerful report generator.

Model II.....\$149.95

Computer professionals have long known the i portance of regular use of diagnostic software in verifying the integrity of computer hardware. The TRS 80 is no exception, good diagnostics elea must in any situation where valuable date freshue main lained. The MICRO CLINIC offers two programs de signed to thoroughly check out the two most trouble prone sections of the TRS 80, the disk system (con tro ler and orives) and the memory arrays

FLOPPY DISK DIAGNOSTIC

is the most complete diagnostic program available for the TRS-80 disk system, and could be the most important porgram in your software library. This program provides a positive means for thoroughly checking out the disk controller circuits and disk drives. In cluded is a test of the accuracy of the drive motor speed, allowing adjustment. From one to four drives can be tested at the same time. 35. 40. and 30 tracks, single or double density with the LNDOUBLER of PERCOM DOUBLER.

MEMORY DIAGNOSTIC

broken down into two basic tests. the conventional write/read test and the M-1 Worm test. The WRITE/READ TEST portion of the diagnostic performs a comprehensive check on the ability of each memory location to store and retain data The M-1 WORM TEST is the most critical in regard to memory timing and 'worms' its way through memory.

BOTH PROGRAMS
MODEL I\$24.95
MODEL III \$29.95

80 MICROCOMPUTING ANNOUNCES...

... and saves you hours of typing and aggravation.

LOAD-80 is a monthly dump of the major program listings in 80 Microcomputing on cassette. Publisher Wayne Green tells you more...

"Frankly, after hundreds of hours of frustration, I seldom even try to keyboard a published program. Even if the magazine manages to get the program typeset correctly (which seems rare), I inevitably screw it up when I keyboard it. Who needs the aggravation?

"This is why I've started a new series of cassettes called Load 80. Each cassette will have program dumps of the listings in an issue of 80 Microcomputing. These listings are direct from the authors and tested by the 80 staff. All but the very short program listings will be on these Load 80 cassettes. Thus you will be able to save hours of inputting programs and even more of debugging your keyboarding errors. "Though the authors of these programs will share the royalties from the sale of the cassettes, this will not preclude the better programs from being issued separately by Instant Software (with royalties) with full documentation and associated hoopla. The documentation for the Load 80 programs will be entirely in 80 Microcomputing.

"I originally was holding out for "Trash Dump" as a name for the cassettes, but cooler heads prevailed. If there turns out to be enough interest in Load 80, we'll set up a monthly subscription arrangement."

Wayne Green, Publisher

The Load-80 cassette is simply the program listings that appear in the articles in 80 Microcomputing. It was created to save you the time involved in typing in the listings yourself. Successful loading of the programs depends on reading the documentation in the articles. If you have your current magazine at hand when you load the cassette, you should have no difficulty. If you still have problems, please return the tape for a replacement.

Check Enclosed	Bill my 🔲 AI	E 🗆 MC 🗍 VISA

Send in the attached card and you will receive the cassette for the major programs in this issue. If the card is gone, photocopy the coupon.

Add \$1.00 per cassette for postage and handling.

Please note there is no warranty expressed or implied that this program is going to do anything other than save you typing.

Broker Botches

I have found an error in one of the listings contained in my article "The Software Broker" which appeared in the June 1981 issue of *80 Microcomputing*. In the 'MOVING/AVE' program (Listing 4), line 200 now reads: 200 A = Q + 1. This should be changed to: 200 Q = Q + 1:AV = 0.

I am sorry if this has created a problem for any of your readers.

> John Harper Rte. #1 Box 252 Lawrenceburg, IN 47025

Hi- Res Help

The April 1981 issue of *80 Microcomputing* had one error in the "High Resolution Video Interface" article. The headlines should have read 192 by 96, not 192 by 26. Also, the schematic shows a 5257 or 4041 as the memory chips. The 4041 is getting difficult to find so use the TMS-4044, MM-5257 or INTEL 2147.

Several recurrent questions have come up that I would like to take the opportunity to answer. The size of the HR-1 board is 3 by 7 and 7/8 inches. Second, the size of the smallest dot is equivalent to the size of the period on the TRS-80 CRT and 18,432 of them can be defined anywhere on the screen. The normal TRS-80 graphics can define only 6144 individual dots.

Third, is the complete (assembled) unit available? At this time, only the circuit board is available. However, there is a company in Augusta, GA, Cardin and Associates, that is considering supplying kits and fully assembled boards. Judicious buying should allow you to gather all the parts (including circuit board) for \$75 to \$80. The six memory chips are the most expensive items. Some distributors want up to \$16 each for these ICs, but they are available for less than \$5 each from *Continued on page 22*

Dirprog Update

In the August 1981 issue of *80 Microcomputing*, we published an article called Dirprog by Jack Egbert. Unfortunately, we ran an older version of the program. The program listing here is the updated (better) version of Dirprog. We hope this eliminates any confusion publishing the older version may have caused:

80 INPUT

FOR X = 15360 to 16383: POKE X, 191 – (PEEK (X) – 128): NEXT : RETURN. If the screen contains some alphanumeric characters, add "IF PEEK (X)<128 THEN NEXT ELSE" before the word "POKE". When graphics are stored in strings (in A\$), reversal would be:

1000 B\$:"": FORX = to LEN (A\$): B\$ = B\$ + CHR\$ (191 - (ASC(MID\$(A,X,1)) - 128)): NEXT

Also similar routines could be used to exchange characters for graphics and vice versa, exchange uppercase for lowercase and vice versa, or to use INKEY\$ to print graphics.

> Marc Brumlik Computer Marketing Radio Shack Groveport, OH 43125

On Time Fix

In reference to the article "Soft Tach" (June 1981), I would like to point out that the program may hang up if the disk motor on time is less than the time required for 12 revolutions. The motor on time is nominally 2.6 seconds and the time required for 12 revolutions is 2.4 seconds at 300 rpm.

However, due to component tolerances, the on time may be shorter, and also the first revolution of the disk will be slower than 300 rpm.

An easy fix is to reduce the total number of revolutions. For seven revolutions change the 24 in line 90 to 14, and change the following lines:

230 FOR N = 1 TO 5 390 AV = RT/5

This will give an average of five disk revolutions.

David Cheney Lachine, Quebec Canada

An A for Alpha

I recently received excellent service from the Alpha Product Company.

I placed a telephone order and had the merchandise in a few days. It wasn't quite the right thing, unfortunately, so I returned the item. With equal speed, checks arrived for the refund and shipping costs. I was pleased by the service, speed and honesty. I will certainly look to Alpha for my future needs, and I'll recommend them to others without hesitation.

companies advertising in the major computer magazines—keep looking! The May 1981 80 Microcomputing does not state on the parts list that all TTL devices must be of the low power Schottky type (74LSXX series). If you do not use low power devices the TRS-80 power supply may not be able to cope.

Next, whether your system has 48K of memory or not, disregard the section pertaining to the memory disable option. Instead use the technique shown in Fig. 1.

Paul C. Fowler, Jr. Enable Electronics 2103 Charlton Lane Radford, VA 24141

High Addresses

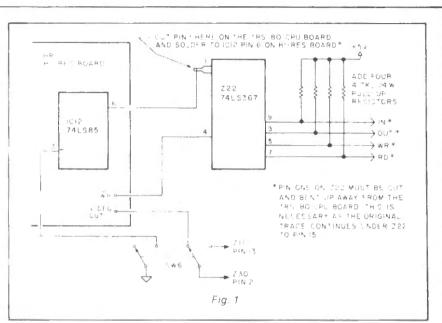

An apology is due readers with 16K systems who tried the demo program in my article "Program Chaining and Local Variable Definitions in Basic" (June 1981 p. 255). Despite considerable thought given the selection of addresses for the start of variable storage, I failed to heed the advice in my own article and set one of them too high. Consequently when run in a 16K system the stack overwrites part of that variable storage area and the program bombed. It runs OK in systems with more memory.

A quick fix is to change the number 32500 to 30500 the four places it appears in the listing (Lines 120, 170, 230 and 1010). The program will then run on any size system.

Hal Brown 643 W. Valley Forge Road King of Prussia, PA 19406

Everyman's Debug

I typed in "Everyman's Mod II Word Processor (July 1981) on my Model III. Everything works well with the following exceptions: To fix faulty video display during edit insert mode, change the end of line 1080 to read:—:PRINT @ C + 1, B\$;A\$ + R\$

Program continued

	CLS:PRINT0128, DIRECTORY FOR DISK NO. ";DRS:PRINT FOR J=1 TO XX

1590	
	AS=INKEYS: IF AS="" THEN 1600 ELSE RETURN

Program Listing

Since Model III doesn't have tab or backspace keys, and does not recognize the up arrow, change line 180 to read:

180 :F A = 62 THEN 430 ELSE IF A = 91 THEN 330 ELSE IF A = 60 THEN 310

This lets you use "<" for the left arrow. ">" for the right arrow "Clear" for the down arrow, and the up arrow as in the text. If moving the line to the right chops off the last character, delete the + from line 1200.

If you use an Epson MX80 line printer, lines 1661 and 1662 will have to be changed to accommodate its char/ inch and lines/inch format.

1661 IF G = 5 THEN W = 14 ELSE IF G = 10 THEN W = 18 ELSE IF G = 16.5 THEN W = 15 1662 IF H = 6 THEN T = 50 ELSE IF H = 8 THEN T = 48 ELSE IF H = 10 THEN T = 49

The Real Thing

What! Another correction? In August's 80 Input, I commented that Frank DiNunzio's joysticks might cause bus contention if used during a CLOAD. That was true, but between my drawing errors compounded by drafting errors the fix that was described would end up being worse than no fix at all. Fig. 1 and Fig. 2 are the real thing.

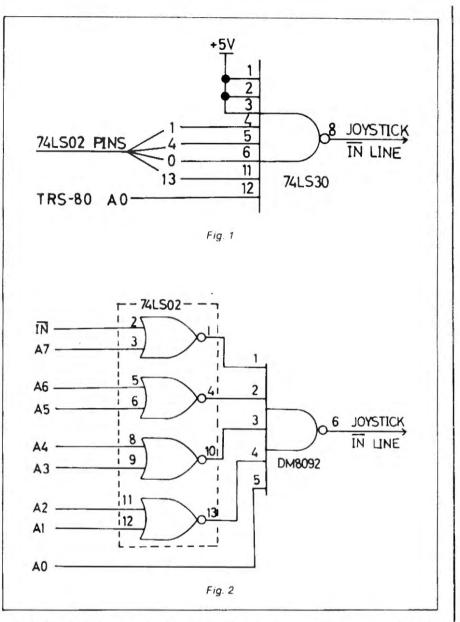

> Dennis Kitsz Technical Contributing Editor Roxbury, VT

Joysticks Damage Hardware

As Technical Contributing Editor for 80 Microcomputing, I am often called on to review hardware manuscripts before their publication. Frank DiNunzio's article on joysticks (June 1981) was such a case. I contacted Mr. DiNunzio before the article was published pointing out my concerns, to which I received a response similar to the one printed in September's Input. I reviewed the article again, and came to the same conclusions. Since he did not wish to incorporate a protective port-decoding circuit in the joystick design and since I believed this would be a very popular project, I prepared a postscript to the article.

For a time, the Keystone Kops syndrome set in. Due to magazine madness, the postscript disappeared and the article was published without it. I sketched out a hasty replacement; unfortunately, I made a mistake in the drawing, later compounded by a drafting error, which completely garbled the so-called improvement (please see this month's Debug). Mr. DiNunzio's rather harsh response to my suggestions then appeared.

If this were a minor theoretical disagreement, I would shelve any response in order to avoid an unseemly and typically mundane war of letters to the editor. But the user's investment in a computer is considerable, so I want to answer Mr. DiNunzio's letter point by point.

First, I understood that the joysticks were meant to be used only with "a suitable program to draw or play games." However, it is unwise and chancy to plug something in when the computer is on, and user manuals for all computer peripherals—including Radio Shack's own warn you to turn your equipment off before connecting them. Since it is important that any peripheral be plugged in when the power is off, Frank's joysticks would be in *and on* when CLOADing such a suitable program.

That brings up a related comment I probably should also have made earlier. Using the TRS-80 bus connector—pins 37 and 29—to complete the circuit that powers the joysticks puts the computer in jeopardy. Plugging the board in on an angle can run a hazardous 6 volts through

other components of the system. So put a switch on the joysticks, too.

Second point: Frank says "INP(1) will not open the cassette port; INP(225) does that." Absolutely right. But the converse is not the case, since opening the cassette port will also open the joysticks. So will input from 240,241,242,243,244,245. 246 and 247 (Exatron Stringy Floppy), input from 232, 233, 234 and 235 (RS-232 Interface), input from 208 and 209 (Microconnection), input from 127 (Micromouth), and so on. I save the chain programs of ESF, and it cannot be plugged or disabled without wiping out a loaded program or program sequence. And removing the RS-232 unit means disconnecting the expansion interface (killing a disk system) or opening the cover and removing the RS-232 board before proceeding.

80 INPUT

Mr. DiNunzio's statement does bring up an interesting question: Why would INP(255) cause the joysticks to open while on the other hand INP(1) does not cause the cassette port to open? That is because INP(1) is a hardware illusion created by software; as I stated in my first comment, *any* INP statement from INP(0) to INP(255) will trigger these joysticks. Mr. DiNunzio uses INP(1) simply because specifying that port number will avoid simultaneously triggering the cassette input circuitry.

Third point: "Hex inverters... pull some of the data lines down to ground potential: this is also done by the keyboard and all other input devices, and is not harmful to the computer." That's true, but all the devices he mentions pull data lines down only when specifically asked to do so by port or address number. Frank's joysticks pull data lines to ground even when not asked to by proper port number, and that is harmful to the computer. Why is it harmful? Because digital electronic devices can have three states: on, off, and a third state of electronic invisibility. To avoid electronic chaos, only one device may be permitted to respond to a central processing unit's request for information. In cases where bus conflict happens accidentally (which will never occur in a properly designed circuit), the low (ground, or "zero") signal takes precdence. But while it is low, it is also causing additional current to flow through any circuits which may be in a high (5 volts, or "one") state. That's what the third state was designed to avoid, which should have been used here. The unorthodox method used by Mr. DiNunzio to turn on the 74LS368's is a partial attempt to provide this invisibility, though 74LS366's (with two enable lines) would have been a better choice in some ways. Though unusual, his method can extend battery life.

To provide signals only when needed, then, every device connected to the computer should be decoded; that is, it should have a specific address or port integrated with it. In that way, only one device is "visible" to the CPU, and no peripherals or memory compete with each other. These joysticks do in fact compete for attention, may respond unexpectedly, and (I repeat) may eventually damage the computer.

Fourth point: When I was reprimanded that "241 is the lowest data number the circuit develops," I checked the original article once again. Actually, the lowest data number produced is 240, as Frank points out in his abstract numbers; rather, they work in digital signals whose actions can be made to simulate decimal numbers. Thus, though 240 is not a decimal zero, that is irrelevant; it is binary 11110000-which means four of the eight independent data lines are pulled to zero. and can conflict with active computer data during other input. Readers can take a lesson here in the dangers of thinking in decimal numbers when binary concepts are being implemented; merely because 240 is not zero, it does not follow that the binary condition it represents has no components which are zero. The possible configurations of Frank's joysticks include several zeros in the lower four lines: 0000, 0001, 0010, 0011, 0100, 0110, 1000, 1001, 1100, and 1111. Nine of the ten combinations present bus contention problems.

Fifth point: Frank states that an AA cell "in theory... is 1.5 volts, but in reality it provides somewhat less voltage." In reality, depending on how new it is, an AA cell can provide *more* than 1.5 volts (as well as less), even under the minimal load demanded by the joysticks. However, I will grant his point that most of the time the voltage will be less than 6 volts. Nevertheless, fairly new alkaline cells will still provide more than 5.25 volts, the maximum operating supply voltage. Here are excerpts from the manufacturer's data sheet on the same integrated circuits specified by Mr. DiNunzio for this project:

"Operating Conditions. Supply Voltage: (min) 4.75 (nominal) 5.00 (max) 5.25. Absolute Maximum Ratings. Supply Voltage: 5.00. Note: Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or at any other condition above those indicated...ls not implied."

For greatest reliability, I would recommend readers use the simple regulator circuit I suggested (80 Input, August 1981, page 18) with five AA cells rather than four; this will prevent the regulated voltage from dropping below 5 volts too soon, giving the appearance that the batteries have gone dead early.

To Mr. DiNunzio's final provocations, I decline to respond. I will say that even if readers do decide to follow his design as printed, at least this exchange of correspondence and commentary should illuminate how different designers approach a task, and how hardware reliability can be increased. As I stated in my original letter, I did not intend to be hard on Mr. DiNunzio; I'm sorry he was offended, but I hope readers know that they are my first concern. It is they who have to face the consequences of what they build.

> Dennis Bathory Kitsz Technical Contributing Editor Roxbury, VT

'Know-it-All' Goof

The program "Know-it-All" (May 1981, p. 288) is a very useful program but is not complete in every detail. First, there is an error in line 65035. The items between the brackets should read (65536-U).

Second, if there are any alpha data lines these will be decoded as a register and to eliminate this, insert OR T = 136 after T = 0 in line 65055.

Third, in program statements such as ON X GOTO 100,200,300, line referencing program only picks up the first line 100 and not lines 200 and 300. To overcome this, type in place of line 65150:

65150 NEXT:RE = 0:C\$ = ""GOSUB650:IFT = OTHEN65045

65152 IFT = 320RT = 44THEN65130ELSEGOT065050

With these additions the program becomes very useful in debugging lengthy programs.

> Brian Heywood, chief engineer Taranki Electric-Power Board Eltham, Taranaki New Zealand

Retrieving Block Cursor

I read the article on "Block that Cursor" by Ron Balewski in the April 1981 issue and noticed that if I tried to relocate the program to a location high enough to use my 48K of RAM I would get an "OV" error from BASIC. Evidently the problem is in the integer arithmetic that is used by the PEEK and POKE statements. While the Z-80 can handle addresses greater than 32767, the TRS-80 integer arithmetic cannot.

Fortunately, there is a way out. You can use the block cursor and your additional memory. It turns out that if you subtract 32768 from the 16K POKE locations the TRS-80 two's complement arithmetic will come up with the appropriate addresses for the POKEing. This is done on line 30 in the program below. Of course, the new memory size will be 65402, and you must change the location that will be referenced by Basic, which is done as follows:

- 5 'BLOCK CURSOR PROGRAM FOR 48K RAM SET MEMORY SIZE TO 65402
- 10 FOR K = 32635 TO 32654
- 20 READ X
- 30 POKE K 32768,X
- 40 NEXT K
- 50 DATA 245,197,205,88,4,237,75,32,64,10,254,95,32,3, 62,143,2,193,241,201
- 60 POKE 16414,123
- 70 POKE 16415,255
- 80 END

"Mr. Baker has some unique ideas compared to others involved in software production."

Trakcess Roxton Baker The Alternate Source Lansing, MI \$24.95

by Ronald Bobo

A fter successfully making backup copies of Acorn's "Pinbail" and Microsoft's "Adventure" (both of which are on copy-protected diskettes), I next turned my attention to those annoying security diskettes that accompany programs from The Bottom Shelf.

Mr. Baker has some unique ideas compared to others involved in software production. To quote from the Trakcess manual, "Congratulations! You have just purchased the most powerful TRS-80 disk access utility yet written. Perhaps you were able to share the cost with a few friends, but even if not I hope you will find Trakcess worth the price."

Baker credits William Barden's *Disk Interfacing Guide for the TRS-80* as inspiration for this program and recommends it to help you use Trakcess efficiently. The non-expert should also have a copy of the data sheet on the 1771 floppy disk controller chip. A copy can be found in the Expansion Interface service manual or may be obtained from Western Digital. National Semiconductor, a second source for the chip, also has a sheet available.

Trakcess requires a 48K TRS-80 Model I. The (C)opy and (D)uplicate commands require two disk drives.

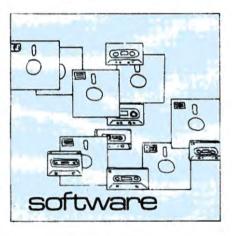

The program is in two parts on the disk —Trakcess, a Basic program, and Trakcess/CMD a machine-language routine. Typing 'Trakcess' and pushing Enter will load the machine-language section, and from there on prompts are given.

Printer output is available, but a printer is not necessary.

Trakcess contains all its own disk I/O routines. If the program stops on an error, however, a DOS disk should be inserted in drive 0 before continuing, to prevent possible system hangup.

Everything is menu-driven. Disk-related commands will not work until a drive is selected and activated. Upon selection, you will be asked for the head position of the drive. Press Enter; the default value is zero, and the head will be positioned at that track.

Typing I steps the head of the selected drive in one track (toward the center of the disk) and O steps it out. These two keys repeat if held down. Trakcess is programmed for thirty-five tracks, but instructions are furnished for changing this if necessary.

G followed by a decimal number allows quick positioning of the head at any desired track.

R and W allow reading into a specified block of memory, or writing from it. It is feasible to modify the data before writing back to disk, making the reconstruction of a damaged sector possible. All sector writes are verified by rereading, so data transfers are reliable.

T and P (Take and Put) allow the taking from or putting to disk of a whole track (about 3120 bytes) in one operation. A track may be read in, then scanned with Trakcess' editor to reveal everything on the track.

B (Build) is a very powerful command. It allows you to tailor a track to your own specifications, with no restrictions other than overall length. As many as eighty different sectors per track may be specified, of different lengths and types, with any names. Once the track has been created it may be edited in memory before writing it to disk, with the P command. For example, you might zero out the DAM (Data Address Mark) for a short sector, thereby generating a false sector ID. Or you may remove the ID CRC to get a false ID pack or the sector CRC for an always-bad sector. Make your own protected disks, anyone?

Typing S causes the current track to be scanned for useable sectors. All the important information (track number, sector number, sector length, whether or not a sector is IBM format, and the data address mark) will be determined and displayed on the screen or printer. This process is not fast; thirty seconds may be required to scan a track. If the track has any false sectors, this will be noted. L (Locate) scans the full disk, tells you which tracks have sectors, then offers you the option of a full report.

C will search the current track, build a matching format track in memory, then write it out to a target disk. Subsequently, it will transfer (and verify) all the sectors. If any sectors are damaged or of undeterminable length, you will have to specify one. Unless you know what it should be, do a track read and look at the sector in memory. Try the next larger multiple of sixteen bytes than the sector's apparent length. For this and the D command, you must have two drives—you cannot copy to the active drive.

D is essentially the C command repeated for each track. Most disks, whether protected or not, can be duplicated in about thirteen minutes. The disk you're copying need not be formatted, but it's a good idea to format it to make sure there are no bad tracks. It may then be bulkerased before copying.

E is a scrolling editor utility. Memory may be edited, or memory between specified addresses may be filled with a specified byte. The arrow keys move the cursor, and scrolling is accomplished with shifted up and down arrows. Memory may be displayed in either hex or ASCII. In either mode, whatever you type will be put into memory at the cursor location.

F calculates the two CRC bytes for any block of code in memory, or for any bytes

THE ALPHA I/O SYSTEM a complete failure?

THE INSIDE STORY

It happened 3 years ago when our President made a decision. At the time we specialized in custom analog and digital circuit design. The decision was to attempt to develop a line of standard interface hardware for the emerging microcomputers. At the time (1977) we had to decide which of the new machines could become the ' industry standard ' of the low cost micros

Despite a few aggravating but minor deficiencies, the TRS-80 seemed tohave the most chance of success and it had the best price/performance ratio. Also, with some imagination. their large sales organization could become the largest service network in the world, a reassur ing throught for the many novices in this new field

It became clear that the TRS-80 could be used (with our then hypothetical system) to solve problems in many helds where computers were not yet used, mostly because of their high cost. The IDEA was simple' ALPHA PRODUCT would supply the missing link between the TRS-80 and the "outside world", (more about this "outside world" later)

Early Survival

DANGER! If Radio-Shack entered the same market, we probably would not have survived, but the expectation was that they would be too busy developing their basic line (drives, printers, modem etc.) Thanks to our more specialized products, we would not be competing with them BAD START! We began with a failure. Our first product was supposed to be a simple, low cost, general purpose device. It would allow the TRS-80 to accept inputs other than the keyboard Many kinds of external devices (the "outside world" mentioned before) like photocells. sensors, thermostats, switches, contacts, etc., could be connected easily. In addition, there were two relays to control (on or off) external loads such as motors, lamps, appliances, heaters, etc., etc., in other words, it would allow the computer to interact or interface with external devices. We called it the INTERFACER 2. What a mistake! It sounded too much like * expansion interface** Many enthusiastic TRS-80 users called thinking that our * INTER FACER 2 * was a low cost Expansion Interface (at \$85 that would have been a real bargain*) We wanted to change the confusing name. That meant reprinting the manual, changing the ad scrapping the flyers discarding the silk screened cases. Well "INTERFACER 2" it would stav

TROUBLE! We also found that the majority of TRS-80 users were AFRAID of the hardware. They could be very comfortable with fancy programming but thought you had to be a computer specialist or technically inclined to put the INTERFACER 2 to work. In truth, some IMAGINA TION and a SCREWDRIVER is all you really need. Anyone able to wire a switch could use this device

WORSE! There was also the fear of plugging a "foreign device" into the precious computer This notion has all but disappeared as there are now so many quality products designed for the TRS-80 that pluoping in a non Radio Shack device has become common

Our ad in Creative Computing (80-Microcomputing did not yet exist) hardly paid for itself

TIMEDATE 80

Neat, Compact Design 3 Years Battery Life

Slips Inside E/I (Y Option Shown)

.Complete, self contained "True" real time clock/calendar, TIMEDATE 80 continues to keep accurate time and date when the computer is turned off or experiences a power failure

.TIMEDATE 80 only needs to be set once, and it's two replaceable "AAA" batteries (not included) keep TIMEDATE 80 running in excess of 3 years. Costly Ni-Cad batteries and

charging circuits are eliminated •The instant power is applied to the TRS-80, TIMEDATE 80 provides M0/DATE/YR, DAY of WEEK, HR.MIN SEC and AM/PM information with quartz accuracy

•TIMEDATE 80 replaces the computer's internal clock. Extremely useful for automatic operation of remote systems with no operator in attendance. If the power fails and then is

NEW: Computer to Computer ordering:(212) 441-3755 (24 hr. data line)

Real Time Without

Expansion Interface

85-71 79th Street. Woodhaven, NY 11421

We had a decision to make. Were we wrong or just too early? Our first INTERFACER 2 was sold to someone who wanted to and succeeded in controlling his fancy model railroad with his TRS-80 Interesting, but what made us stick with the concept was that some of our INTER-FACERS began finding use in applications with fascinating possibilities. Space is lacking to describe them, but the most exciting was the successful use of the system in assisting a handicapped young boy. We were pleased to hear of such a meaningful application

Today

Three years later, as you can see in our ads. The INTERFACER 2 is alive and well. The price went up a bil, and despite the introduction of the more powerful INTERFACER 80 the sales have been steady

Then came the least understood product! the ANALOG 80 This \$139 nicely designed module is an Analog to Digital converter with 8 input channels. Used with your TRS-80. It provides a powerful ''data acquisition system''. This jargon simply means that you can monitor, measure and record 8 independant varying voltages. Very lew people realized visi real power. Such a system would have cost over ten thousand dollars just a few years ago

The possibilities in scientific and engineering environments are endless. This system could replace chart recorders, digital data recorders, programmable calculators data analyzers. and many other specialized and expensive pieces of equipment. Furthermore, up to 8 ANALOG 80's could be used simultaneously for a total of 64 channels of analog input! They simply plug into the TRS-80 using our "X" series of bus extenders (EXPANDABUS)

The idea was simple. We would supply the missing link between the TRS-80 and the outside world".....

Our next product was to be a second generation. Input/Output interface, with more flexibility than the INTERFACER 2 Careful design and refinement yielded the INTERFACER 80. the most powerful real world interface on the market today. It has 8 inputs, each optically-isolated and 8 outputs, each with a relay contact. The INTERFACER 80 is fully compatible with our ANALOG 80, allowing these to be used together in order to create systems that control external devices based on "sensed" input under control of the TRS-80. A FAILURE! In spite of our extensive advertising, very few are aware of the existence of the

powerful ALPHA I/O SYSTEM

The Facts Are:

The ALPHA SYSTEM/TRS-80 combination forms an incredibly versalite and powerful tool for acquisition/processing/control

in spite of its moderate cost, the system is sophisticated and reliable

The entire system can be easily programmed in BASIC using INP(X) and OUT X Y commands. The modular approach and our EXPANDABUS allow for instant expansion as requirements. demand

The following pages contain more information about the devices mentioned here. We invite you to call or write to discuss your particular application

Device descriptions; NEXT PAGE

WHY LOSE PRECIOUS TIME ?

restored, only TIMEDATE 80 will update the system with current TIME and DATE information an impossibility with the computer's internal clock

.TIMEDATE 80 is quartz crystal based with INTELLIGENT CALENDAR including provisions for leap year! TIME display may be by 12 hour AM/PM or by 24 hour military and Eruopean tormat

•TIMEDATE 80 plugs directly into the rear of the TRS-80 keyboard and gives the TIMES function even without an Expansion Interface. For those with a disk system, it plugs into the left side panel of the Expansion Interface. An optional "Y" connector can provide for further expansion

•TIMEDATE 80's small size keeps the computer table uncluttered. If you have an Expansion Interface, TIMEDATE 80 literally "DISAPPEARS" by slipping into the empty space in the bottom of the interface

•Two sets of software, on cassette, come with TIMEDATE 80— TIMESET and "TIMES"

'TIMESET' is a step by step set of simple instructions for setting TIMEDATE 80. 'TIMES' is a set of poke routines which patch DOS and Level II TIME\$ to read TIMEDATE 80 and is easily incorporated into any user software TIMES' will always print the time and date when LISTING a program-great for keeping track of revisions1

+Other valuable uses for TEMEDATE 80 are accurate date and time information for business reports like payroll records, financial reports etc., or to various 1/0 devices requiring 24 hour clock input such as laboratory instrumentation, and to communication systems needing "Log In/Log Out" data (bulletin boards)

•TIMEDATE 80, fully assembled and tested, 90 day warranty, complete with instructions and software on cassette. \$95.00 Y option add \$12.00

typed in. Useful when examining damaged or tricky sectors, the CRC may be regarded as a two-byte checksum. The disk controller starts calculating a CRC whenever an address mark of any kind is encountered during a track write, and whenever a sector is being written or read. On a write, these go to the disk and on a read they are compared to the CRC bytes on the disk, then reported back to the CPU along with an indication of their correctness.

H gives a choice of hex or ASCII dump to the printer starting at any memory address.

According to the manual, possible fu-

ture additons to Trakcess are a disk compare and a disk search facility. Improvements are promised to keep up with the state of the art in protected disks. An upgrade to the latest version may be had at no charge by sending a diskette with a postpaid mailer to The Alternate Source. Presumably, you would also have to furnish proof of purchase.

Mr. Baker says he doesn't like protected software because it makes modifying or moving the code difficult, and it is usually a pain to back up and use. Baker maintains that, with 300,000 or more TRS-80's in the field, and the fact that relatively few owners are in close contact with large numbers of other users, and that most owners are willing to spend some money on software, there will be plenty of sales potential even after all the swapping.

Whether or not you agree with Mr. Baker's philosophy, it should be pointed out that reproducing copyrighted software for other than your own use is illegal.

Trakcess is a good program, it works and, though not a replacement for Superzap or similar programs, it can be used for purposes other than copying. Besides that, it will give you a mini-education on the working of the disk controller and the various disk formats possible. ■

Hellfire Warrior Automated Simulations Mountain View, CA \$39.95 disk, 32K TRSDOS \$39.95 cassette, Level II, 16K

by Debra Marshall 80 Microcomputing staff

ellfire Warrior is the second in the Dunjonquest series of full-length fantasy role-playing games produced by Automated Simulations (the first is the Temple of Apshai).

The game is structured much like Datestones of Ryn, the minigame introduction to the Dunjonquest series. Like Datestones, commands are issued by pushing various single keys. Graphics on the '80 consist of a single-dimensional top-view representation of corridors and rooms found in the cave you venture into in your hero's role. The character appears on the screen as a triangle created from graphics pixels, treasures are rectangles, and critters and nasties apppear as squares of different sizes, which disintegrate into shooting rays when they are defeated.

Hellfire Warrior consists of four levels of dungeon. Each level proves increasingly harder to stay alive in. However, experience points are gained with each nastie killed, and your character becomes stronger, more resilient and harder to defeat with each battle.

This game is perhaps unique in the fantasy game field because you have the option of creating your own character or bringing a favorite character from any other role-playing game, computer-based or otherwise, with you to Hellfire to be your hero. The Gamemaster will randomly select a hero's attributes for you if you do not choose to create your own character. Either way, you must name your own character, and I quickly discovered the name must have a hero's ring to it, or the program has some distinctively reprimanding thoughts to share on the subject.

You may increase your character's native attributes (and chances to stav alive) by visiting and spending your money at the Armory, the Apothecary Shop and the Magic Shop. Each shopkeeper has many things of various import for sale, and you should choose carefully, because the weapons, armor and magic you provide your hero will greatly affect his chances of remaining alive in the dungeon. Each shopkeeper sets a price for his goods and is open to haggling, within reason. If you haggle too much or offer too low a price, you may find the shopkeeper raising his prices. Weapons may be enchanted, indeed, should be enchanted; elixers, nectars, bloods and salves are available in plenty, but without any explanation or quarantees as to their desirability; magic amulets and talismans are also available to the wealthy (read: successful) adventurer.

The object of the game is simple: Wander through the maze, collect all treasure on all levels, buy advanced magical aids, proceed to higher levels, and eventually rescue the warrior maid Brunhilde held enthralled deep in the dungeon. Exit the maze with Brunhilde, treasure and body intact, and you win. Oh yes—pay the cleric and try not to get yourself killed. While resurrection is possible (and even likely), you always seem to lose a lot in the process. Provisions are made for saving a game or character.

Frankly, one of the most enjoyable things about this game is the Book of Lore. It is nicely illustrated, slickly presented and makes for enjoyable reading, which is saying a lot for something that is software documentation. The directions and explanations are thorough and explicit; you will be well-advised to read the book completely before attempting to play the game. There are room and treasure descriptions, and some secret messages that come in handy. In addition, there is a short scene-setting story that proved to me the people who wrote the documentation are game players and fantasy lovers.

The game proceeds in much the same way as Datestones: You manuever down halls and into rooms searching for treasure and secret doors. At any moment, you may be attacked by a nastie or beastie and have to defend yourself. There are pits and traps, and any treasure box may be boobytrapped.

The game is written in Basic and unfortunately, this makes for slow graphics drawing and reaction time; you may continue fighting a battle after you have demolished your opponent because of the slowness of program execution. It is also difficult at times to determine exactly who is coming out ahead in a battle. Unlike the Datestones game, however, critters in this contest do not self-destruct without any effort on your part. In addition, the game is the real time, so don't let your attention wander; you may discover you have been killed while you ran out to the kitchen to get a snack.

The game is not easy to win. The beasties change types on each level, different magic is required, and there is enough going on when the graphics aren't being drawn to keep your interest up. Some of the graphics sections were poorly conceptualized; when it takes many seconds to draw a dungeon section, I don't want to have to watch it being done every three or four steps I take, which occasionally happens. On the whole, however, any true game fanatic will find this game intriguing and entertaining. It is also a welcome change from adventure games without graphics.

NOW MODEL I AND MODEL

Now Model III users can take advantage of the ALPHA I/O system too, Our new MOD III/I BUS CONVERTER allows most port based Model I accessories (such as our ANALOG-80, INTERFACER 2 and INTERFACER-80) to connect to the Model III bus, MOD III/I BUS CONVERTER, complete with all connectors, only \$39.95.

GREEN SCREEN NARNING IBM and all the biggles are using green screen monitor

Its advantages are now widely advertised. We teel that every TRS-80 user should enjoy the benefits it provides. But WARNING all Green Screens are not created equal Here is what we tound

Several are just a flat piece of standard colored Lucite. The green tint was not made for this purpose and is judged by many to be too dark increasing the brightness control will result in a fuzzy display

me are simply a piece of thin plastic film taped onto a cardboard frame. The color is satisfactory but the wobbly tim gives it a poor appearance

One optical filter is in fact plain acrylic sheeting

•Faise claim. A few pretend to reduce glare In fact, their fial and shiny surfaces (both him and Lucite type) ADD their own reflections to the screen

A few laughs. One ad claims to i reduce screen contrast. Sorry gentleman but it's just the opposite. One of the Green Screen's major benefits is to increase the contrast between the text and the background

 Orawbacks. Most are using adhesive strips to tasten their screen to the monitor. This method makes it awkward to remove for necessary periodical cleaning. All (except outs) are flat. Light pens will not work reliably because of the big nan between the screen and the tube

Many companies have been manufacturing video filters for years. We are not the first (same think they are), but we have done our homework and we think we manufacture the best done but homework and a skin because it is the other who here is why the other who here but the because it is the other bube.

only CURVED screen MOLDED exactly to the picture tube curvature it is Cut precisely to cover the exposed area of the picture tube. The fit is such that the static electricity is to keep it in place? We also include some invis SUT reusable tape for a more secure fastening

he filter material that we use is just right not too dark nor too light. The result is a really eve pleasing display.

We are so sure that you will never take your Green screen off that we offer an unconditional money-back guaranty fry our Green Screen for 14 days. It for any reason you are not delighted with it return it for a prompt retund

A last word. We think that companies, like purs. who are selling mainly by mail should wist their street addresswhave a phone number (for questions and orders)waccept CODs not every one likes to send checks to a PO boxwoffer the convenience of charging their purchase to major credit cards How come we are the only green screen people doing it? Lisp Interpreter Supersoft Associates Champaign,IL \$75 cassette \$100 disk

by Gary McGath

An unusual entry in the language field is Supersoft's Lisp interpreter. Lisp is not as well known to microcomputer users as it might be, although it is the most heavily used language in artificial intelligence research. Its simple (though unusual) syntax and powerful data manipulation capabilities make it an excellent choice for dealing with the complicated data structures required by artificial intelligence programs used for natural language processing and pattern recognition.

Other areas where Lisp is effective are symbolic mathematics and adventuretype games. The Supersoft interpreter runs on both the Model I (Level II) and the Model III with 16K of memory; the disk version runs under TRSDOS. All these versions offer TRS-80 owners the opportunity to experiment with artificial intelligencetype programs on their microcomputers.

Lisp stands for List Processing. The only data structure Lisp uses is the list, which is a series of linked data cells. The elements of lists may be other list; this permits the representation of any tree data structure. Programs are lists and may create other lists; memory space for lists is allocated by the interpreter as needed. As a result, it is possible for one Lisp program to create or modify another one.

Supersoft's implementation of the language is fairly complete. Floatingpoint numbers are used, and a variety of mathematical functions are provided. Variable names (atoms) may be of any length. Property lists, allowing the program to associate attributes with atoms, are supported, as are two different kinds of user-defined functions. Functions that are part of standard Lisp, but can be composed easily from other functions, have been omitted to save space. The user's manual gives Lisp definitions for these functions which can be typed in. The set and reset functions permit screen graphics.

Input/output operations on cassette and disk consist of saving and loading all data are not formally distinguishable.) On the Model III, either 500 or 1,500 baud may be selected for cassette input/output but the rate cannot be changed once it has been set. This limits the Model III user to 500 baud if he or she wants to use the Edit and Trace programs Supersoft provides of tape.

The interpreter is quite fast and nearly bug-free. Garbage collection—the reclaiming of released storage—is the most difficult problem in implementing Lisp; but in this case, the hesitation caused by the garbage collector is barely noticeable, even on a 48K machine.

I have found only two bugs so far in the cassette version. One is typing an atom at the interpreter will not produce a response unless the atom is followed by a space or a right arrow. The other is if an atom is given a property of NIL, that property can never be changed except by directly modifying the property list.

There are, however, a couple of disappointments in store for the buyer of Supersoft's Lisp. The manual is a thin document, typewritten and cheaply bound. It will be an insufficient guide for anyone, even a professional programmer who is less than fluent in Lisp. It does, however, tell the experienced Lisp programmer everything he needs to know.

The major deficiency in the software itself is the lack of any printer output. The only way a printout can be obtained is to save a program on cassette, return to Basic to redirect screen output to the printer, reload the program, and obtain the listing. If Supersoft had provided a POKE function like Basic's, this redirection could have been performed without leaving Lisp.

These problems, however, will not stand in the way of anyone who believes Lisp is the right language for his or her projects. I hope Supersoft will add some improvements in the future, but their product is already an exciting alternative to programming in Basic.■

Ed. note: The Al references are our comments, not the author's.

Spooler

Spooler Mumford Micro Systems Summeriand, CA \$16.95

by William C. Huffman

Spooler by Mumford Micro System is a print formatting system for parallel or serial printers. Spooler allows you to specify the number of lines per page, the number of characters per line and a pause, if needed, between pages of output. The pause allows insertion of another sheet of paper if your printer prints only one page at a time. Spooler also allows you to send the contents of the video screen to the printer. This last feature is similar to the JKL function of NEWDOS and others.

Works Without Disk

Spooler is a machine-language program which works on any Model I, Level II, 16K or larger and Model III 16K or larger TRS-80. Spooler will work without disk. Let me repeat that, Spooler works without disk. It is supplied on a cassette containing six copies of the program. Included on the tape are two copies each of the 16K, 32K, and 48K versions of the program. Directions for placing the program on disk are included in the easily read and well documented instruction booklet.

Spooler works by setting aside a userdefined chunk of high memory. All output intended for the printer is intercepted and sent to this area. Whenever Spooler is active and LLIST or LPRINT commands are encountered, the cursor disappears from the video monitor for a brief period. The printed output is rerouted to the reserved high-memory area. When the cursor returns to the screen, you are able to continue execution of your program. You may even load and execute another program while the printer goes merrily on its way producing printouts. The printer continues to run while you continue with your program.

Spooler also works while in DOS. Now you can get a printout of your disk directories if you do not have Newdos or one of the other operating systems with a JKL feature.

I like the indent function of Spooler. I tend to program using very long or multiple statement lines. It is difficult to follow a listing of a program which contains long lines because the line numbers do not stand out. I use Spooler to indent my listings and they become much easier to read.

My Centronics 779 line printer is slow and my Texas Instruments 810 printer will not indent listings. With Spooler, my waiting on a printer is over. In short, I like Spooler. I like Mumford Micro. They sent me an improved version of Spooler several months after 1 received the original version. The improved version was sent without charge and without my requesting it. I can only give my highest recommendation of Spooler and of Mumford Micro Systems.

TALKING **ROBOT ATTACK**

IS THE ALPHA JOYSTICK

INCREDIBLE! This amazing game actually TALKS without a speech synthesizer, through the cassette AUX plug

You are armed with just a hand held laser. In a remote section of the space station you encounter armed robots, some march towards you, some wait around corners. Watch out, the walls are electrified. Zap as many robots as you dare before escaping into a new section where more robots await you. The struggle continues. With Joystick action and VOICE OUTPUT, this game will amaze you.

SCARFMAN

THE LATEST ARCADE CRAZE now runs on your **TRS-80**

It's eat or be eaten. You control Scartman around the maze, gobbing up everything in your path. You attempt to eat it all before the monsters devour you Difficulty increases as game progresses. Excellent high speed machine language action game. From The Cornsoft Group With sound

CAUTION: Played with the Alpha Joystick, Scarfman may become addictive.

80 REVIEWS

EDTASM-Plus Mark Chamberlin and Bill Yates Microsoft Bellevue, WA \$29.95

by Chris Gundlach

ince the introduction of the TRS-80, those of us wishing to try our hand at Assembly-language programming have had the excellent Radio Shack Editor/Assembler which is well known as a good value because of its "big assembler" features. Unfortunately, using the original EDTASM meant writing programs with the Editor/Assembler, saving the source code on cassette (for later work), saving the object program on cassette, and finally loading the object program and T-Bug (two more cassette operations that cause loss of EDTASM in memory). For me, all the cassette flipping (and the usual hassles with wrong volume settings) took away a lot of creative gusto needed to work with a machine-level program.

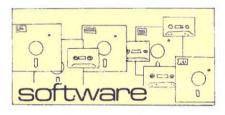

Microsoft's new EDTASM-Plus is one of those miracle programs that cures just about every hassle you might think of. If you are just starting to get into Assembly language and the inner workings of a TRS-80, EDTASM-Plus is just what you want.

EDTASM-Plus is written by Mark Chamberlin and Bill Yates; Chamberlin designed the original Editor/Assembler. These people know the TRS-80 inside out, and have been in touch with this computer since it first came out. The knowledge shows, since EDTASM-Plus is an incredibly complete Assembly-language development system oriented to the cassette TRS-80 user, and takes into account the overall design of the TRS-80, the way it uses memory, and so on.

EDTASM-Plus has three important parts and we'll review features of each for you. We'll try to explain things in a way that new Assembly-language programmers can picture. The three parts, all contained within EDTASM-Plus and loaded with one cassette load using System, are: the editor, the assembler, and Z-Bug (a debugging monitor similar in function to Radio Shack's T-Bug).

The Editor

The editor is very much like the same feature in the original Editor/Assembler. Using numbered program lines, it allows you to type in Assembly-language programs in Z80 mnenomics, or code words, such as the command LD A, (HL) which loads the computer's A-register with the contents of a memory location pointed to

by the H and L register pair. The editor stores these lines for later conversion, or assembly, into the actual numeric machine-level commands which the Z80 chip in the TRS-80 was designed to work from.

Editing features in EDTASM-Plus have been greatly expanded over those in the original Editor/Assembler. Using a lineediting feature like the Edit function of Level 11, you can change program lines. However, EDTASM-Plus also allows you to move any part of your Assembly-language program to another set of program lines. This saves you the headache of retyping one or several lines of assembler code after discovering you had them in a bad place in your program.

EDTASM-Plus' Editor also allows you to edit a given series of program lines without having to reenter the Edit function for every line. You just give the Editor the linenumber series and it stays in the Edit mode for each of the lines. Rather than giving the exact range of line numbers, EDTASM-Plus also lets you give a starting line number and a number of lines to edit—a handy feature to use after you've inserted new lines that might be numbered oddly.

Using a variation of this feature, you can also go through your program to add comments to each line. Called the extend function, it lets you move to each line, positions the cursor at the end of each line, ready to input your comment for the line. After you Enter the comment, the Editor moves to the end of the next line—you don't have to retype the Edit command and the X subcommand for each line.

EDTASM-Plus has the other program editing features of the original Editor/ Assembler. For example, insert lines starting at a certain number with a certain increment, replace a line, renumber all the lines or a part of them, delete lines, find a string within the assembly code, and so on. Together with the new line, block copying and moving features of EDTASM-Plus, the new Editor is a powerful and versatile working tool for entering Z80 mnenomic code.

EDTASM-Plus also adds a couple of important features not found in the original Editor/Assembler, and which may be new to those familiar with original version.

It will accept macro definitions. A macro is something akin to a DEF FN statement in Disk Basic, by which you define a function that contains a number of actual program statements. When you call the function by name, the computer performs the steps of that function just as if you had written them out. Similarly, a macro is a block of Assembly-language statements that you might wish to use over and over again, but with different parameters or values within the routine. You define, or describe, a macro by writing out the steps using dummy values. The Editor remembers the steps in the macro, and whenever you call it by name and provide the values-a step involving a single program pseudo-op line---it generates the steps of the macro in your Assembly-language program when it's assembled.

EDTASM-Plus also allows conditional assembly. You may establish conditions that must be met for a given part of the program to become part of your assembled machine-language program, and if the condition is not true, the assembly just skips that part of the program as if it were not there. The example given in the EDTASM-Plus manual is a good one: You have a program you wish to assemble to fit a 4K TRS-80 and an extended version of the program to fit a 16K machine. Conditional assembly lets you pluck out the parts you do not want to include in the smaller program, so that you can create both versions using your master program instead of typing in and assembling two versions yourself.

"EDTASM-Plus is one of those miracle programs....'

EDTASM-Plus also recognizes new operators within you source mnenomics. Besides using expressions such as VIDEO + 40H, you can use multiplication, division, modulo division, and logical operators within your source code, so that the Assembler will calculate and assemble your program correctly without your having to work out the expressions by hand beforehand. You can also use parentheses in expressions, something that was not allowed in the original Editor/Assembler.

The Assembler

The assembler portion of EDTASM-

Plus is the part which reads your mnemonics and converts them to actual digital instruction for Z80. EDTASM-Plus provides a variety of error messages and warnings when your program is assembled, like the original Editor/Assembler.

But the original E/A left you with just a couple of options upon assembly-record the program onto a cassette to reload and run it, or continue working in the Editor. EDTASM-Plus will assemble your program directly into the TRS-80's memory, using a location you choose or one provided automatically by EDTASM-Plus, so that you don't have to record it on cassette to run and debug the program. Using Z-Bug (described next, and part of EDTASM-Plus), you can immediately run your assemblylanguage program. EDTASM-Plus gives you plenty of the interactive features that are inherent with a Basic interpreter, and eliminates a tiresome and often discouraging series of cassette loads and reloads just to test a program and get it right. This Microsoft package assembles into memory without destroying the Editor/Assembler itself, so you can go back to your source program in the Editor to make corrections and reassemble it to try again. Then, after the program is the way you want, EDTASM-Plus will assemble the program for loading into any memory location you specify, so that you can make your machine-language cassette and use the program without EDTASM-Plus.

The symbol table is alphabetized and error-codes are appended to listings in the symbol table for things such as undefined or redefined labels. Labels used to identify macros rather than actual source-program steps are also identified.

EDTASM-Plus supports lineprinter output, as does the original E/A, so that you can lineprint your source code with or without line numbers, the symbol table, the assembled listing, and so on. Switches (in-line commands given when you assemble the program) allow you to suspend or allow printouts of macros and other parts of the program.

Z-Bug

Z-Bug, the third part of EDTASM-Plus, is like a T-Bug whose IQ was beefed up by some miracle drug! Z-Bug is a *monitor*, a program that allows you to look into the TRS-80's memory location and change them if needed. You use Z-Bug to run your assembled machine language program, see what it does, make corrections and try again, set breakpoints, and jump back to EDTASM-Plus and the source program.

Z-Bug goes beyond T-Bug in that it will display program steps as mnemonics rather than simple byte-by-byte hex numbers. It's like a line-by-line disassembler and because Z-Bug stays resident with your source program and EDTASM, you can reference locations to be examined with Z-Bug using your own symbols rather than specific hex memory locations.

Z-Bug also has a calculator mode so you can perform hex-to-decimal conversion on-line (without disturbing your programs or entering special conversion subroutines) and even calculate expressions. You can ask Z-Bug, for example, to tell you where VIDEO + CURPOS + 40H is by just typing it like that, followed by = Z-Bug will output numbers in hex, octal, or decimal, and will input numbers from the keyboard in any base from 2 to 16. You can therefore use Z-Bug to type in a memory location bit-by-bit (10011101, for example) and then see what that binary number is in hex, decimal, or octal.

A Byte mode lets you look at individual memory bytes (like T-Bug), and a Word mode lets you see pairs of bytes—properly decoded from the Z80's reversed storage format which has the low-order byte first. Z-Bug allows you to display memory locations as ASCII (character) output, too.

Z-Bug allows eight breakpoints in your program and you do not have to fix a breakpoint after it's reached, as you do with T-Bug. Z-Bug also allows you to step through your program by single steps which is a lot easier than trying to test a program on the fly at microsecond speeds.

The Southeastern Textan Southeastern Software Birmingham, AL \$40, cassette Model I

by Dennis Thurlow

Find a need and fill it! Yep, those six words are the secret to success alright, and Southeastern Software has got a winner here! From the well written, indexed(!), easy-to-follow manual to the flawless execution of each and every command, this has got to be one of the best thought out packages I've seen.

The program locates itself to the top of available memory, then asks if you want to type in, or CLOAD, a program. Either way, when you're ready, you have an incredibly powerful editor at your disposal.

Using the shift key and down arrow as a control key, there are 24 cursor control commands that allow you to insert or delete characters, words, or lines of Basic, Microsoft has included a stand-alone version of Z-Bug on the back side of the EDTASM-Plus cassette, so you can use Z-Bug alone. Symbolic references, of course, work only with a source program, resident with EDTASM-Plus, so the standalone version of Z-Bug can't reference symbols.

Z-Bug is great just for looking at the TRS-80's ROM subroutines and the program routines in the reserved RAM areas, so you can learn something of how Basic does what it does.

The EDTASM-Plus Handbook

The instruction handbook is as excellent as the software itself. It's written by William Barden, the author of Radio Shack's book on TRS-80 Assembly-language programming, thereby making EDTASM-Plus a fine companion to your first explorations in machine language. Some assumption of Z80 programming and the original E/A are assumed in Microsoft's manual, but all of EDTASM-Plus' new features are explained thoroughly and well. Microsoft even included a notice of a couple of obscure bugs that would arise in tricky assemblies, and tells you how to use Z-Bug to make the corrections to EDTASM-Plus and punch yourself a corrected tape. Needless to say, EDTASM-Plus obviously represents a huge amount of work by its programmers and Microsoft.

search for any character, replace any character with any other, or load another program. The control X command puts you in an extended mode that allows eight more commands including string search and replace, block delete, insert lines with automatic numbering, and displaying the amount of free memory.

In addition to the text handling features there is an abbreviated keyboard. Pressing shift and any letter types a complete Basic command or statement.

The repeat key feature works for any input not related to editor commands, the break key will abort a bad load, and the non-destructive cursor can be moved to any point on the screen using the four arrow keys. Complete error messages are displayed on screen and thoroughly explained in the previously praised manual, and programs can be merged in the buffer. When you exit the editor, all text is fed to a compiler that returns it to Basic compression codes.

This is a dream utility for the Basic programmer. Planet Miners Avalon Hill Baltimore MD 16K, Level II, Mode's I & III \$14.95

by Darren DeVigili

Planet Miners is Avalon Hill's first effort at a microcomputer game outside the strategic war genre, and is an excellent example of thorough programming. While Avalon Hill is a well established game company, I was a little leery of their excursion into the world of microcomputer game design. planets); display mining status; display ships in orbit; display ship status (yours); set ship destination; protest a claim; attempt to claim jump; attempt sabotage; finished with commands for today (not exactly my idea of an option, more like death and taxes). When attempting sabotage or to claim jump, keep in mind that the Space Patrol may arrest you if you are caught in the act. If there are no Patrol ships around and your opponent catches you, your ship crew will be detained and tortured by your would-be victim. The scars still show, and I've become a wary miner indeed. (I told you it was realistic).

If you play with fewer than four players,

"While Avalon Hill is a well-established game company, I was a little leery of their excursion into the world of microcomputer game design."

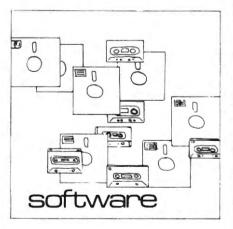

The game's scenario is a futuristic Gold Rush. You have five ships, three opponents, and a limited amount of mining claims to try for. To add realism to the game, the playing options include claim jumping, protesting claims, and (my personal favorite) sabotage.

The game is for zero to four players; zero being the computer versus itself. (The computer always plays in the capacity of the Space Patrol regardless of the number of human or non-human players). All the play options are interactive, for example, jumping a claim on Pluto causes the computer to evaluate the location of your ships, the Patrol's ships, and the claim holder's ships. It also evaluates the finesse of these ships, each player's political pull, and current popular opinion concerning your family. (Each player's ships are considered to be part of a corporate family.) Those factors concern not only claim jumping, but just about every aspect of the game, and its outcome.

I have noticed two detachments from reality in the game. One is that there are 10 planets in the solar system (the addition being Ceres), and two, once you set a ship's destination, you can't alter it (after take off), until the ship arrives. This adds a degree of spice in some situations.

There are 10 play options available: Large solar system (map); small solar system; display travel times (between the computer automatically assigns names to the other players, which are simulated by the computer. This may not seem like much, but I still hate the Lysanders—they win too much.

One game rule worth special mention is that just because someone types their name in first doesn't mean they will play

first—the sequence of turns is randomly chosen every round. This is the only program I've seen with this feature. Planet Miners is an exceptional buy.■

Disk Storage: It's No Place to Compromise.

A dependable disk system means everything to the highperformance operation of your computer. At Percom, we know this. And we do something about it.

For example, the connectors on our TFD drive systems are gold plated.

Why? Because solder-plated contacts oxidize, forming an insidious insulation that can cause erratic operation. And then total failure.

Gold-plated connectors are just one way we make better drive systems than the competition.

Now #1 for the Model III

Quality Percom TFD drives provide more features, cost less. Add-on drives start at only \$439.00. Complete First-Drive Systems start at only \$749.95. Features: "Flippy" Capability — Record your

To order products, or for the name of your authorized Percom retailer, call toll free 1-800-527-1592.

programs and data on either side of a diskette. Greater Storage Capacity Store 180 Kbytes - formatted - on one side of a 40-track TFD drive. Store over twice as much on a TFD 80-track drive. Think Megabytes — Your TFD drive controller will handle up to four drives. You can access almost 1.5 million bytes of on-line program and data files. Either Add-in or Add-On - Your TFD First Drive System can be either internal (add-in) or external (add-on). In either case, you get a complete system including the disk controller, drive, power supplies and disk-operating software. BASIC-Language DOS — Included on diskette with each First Drive System is Percom's OS-80/III." This easy-to-use disk-operating system loads into 7 Kbytes of RAM and then frees the drive for other use. With OS-80™ programs, you can have full, read-write interchangeability between Model I and Model III diskettes. Or Model III TRSDOS* - TFD 40track drives work with Tandy's Model III TRSDOS, without modification. For 80track operation, TRSDOS can be easily modified with diskette patches supplied.

Still #1 for the Model I

Besides greater storage capacities, more quality control measures and lower prices, all Percom Model I drives are rated for double-density operation

for double-density operation Plug a DOUBLER[™] in your Expansion Interface and enjoy the same doubledensity disk storge capacity as Model III owners. Included with each DOUBLER is a TRSDOS compatible double-density disk-operating system. DOUBLEZAP programs are available for upgrading other popular DOSs for DOUBLER operation. And our double-density version of OS-80¹⁴ costs just \$49.95.

Of course you don't **have** to upgrade your Model I for double-density operation to use Percom disk drives. But it's nice to know you can.

Percom TFD drives for the TRS-80* Model I are available in 40-, 77- and 80track versions, in 1-, 2- and 3-drive configurations. Prices start at \$399.00.

System requirements: Model III TFD drives work with a 16-Kbyte system (min) and Model III BASIC. The initial drive must be a first-drive system. An ophonal interconnecting cable is available for expanding with external drives #3 and #4. Model 1 TFD drives work with a 16-Kbyte system (min) equipped with an Expansion Interface, Level II BASIC and DOS software, and an interconnecting cable. Twoand four-drive interconnecting cables are available from Percom.

TRS-80 Assembly Language Herbert S. Howe, Jr. Prentice-Hall, Inc. Englewood Cliffs, NJ \$15.95 Hardcover, 186 pp. \$6.95 Softcover

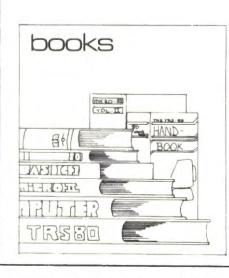

by Edward D. Young III

earning how to write TRS-80 Assemblylanguage programs can be a very difficult task. Unlike Basic, in which the instructions bear a logical relationship to the operation intended, Assembly-language instructions usually resemble the names of exercises rather than computer operations. For example, you can Push or Pop a byte, Rotate or Shift a bit, etc. Hubert Howe, Jr., a columnist for the TRS-80 Monthly News Magazine, offers his book as a guide to understanding this complex, yet elegant, language. Except for the few reservations noted below, this book is a good reference for both beginning and experienced Assembly-language programmers.

Howe divides his book into two sections. Part I introduces and explains the basic concepts of Assembly-language programming. In addition to describing the operation of the Z80, the heart of the TRS-80, it explains the organization of the TRS-80's memory and how to use the various permanent subroutines which reside in it.

The discussion of how certain input/output devices, such as the keyboard and video display, are linked to special memory locations is particularly informative. Other chapters in Part I introduce the Z80 instruction set, the Z80 stack, and Radio Shack's Editor/Assembler program.

Howe assumes that the reader has ac-

cess to a 16K Level II and has Radio Shack's Editor/Assembler or an equivalent assembler (such as the Apparat EDTASM which comes with NEWDOS +).

An assembler allows you to assemble and execute programs. If you do not have one you may still be able to load and execute the programs in this book by using POKE or by using a machine language monitor program such as T-Bug. In any event, the book will be clearer if you can assemble the sample programs and execute them on your own computer. This fact notwithstanding, the chapters in this section are clear, instructive, and a joy to read.

Illustrating Practical Tasks

Part II of the book illustrates the practical tasks that can be performed using Assembly-language programs. There are chapters on how to input and output data efficiently, read a cassette tape written in any format, move large blocks of data, and perform floating-point and integer arithmetic. Three chapters, however, are particularly outstanding. Chapter 15 describes, in great detail, how to use Assembly-language subroutines in conjunction with Basic programs. This chapter culminates in the presentation of a subroutine which allows the user to sort 100 alphanumeric strings in less than two seconds!

Chapters 16 and 17 discuss disk input/output and disk files. Chapter 16 contains a concise explanation, in simple terms, of how a disk is formatted and accessed. It also points out errors in the documentation of TRSDOS. Chapter 17 reveals how to store and retrieve information from seven different types of disk files. This chapter alone is worth the price of the book. Using the information contained in this chapter you can read virtually any disk, even one protected by a password.

On the negative side, a glossary and index are notably absent from the book. Both of these items are important in an introductory guide, since beginners cannot be expected to retain everything they read the first time through. A reader trying to find the definition of "two's complement", for example, must thumb through the book before discovering that the definition is on page 85. Also, there are a number of typographical errors in the book-a minor distraction. Finally, this book is not typeset in the usual manner. Rather than using the easy-to-read typeface found in most books, the author proudly announces that this book was composed and printed using a Diablo Hy-Type I printer with a Model I. The author probably thought that it was a good illustrative example to use a computer to write a book about computers; I found the print hard to read.

Nevertheless, I think this book will prove valuable to TRS-80 owners. It is written specifically for the TRS-80; it takes advantage of the short-cuts and features designed into the '80; and it provides helpful hints of practical importance to programmers.■

The Nature of Computation: An Introduction to Computer Science Ira Pohl and Alan Shaws Computer Science Press Rockville, MD Hardcover, 386 pp. \$16.95

by Joel Benjamin

The Nature of Computation: An Introduction to Computer Science is a rigorous introductory textbook to computer science and is for anyone just beginning in the field.

The authors have used preliminary drafts of this book as the text in college classes over the past ten years. They state their objective is to provide the following:

- 1. A survey of the field;
- 2. Initial literacy of the language and

methods found in computer science, and;

3. A historical, philosophical, and social perspective.

The authors have succeeded admirably in achieving these goals.

Algolic

The book has been organized logically and coherently. First, we are presented with a taste of what programming is like with the use of a machine-independent, high-level language known as Algolic. It is similar to Pascal and is particularly suited to expressing and executing algorithms. A number of well-known algorithms are examined, and we are shown how to express them in Algolic.

An Account of Techniques

We are then treated to an interesting

account of the development of computational techniques from the abacus to the intricacies of the structure of a modern computer. Along the way, number bases, floating point numbers, strings, arrays, Boolean algebra, hardware components and circuits, digital logic, and computer architecture are all presented and explained in a remarkably lucid fashion.

Programming languages and operating systems are then explored. In this section we get an insight into the relationship between high-level, Assembly, and machine languages; the use of compilers, interpreters and assemblers, and the various examples of different languages suited to particular programming needs.

Next, the authors introduce us to the theory of Turing Machines, computability and algorithms.

The book ends very appropriately with a discussion of the social and ethical questions raised by the various ways in which computers are used in our society.

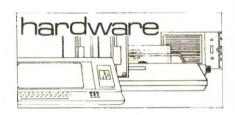

There is a set of comprehensive excercises and questions at the end of each chapter as well as suggestions for additional readings. These aids, along with the comprehensive nature of the text, make *The Nature of Computation* ideal as a textbook in an introductory college course. But it can also be used by an individual who wants a painless and clear introduction to computer science, which can be read on his or her own.

DIP-81 DIP, Inc. Boston, MA \$499

by David Tinis

A side from the computer itself, the single largest purchase a hobbyist makes is a printer. Just one year ago a usable impact printer retailed for at least \$1,000. But that is changing. By flipping through the ads in any of the magazines it's evident that a printer price war is raging. With that in mind, I went out to find a low-cost, reliable, well built printer. I finally settled on the DIP-81. It seemed to offer the best value for the price. The DIP-81 is an impact printer capable of printing 100 characters per second bidirectionally on an 80-character line. It can use rolls, fanfold or single sheets up to 8.5 inches wide. Paper feed is by friction roller only. The normal print mode is a 7 by 7-dot matrix but can be expanded under software control to a 14 by 7 matrix.

The DIP-81 is not a marvel of advanced technology. It uses proven parts to accomplish a simple task—print. The unit is built on a steel chassis to which all subassemblies attach. Covering it is a single-piece shell of durable plastic. The funny bulge on the right covers a cooling fan that directs air over the electronics and the print head. The print mechanism is manufactured by the Two Day Corporation and uses a single ac synchronous motor to drive both the print head and paper feed mechanism. The print head itself is a seven-wire design that has a rated life of 100 million characters. I was already familiar with this print head when I started looking at the DIP-81. The rest of the mechanism is rated for 10 million lines of printing.

DIP Print Samples

Electronically the DIP-81 is just as simple. All components except the power transformer, bridge rectifier and cooling fan are mounted on a single P.C. board. Overseeing operation is an 8035 microprocessor with the control program in a pair of 2708 EPROMs. An 8155 RAM-I/O controller round out the large scale ICs. Toss in a half dozen TTL parts, some voltage regulators and the TIP122 hammer drivers and you have a simple but efficient design. A quick note about the TIP122s: They were chosen because of their ability to drive inductive loads without the need for clamping diodes to suppress the inductive kickback of the print hammers, a sign of good design practice.

A parallel Centronics interface is standard with the unit though a serial RS-232 interface is available on the P.C. board as an option. Interestingly enough, simple conversion instructions are included in the operation and maintenance manual, but conversion by a non-authorized person voids the 90-day warranty.

There are three operator controls and two indicators on the front panel plus the on/off switch on the back panel. From left to right the controls are TOF (top of form), SEL/DESEL (select/deselect) and Line Feed. Since the DIP-81 doesn't have a separate paper feed motor, pressing TOF initiates a series of line feeds. At power-on, the printer assumes the paper is already at top of form. It then counts lines and if a TOF command is encountered, it advances to the next logical top of form and resets the line count. Line Feed initiates a single print cycle during which nothing is printed, although the print head travels across the paper. Again this is a result of using a single motor for all mechanical functions. It also explains why the DIP-81 is a bi-directional printer. You never know

on which side of the printer the print head will start or stop. Having a synchronous motor instead of a more position-precise stepper motor also causes a slight column misalignment during printing. SEL/ DESEL determines if the printer is ready or not, if it is, the red select indicator directly above the SEL/DESEL switch will be on. In the deselected mode you can use the DIP-81's self-test feature. Pressing Line Feed and TOF simultaneously causes the printer to display the 96 ASCII characters it is capable of printing. The final indicator is power-on located directly above Line Feed.

I ordered my DIP-81 with the parallel interface and connecting it to my LNW Expansion Interface was no problem. I did cut line 33, printer chassis ground, to avoid its being connected to signal ground in the expansion interface. The unit powered up and operated properly the first time I tried it. The DIP-81 lists for \$499 but, like all current printers, is being discounted. I got mine for \$395 and have seen it advertised since at \$379. In retrospect I am quite satisfied with my DIP-81. While I wouldn't recommend it for highest quality business applications, I do feel it makes an excellent printer for the personal computer owner.

Home Computer Work Table Computer Roomers, Inc. Dallas, TX \$179.95

by Dan Keen and Dave Dischert

hen microcomputing was "just a hobby", we were content to stick the computer in a back room of the house. But then we became computer-holics, never leaving the machine except to eat, and go to work. So, we centrally located our TRS-80 in the living room.

Now we needed to solve the problem of what to set it on. We have a Daisy Wheel II which develops a lot of torque and requires a table of steady support, preferably one made out of cast iron or concrete. Daisy is also very wide, which makes placement difficult in some areas of the room.

Since the unit was to be placed in a very visible part of the house, it needed to be decorative.

So the criteria for our table was that it had to be firm, well built, be able to provide a home for peripherals, and provide a work space. It had to look nice and most of all, since we are cheapskates, it had to be reasonably priced.

This describes a new computer table from Computer Roomers, Inc. which has a nice walnut wood grain look with black trim.

The unit came in a box and though it was only about three inches deep, it was wide and heavy! (Plan on inviting a friend over the day you expect delivery.) It was packed extremely well, using big pieces of custom cut styrofoam.

We found that the shelf which is at the rear of the table and runs along its entire width is the exact depth of our Shack disk drive as well as a friend's Apple drive, and we would assume most 5-inch disk drives. This shelf (called a video shelf) is a real plus since it gives you more room on which to place items and yet doesn't take up any more space in the room. The video monitor fits well on the shelf also, along

> "We...enjoy our new table."

with four drives and cassette recorder (your monitor can't sit on that interface any longer). Personally, we found this preferable to desks which have a shelf underneath to house only the drives. Frequently we have more than one person sitting at the console, and this table has plenty of leg room.

An open space along the rear allows for cables and wires to be routed neatly out the back.

It's so easy to put together "even a child can do it" . . . well almost. It took about 20 minutes to assemble. They say "no tools needed," but we did need a hammer to tap a few sectors into their locked position. A wide blade screwdriver is required for disassembly.

While the instruction manual pictures the desk with two "wing" extension shelves, it is apparent that only one at a time can be used. We assembled two tables, and both were missing the necessary "shoulder screws" that mount the second side. So, although a left and right wing come with the unit, plan on only using one or the other.

We thoroughly enjoy our new table, but some computerists may find its lack of drawers a slight disadvantage.

UCSD Pascal Compiler FMG Corporation Fort Worth, TX \$250

by Dennis Thurlow

First, will all of you who program 370's for a living, and are only reading this to find out about "little" computers, please wait on the other side of the room?

Now, I did that because those guys would laugh if I called Basic a language because, in fact, it isn't! Basic is a code that must be interpreted by a large machine-language program called (appropriately enough) an interpreter. Usually an editor of some kind is included to help you build the code, make changes if necessary, and save the code to a storage medium.

A real language, on the other hand, is used by a compiler to generate machine code that is directly saved to disk or tape, or automatically executed. Since the system was never meant to be interactive, no editor is included and the program is usually punched onto cards and fed into the computer.

Let me also point out that there are exceptions to the rule. There are Basics that compile, and versions of languages, such as Cobol, that run on interpreters. And then there is Pascal.

The Language

Pascal incorporates all the standard programming features found in most languages, but the syntax is much easier to learn. Example 1 presents a typical Pascal program and Example 2 is the same program in a non-structured format. Both run identically, compile to the same number of bytes, and follow the same syntax rules, as laid out in the syntax tables in Examples 3–5.

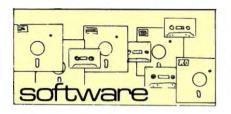

Example 3 indicates that a program must start with the word Program. Any time a word or character appears in a balloon (rounded corners) it must be entered literally. You can see that the word Pro-

PROGRAM TEST (OUTPUT); BEGIN VAR X:INTEGER; REPEAT WRITELN(THE SQUARED = ',SQR(X)); WRITELN(THE SQUARE ROOT OF',X,',SQRT(X)); UNTIL X>100; WRITELN(DONE') END Example 1. gram is in both Examples 1 and 2.

Next an identifier is required. The square corners indicate that options are available and that there is probably another syntax table to define those options. In this case Example 3a is the syntax table for identifiers. In Example 1 the identifier is the word Test.

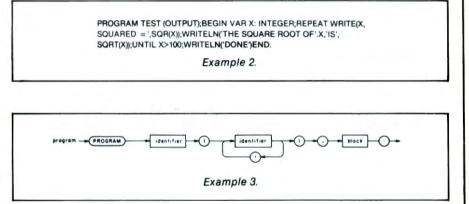

The identifier in parentheses usually defines whether I/O is going to be used. Note that all statements in Pascal end with a semicolon. The program itself ends with a period.

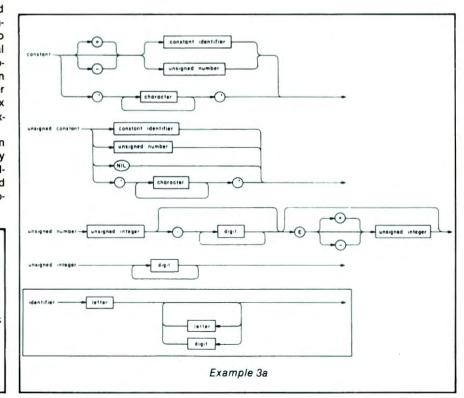

Example 4 is the syntax table for a block. It provides for variable definitions and the procedures used in Examples 1 and 2. To define a statement you must use the syntax table in Example 5. You can

also define procedures and functions that will be used repeatedly.

Structuring is important when you develop large programs that someone else may have to maintain, or that take so long to write you forget what was going on in the different sections. Professional programmers, in particular, tend to favor structured programming, particularly

when it is this easy!

The FMG package is on three disks. The modules are arranged to allow for maximum free space on the disk, which is usually about 30K. Interaction with the user is achieved with a command prompt line upon boot up. From this the user can call up:

1. L(ink): The linker grafts routines from the System Library to the program that is to be compiled. You may also link to machine-language routines that you have written yourself! The advantage of this is that only those routines that are necessary to run the program are linked. This results in a tremendous saving of space and time.

2. C(omp): The compiler saves the compiled program to disk.

3. X(ecute): Execute a program that is already linked and compiled.

4. R(un): Compiles a program that has been linked, and runs it instead of saving it.

5. F(ile): The filer handles all the disk I/O that a DOS would take care of in othe interactive systems. This is one of th two routines added by UCSD to make Pascal interactive.

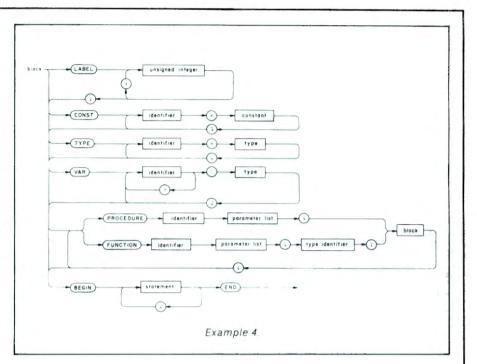

6. E(dit): This editor is specifically for constructing Pascal code. By inserting a different disk you could call the editor for the assembler, also supplied. The keyboard is debounced, but is a little slow.

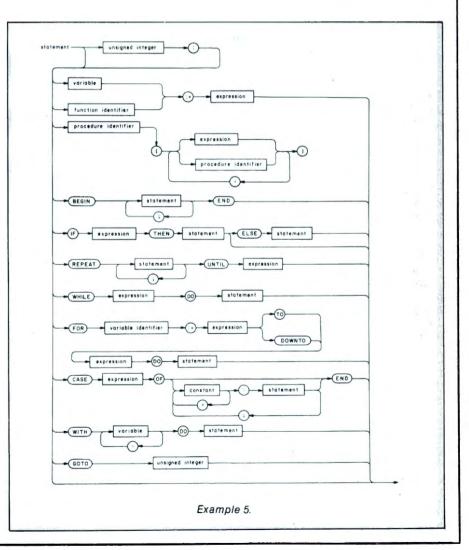

All the modules work very well, and generate nice, compact code, compared to Microsoft's Basic compiler, for instance. The program in Example 1 takes 1407 bytes of code when compiled and linked. This may appear to be quite a bit when compared to the 198 bytes of Pascal code, but remember that most the overhead is constant, and as your programs get longer, the overhead gets less significant. And it's still quite a savings over the 14K the same program takes compiled with Microsoft's Basic compiler.

The Documentation

The sore point of the package is the documentation. The manual is a 284-page looseleaf folder. It was written to supplement a teacher's instruction, and does *not* teach you Pascal. You must know Pascal or be learning it from another text (or teacher) to use this compiler.

Another problem is that the manual is the same one used with the PDP-11 and CP/M versions of the package. Most of the examples and tables are useless unless you keep flipping back to the additions in the front of the book. And, lest you get your hopes up, let me say that there are only seven of those pages.■

THE ASSEMBLY LINE by William Barden, Jr.

"Look on these next two columns as a sort of "Cliff Notes" about the book—a supplement to those six pages."

'm currently reading Going Ahead With Extended Color Basic. I was even amused by the drawings of the Color Computer with legs, the result of inbreeding in the Radio Shack computer line. Everything was fine until I got to page 144. Even though it was an exciting plot, the next six pages took several days to get through. Look upon these next two columns, then, as a sort of "Cliff Notes" about the book—one that you can read to supplement those six pages.

These columns are meant to give Color Computer assembly language users some hope. Model I and III users may wish to read them to see how the 6809 compares to the Z80.

First let me say that the Extended Col-

or Basic book is very well written— Jonathan Ericson at Radio Shack deserves credit. The book is geared to the first time user, and it's very difficult to present detailed machine language information in six pages.

We'll start from the ground up, so the first-time Basic programmer may be able to get into machine language programming with a minimum of grief. Experienced programmers, bear with me for a while.

6809 Machine Language

The Color Computer uses the 6809 microprocessor which is an upgrade of the popular 6800. Both microprocessors are manufactured by Motorola. The 6809

instructions include the 6800 instructions as a subset on an assembly language level.

This means that both instruction sets would have similar instruction mnemonics, such as CLRA, for Clear A, but that the binary value for instructions might be different between the two. One important implication of this is that you can't pick up the *machine code* for a 6800 program and run it on the Color Computer—it probably won't work. You might be able to pick up the assembly-language code for a 6800 program, however, feed it into the Color Computer assembler, and get resulting *object code* that works.

A sample of 6809 machine language is shown in Fig. 1. This happens to be a short segment of code that will divide the contents of a 16-bit value by two. The code is in hexadecimal, which is a shorthand way of representing binary data. One hexadecimal digit represents four binary digits, or bits. Two hexadecimal digits represents two groups of four binary digits.

The basic number of bits in the Color Computer and 6809 is eight, constituting one byte. All memory and CPU operations generally transfer data and perform operations on eight bits or one byte of data. Eight bits can hold binary values of 00000000 through 11111111, the decimal value of 0 through 255, or the hexadecimal value of \$00 through \$FF. The prefix \$ is used in the 6809 and other microprocessors to indicate that the following data is in hexadecimal. Basic uses &H in lieu of the \$.

If you're hazy about binary and hexadecimal, you'll have a tough time following anything from this point. Proceed as follows: Go to a chapter on binary and hexadecimal in any basic computer text and practice some conversions between binary, decimal, and hexadecimal. You don't have to spend hours in practice, but get a nodding familiarity.

Back to the machine language ... A machine language instruction consists of one, two, three, or four bytes of data that the 6809 will recognize as an instruction. The instructions will range from

such simple operations as putting a zero into a CPU register, on up to a multiply. The instructions from Fig. 1 are shown in Fig. 2 with the operations they represent.

Assembly Language for the 6809

Fig. 2 shows the machine-language codes on the left, and the equivalent assembly on the right. The *mnemonics* are just what they sound like (from Mnemosyne, the Greek goddess of computer writers)—abbreviations for 6809 instructions. For example, it's much easier to write LDX instead of Load the X Register.

The mnemonics for the instructions are called *op codes*, short for operation codes and are in the second column of the assembly language. The third column figure is the *operand* column. Certain instructions require no operands, while others require several operands. To transfer data from a memory location to the X register, for example, an LDX \$2000 would have the mnemonic LDX and an operand of \$2000.

The first column of the assembly language represents a label field. The location of an instruction might be labeled with a label such as LOOP and subsequent instructions could refer to the location by the label, rather than an absolute address, such as BEQ LOOP, which would be a "Branch on Equal to location LOOP."

The last column holds applicable comments.

The portion of the figure representing the labels, op codes, operands, and comments field in Fig. 2 is the assembly language. The portion on the left with the hexadecimal values is the machine language. The assembly language code, called the *source code* is translated into the proper machine language by an *assembler* program for the Color Computer. (By the time you read this, the Radio Shack Color Computer assembler should be out.) The assembler decodes the symbols into the proper machine language instructions.

Not only is it possible to translate from assembly language into machine language, but it's possible to go the other way, from machine language into assembly language. A *disassembler* program will examine a machine language program and produce the mnemonics and operands. There are several disassemblers available currently for the Color Computer.

Hand Assembling

In the remainder of this discussion we'll be using examples of machine language rather than assembly language. It is possible to bypass an assembly process by doing hand conversion of what looks like assembly language code. An example is shown in Fig. 3. The instructions are first written down with their op codes and operands. Next, each instruction is "roughed out" as far as the number of bytes in the instruction. Next, the op code values are filled in, followed by the values for the operands.

This process is not a simple one. It requires a good book on the 6809 instruction set, and some study about the CPU registers, instructions, and addressing modes. The bible for this instruction is not Barden, or Leventhal, or Warren, but Motorola. Motorola's *MC6809 Preliminary Programming Manual* is available from Motorola Semiconductor Products Inc., 3501 Ed Bluestein Blvd., Austin, TX 78721.

Next let's make certain we know something about the internal architecture of the 6809. The 6809 chip has a number of *registers*. A register is nothing more than an eight or 16-bit memory location that is located in the CPU, rather than in RAM memory.

The registers are assigned names that are related to their function. Fig. 4 shows the 6809 registers that are accessible to the programmer. There are other registers, of course, but we'll leave an excruciatingly detailed account of the internal operation of the memory fetch cycle and the associated registers to Adam Osbourne.

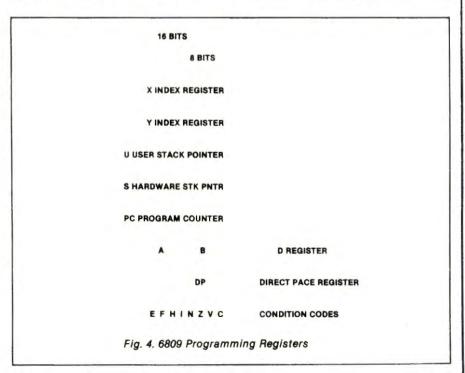

6809 Registers

The A and B registers are eight-bit registers that hold the results of arithmetical, logical, and other types of operations. They are called accumulators, and are used to process data by adds, subtracts, shifts, exclusive ORs, and so forth. A and B can be lumped together to form one 16-bit register called the D register to allow operations on 16 bits at a time.

The PC is the Program Counter register. It points to the next instruction byte. For a machine language instruction

THE ASSEMBLY LINE

of three bytes, the PC will increment three times as the three machine language bytes are assembled in the CPU. This is the fetch cycle. At the end of the fetch cycle, the PC points to the next memory location, which must hold another instruction.

At the end of the fetch cycle, the assembled instruction is executed. This might involve reading an eight or 16-bit operand from memory and adding it to the A register, loading the B register with the contents of the A register, or many other operations. The fetch and execute cycles are executed automatically with each instruction-for the time being, simply forget about the two separate parts of an instruction. About the only consideration is that more involved instructions take longer to execute; this is sometimes a factor when you're figuring out timing loops or trying to speed up programs.

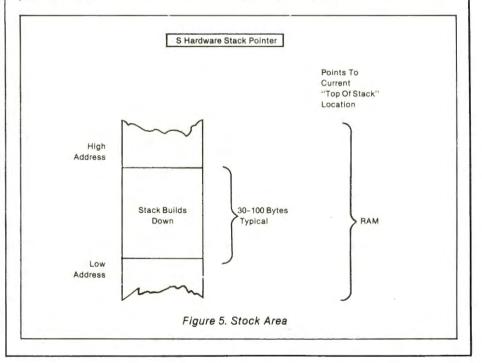

The S, or Hardware Stack Pointer, points to the stack area of memory. Stack can be located just about anywhere the programmer desires (ROM is a bad choice). Usually 100 bytes of stack is sufficient. The stack (see Fig. 5) is an area used to store return addresses for subroutine calls, temporary data from the CPU registers, or interrupt addresses. Branching to a subroutine saves the return address on the stack, for example, and a subsequent RTS, or Return from Subroutine, instruction retrieves the return address from the stack. The stack builds down from high memory to low memory as addresses or data is pushed onto it.

The U register, or User Stack, is a second stack pointer that points to a user-specified stack. The S register is a hardware stack, since it is related to the built-in hardware functions that store data in the area pointed to by S, such as "branching to subroutines." The U stack area may be redefined constantly for the programmer's convenience.

The X and Y registers are *index* registers. They are used to point to the location of memory operands. Operands beyond or prior to the pointer may then be easily accessed by an indexed-type instruction, such as "LDX + 20,X", which loads the contents of a location pointed to by the index register *plus* 20 locations. The X and Y registers are continually loaded with new values as new blocks of data are accessed.

The DP, or Direct Page register, is used to define *pages* of 256 bytes. This is an optional addressing mode that allows shorter instructions (using less memory and time). We won't be using this mode in the examples here.

The Condition Code register is an eight-bit register that is really a conglomeration of eight bits. These condition codes are set (1) or reset (0) according to the actions of certain instructions. The Z condition code, for example, is set if the result of an add (and many other instructions) is a zero. The condition codes may be tested by conditional jumps and branches that follow the operations. This is the main way of altering the path of a program. A "BEQ \$2000", for example, branches to an instruction at location 2000 hex if the result of the last operation

THE ASSEMBLY LINE

was zero; if the result was not zero, the next instruction after the BEQ is executed.

On to the Six Pages

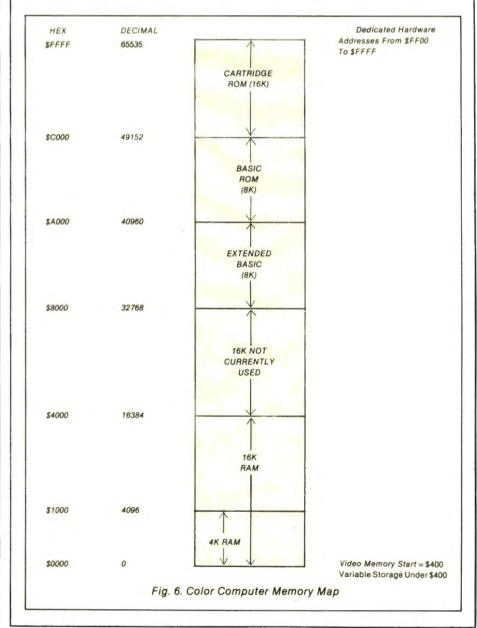

Well, we're finally there: The first machine language related Basic command to consider is Clear. The format of Clear is: CLEAR XX,YYYYY.

The XX represents the decimal number of bytes to reserve for string storage. The YYYYY represents the area of memory to be reserved for machine language programs. Typically, a "Clear 100,YYYYY" would be fine, unless your program has a lot of string storage. The YYYYY is a number that protects RAM beyond a certain point. For our purposes we'll use a YYYYY of \$2000, which is 8191 decimal. This will prevent Basic from using anything above memory location 8191 for stack or string storage. This leaves about 379 bytes of memory for Basic programs and variables, which is somewhat on the sparse side but enough for our purposes.

A memory map for the Color Computer is shown in Fig. 6. Note that Color Basic is above the Extended Color Basic, that video memory starts at \$400, and that page 0, 1, 2, and 3 is used for variable storage. Also interesting is the fact that the Color Computer uses high-memory addresses to address various functions for graphics functions, sound generation, serial data, and the like.

Stack Area

We won't explicitly set the S register to

TRS 80 is a Trademark of Tandy Corp

THE ASSEMBLY LINE

a stack area in the following examples. It is set in Basic, and points to a 30-byte stack area. Unless you're doing a lot of processing, it's not necessary to redefine it by a load of the stack pointer in your program.

The DEFUSRn Command

The next machine language related Basic command we'll tackle is DEFUSRn. DEFUSRn is unsophisticated; it simply tells the Basic interpreter where a user machine language subroutine will be located. The n may be any decimal value from zero through nine, allowing for 10 unique machine language subroutines.

Suppose we had a machine language subroutine for division at location \$2000 (8192 decimal) and another to find the integer solutions to $A^{N} + B^{N} = C^{N}$ (see Fermat's last theorem) at location \$2100 (8448 decimal). We could define the lo-

"I was amused by the Color Computer with legs, a result of inbreeding "

cations by: 100 DEFUSR0 = & H2000: DEFUSR1 = & H2100.

From that point on in the Basic program, the ID number of zero would be associated with the divide routine and the ID number of one with the Fermat processing. The ID numbers would be used in conjunction with a USRn call to call the subroutines as required from the Basic program. For example, 1300 A = USR1 (0) would call the Fermat processing routine. The machine code would be entered by USR1 in statement 1300, and, after processing was done, a return would be automatically made to the Basic statement following line 1300.

This is probably a good point to determine what type of machine language subroutines should be called: any type. Whatever proves useful from a Basic program-subroutines that are often called and that can do things faster than the equivalent Basic code, such as sorts of strings, serial I/O, or number crunching. Furthermore, the subroutines may be any size, from two or three instructions, up to thousands. In addition, the subroutines may even be ROM subroutines

"I BOUGHT IT" "My biggest loss of programming time using Snappware's AUTOMAP and AUTOFILE is spent inserting my diskette."

When working with direct files or creating a formatted screen. Autofile and Automap are indispensible aids.

Autofile is designed to automate for the BASIC programmer the task of moving data elements to and from a direct file. Pre viously, this was a time consuming chore because the FIELDed variables may not be directly referenced by user logic. The FIELD statement was eliminated, thereby relieving you of the guessing game as to where the FIELDed variable is. In addition, the CHR\$ and the ASC function references are performed automatically. The software, when installed, becomes part of your BASIC interpreter providing the enhancements without additional memory or disk space.

Automap is designed to automate for the BASIC programmer the task of presenting information on the video display and accepting information from the keyboard operator. The software consists of two main components: the OFF-LINE COMPONENT used to describe to the system the screen formats and the ON-LINE COM-PONENT from within your BASIC program to initialize a screen. send data to the video display and receive data from the keyboard operator. This facility when installed, becomes part of your BASIC interpreter providing the enhancements without requiring any additional memory or disk space.

Both products compliment one another and if used in conjunction can save up to 75% of your programming time.

If you consider your programming time to be worth money, call us and let us show you how to get more of it.

THE ASSEMBLY LINE

in Basic ROM that are convenient. One example of this is the cassette subroutines in ROM that allow the user to construct his own cassette tape files. Larger programs that operate only in machine language can be loaded and executed by the CLOADM command, followed by EXEC. We'll give these only a passing mention in this article, as they are usually large dedicated assembly language programs.

The Simplest USR Call

We're finally at a "real" USR call. The Basic code shown in Program Listing 1 defines the simplest call to a machine language subroutine. The subroutine in this case consists of a single instruction, an RTS, or "Return From Subroutine," shown in Fig. 7. The RTS must terminate every machine language subroutine. It POPs the return address of the Basic USR processing code from the hardware stack and causes a return to Basic. All we've really done here is define a machine language subroutine at \$A936 and call it by the USR0. The subroutine is repeatedly called by a GOTO 200.

The call was made with two dummy arguments, zero and A. The argument of

	200	A = USRO) = &HA936	
	300	l=l+1	(0)	
		PRINTI		
	500	GOTO 20	0	
Program Call.	Lis	ting 1.	Simples	st USRn
	200	DEFUSR A = USR0 GOTO 20		
Program Subrouti		ting 2.	Calling	a ROM
A931 A934	8C 23	05FF F9	CMPX BLS	#1535 \$A92F

	Sina	le RTS		
	-	uction		
	At Lo	ocation		
	\$A93	6		
F1-	-		Subrout	

zero within the parentheses is the input argument. A pointer to its location is passed to the subroutine. The argument of A is the output argument. A possible value from the subroutine is returned in variable A. Both these arguments are dummies in this case, as the subroutine does not require an operand to be passed to it; neither does it return an operand. Use zero for the input and any variable for the output argument as dummies; if you don't, you'll get a nasty message from the Basic interpreter.

Multiple USRn Calls

Next, we'll tackle two USRn calls. Program Listing 2 is a Basic program that defines two machine language subroutines, one at \$A936 and another at \$A7D7. Both are one-instruction subroutines consisting of RTS instructions in ROM. Here again, the locations are defined, and repetitive calls are made to each subroutine.

A ROM Subroutine Call

Program Listing 3 shows a call to a ROM subroutine at location \$A928. From a disassembly, I found that this code clears the screen. The call with two dummy arguments repetitively executes the machine language code to clear the screen.

Passing Arguments to the Subroutine

Those of you making snide noises about simple writers, you're about to get your comeuppance...

Let's look at how an argument is passed to a machine language subroutine. Two sentences in the Extended Color manual have implications that Adam Osbourne couldn't explain even

	Hex	Decimal
Code	Machine Code	Machine Code
STA \$2000	87 2000	183,32,0,
STX \$2001	BF 2001	191,32,1,

4	00	PRINT	1			
5	00	GOTO	200			
Program Calls	L	isting	3.	Multiple	USRn	

THE ASSEMBLY LINE

with timing charts ...

According to the manual, the USRn call results in the A register being loaded with a code for the type of argument and the X register being loaded with a pointer to something called a "floating-point accumulator." What does this mean? How did we suddenly go from no arguments to floating point?

To see what is happening, we'll use our first hand-assembled program, shown in Fig. 8. This three-instruction program stores the contents of the A register into location \$2000 and the contents of the X register into locations \$2001 and \$2002. The last instruction is the ubiguitous RTS. We can use this gem to see how A and X look upon entry to the machine language program. The Basic program in Program Listing 4 shows the approach.

The values for the three instructions are first converted to decimal, a total of seven bytes. The code will occupy RAM locations \$2003 through \$2009. The Basic statements use a data list of the values, a Read and a POKE to move the values from the data list to RAM. Next, a call is made by USRO(0). This call executes the three instructions, which store A and X. The last three Basic statements print location \$2000 (A), and locations \$2001 and \$2002 (X).

When this program is run, we see a display of 0, 0, and 79, indicating that the A register held 0 on entry and that X held 0,79, or 79. (The first value for X is the upper eight bits, while the second is the lower eight bits; together they constitute the entire 16 bits of X.)

The 0 in A indicates a numeric arqument, according to the Extended Basic manual. The 79 is a "pointer to the Floating-Point Accumulator which contains the argument." What's in location 79 and what is its format?

We'll answer these questions and more when we continue with the "Saga of the Six Pages" in next month's column. Stay tuned to 80 Micro.

"I BOUGHT IT" "My biggest loss of programming time using Snappware's EXTENDED BASIC is spent inserting my diskette." SCOTT ADAMS PRES. OF ADVENTURE INTI

Reduce your programming time up to 75% using Snappwares' EXTENDED BASIC. The program is written entirely in machine language for Super Fast execution and is fully integrated into the Model II BASIC interpreter, requiring no user memory and no user disk space. Here are just some of the ways EXTENDED BASIC can make your programming task easier:

- Quick way to recover BASIC program following a New, System or Accidental re-boot.
- Single character abbreviations for the most frequently used commands.
 - Six single key stroke commands to list the first, last, previous, next or current program line. Even edit current line.
 - A powerful cross reference facility with output to display. and /or printer.
- Ability to trace a variable through the code.
- Determine easily if a variable is in use.
- Permits programmer to display and or print the value of any or all program variables.
- identifies the variable type for all variables.
- Lists each element of any array separately.
- Program line renumbering facilities allowing for specification of an upper limit of the block of lines to be renumbered, relocation of renumbered blocks of code and duplication of blocks of code.
- Cross reference facility for key words and character strings including global replacement of key words.
- Compresses your BASIC program to an absolute minimum by removing extraneous information.
- Merge lines
- Deletes statements that could not be executed

If you consider your programming time to be worth money, call us and let us show you how to get more of it.

Time saving power at your fingertips. CALL TOLL FREE: 1-800-543-4628 OHIO RESIDENTS CALL COLLECT: (513) 891-4496 3719 Mantell Cinti., Ohio 45236

EDUCATION 80

"Most of us have wasted a lot of time reloading programs because we did not follow instructions."

ow many times have your students loaded programs and had them crash because they forgot to set the memory size? How many times have you done it? I suspect that most of us have wasted a lot of time reloading programs because we did not follow instructions carefully.

All these crashes and reloads are unnecessary. The program itself can set the memory size as soon as it is run. Unfortunately, many programmers have not learned how it is done.

If you are not putting this feature in your programs, these directions will show you how to do so. You can even go back and add "auto mem set" to your old programs and to the programs of others, as well.

Auto Mem Set

This technique works in Level II and in Model III Basic. I have also used it in two versions of TRSDOS and suspect that it will work in all versions. If you use another DOS, try it carefully before you change all your programs just in case your DOS modifies the memory locations used.

Memory locations 16561 and 16562 contain the numbers which protect memory; that is, they set the memory size. All the program has to do is POKE the proper numbers into those places. Location 16561 holds the low-order byte and 16562, the high-order byte. Let's run through a specific example.

Suppose your program requires that memory size be set at 32699. You would go through the following steps:

1. Subtract two from the required size and call the result X.

32699 - 2 = 32697 X = 32697

 Divide X by 256 and discard any remainder (use only the whole number part of the answer). This is the highorder byte.

> 32697 / 256 = 127.723 High Order Byte = 127

 Multiply the high order byte by 256 and subtract the result from X. This is the low-order byte.

 $32697 - (127 \times 256) = 185$ Low Order Byte = 185

 Insert the following statement at the beginning of your program:

3 POKE 16561, 185 . POKE 16562, 127

By following these steps, the memory size is set at 32699 just as though you had answered the prompt message with that number. Of course, the memory is not set until the program is run.

Did you notice the low line number in step four? It was made low for a reason. The memory size should be set at the beginning of the program—before any other statements are executed (except for remarks). If you set (or change) the memory size after the program is under way, the memory allocation will be wrong for program operation. What happens is

"You might jump into areas the program has set aside..."

that you might jump into areas that the program has set aside for the stacks or variable storage or something else. This would cause the program to crash.

So, set the memory size first. The line number above 3 will remind you to do that. I would have numbered it "1" but most of us use the first line or two for remarks which identify the program.

Before you change your programs over, this technique may save you some time, too. Suppose you (or a student) begin loading a program and suddenly realize that the memory should have been set. All you have to do is to figure the high and low bytes as above and then execute the statement in step four in the immediate mode before the program is run. The size will be set just as though the statement were in the program.

Chain-Loading Programs

At this time of the year both students and faculty are settled down from the initial flurry of getting school started. This is the time, too, when it dawns on other students and faculty that it might be prudent to learn something about your computer operation.

Often their first question is, "What is the thing good for?" You should have a special program sampler prepared just for such occasions. Sampler—that's what I call a program that consists of several demonstration programs. Here is how you can make one.

The idea is to select a few programs which show off your computer. This might include games, graphic displays or instructional programs.

Next, write a Menu Program which will fill two functions: it allows the operator to choose among the programs you selected, and then it automatically calls up the selected program.

Finally, put all the programs on the tape or disk with the Menu Program and you are ready to go. Let's look at the make-up of that first program.

The Menu Program

The Menu Program is straightforward. It presents a list of the available programs and allows the operator to select one by entering the corresponding number. There are several ways to get the selected program into the computer but I will show you the simplest method. If you use the standard cassette, it would go something like this:

....list and selection....number selected is in variable A.... 250 ON A GOTO 260, 270, 280, 290, 300, etc 260 CLOAD "A" 270 CLOAD "B" 280 CLOAD "C" 290 ...etc...

It is evident that programs A, B, C and so on must be properly labeled when saved and they must follow the Menu Program on the tape. Then, too, the tape must be rewound after each selected program has been loaded.

If you are using the Exatron Stringy-Floppy, the appropriate statement would be: 250 @ LOAD A + 1. The advantage to the ESF is its fast load time and the fact that it does not have to be rewound. However, you should provide enough space to hold the longest program (see the manual for details). If you are using Disk Basic, your statements would look like this:

250 ON A GOTO 260, 270, 280,..... 260 RUN "STORYBOOK" 270 RUN "MATH I" 280

Of course, both the cassette and disk systems offer neater ways to accomplish this programming, but these are the easiest to understand. You might experiment to discover shorter methods with your system.

I have put together several disks which follow this plan—one for science, one for math, one for language arts, and so on. Since making them, life has been easier. I simply put in the appropriate disk and say, "Try it for yourself."

Reader Inquiry

Bjarne Madsen in Saksatchewan, Canada, leads a project which developed a curriculum for computer awareness and programming techniques at the junior high school level. His course has proved very successful in classroom tests.

BJ is quite interested in corresponding with others who may be involved in a similar effort. The exchange of ideas could be beneficial to both parties. If you have worked in this area, send me your name and I'll pass it along to BJ.

In fact, if you are interested in communicating with others in any area of interest, send me your name, complete address, and the areas of interest. Include a statement to the effect that you would like that information published and, as space permits, I'll put it in Education 80 so that others can get in touch with you.

New Address

This summer I took time out to move across the state. For six weeks or so I was out of touch with everything except boxes to pack and unpack. I don't know if I'll ever catch up with what happened in the world of computers. (I have caught up with the new Model III TRSDOS 1.3 which offers significant improvements on an already good 1.2 version.)

However, I am happy to report that my computers made the trip in fine shape—not even a slight hiccup when I finally got settled enough to hook all the pieces together and plug them in. So much for my fears of horrendous repair bills!

My new address is 6 Darl Avenue, Colonial Beach, VA 22443. Of course, you may write me through 80 Microcomputing. Either way, please enclose a selfaddressed, stamped envelope and I'll get back to you when time permits. ■ "Ay biggest loss of programming time using Snappware's EXTENDED BUILT IN FUNCTIONS is spent inserting my diskette."

Snappwares' EXTENDED BUILT IN FUNCTIONS is a collection of much needed additions to the Model II BASIC interpreter which greatly extends its convenience and utility. The following features become a part of your BASIC language and provide the enhancements without requiring any additional memory or disk space. The heart of our EXTENDED BUILT IN FUNCTIONS is an in-memory sort routine, guaranteed to be the fastest general in-memory sort on the market, or your money back. Along with this, you also receive these EXTENDED BUILT IN FUNCTIONS:

VISI

3719 Mantell

Cinti., Ohio 45236

SOAPPLICATIONS by Dennis Kitsz

Way back in the early days of 80 Microcomputing, I created a machinelanguage monitor called Babybug. It was short, written in Basic, and sparked with a large and continuing reader response. Since that time, many excellent programs for examining and modifying TRS-80 memory have appeared, and some interesting software is beginning to be offered for the Model III and the Color Computer as well.

This month I'd like to present new versions of the original.Babybug: a condensed and improved Model I or III program, plus versions for Color Basic and Extended Color Basic. Once again, they are written entirely in Basic, yet consume small amounts of memory. Before turning to the programs, I'd like to explain what a machine language monitor is, how it is used, talk about entry and display in hexadecimal numbering, and in passing describe the process of packing information into integers.

A Window into Memory

At some point in the life of every programmer-amateur or professionalcomes the desire to have programs perform faster or use less memory. There also comes creeping the need to understand what makes the computer tick, why protected memory is sometimes necessary, and maybe just what kind of software is hidden inside that anonymous box. It's that Something which gives the system life, makes it say "OK" when it understands you and "?SN ERROR" when it doesn't.

Small computers are made up of several classes of black boxes which compose a computer when connected together. In its purest form, the computer we know consists of a general-purpose, simple-minded calculator—the central processing unit (CPU). The CPU is connected to one or more blocks of temporary or fixed storage/instruction area, its memory. Finally, communication with the real world is achieved with input/output (I/O) devices.

The Babybug machine-language monitor is concerned with the contents of read/write memory—that is, memory which may be examined or changed by the CPU. It can also be used to examine permanent (read-only) memory, in order to see what the CPU follows to perform its work in Basic. With a monitor, I can ask the computer to tell me what is found at its memory location 0 or 100 or 24576 or 65500. In the Model I, if I examine location 01 will find the value 243; if I examine location 100, chances are the value 251 will turn up. Both 0 and 100 are in permanent, read-only memory (ROM). On the other hand, locations 0 and 100 are in temporary memory in the Color Computer, holding the values 0 and 171 when Basic is in operation. Model I locations 24576 or 65500 may reveal anything, since they are read/write memory (also called random-access memory, or RAM)-whatever the computer last placed there. In the Color Computer, 24576 is read-only memory, and 65500 is part of I/O memory. With the Babybug machine-language monitor, I can read memory and change its contents at will.

What is the machine language that Babybug monitors? Since the information stored in any spot in memory can be thought of as instructions intended for the CPU's internal mechanism, causing it to respond according to a predetermined pattern, such memory contents are called machine language, or machine code. Throughout this magazine, you will find listings written in Basic, but other software is presented in rigorous-looking listings for the Editor/Assembler. This is assembly language, merely a convenient form of producing numerical machine instructions using English-sounding names instead of numbers alone.

The basics of machine and assembly programming have been presented in this column before (see especially March 1981), in Bill Barden's monthly Assembly Line column, as well as in many other fine articles. These fundamentals won't be repeated here, but I would like to explain why so often you will find machine code used in this column, and why nondecimal notation can be very revealing when programming at the machine level—as well as in sophisticated Basic.

Computers are nothing more than an array of fast on-off toggle switches, which means if you learn to read the toggle switches, you know exactly what your computer is doing. For example, in May I presented a Micro Front Panel construction project. It's a bank of 24 LEDs which flash a binary value according to the current memory location the computer is using. It displays both the location (address) and the information (data). Several people have written to me asking what good it is, and I reply with an example: when programs seem to get lost, there's practically no way to know whether they are truly lost, merely involved in some time-consuming process, or hung up in a minor program glitch.

Something peculiar happened when I tried to load one disk. The familiar noises took place, but then everything just stopped. I pressed the reset button again, the system reacted normally, but then just stopped. I glanced down at my Micro Front Panel, which read:

L	LSB	MSB	DATA	t
1	0000 0000	0100 0010	0000 0000	3

It told me that my computer stopped writing data at binary address 0100 0010 0000 0000 (which translates to hexadecimal address 4200) and the data it wrote there was 00. I happen to know that 4200 is where the disk's bootstrap load routine is placed in memory, so I learned that the bootstrap loader was never written.

With the front panel I can also observe that the machine is still working when it pauses during a long program and will not respond to the Break key. Those of you whose programs have been trapped in seemingly interminable string sorts (where garbage collection is in progress) can be reassured that there is activity even though the machine seems hung.

My point? Only that there is no way to know exactly where a machine is hung (and what to do about it) unless you can decipher binary numbers.

If that's too esoteric a notion, try this simpler one from the realm of Basic: By using a *single integer*, you want to find out whether a person on your mailing list (a) has one of up to eight special skills; (b) was originally contacted through one of eight possible methods; (c) responded to one of eight mailings; (d) attended the last meeting; (e) was contacted by phone; (f) paid the most recent dues; (g) registered for an upcoming seminar; (h) participated in an event; and (i) turned in a survey form. Can you do it? In binary, it's possible.

Data Packing is Binary

Program Listing 1 is a possible solution to that question, drawn from a larger program. It requires an understanding of the binary consequences of some integer action in the computer, and also demands knowledge of the logical functions (AND, OR). Although this section of the program by itself seems lengthy, the resulting information is only *one* integer, meaning it can be stored in your mailing list or other data file as an economical single integer—just two bytes of memory or file space!

Here's a look at the byte the program starts with, represented by integer Q: 0000 0000 0000 0000. In the TRS-80, the leftmost binary digit (bit) is reserved for the number's sign. Zero defines a positive integer, one defines a negative integer. Since coded information containing a minus sign might look strange, I've discarded the leftmost bit in this scheme, leaving: (0)000 0000 0000.

Defining the arrangement of information to be stored in the two-byte integer is arbitrary. In the sample listing, there are eight choices for the first input (lines 150 to 280 in Listing 1), so I reserved the leftmost three bits for the response. Why only three bits for eight choices? Because there are eight possible combinations of these three bits: 000, 001, 010, 011, 100, 101, 110, and 111. Likewise, the second input (lines 310 to 390) can allow eight possible choices, as can the third input (lines 420 to 550). The remaining questions are yes or no responses, meaning only a single bit need be used for each (1 = yes, 0 = no). The result is a positive integer with its bits divided as in Table 1.

Now, the bits themselves have to be made accessible to us, which means it's essential to know the value of each bit in the integer. Since this is binary numbering, these are simply powers of two. Simply, I said? Sure. In decimal, the numbers are ranked according to powers of 10, which in elementary school was referred to as the "one's place," the "ten's place," the "hundred's place," etc. In binary, the numbers are still called out by their places, except that they would be called the "one's place," "two's place," "four's place," "eight's place," and so on.

That breaks the binary integer up as shown in Table 2.

Snappware Goes On Trial! You Be The Judge!

Snappware knows your programming time is valuable.

That's why we are offering a trial package that will cut your programming time up to 75%. This unprecedented offer allows you to judge for yourself the value of our software using *your* hardware at *your* convenience. Our four best selling products: EXTENDED BASIC. EXTENDED BUILT IN FUNCTIONS. AUTOMAP and AUTOFILE, are available to you on a trial basis for only \$50.00 for the model II and \$35.00 for the Model III. We're convinced that after you see how well our software helps you perform programming tasks. you will purchase them like thousands of others have. Our trial package consists of a master diskette which may be used to create one working copy. Your purchase of any software Snappware sells.

If for any reason you are not satisfied, just return the trial diskette and we will refund your money, no questions asked. With an unconditional guarantee like this, you can't lose.

Call our toll free number 800-543-4268 to put us on trial. We're sure your verdict will be: Snappware saves you time and money.

> Model II Trial Package \$50.00 Model III Trial Package \$35.00

Time saving power at your fingertips. CALL TOLL FREE: **1-800-543-4628** OHIO RESIDENTS CALL COLLECT: (513) 891-4496 3719 Mantell Cinti.. Ohio 45236

80 APPLICATIONS

Turn to line 300 in Listing 1, particularly the command $A = (A-1) \times 4096$. Notice that the variable A was set to be the numerical result of the input from choices one through eight, in lines 170 to 240. Since the bit patterns to be used to represent these choices run from 000 to 111 (decimal 0 to 7), the value of A must be decreased by one to force it to be within the range 0 to 7. That's the easy part.

The upper three bits of the integer are

going to be used to store variable A; those upper three bits are the 16384's place, the 8192's place, and the 4096's place. Table 3 is a chart of the possible combinations.

With this in mind, you can see how line 300 creates the upper part of the integer out of this pattern of eight choices by multiplying by 4096. The final command in the line is Q = Q OR A. Again, this is visualized in binary, since logical functions AND, OR, and NOT operate on

binary digits. Here's what happens, assuming choice 8 was selected:

Qatstart	=	000 0000 0000 0000
A is selected	=	111 0000 0000 0000
Q OR A funct	ion	******
Result	=	111 0000 0000 0000

....

Remember that the OR function specifies that if either bit X or bit Y (or both) is 1, then the result will be 1. The reason for using the OR function here is to leave the original bits untouched while setting (changing to 1) the bits that are needed to produce a packed byte. Turn to line 410 to see how another group of bits is packed into integer Q. Again, the first part of the command $A = (A-1) \times 512$ moves variable A from its original input range of 1 to 8 down to the range of 0 to 7, because three bits are being reserved in the integer byte (000 to 111) with decimal values from 0 to 7.

The response bits for this input fall (referring to the binary "place" chart) in the 512's, 1024's, and 2048's place. Likewise, the patterns appear as in Table 4.

All are multiples of 512, so the command $A = (A-1) \times 512$ sets up the correct bits. In this case, assume that the user's choice was number 6, resulting in a bit pattern of 101 in the appropriate integer's positions. The OR function is used again in line 410, but recall that Q already has been assigned a value in line 300:

Q new value	-	111	0000	0000	0000	
A now selected	=	000	1010	0000	0000	
Q OR A function						
New Q result	-	111	1010	0000	0000	

What is the resulting Q at this point? You can calculate it by adding the sum of the powers of two, as above, and you will discover the integer is now 31232. Or, more simply, you can hit the Break key and enter the command: PRINT Q. 31232 will be the result.

The yes or no questions are simpler. If the answer to a question is yes, its respective bit is set to 1. If the answer is no, that bit is set to 0. The answers to the six questions in this example are packed into integer Q in lines 610-620, 660-670, 710-720, 860-770,810-820, and 860-870. For example, assuming a yes answer to question 4, variable A would be set to 32, then ORed with Q. Notice that if you wish to pack the answers to 15 yes or no questions into a single integer (instead of multiple-selection responses), this method can be used easily.

The final three bits of integer Q hold the results of another eight-answer ques-

Now for the TRS-80[®] Models I & III

THE TRS-80[®] OPERATING SYSTEM FEATURING:

* DOUBLE Sides & DOUBLE Density support

- * AUTOMATIC Density recognition.
- * 35, 40, 77, 80 and any other track counts are supported.
- * All available drive stepping rates are supported.
- * Hard Drive support, can be HANDLED AS A SINGLE DRIVE.
- Hard drive partitioning, one hard drive can act as up to six drives.
- * Intermix 5", 8" and Hard drives, up to a total of 8 drives.
- Compatible with the Model I Radio Shack Expansion Interface.
- Upward compatible with TRSDOS (2.3 & 1.3 as documented).
- Fully supports Microsoft language products, without modification.
- Complete media compatibility Model I to Model III and Model III to Model I.
- . Full support for LOBO's LX-80 interface
- Full support for PERCOM's DOUBLER II.
- Complete documentation (well over 250 pages).
- Complete technical information.
- A TOLL-FREE 800 number for customer service.
- An LDOS users bulletin board on MicroNET.
- A Quarterly LDOS users magazine (The LDOS QUARTERLY).
- A liberal update policy.
- An enhanced BASIC (LBASIC) including:
 - > Upward compatible with Microsoft Basic.
 - > High speed LOAD and SAVE.
 - > Run multiple programs with common variables.
 - > BLOCKED (variable length) files are supported.
 - > DOS commands may be executed from LBASIC.
 - > Built in string array SORT.

- > Single stepper for debugging.
 > Several new statements and file modes.
- A compiled JOB CONTROL LANGUAGE (JCL).
- A compiled JOB CONTROL LANGUAGE (JCL).
- An Extended Debugging and Monitor program (with disk access).
- CMDFILE for movement of disk and/or tape system (/CMD) files.
- Device independent operation.
- Full LINKing, ROUTEing, FILTERing and SETting are supported.
- MiniDOS feature for constant access to certain DOS commands.
- Sophisticated communications software included.
- Wildcard characters and partial Filespecs are supported.
- Each file is DATED, showing when it was last modified.
- Backup: Mirror, by Class, if Modified, by Date, by Extension, etc
- Selectable PURGE for fast disk "cleanup" of unwanted files.
- Print formatter, for control of printer output
- Built in printer SPOOLER, to both disk and memory.
- Joblog to record all system operations with time stamps
- UPPER and lower case support, throughout the system.
- · Blinking cursor with selectable cursor character.
- 128 character TYPE AHEAD buffering for keyboard input.
- Assign strings to individual keys with Key Stroke Multiply (KSM).
- SUPER FAST operation with the SYSRES feature.
- Extensive user control and system feedback
- Complete transportability of software among all Z-80 LDOS systems through the use of the LDOS high memory supervisory call system.
- Dealers to serve users Nationwide and in the Common Market.
- The only DOS with a limited ONE YEAR WARRANTY!
- · Enjoy a professional operating system on YOUR TRS-80!

* Specific hardware is required to use these features

The Ultimate In Operating Systems For Model I & III

- * Model I LDOS provided on 35 track single density media
- Model III LDOS provided on 40 track double density media
 LDOS can be provided on special media configurations at an additional charge.
- Prices & Specifications are subject to change without notice

tion, and the process (which I won't describe this time) is carried out in lines 420 through 570 of Listing 1.

Getting It Back

Once the information has been packed into integer Q (which will be a number from 0 to 32767), how is it retrieved? Lines 900-920 print the number on the screen in five-digit format, merely for convenience. Its decoding follows, employing another logical function: AND.

In brief, if bit X is 1 and bit Y is 1, then the result of the function X AND Y will be 1. Any other combination of X AND Y will result in a 0. Look at line 940, which uses the AND function in the command R = Q: R = R AND 28672. Remember that at this point Q is the coded integer containing a lot of information; by making R equivalent to Q, value Q can be saved intact for

later use. So this value R (= Q) is ANDed with 28672. What is 28672? It is 16384 + 8192 + 4096. In other words, the value 28672 is an integer with the upper three bits already set to ones (111 0000 0000 0000). This is the key to recovering the information packed into Q.

The following example shows a possible coded number Q (decimal 22190) generated with this packing system. It is being ANDed with 28672, which will "mask out" all the bits we do not need to know about. Since everything ANDed with 0 will end up being 0, this method simply places zeros where they are needed in the masking integer:

Q Integer being tested:	101 0110 1010 1110	
28672 used as a mask:	111 0000 0000 0000	
Executing Q AND 28672:		
Resulting masked value:	101 0000 0000 0000	

Any 1 bits in integer Q (22190) will filter through the mask, giving a binary result. Converting the result to decimal gives the value 20480 in this example. The next command in line 940 is R = R/4096. Recall that value A in the input phase of the sample program was multiplied by 4096 to shift the bits into the high position of integer Q. Here is the reverse of the process, resulting in an integer with the value 0 through 7. Since the original choices were 1 through 8, the final command on line 940 is R = R + 1. In this sample, R (=22190) AND 28672 = 20480. R/4096 = 5. R + 1 = 6. Therefore, the information has been recovered, and it can now be stated that the original value input was sixty. It is only a simple matter (in line 960) to display what that original input choice means.

Line 1060 performs the same sort of activity to recover the response to the second input. Again, R = Q to recover the initial packed integer. Then R = R AND 3584, since 3584 equals 2048 + 1024 + 512 (another three-bit mask). R = R/512 shifts the values to 0 through 7, and R = R + 1 returns the values 1 through 8. Displaying the original input is again simple. Here is the binary representation:

R (= Q):	101 0110 1010 1110
3584 Mask:	000 1110 0000 0000
R AND 3584:	
Recovered info:	000 0110 0000 0000

When all this information is recovered, it's possible, by feeding in a five-digit code on someone's mailing label, to print out a report for your club or user's group which says, "John Jones is a TRS-80 Model III user with whom we made contact through another member. He has responded to each of our mailings, attended the last meeting, participated in the flea market, his dues are up to date. Jones's specialty is assembly language, and he participated in the club's last seminar." All in one two-byte integer.

How to Hex

Okay, you say, binary has its uses if I'm willing to spend some time and effort to use it. But why hexadecimal notation? Who cares? Hexadecimal notation, as a reflection of Its binary function, can clearly demonstrate the relationships between machine functions. A very few of the 6809E instructions, commands which affect the operation of the Color Computer's central processing unit, are in Table 5.

Obviously, the easiest way to remember these instructions is by their mnemonics. But the TRS-80 cannot easily report back its memory contents in mnemonics, at least not without an extensive programmer's aid called a disassembler. Therefore, when you see a bunch of numbers, ideally they should provoke some familiar reaction. Numbers like 136, 152, 168, and 184 are not likely to emphasize their straightforward relationship to each other. Examine instead Table 6, with those same four instructions (all sixteen forms) shown in mnemonics, decimal, binary, and hexadecimal.

See how neatly the leftmost digits count upward in binary? And notice how the commands count upward, in hex 10's, in that same neat way. The relationships between the versions of ADC are visible, as are the relationships between the variants of EOR. Their nature is clearest in binary, but it is also easily visible in hexadecimal—a far cry from attempting to quickly discern the relationship between 136 and 152, or 200 and 232.

Not impressed? Then how about an excerpt from Bill Barden's August 1981 Assembly Line. On page 49, a man with staggering insight named David Lamkins offered this remarkable binary-to-ASCII conversion routine (wish *I'd* thought of this one):

SPECTACULAR OFFERS

80 APPLICATIONS

makes sense. Add 144 to the accumulator, decimal adjust the accumulator (for base ten operations), add 64 to the accumulator plus the contents of the carry flag, and decimal adjust the accumulator again. Hmm. Let's convert decimal 14 to ASCII with it. 144 + 14 = 158. Decimal adjust. From what? The Z80 assembly programming guide talks in terms of hex values in upper and lower digits, but I've converted it to decimal equivalents for this example. Take my word that DAA would add 102 to this value, resulting in 260. Since the maximum value is 255, this 260 must have actually produced four and set the carry flag. Add 64, with carry, to the accumulator produces 69-the ASCII code for uppercase letter E.

Was that clear? I really didn't try to murky it up at all; it's just the best that can be done in decimal terms. Now here's the same conversion of OE (decimal 14) to ASCII using hexadecimal notation. 90H + 0EH = 9EH. Decimal adjust. The programming guide says if 9-F is in the upper digit and A-F is in the lower, decimal adjust (DAA) adds 66H to this result. 9EH + 66H = 104H, with the leftmost 1 ending up in the carry flag. Add 40H, with carry, produces 04H + 40H + 1 = 45H—the ASCII code for letter E.

Any clearer? Obviously, since the programming guide forces you to use hex digits to determine the decimal-adjusted results, that consideration is simpler. But also, notice that decimal 256 is actually 100 hex—in terms of the accumulator, it is 00 with the 1 carried over. That's why 260 decimal produces a result of four with carry, not five. It just isn't visible to the eye in decimal notation, whereas hexadecimal makes it very certain that a carry has taken place.

I've jumped to the defense of hexadecimal notation not because I'm a longtime programmer rigidly committed to it (I'm neither), but rather because it's essential to understanding what your computer is doing, if understanding is what you care to do. Sure, numbering systems are arbitrary, and It's unfortunate that we're stuck with binary notation and digital logic to start with. But it's currently an economic fact of life for computers; even if computers move away from binary operation, your TRS-80 Model I, II, III, Color Computer, Videotex, Pocket Computer—or your Apple, OSI, Pet, Northstar, Atari, Vic, or Compusquat—is a digital device. That's its nature, so that becomes your problem to deal with in the least time-consuming manner.

What VAR is that VARPTR PTRing to?

One more example; hang in there with me. Most programmers end up being forced to write sorting programs. Aside from being an unsatisfying project, sorting programs written in Basic can be dreadfully slow. Normally, sorting is done by comparing one item with another in some manner, and switching those items. But if the items are very long (such as names and addresses or other long strings), the sorts can take hours to complete.

There's another way. Imagine you are the curator of a museum full of artwork, each piece with a reference number tacked nearby. You have had the catalog reprinted, but the artwork now does not

match the numbered reference labels. Would you (a) move the artwork to match the labels, or (b) move the labels to match the artwork? Assuming there has been no artistic decision involved in rearranging the catalog, it's probably a lot easier to move a label instead of, perhaps, a two-ton plece of sculpture.

This relates directly to sorting programs. Every variable is located by Basic by means of a variable table it builds and stores just after the program listing. Your computer can provide you with that information by means of the command VARPTR (variable pointer). If variable R\$ has been defined, then command PRINT VARPTR(R\$) will return the decimal value of the address at which all the information about R\$ is stored.

If PRINT VARPTR(R\$) yields 8591 on the Color Computer, then PRINT PEEK(8591) will reveal the length of R\$, and PRINT 256 × PEEK(8593) + PEEK (8594) will tell wherè R\$ starts in memory. For example, in the Color Basic version of Babybug, the command PRINT VARPTR(R\$) might in fact yield 8591, PEEK(8591) = 2, and 256 × PEEK(8593) + PEEK(8594) = 16381. Interestingly, you will find that the formidable question-

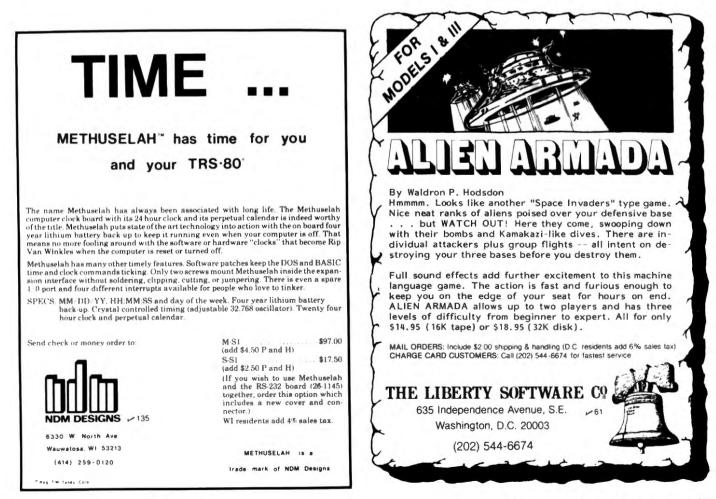

FOR X = 1 TO PEEK (VARPTR (R\$)) : PRINT CHR\$ (PEEK (256 × PEEK (VARPTR (R\$) + 2) + PEEK (VARPTR (R\$) + 3) + X - 1)); : NEXT

FOR X = 1 TO PEEK (VARPTR (R\$)) : PRINT CHR\$ (PEEK (PEEK (VARPR (R\$) + 1) + 256 × PEEK (VARPTR (R\$) + 2) + X - 1)); : NEXT

What is this $256 \times PEEK(N) + PEEK$ (N + 1) business? Because there are so many memory locations in the computer, any given location must always be specified using sixteen binary digits of data—one group of eight bits defines the most significant byte (MSB), or highest eight binary digits, and the other group defines the least significant byte (LSB) of the address. You will recall that integers were also stored as two bytes of information, so this type of format is not new. What is new, at least in the Model I or III TRS-80s, is how this information is ordered.

Because of choices made when the original 8008 microprocessor was designed in the early 1970's, its grandchild the Z80 stores addresses with the LSB *first* and the MSB *second*. Fortunately, users of the Color Computer will find that the 6809E processor keeps things in a more human-oriented order, with MSB first and LSB second. In both cases, though, the lower eight bits can be used as written, but the upper eight bits occupy the 256's place through the 32768's place. Therefore, the number represented by this byte is actually 256 times that of the least significant byte.

Now to the point. If I PEEK into the Model I's memory and find that an address is given as 233 decimal, 66 decimal, I can calculate the true address with the formula LSB + $256 \times MSB$, or $233 + 66 \times 256$. That is 17129, which many of you will recognize as the beginning of Basic program storage. If I PEEK into the Color Computer's memory and find an

80 APPLICATIONS

address written 30 decimal, 0 decimal, I can calculate that address as $256 \times MSB + LSB$, or $256 \times 30 + 0$. That is 7680, also the beginning of Basic.

However, these time-consuming conversions are easier for me because I think in hexadecimal; I can do it in my head, since I only need to know the onebyte hex-to-decimal conversions. With practice, these one-byte conversions are easier to remember than multiplying by 256. My decimal 233, 66 address mentioned earlier turns into E9 42 hex, which (because it's stored backwards in Z80 terms) becomes address 42E9. In the Color Computer, decimal 30, 0 becomes 1E00 hex, which is already in the proper order. And since the Model I's disk and Level III Basic packages all include the &H option for hex numbers, I need convert no further. Extended Color Basic also includes &H as standard equipment (as well as HEX\$-read on).

Toll and Trouble

There is a reason I brought up all these addressing confusions: like switching the catalog labels under the pieces of art, it's faster to switch the VARPTR labels to variables rather than the variables themselves. Program Listing 2 shows two ways of doing a simple bubble sort on the Model I. The normal sort starts at line 140, evaluates each item in the list against the next item in the list, and switches them (line 220) if they are out of order. A flag is set (variable Q) any time items in the list are switched; when all have been switched, Q is zero, and a completion message is printed. This sort essentially moves all the artwork every time the sort is passed through.

The VARPTR sort begins at line 290, defines all variables (to set aside all necessary space in the VARPTR table), and starts in much the same way as the usual bubble sort: an item is evaluated against the next one in the list. Then things begin to change: Line 380 is packed tightly to speed up the operation. Z is set to VARPTR(A\$(X)), the address at which information about the current item being sorted is stored. Variables K. L and M are given the information about the item under consideration-its length, and where it currently resides in memory. Y is then set to VARPTR(A\$(X + 1)), the address at which information about the next item in the list is stored. A\$(X) is POKEd with PEEK(Y), PEEK(Y+1), and PEEK(Y+2), meaning the information about A\$(X+1) is being POKEd into A\$(X). Likewise, A\$(X + 1) is POKEd with K, L and M, the storage information about A\$(X). The computer can now be fooled into believing A\$(X) is A\$(X+1) and vice-versa. This line has switched the labels, not the artwork.

Is it worth the trouble? That depends

on the length of the sort you are doing. The fewer the items in the sort, the less advantage the VARPTR method will have. Table 7 compares the two sorting techniques.

It's clear that when memory space is at a premium, as it probably would be with large amounts of data to be sorted, the VARPTR method has a remarkable advantage—sorting 50 four-character strings in less than half the time an ordinary sort would need. It can also avoid potentially disastrous out-of-stringspace errors.

The cause of the delay during sorting, by the way, is something called "garbage collection." When small computers such as the TRS-80 manipulate strings (such as the command Z\$ = A\$(X) in Listing 2), temporary string space is set up for Z\$. Each time Z\$ is used this way again, *new* space is set up for it, and the old version

of Z\$ is abandoned. It's still there in memory, but it's inaccessible and the memory space is lost (temporarily!). Why would anyone create a Basic that did this? The answer is really quite reasonable: Since your TRS-80 Basic doesn't require you to define how long any string is going to be before you use it, Basic can't know ahead of time. If it was forced to use the same location to store Z\$ every time, and Z\$ got longer, it just wouldn't fit. To avoid any such conflicts, every time a string is defined—even if it has the same variable name—new space is set aside for it.

However, Basic has to recover this dead space sometime, and that process is called garbage collection. When Cleared string space is used up, operation of your running program is suspended, and Basic picks its way through string storage memory, cleaning out the dead strings and moving the live strings into those areas. When there are hundreds of strings involved, Basic has to check each and every one against its entire VARPTR table to see if it's alive or dead. That process can take up to an hour in complicated programs.

With the VARPTR sort, there is no garbage collection during the sort, because no string equations are used—only numerical pointer switching! That accounts for the remarkably consistent time for sorting, irrespective of the length of the items being sorted. The normal sort, on the other hand, takes longer and longer as it is required to pick up its garbage more often.

In Listing 2 I've only cleared a small amount of space (in line 60); if the cleared space were larger, the normal program would beat the VARPTR sort. But don't forget that most sorting programs will use massive amounts of data, thereby limiting the amount of string space you can clear. If you have a sorting program that runs a long time, try re-writing it with the VARPTR sort. It might save you a couple of hours.

At Last

The purpose of this month's column (several thousand words ago) was to present again the Babybug machine-language monitor. Here is a brief description of the major actions of each version of this program.

In Program Listing 3 (the Model I or III version), string space is reduced to a minimum, and integers and other values are defined. The input prompts for mostsignificant and least-significant address bytes are presented, and the input strings are converted to numbers and

80 APPLICATIONS

POKEd into the machine-language USR entry point. Variable Q is set to the current address being inspected; if Q is greater than address 32767, Level II Basic requires that it be converted to a negative number.

The user is then given a short menu of options (to enter hexadecimal bytes, to stop entry, or to skip the current line). The target address and the memory contents of it and 15 successive locations are displayed in hex. An arrow prompt points to the first hex byte. The options are (enter) to move on to the next byte; S (enter) to redisplay the first line and display the next one; X (enter) to terminate entry and present a new prompt; or the entry of any hexadecimal byte from 00 to FF.

A total of eight lines (128 bytes) may be displayed at any time; advancing to the next memory location clears the screen and presents a new line of information. The X command (terminate entry) presents a new prompt asking the user either to run the machine code which has just been entered, starting at the initial entry address (the response to the MSB/LSB prompt), or to re-enter at a new address and begin the process again.

Major subroutines include hexadecimal string to numeric conversion (lines 13-16), integer to two-character hex string conversion (lines 17-18), full line display (line 19), revised line display (line 20), and address display (line 21).

The programming for the Color Basic version (Program Listing 4) differs from the Model I or III Babybug in two ways: the lack of the DEFINT function requires that integers be taken during calculation (line 17), and the absence of a USR function demands that the EXEC routine be used instead (line 12). Minor differences include the absence of an upward carriage return, and a required space

separating variable names from subsequent keywords (line 3, for example). The display is similar but not identical because of the 32-character line limit on the Color Computer; only eight bytes of hex data are displayed per line (64 per screen).

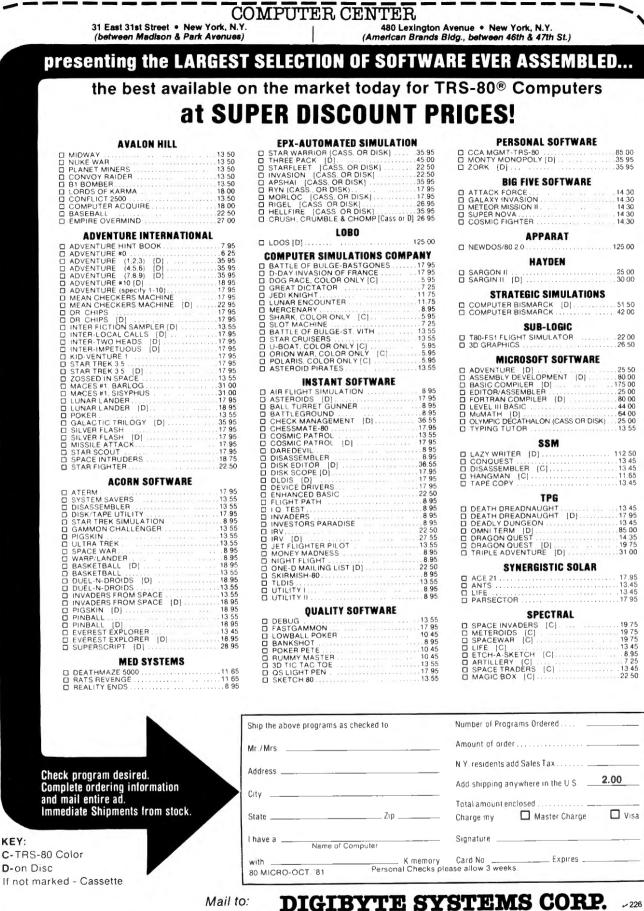

The Extended Color Basic version of Babybug (Program Listing 5) is similar but faster than the Color Basic program because of the excellent HEX\$ command. The entire numeric-to-hex*conversion process is handled by the command V\$ = HEX\$(V) in line 17. The only modification I've made is the addition of a leading zero in front of single-digit hex numbers. A DEFUSR function is used instead of EXEC.

Sample Session

Enter Babybug in Basic, and be sure to save a copy to tape before you run it, as random entry of hex information into memory can crash everything. After saving and verifying a copy, run the program. The screen will clear and this prompt will be displayed: ORG MSB?__. It is asking for the most significant byte of the address you wish to inspect, a two-digit hexadecimal number. For this first session, the screen will be examined. Enter 3C (04 on the Color Computer). The next prompt will be: ORG LSB?__. This asks for the least significant byte of the address to be examined. Enter 00 (00 on the Color Computer). The short menu (Enter Hex Bytes. X = Stop, S = Skip) will be displayed, followed by the complete address (3C00 or 0400) and sixteen (eight) hexadecimal bytes of data.

The first three bytes will likely be 4F 52 47. No, this is not machine code yet. These are the ASCII values for the first three letters at the top left of the screen-ORG. Type: 41 (enter) 42 (enter) 43 (enter). The bytes displayed should change as you enter each one, and the characters at the top left corner of the screen will change to ABC. Continue to enter hex data from 00 to FF and observe the screen display change. As you reach the end of the line, a new line will be displayed with the continued screen information. When you have entered 128 bytes (64 on the color computer), the screen will clear and the hex display will be continued.

Now type X (enter). You will see the prompt 1 = RUN PROG, 2 = RE-ENTER. Type 2 (enter). The screen will clear again, and the entry (origin) prompt will reappear. Before continuing, make sure you have saved a copy of the program! Enter 00 (A0 in Color Basic, 80 in Extended Color Basic) to MSB and 00 to

80 APPLICATIONS

LSB. The screen will now display the opening hex bytes of Basic. This is machine language, and this is a machine language program that you are going to run. Type X (enter), and in response to the run/re-enter prompt, type 1 (enter). You will see your computer's sign on message—Memory Size? or MEM SIZE? for Model I; CASS? for Model III; Color Basic 1.0 or Extended Color Basic 1.0. Babybug has been crashed, and your computer looks like you just turned it on.

Now reload Babybug (you *did* save it, right?), and run it. Respond to MSB and LSB with 70 and 00 (0E 00 on the Color Computer). Enter the bytes in Table 8 one at a time.

Enter X. Now run this program by responding 1 to the prompt. Nothing? Begin to type. Letters are displayed on the screen, starting at the top left corner. But no, you are *not* in Basic. This is a machine-language program which (a) calls a Basic keyboard scan routine, (b) checks for the enter key—carriage return code 0D hex—returning to Basic if it finds it, and (c) puts the typed character in screen memory. You'll notice some interesting things when you begin typing with this routine. There is no cursor following the letters, since this program doesn't invoke a cursor display routine. Also, things like shift and shift lock (shift-0) produce odd characters on the Color Computer, and the backspace displays an H on all machines.

Here's a look at the hex code and what it does. The Model I or III program loads register HL with screen address 3C00 (21 00 3C), calls the ROM keyboard input routine (CD 2B 00), loops back to the keyboard routine if the value returned from the keyboard is zero (28 FB), compares to see if it is a carriage return (FE 0D), returns to Basic if it is a carriage return (C8), otherwise puts the character on the screen (77), moves to the next screen position by incrementing HL (23), and loops back to do the whole thing over (C3 03 70).

The Color Computer program loads the X register with the screen address 0400 (8E 04 00), calls the Color ROM keyboard routine (BD A1 71), checks if the value is a carriage return (81 0D), jumps ahead one

place if it isn't a carriage return (26 01), otherwise returns to Basic (39). When it jumps ahead with a character, it puts it in screen memory (A7 80), and loops back to do it again (7E 0E 03).

The Z80 and the 6809E are different processors with unique properties; yet it's revealing to notice how similar these processes are, and even to compare them instruction-for-instruction. Although the hex codes are different, many of the properties are the same.

You're tired of testing and want something substantial? That's up to you. I will be happy to publish interesting routines created in hex code, as well as some of your experiences in developing them in hex notation alone. (No cheating, assembly language users!).

Updates

Look for some minor corrections and suggestions to the high resolution graphics board for the Model I (The Detailer, July) in next month's issue.

A printed circuit board is available for the Micro Front Panel (May). Write to me at Roxbury, Vermont 05669. ■

Combine accurate flight characteristics with the best in animation graphics and you'll have SubLOGIC's

T80-FS1 Flight Simulator for the TRS-80

SubLOGIC's T80-FS1 is the smooth, realistic simulator that gives you a real-time, 3-D, out-of-the-cockpit view of flight.

Thanks to fast animation and accurate representation of flight, the non-pilot can now learn basic flight control, including take-offs and landings! And experienced pilots will recognize how thoroughly they can explore the aircraft's characteristics.

Once you've acquired flight proficiency, you can engage in the exciting British Ace 3-D Aerial Battle Game included in the package. Destroy the enemy's fuel depot while evading enemy fighters.

Computer and aviation experts call the T80-FS1 a marvel of modern technology. You'll simply call it fantastic!

Special Features:

- 3 frame-per-second flicker free animation
- Maximum transfer keyboard input
- Constant feedback cassette loader

Hardware Requirements:

- Radio Shack TRS-80, Level 1 or 2
- 16K memory
- Nothing else!

See your dealer or order direct. For direct order, include \$1.25 and specify UPS or first class mail. Illinois residents add 5% sales tax. Visa and Mastercard accepted.

SOACCOUNTANT by Michael Tannenbaum C.P.A.

Of all microcomputer software packages available, a Financial Report preparation package can be the most valuable to an accountant. The use of a microcomputer system to prepare these reports can be an enormous time saver. used, summ

Without a microcomputer report preparation requires an enormous amount of effort. First, a hand written report must be prepared and reviewed by the audit partner. Then a copy must be typed, proofed and compared to the original. Finally the whole report must be subject to an independent review. If a last minute change is required, the whole process of proofing must be repeated. Needless to say, the opportunity for an embarrassing error to occur is quite high.

The alternative of using a microcomputer to minimize this risk has been the root of the many requests I have received for information about report preparation systems. However, all the reports I have seen were part of General Ledger packages and were limited to an income statement and balance sheet. Reports such as the Statement of Retained Earnings, Changes in Financial Position, Analysis of Changes in Working Capital and Cash Flow Statement were missing. These reports are required to conform to professional standards.

Since the report is often used by third parties the standards of disclosure are higher than reports prepared for internal use. As a result, the reporting system must accommodate data such as footnotes where explanations of complex transactions or accounting policies must be presented. Although summary data may be adequate for outsiders, many clients require detailed financial reports for their own use. Thus many accountants prepare, in addition to summary reports, detailed departmental and comparative reports. These supplementary reports are usually presented in an appendix to the main reports.

New General Ledger System

The new three-disk General Ledger system (#26-4601) has been designed to cope with the problems of the professional and yet be usable in a small business environment. The ledger is designed to integrate with the other three disk systems, Accounts Receivable (#26-4604), Accounts Payable (#26-4605), and Payroll (#26-4603). If these other systems are used, summary data can be transferred at the month's end without the need for manual journal entries. The system has the capacity to handle up to 400 general ledger accounts and 4300 year-to-date transactions.

It is supplied on seven disks, three of which contain programs, and four data files. Two of the data files contain a sample general ledger with all accounts and reports previously defined. These sample data files are intended to provide a practice set for the owner of the system to use and become acquainted with. They are quite useful. The procedures to define accounts and output reports are complicated and the examples of data files that already work are helpful for reference purposes.

The program disks are arranged so that file maintenance programs are contained on program disk two and data entry programs are contained on disk one. This provides a sound method for separating file maintenance and up-date functions for general ledger processing. If these functions are separated, proper internal control over the ledger should be established.

Once a decision is made to automate general ledger processing, serious thought should be given to the arrangement of the output reports and the content of the financial statements prior to setup. Once installed, changes will be quite painful. The system contains an enormous amount of data. Balances are retained for each prior account and budgeted data by financial period. Thus, changes will involve shuffling lots of data.

File Setup

After the content and presentation of the financial reports has been determined, preparation and input of master file data can proceed. To aid in this process, the accompanying documentation devotes a good deal of space to file setup. I recommend that you read it several times before attempting the setup pro-

"Of all software packages, a financial report preparation package can be most valuable..."

cedure. As with the accounts receivable system, an error in selecting an option in the initial files can cause a problem later on. The system uses decisions made when setting up the initial files to guide the setup procedure on the account and report files. For example, if a negative answer is made to the G/L cost center question on the company file maintenance screen, departmental reporting is inhibited and only a four digit account number is permitted.

Written in Cobol

The system is written in Cobol and like the other Cobol systems does not have full cursor controlled data entry screens. If an error is noticed in a data line after Enter has been pressed, the entire screen must be completed before corrections can be made. This feature and the strange assignment of special function keys will take some time to become familiar with. the Tab. ESC and F1 and F2 are used as special function keys. Tab is used to end a program and ESC is used to restart data entry in a field. F1 and F2 may have different functions depending on the program in use. Unfortunately not all of the screens indicate the operation of these special keys so you just have to remember what does what and when. While this is inconvenient, the other benefits of the system far outweigh this difficulty and all of the other three disk systems use the same conventions.

Report Generator

The key factor that distinguishes this system from all others that I have seen is the report generator. The report generator accommodates five types of statement formats and allows a great deal of customization. The reporting format types include the balance sheet, profit and loss statement, cash flow, statement of changes in financial position and analysis of changes in working capital. The different format types limit the column headings and ratio analysis options available but otherwise allow freedom over account combinations and presentations.

The means of implementing each format is found in the financial statement

80 ACCOUNTANT

layout procedures. The layout is accomplished by creating a data file with a description of the form. To provide instructions to the printing program a special syntax is employed. The instructions are arranged in sequential order and are executed in the same manner as a Basic program. Although the report specification procedures are complicated, the sample report specifications included in the sample data files can be referenced as a guide. By comparing these specifications with the printed reports the use of each type of report syntax will become clear.

In concept and implementation, the report preparation procedures are similar to commercial general ledger systems. Vendors of these systems, which usually cost many times more than the Radio Shack system, train customers in use of report generators in special classes. Typically class time ranges from a week to several days.

Running the sample forms will give you some idea of the report preparation potential of this system. Nine sample formats are provided ranging from a balance sheet to profit and loss reports. These formats can be combined with the data in a variety of ways. For example, a balance sheet can be prepared with and without comparative information. The comparative data can either be a budget or the prior year's end of month balances. The same format can be used for either type of comparative data. As a result more than nine output reports can be generated with the nine formats.

When printing these reports the system allows printing in any sequence desired. The sequence must be previously defined. This has an important advantage. If a summary set of reports and supporting schedules is required, then the whole set can be printed before any other printing is scheduled. Since the distribution of summary and detailed reports is usually quite different, this method of setting up a printing "job command language" for sequencing printed reports will be most appreciated.

Be prepared for a slow printing process. During the program evaluation process it took almost half an hour to print twelve reports with the limited sample data. While the computer is assembling the data, it appears to go to sleep. The screen indicates that processing is occurring and occasionally the drives are accessed but not much else is visible. The actual printing is also quite slow. The computer must do a great deal of processing since there is a rather long pause between lines.

However, the resulting reports are worth the wait. They reflect many thoughtful features which will be appreciated by the professional user. Account numbers are not printed. Dollar signs are inserted and foot notes are printed. A useful feature is the elimination of minus signs. In many reporting systems credits are identified by a minus or "cr" sign. In this system, if the balance is normally a credit or debit it is printed without a sign. If the balance is reversed, then the amount is printed with a parenthesis around it. This treatment conforms to normal practice for manual systems.

The system provides for the inclusion of text files. In the sample data only one text file is included-a disclaimer; however, up to 99 different files each with a maximum of 23 lines of textual data can be accommodated. This feature is ideal for an opinion, footnotes, segment reports and any other type of detail which must be appended to professionally prepared financial statements. Once a text file is created it is printed as specified by the statement layout description. There is no reason why text file two cannot be printed before text file one. This will be a big help to those who cannot decide the order of footnotes until the last possible moment.

Of course the source of all financial data for the reports is contained in the account files of the system. If departmental reporting is to be used these files will be quite extensive. When building the files, every bit of historical and budget information that will be required on the financial reports must be entered. This will be quite a considerable undertaking. There is a provision to enter budget and prior year month end balances for thirteen periods. Once all balances are entered, the final amount for the prior year's activity can be established as the opening balance for the current year's activity. This is done by running a special program appropriately called Setup.

Monthly activity is obtained from three sources: standard journal entries, general journal entries and other three-disk systems. The standard journal entries or recurring entries are sub-divided into two types, permanent and variable. Permanent entries are always the same amount and variable entries change each month. These entries, once defined, can be posted each month at the will of the system operator. If required, an automatic reversal entry can be specified. If that is done, the system will automatically generate the required reversing entries at the beginning of the next fiscal period.

Data entry from other three-disk integrated systems is accomplished by use of a transfer disk. Amounts to be transferred are extracted by a special interface program which offers the option of a transfer of details or the summary data for each account affected. We did not examine the transfer system during the evaluation process.

Data Entry

If the superior financial reports represent the good news, data entry can be considered the bad news. If data is to be entered through the general journal subsystem be prepared for slow data entry. Once the account number is entered, a two step procedure, the transaction date, amount, source, reference and reversal code must be entered. To reduce data entry time the system provides as default values prior data entered for the date, source and reference fields.

Obviously data for the system is best obtained through transfer from the other three disk systems. This condition should be easy to satisfy in a commercial environment where the other systems will be installed. However, in an environment where the accountant "writes up the books" on a monthly or annual basis a quicker method of data entry should be developed.

The slow speed of data entry is matched by the slow transfers from program to program. When a new option is selected on a menu, a caption appears on the screen—"Please Wait." After disk access, the selected program appears on the screen. If an error is made, a slow return to the main menu occurs and a slow selection of the new program is required. An examination of the disk directory provides a clue to this ponderous behavior. The system is segmented into many small programs which obviously take time to get in place to execute system functions.

This system, like the accounts receivable system, cries for a hard disk. If disk access times were quicker the system would be much more responsive. I suspect that when this system is installed in a more congenial environment than the floppy system it will behave with more alacrity. The floppy system also limits system capacity. In this system drive one is devoted to the five most frequently accessed files in the system. Only drive two is available for transaction data.

To increase the storage room available for transactions, it is possible to "compress" data already on file. To understand the process, consider that an account like wages could contain daily information from a variety of sources, weekly information and monthly information. Until instructed to "compress" the data, the system will retain all detail. The system offers the option of compressing data by date or

80 ACCOUNTANT

by period. If compression by date is selected, all activity for a day will be consolidated. Debits will be offset against credits and the net result reflected in the account. If the debits and credits offset, no entry will be reflected in the account. If compression is by period, only the net activity for the period will be reflected in the account.

Compression

Compression should be used with care. Once data is compressed a cross reference back to the original journal entry will be impossible. Probably a good method for retaining data for cross reference purposes will be to retain a backup prior to the compression procedure. Then, should a question occur, the cross reference run can be performed on the backup disk to locate the problem.

Documentation

Documentation for this system is pro-

80 REMARKS

Continues from page 8

our station is listening for any queries. When some amateur station comes on frequency and sends, say, an "M?" our station would automatically respond with a menu of the available bulletin board materials. The other station would then choose one item from the list and request it... "7." Our station would then supply the number seven item, which might be the latest in DX news, complete with a list of the stations active from rare countries, their frequencies, where to send confirmations of the contact, and so on.

Or we might send out a list of the latest FCC dockets affecting amateur radio or other recent FCC news. We could have a list of the traffic networks for handling messages, the recent repeater station changes, lists of other special interest nets, their times and frequencies, propagation predictions, a list of scheduled hamfests and conventions, new awards, and so on. There is a long list of information that hams might want to get and it would be available for the asking.

The plan will start out with 300 baud transmission, but soon revert to 1200 baud. We're going to encourage the experimentation with 9600 baud transmissions, since that would allow the transfer of information at around 7300 words per minute. At that speed we might be able to get most messages in between the dots of jamming CW stations!

The next step would be to develop

vided in a large binder similar to the Accounts Receivable system. Index tabs divide each section. These tabs make using the documentation considerably easler than other Radio Shack offerings. Unfortunately the tabs have only paragraph numbers rather than descriptive names. This made referral to the index mandatory before a section could be selected. Hopefully this will be corrected in future releases. I found the documentation complete and informative. It included a section on general ledger concepts and contained two appendices on data files and handling inventory. With the documentation in hand, I found no difficulty in using the system.

In summary, if the account and transaction capacity do not disqualify this system, this package should be ideal for a practitioner with write up work. If the client can be induced to use the Model II for accounts payable and billing, data entry should be minimized. The General Ledger report generator will provide all of the required reports. Even if month end activity posted in the general journal is the sole source of data, the system will be useful. After all the financial reports are the professional's product and this system makes report preparation easy.

For the non-professional, the ability of the system to generate complex financial reports will be less important. However, because the system can generate departmental reports with comparatives and budgets, much valuable management information can be presented. In addition, the ability of the system to retain up to 4300 detailed transactions will be quite useful in tracking financial irregularities which could appear on the detailed reports.

This is indeed "big" system software at a micro price. I look forward to the next module in the "three disk" Cobol series.■

automatic message relaying stations so that ham messages could be sent anywhere in the country in seconds. Imagine being able to drop a message to someone asking for a schedule in a few minutes on twenty meters! Where this would really come into its own would be during emergencies, when all the emergency traffic could be sent via automated means. Thus a ham could merely type the message on a small computer system. like the Radio Shack Pocket Computer, and it would be transferred to a central station for relaying to the addressee-much as Federal Express flies all packages to one city for sorting and reshipping the next day.

Emergency nets would then be set up with the control station polling each station in the net every few seconds, looking for messages. When the station had one, the polling would trigger sending the message. In this way no two stations would be transmitting at the same time. The message received, polling would continue.

We will need to develop error-correcting systems so that all messages are received perfectly. 80 is open for any ideas or articles along this line.

The Third World

A recent visit to the small Caribbean Island of St. Lucia brought home to me the need for some sort of education for deserving people from the smaller countries of the world. The U.S. used to have the Point Four program, but that is long gone. Today, most of these students either have to make do with a poor education at home or else go to Russia or Cuba, where they are taught more politics than college.

Could we develop our proposed microcomputer school to the size where it could handle students from a hundred small countries? How would this be financed? Our government is trying to do all it can to stop spending, so they really don't need a new way to invest, even though it would be about the least expensive investment they could make, in the long run. These students are willing to work hard, not only at school, but also at part time work to get an education. I'll be visiting some more small countries in the next couple of weeks and will see what I can find in the way of answers to this problem. I'll be stopping off in Rio to set up plans for a South American edition of Microcomputing. Then Sherry and I will be off to South Africa to attend a microcomputer exposition in Johannesberg, where I'm a speaker. We'll be visiting Swaziland and Lesotho, two very small nearby countries, where ham licenses and stations for me to operate have been arranged. I'll be talking with the local hams and looking for ideas for practical ways to get Third World students the education they need. Indeed, their countries have a desperate need for skilled electronics and communications people.

Meanwhile, I will be dreaming about a college campus in New Hampshire, with modern buildings, heated mostly by solar heat, and surrounded by a couple hundred entrepreneurs and their growing electronics and computer businesses.

"You can try to design algorithms to emulate human behavior, or you can try to explain human behavior in terms of machines."

At SI, Machines Imitate Humans

The phrase 'artificial intelligence' summons up science fiction images of super-giant mainframe computers achieving sentience by sheer power and leading a revolt of the Moon colony against the government of Earth.

The truth is actually much stranger. At the Artificial Intelligence Laboratory at SI International (formerly Stanford Research Institute), Stanford, CA, one of the world leaders in this research, no huge light-blinking machine is achieving sentience. Rather, researchers use Digital Equipment Co. (DEC) PDP-10 computers programmed in Lisp to model aspects of human behavior.

Chuck Untulis, assistant director of SI International, stated that the PDP series

Students Learn Psychology From Artificial Intelligence

While most people are interested in Artificial Intelligence for its practical applications in the computer field, at least one other use has been found. Dr. Homer "Tony" Stavely, a psychology professor at Keene State College in Keene, NH, is teaching a course using AI as a tool to illustrate some principles of psychology.

"Computers and Thought," as it is titiled, will emphasize the "use of computers to simulate psychological processes," according to the course catalog. The course will also review early AI research as well as theory. Students will discuss the current state of the art and the possible future of AI. Textbooks will include Artificial Intelligence by Patrick Henry Winston and Machines Who Think by Pamela McCorduk.

Stavely, who has had an active interest in computers for several years, believes that there is a similarity between the thinking process of a computer. Though he concedes there are some obvious great differences, he said, "in the fundamentals of information processing, it doesn't matter if it is a machine or an organism... (there are) probably similar principles."

Stavely makes a convincing argument for using AI in teaching psychology. "The study of psychology is the behavioral relationship between organisms and their enviroment," he said. This "transactional relationship" produces behavior guided by the intake of information. "Al attempts to program machines to process information in ways which approximate the sophistication of (human) information processing," Stavely said.

There are three goals that Stavely has set up for his students to achieve. He wants to increase their understanding of the nature of perception and thought; to demonstrate that computers are tools to aid in their thinking; and to show that computers are inportant as a simulation device. This last goal emphasizes the use of a computer to set up a hypothetical situation to "see what happens if..."

Stavely sees AI programming giving computers some ability to perceive problems, organize and remember information and, ultimately, write programs on their own to control their databases.

The future of AI is promising, Stavely believes, especially in the educational field. He said that hardware capabilities far outstrip the capabilities of the software that has been produced. He thinks that AI may be the answer to this software problem. "AI is the area in which we are learning the software skills to bring about advances in using computers as tools to think with," he said.

> by Michael Nadeau 80 Microcomputing staff

is the standard machine in artificial intelligence research because it is designed for interactive work. "The IBMs are all batch process," he explained, "and the super-glants are just big scientific number crunchers."

SI approaches artificial intelligence from the computational or computer side. "You can try to design algorithms to emulate human behavior, or you can try to explain human behavior in terms of machines. We take a look at the way people behave in the world and try to emulate that behavior."

Although they do this entirely with software, they would like to have some specialized hardware.

"We keep talking to anyone who will listen about what we want in hardware," he stated. "Unfortunately, we're a pretty small organization, and none of the big companies listen, so we end up buying from the small firms."

Hard to Define

Untuils sees artificial intelligence research as going in several directions, but finds it very hard to define goals or even talk about the research because the concepts are so new the language has not adapted to it yet.

"We really don't know what artificial Intelligence is, so there's no way we can define what our goal is. In the more traditional areas of science you can define your goal, and you know the methods you will use because they are all established. We work with concepts nobody has used before, and we're not sure how to talk about them, much less how to define our goals."

Many labs are heavily researching distributed intelligence. This concept postulates a large number of intelligent machines in independent operation in various parts of the world. Because of distance, different design and different use, they would have different information. One machine might have more upto-date knowledge on a given subject than another.

80 NEWS

If, then, one machine asks another a question and receives data back in answer, how does the first machine handle the data it receives?

"You get into the whole question of belief structures. Each machine has a belief of what the world is, and that belief might be inaccurate." The question is how these belief structures are modeled, limited and changed.

Expert Systems

Another area of artificial intelligence is rule, or expert, systems, in which researchers preserve and communicate to others the special understanding of an expert (an Einstein, for instance).

The hope is to capture the expert's world view in a finite number of data statements to quantify it. "You do that with a set of rules which set up a model which can be given data or asked questions."

Another area involves designing programs that will handle normal language, either in the form of keyboard input or, further down the road, verbal input. The goal is to eliminate the need for programming languages to communicate with the computer. The businessman could talk with his machine just as he can with a human employee; if he needs to know how many widgets he has in St. Louis, all he has to do is ask. The computer will decide what data bank to query and exactly what piece of information is wanted.

Vision Input

Vision research is another area in which SI International is active. Humans have a very high talent for interpreting visual data; it is difficult to approximate that ability with a machine. SI is developing programs which allow the computer to digitalize a picture and not only understand the literal data but draw conclusions from clues.

For instance, they would like the machine to locate a hidden light source from such clues as the size and placement of shadows. It then should be able to describe the expected reflectivity of objects from the inferred position of the light source.

One goal of artificial research is the self-programming computer, the machine which can decide for itself how to go about doing something and change its ideas on the basis of experience. According to Untulis, SI is working on the theoretical end of this question by designing theorem-provers. These are methods whereby a machine, given an idea or theory, can experiment to determine whether the theory is correct. If it is not, the machine will modify it to fit the experimental data, much as a scientist works in a lab.

A Question of Difference

All of this involves one of the basic questions of artificial intelligence: Is it qualitatively different from human intelligence or does it only appear to be different at this stage because it is so primitive?

Computers are famous for their ability to instantly memorize and manipulate huge lists of items. Humans cannot do this nearly as quickly or as well. Yet, machines cannot make decisions on their own—humans have to tell them precisely what should be done with their data.

The answer, Untulis explained, "depends on whether you are talking on the short run or the long run. If you are talking on the short run, then it is both qualitatively and quantitatively different. If you are talking about the long run, then it is not." However, the long run probably means anywhere from 200 to 1,000 years.

Researchers are presently working with limited domains, try to construct algorithms that emulate human behavior, while dealing with general problems in a theoretical manner.

So why is this in a magazine on microcomputers? What relevance does it have for the TRS-80 user?

Cognitive Science

The research into artificial intelligence falls under cognitive science, a new branch of science that includes aspects of both computer science and psychology. The fallout from the research in this area is likely to influence the design of the machines we will be using as well as our concepts of ourselves in the 1990s and beyond.

Untulis mentioned he sees a couple of areas in which artificial intelligence research may soon be influencing software design, although he cautioned that the issues are far from clear.

One area in which machines can do a better job than humans is very largescale integration in, for instance, circuit design. One company is trying to adapt planning and deduction methods worked out at SI International for multiple-level planning to this sort of operation.

In multiple-level planning the machine works on an abstraction ladder. It starts at the top, forming a very generalized plan, or, in this case, circuit design concept. It then moves down a step and makes a more particularized design concept based on its generalized work. In this way it works from step to step towards the actual design of the circuit.

"The hope is to capture the expert's world view in a finite number of data statements..."

If its tests show that the most recent plan is faulty, it moves back up the ladder to more generalized plans and refines its steps.

Visual interpretation would also be very handy for a machine that designs or tests circuits using this multiple planning method.

"All these things go hand-in-hand," Untulis told us. "We want the machine to keep track of the errors we make in designing one circuit, for instance, so it will be able to warn us if we start to repeat them in the next circuit design."

These ideas may be used in the future but they will not be here tomorrow.

"The things we're talking about are 10 to 20 years from fruition. We're just thinking about these things today."

Radio Shack, Ohio Publisher Plan Joint School Market Assault

Tandy/Radio Shack, Fort Worth, TX, and South-Western Publishing Co., Cincinnati, OH, a leading business education and business administration publisher, will work together to develop and market educational courseware for TRS-80 microcomputers.

According to William D. Gattis, director of Radio Shack's Education Division, South-Western will help Tandy in the development and marketing of programs for Models I and III, and Radio Shack, in return, will provide computers for demonstrations and displays by South-Western at major educational shows and conventions.

Radio Shack will also develop special software protection features for the Model I similar to those already available for the Model III, to prevent unauthorized copying of South-Western's software.

South-Western is a subsidiary of SFN, Chicago, IL, a large elementary and high school education publisher.■

Microcomputers Enter Medicine

omputers have been used by the Gmedical community for nearly two decades. In May of 1980, Modern Healthcare reported that community hospitals spent more than 1.25 billion dollars a year on computerized business and medical information systems. The Journal Of The American Medical Association found, in its report on "Computers in Medicine" (Dec. 1978), that computers were being used routinely in hospital laboratories, radiology departments, emergency rooms and pharmacies. Not only were computers maintaining patlent charts and billing records, they were also capable of such high level tasks as predicting the probability of gangrene infections in appendicitis victims.

Since their widespread introduction four years ago, microcomputers have also begun to have an impact on the practice of medicine. The vast majority of physicians who use microcomputers are primarily interested in office management, but according to Gene Thompson of Thompson Consultants, Seattle, WA, "Thirty percent of the doctors who have been exposed to microcomputers are learning to program."

This is because doctors appreciate the potential of the microcomputer and realize they themselves "will create the applications—once they learn to program," says Thompson.

Hospitals are using microcomputers in increasing numbers to handle specialized tasks. Many such tasks could be performed on hospital mainframe computers but this creates a number of problems—timesharing limits accessibility, new software is extremely costly for mainframe computers and setup procedures are costly. With a microcomputer in the lab to calculate blood gases or in the pharmacy to assist in the preparation of prescriptions, hospitals can greatly improve efficiency without a large financial investment.

"One hospital I know of uses a microcomputer to calculate hormone balances, others are using them to do small office tasks, and one pathologist uses a text editing program and a micro to keep notes on patients," said Thompson. "Micros are especially useful for recording and tabulating laboratory protocols, which are the results of visual tests and inspections in fields like bacteriology and microbiology." Thompson speculates that microcomputer use in medicine will continue to grow and that software exchange among physicians will become a common practice.

There is a precedent for this kind of software exchange. Robert Kinch of the Forsyth Memorial Hospital in Winston-Salem, NC, is the President of ECHO, an IBM users group whose members are hospitals and doctors. This group exchanges software across the entire spectrum of medical related applications, including ambulatory care, clinical management, census management and laboratory/pharmacy use. There is a similar group for microcomputer users as well as several medically-oriented try. These bulletin boards will likely play a key role in the development of physician's key role in the development of physicians user's groups.

Commercially produced software is also available. Radio Shack sells a Medical Office System package for use with the TRS-80 Models I and III. Dr. Larry Stoneburner runs MedLogic Systems, a Los Angeles, CA, firm selling software for both administrative and medical applications.

Thompson, however, thinks most doctors are "skeptical about prepackaged software." Hence, many physicians are becoming programmers.

One example of the way a microcomputer can make a hospital more efficient is the General Hospital in Ventura, Calif. As reported in *The Journal Of Family Practice* (Vol. 11, No. 4), the hospital's resident doctors were tying up phone lines to the outpatient clinic with constant checks to see if their patients had arrived, when their next appointment was scheduled and the like. With 35 physicians using the clinic, the load became hard to manage. The solution proved to be a microcomputer. The hospital had a closed-circuit television system already in place. It was a simple matter to patch the microcomputer into that closed circuit system. The outpatient schedule could then be entered into the computer by a secretary and displayed throughout the hospital on a regular basis. The software was designed to permit not only a display of the clinic's schedule, but also to indicate whether a patient had arrived for his scheduled appointment.

The physicians were able to conduct their rounds in the hospital while periodically consulting the televised outpatient schedule to find out when they needed to be in the clinic to see a patient. This system cut down on the volume of doctor's telephone calls to the clinic by 40 percent in the first four weeks of operation. The physicians involved overwhelmingly approved of the system.

Still, while microcomputers are catching on with the medical community, some doctors and administrators harbor reservations about system capability. The Canadian Medical Association's Executive Secretary, writing in the March 22, 1980 issue of the CMA Journal, stated flatly that microcomputers were too small and too unreliable for use in medical practice. B. E. Freamo cautioned physicians to wait to see if good software was developed and to demand that hardware vendors provide service contracts as a condition of sale.

In spite of these kinds of cautions and what Gene Thompson calls the "innate conservatism of physicians," don't be surprised if you see a TRS-80 in your doctor's office sometime in the near future.

Medical Journals Cover Computers

As if doctors didn't already have enough literature to keep up with, there are now several publications circulating information about clinical uses of microcomputers. There is a nationwide, general purpose publication called *National Report: Computers And Health;* there are general information exchange newsletters such as *Dr. Com Puter's Report* and the *Apple Mug Newsletter;* and various specialty newsletters for dentists and psychologists.

Most of these publications are concerned with one thing-finding out who's doing what and how to contact them. The name of the game is information exchange. There is apparently no greater consumer of information than medical doctors.

In February Dr. Larry Stoneburner of Orange, CA started a newsletter as a method of information exchange among the Apple Medical User's Group. Called the Apple Mug Newsletter, the publication has grown from five subscribers to its present 400, in just five months. Apple Mug is a member of the International Apple Core, an international organiza-

80 NEWS

tion of Apple Computer Clubs.

The Apple Mug Newsletter features news about doctors using computers in their practice, particularly clinical applications. It is a forum for the exchange of ideas among its members. Although the Apple Mug is primarily composed of Apple computer uses, the Newsletter is interested in developing a rapport with CP/M users in order to obtain a broad base of software techniques, ideas and applications.

The Apple Mug Newsletter has plans to present a Medical Applications Seminar at the West Coast Computer Faire in San Francisco next March, and is currently soliciting papers for presentation during this seminar.

On the east coast, there are two medical microcomputer publications coming from the same office. The *Medical Computer Journal* and *Dr. Com Puter's Report* are published quarterly by Dr. Azis Ghaussy of East Hampton, CT. Dr. Ghaussy's journals not only provide a forum for the exchange of news and ideas—they also publish medical ap-

Dr. Ghaussy's journals not only provide a forum for the exchange of news and ideas they also publish medical application program listings.

plication program listings. With well over 1000 subscribers, including 75–100 international subscribers, the *Journal* and the *Report* reach a wide variety of physicians using microcomputers. Both publications print software listings for Apple, TRS-80 and North Star Horizon computers.

The Journal and the Report seldom pay for submissions; physicians share software in an effort to help their patients by keeping the information exchange dynamic.

The publications mentioned in this article may be contacted at the following addresses: National Report: Computers and Health, PO Box 40838, Washington, DC 20016; Apple Mug Newsletter, 2914 Katella Suite 208, Orange, CA 92667; Medical Computer Journal and Dr. Com Puter's Report, Dr. Aziz Ghaussy, 42 East High Street, East Hampton, CT 06424.

Medical Software Exchange Helps Docs Sell Programs

As physicians begin to develop an appreciation for the potential of the microcomputer, they apply their medical knowledge to the task of producing software with medical applications. Many physicians try to market the result of their labors but find it extremely difficult to track down other computer doctors. Enter SoftDoc, a microcomputer software exchange.

SoftDoc is the creation of Dr. James Gange of Los Angeles, CA. Dr. Gange began SoftDoc as a way to help some like-minded physician friends who all had some software they were willing and eager to share with their colleagues. Since its inception about a year ago, SoftDoc has been adopted as an official project by the Society for Computer Medicine, whose President is Dr. Marion Ball, the Director of Computer Services at the Temple University Medical School.

SoftDoc's current offering is a CP/M based collection of approximately 25 programs. Included in the package, distributed on an 8-inch floppy disk, are programs to:

- · evaluate pulmonary function;
- · set up a respirator;
- generate evaluations of lab tests such as glucose tolerance and electrolyte balance;
- evaluate a patient's lifestyle, help the patient figure out why he cannot give up smoking, and suggest ways to improve health by changing lifestyle habits;
- the ANSI standard Mumps program, the most commonly used medical usage language.

All these programs are written in various dialects of Basic (with the exception of Mumps). The disk is available to physicians for a price, or a physician can join SoftDoc and receive the software free by contributing software to the exchange.

The program will run, with some

modification, on the TRS-80 Model II under the CP/M operating system.

SoftDoc is always on the lookout for new software and is looking for competent software editors and programmers, as well. Dr. Gange says the exchange cannot pay editors at present but can arrange to provide references in return for editing, translating to other Basics and operating systems and debugging. Soft-Doc is not interested in business office software; the thrust of SoftDoc is clinical application software.

In a recent interview with 80 Microcomputing, Dr. Gange said that, theoretically, microcomputers should have a profound impact on the practice of medicine. Practically, however, he said, "this hasn't happened yet. The development of clinical applications is still in the embryonic stage."

Dr. Gange speculated that growth in the field had been slowed by the difficulty of distributing medical software. This was one of the reasons he has launched SoftDoc.

For further information, write to:

SoftDoc c/o Dr. James Gange 1433 Roszmare Road Los Angeles, CA 90024

Computer Aids Help Handicapped

Computer aids now make it easier for the handicapped to work, communicate with others and seek emergency help. They assist the hearing and visually impaired as well as those severely handicapped from cerebral palsy or spinal disorders.

The most widely used device is the TTY/TTD (teletypewriter telecommunications device), which allows the deaf to communicate over telephone lines. The National Crisis Center for the Deaf has a 24-hour hotline that receives TTY/TTD communication concerning medical and emotional problems and dispatches emergency help to callers. "They receive 10 to 15 calls a week," says director Mary Compton.

A prototype conversion of the TTD baudot to ASCII code has been developed by Paul Rinaldo of the Amateur Radio Research and Development Corporation (AMRAD), using the TRS-80 Model I. Rinaldo has also made prototypes using the Commodore PET and Apple computers. This would allow these machines to replace the teletype terminals as home communication devices.

Two states offer TTD/TTYs at low or no cost. Michigan Bell now sells the device after a Public Act mandated they be made available at cost of production. Since March 1981 they have installed 800 TTDs.

In California, phone companies are required to supply the devices at no cost; they have until 1984 to comply with the legislation. An original bill required TTDs be available at \$14.50 a month, and they were installed in the pllot program in Fremont, CA.

Microprocessor

Most TTDs feature a single chip microprocessor that converts baudot to ASCII. Printer and display are either separate or one unit.

A number of companies are producing the TTDs, including Plantronics Inc, whose VuPhone has both baudot and ASCII; Applied Communications Corporation, whose Phonetype was the first TTD developed; Specialized Systems Incorporated, whose customers include Sears Roebuck, Bank of America and 32 state governments; and Krown Research, whose Porta Printer Plus offers ASCII code format for \$100 over the \$575 price tag. Various teletypewriters are also available.

Automated Data Systems of Madison, WI, produces an alternative to the TTDs called Superphone, a terminal with voice synthesis that can be used with any touchtone phone. It allows direct contact that the TTY doesn't, since the receiver of the call doesn't need a TTY terminal. The Superphone terminal also can be attached to a television set to produce a CRT screen and has features such as an automatic answering device.

For face-to-face communication, the deaf and dumb can use Automated Data's VIP communicator, a pocketsized teletype with an attachment worn on the person's lapel flashing the letters being typed.

For the Blind

Terminals are also being modified for the blind. A Low Vision Terminal (LVTS) prototype has been developed by M. Daniel Simkovitz, an engineer at Wayne State University in Detroit. The screen shows characters three inches high and allows the partially sighted to read serially or a few characters at a time.

"The partially sighted are not understood," says Simkovitz.

Most work has gone into synthetic voice for talking computers or braille keys with a voice output. But 80 percent of the 347,000 legally blind still have some vision, and many of those could use the LVTS, he says.

There are also printers available for the partially sighted. Automated Data offers printers and CRTs with large characters and a computer with brallle

printer output.

Voice synthesizers use either electronic phoneme synthesis or the more subtle allophone synthesis. Most micros, including the TRS-80, have single chip voice synthesizers available.

But not all computer commands can be represented by speech, Simkovitz says, which makes the LVTS more valuable to the partially sighted. Besides, the partially sighted often don't read braille.

Interfaces are being produced that allow the severely handicapped to operate a keyboard. The Express I & II from Prentke Romich Company, Shreve, OH, are key interfaces with serial ASCII data that converts to parallel ASCII. The interface features a panel of 120 blinking lights. A joystick or optical head pointer is used in place of the keyboard. When the user makes the selection by an optical head set, a microprocessor receives the signals via a small tube with a lens and light sensor.

These devices should help the nation's 21 million disabled in their homes and jobs. Those developing computer aids hope to increase job opportunities for the handicapped.

Superphone "could make a difference, especially when employing the deaf," says Rob Engelke of Automated Data. "Even a stock clerk...has got to be able to contact people."

Electronic Silly Putty

A writer in the Midwest is using the Express I with printer hookup to produce a monthly column. Engelke says he's had some orders from businesses, and computer companies are snapping up his terminals because they can be modified for other applications.

"It has a bus, it's just like an Apple," he says. "There's plenty of room in there. It's electronic silly putty in a keyboard."

Institutions have also been buying products for the handicapped. Now that

Aerocomp's Proven **Best-By Test!** The

Double Density Controller * Technical Superiority

At last! A double density controller for Model I with HIGHER PROBABILITY OF DATA RECOVERY THAN WITH ANY OTHER DOUBLE DENSITY CONTROLLER ON THE MARKET TODAY! The "DDC" from Aerocomp. No need to worry about the problems that keep cropping up on existing products. AEROCOMP'S new analog design phase lock loop data separator has a wider capture window than the digital types currently on the market. This allows high resolution data centering. The finest resolution available with digital circuitry is 125 ns (nano seconds). The "DDC" analog circuit allows infinately variable tuning. Attack and settling times are optimum for 5-1/4 inch diskettes. The units presently on the market use a write precompensation circuit that is very "sloppy". Board to board tolerance is extremely wide - in the order of ± 100 ns. The "DDC" is accurate to within ± 20 ns. The botton line is state of the art reliability!

★ Test Proven

Tests were conducted on AEROCOMP'S "DDC", Percom's "Doubler A"* and "Doubler II"* and LNW's "LNDoubler"** usi a Radio Shack TRS80*** Model I, Level 2, 48 K with TRS80 Expansion Interface and a Percom TFD100* disk drive (Siemens Model 82). Diskette was Memorex 3401. The test diskette chosen was a well used piece of media to deterusing mine performance under adverse conditions. The various double density adapters were installed sequentially in the expansion interface.

The test consisted of formatting 40 tracks on the diskette and writing a 6DB6 data pattern on all tracks. The 6DB6 pattern was chosen because it is recommended as a "worst case" test by manufacturers of drives and diskettes. An attempt was then made to read each sector on the disk once - no retrys. Operating system was Newdos/80, Version 1.0, with Double Zap, Version 2.0. Unreadable sectors were totalled and recorded. The test was run ten times with each double density controller and the data averaged. Test results are shown in the table.

★ Features

TRS80 Model I owners who are ready for reliable double density operation will get (1) 80% more storage per diskette, (2) single and double density data separation with far fewer disk I/O errors, (3) single density compatibility and (4) simple plug-in installation. Compatible with all existing double density software.

* Value

\$149.95 for the BEST double density **Controller on the market.** \$189.95 for "DDC" complete with DOSPLUS 3.3D \$239.95 for "DDC" complete with LDOS

FREE TRIAL OFFER

Order your AEROCOMP Disk Drive and use it with your system for up to 14 days. If you are not satisfied for ANY REASON (except misuse or improper handling), return it, packed in the original shipping container, for a full refund, ispecial packages will be perforated) We have complete confidence in our products and we know you will be satisfied! ORDER TODAYI

WARRANTY

We offer you a 120 day unconditional warrenty on parts and labor against any defect in materials and workmanship. In the event service, for any reason, becomes nescessary, our service department is fast, friendly and cooperative.

100% TESTED

AEROCOMP Disk Drives are completely assembled at the factory and ready to plug in when you receive them. Each drive is 100% bench tested prior to shipment. We even enclose a copy of the test checklist, signed by the test technician, with every drive. AEROCOMP MEANS RELIABILITY!!

ORDER NOW/II

To order by mail, specify Model Number(S) of Drive, cable, etc. (above), enclose check, money order, VISA or MASTERCHARGE card number and expiration date, or request C.O.D. shipment. Texas residents add 5% sales tax. Add \$5.00 per drive for shipping & handling (Cont. US). Please allow 2 weeks for personal checks to clear our bank. No personal checks will be accepted on C.O.D. shipments-cash, money orders or certified checks only. You will receive a . card showing the exact C.O.D. amount before your shipment arrives. Be sure to include your name and shipping address. You will be notified of the scheduled shipping date. Your bank credit card will NOT be charged until the day we ship.II

80 NEWS

Michigan Bell has made the TTD available, several offices and stores have purchased the equipment for employees.

"The cutting edge for this type of device is employment," says Simkovitz of his LVTS. Many partially sighted people "have steered away from some professions because of obstacles they face with computer devices."

Simkovitz, who is himself legally blind, says "For many years I faced frustration with computers." He's hopeful others will develop further applications of the device.

There is a program currently placing handicapped people in the job market. National Quest, a part of Unicos Corporation, Leominster, MA, will train the handicapped in computer-related fields and place them in industry. Integral to the program is the talking computer Unicos has developed that reads back input and output to the blind. The handlcapped could also work at home, sending reports to their employers through a modem.

Interest in computers for the handicapped is growing, and Johns Hopkins University hopes to harness some of this enthusiasm with a Personal Computing to Aid the Handicapped contest, sponsored jointly with the National Science Foundation and Radio Shack. Entries will be judged in three categories: computer-based devices, computer pro-

"For face-to-face communication, the deaf and dumb can use ...a pocket-sized teletype with an attachment worn on the person's lapel flashing the letters being typed."

grams or system concept/design. The entries will be displayed in ten regional fairs with a final exhibit from Oct. 31 to Nov. 1 at the National Academy of Sciences, Washington, DC. Johns Hopkins will eventually have a two-day workshop to unite the winning inventors. They've received over 800 entries so far.

Market Problems

Though interest in computers is high, it's sometimes hard for inventors to find companies to market their products. Paul Rinaldo is still trying to find someone to market his ASCII prototypes for the TRS-80, Apple and PET. It's particularly hard to find a distributor for the TRS-80, since the Model I is out of existence. Creating a Model II or III prototype "would mean starting all over again," he says. The Model I prototype took two years to develop.

Now Rinaldo is planning an S100 Interface and prototypes for the TI and Atari computers. He's received federal grants of \$46,000 and \$50,000 in the past two years.

Simkovitz's project was underwritten by the university "way beyond their initial commitment," he says. But budget cuts made further funding impossible, and he needs \$30-50,000 to complete the LVTS so it's ready to market.

Support from the outside has been "shameful and shabby," he says. He's

Shown above is the IM-2 48K INTERNAL MEMORY' and a phillips screw- driver — everything you need to ADD up to 32K RAM to your TKS-80* Model I keyboard unit (for a total of 48K RAM). No soldering or trace cutting — just open the case, remove your RAM chips, plug the INTERNAL MEMORY (IM) into the RAM sockets, plug your chips back in, connect 4 solderless clips (they work!) and close the case (Detailed, illustrated step-by-step instructions show you how to do this). You now have a 48K keyboard unit — and you didn't have to buy an expansion interface! If you don't need 48K, a 32K version is available. Time and experience have shown that the TKS-80* expansion buss cannot reliably drive memory systems. Because the IM does not use the buss, it may be used with ANY expansion device for reliable memory operation. Some of our customers use an IM INSTEAD OF the RAM in their expansion interface to eliminate EI memory problems! Because the IM draws most of its power from the I2 volt supply, power supply loading is not a problem. Some additional heat is generated, but the TKS-80* runs so hot anyway you probably won't notice the increase! The INTERNAL MEMORY is completely tested and assembled using only the finest materials. You have IS days to return it for a refund if you don't like it, and a SA SE for more information.	driver — everything you need to ADD up to 32K RAM to your TR5-80* Model I keyboard unit (for a total of 46K RAM). No soldering or trace cutting — just open the case, remove your RAM chips, plug the INTERNAL MEMORY (IM) into the RAM sockets, plug your chips back in, connect 4 solderless clips (they work!) and close the case (Detailed, illustrated step-by-step instructions show you how to do this). You now have a 48K keyboard unit — and you didn't have to buy an expansion interface! If you don't need 48K, a 32K version is available. talked to several companies, and half a dozen have seen the prototype, but he's had no offers yet. Simkovitz would like to take the product to a small company experienced with products for the partially sighted.

Costs

The cost of computer aids may be steep for the user as well. The LVTS should retail for between \$2500 and \$4500. The Express I interface is \$2380; the Express II, with full ASCII character set but no printer, is \$1900. Prentke Romich's environmental control units, which hook up to electrical appliances in the home, run from \$560 to \$1325. The hand-held teletype VIP communicator is \$199 with an \$89 voice attachment. Automated Data also offers a computer terminal for the blind with speech output for \$900 to \$1000.

The TTDs, in states that don't provide them through the phone company, run about \$550. In Michigan, Bell Telephone provides a TTD for \$400.86, or \$6.68 a month for five years. You can lease the device for \$125. In California, users pay only for regular telephone service.

More affordable are information services including the builetin board service SpecialNet and Creative Computing for the Handicapped, a West German organization.

Though SpecialNet is directed at special education administrators, its

"The cost of computer aids may be steep for the user as well."

bulletin boards will feature information useful to the handicapped. A Iltigation bulletin board will be managed by the editors of the *Education of the Handicapped Law Review*; the Prentke Romich Company will operate a bulletin board on system devices for the handicapped; and a federal bulletin board will contain pending legislation of importance to the handicapped, including federal budget actions. SpecialNet will also feature electronic mail.

The Association for the Advancement of Microcomputer-Based Work at Home for the Handicapped, West Germany, will translate articles on microcomputers onto cassette for the blind. They also will translate advertisements with information on how to order software and hardware from American distributors.

Prentke Romich may organize a review board made up of special education teachers and the handicapped who would evaluate educational software. Their initial network project, Apple Computer Clearinghouse for the Handicapped, has been scaled down, though they may compile a service catalog of software for the handicapped, says computer manager Neil Russel.

Computer companies are offering more services and products for the handicapped, and finding a market for them. All they have to do," says Engelke, is "use their imagination."

NEWDOS 2.1 — NEWDOS/80 users INTERACTIVE CONTROL LANGUAGE

Aren't you tired of waiting for and answering endless prompts like — "ENTER FILE NAME?" every time you've got to

work with your computer? And how many times were you dreaming about having additional features in DOS or DEBUG — something quite handy like repeating previous command or having an option to define your own new command?

Now we've got it all for you - the complete control language system!

Create and run your own multilevel procedures, dynamically generate/store replies for prompts, intercept and switch control back and forth between running program and ICL, execute and check execution of DOS commands and (CMD files within procedures and much much more! ICL is especially convenient for 1 drive systems where a lot of diskette swapping is necessary.

To you procedures look like additional and quite intelligent commands. Works fine with BASIC programs, EDTASM, DISASSEM,

Works fine with BASIC programs, EDTASM, DISASSEM, F80, L80, SUPERZAP... almost any program using standard DOS I/O drivers. Basic editor can be used to create procedure text files.

Superb documentation with detailed "how-to-use" and tutorial information, most useful procedures, system information and patches provided.

All for unbelievably low price of \$29.49 — (on 5" diskette + documentation). To order send check or money order to

sity, New Haven, CT) and a group of experienced teachers spent two weeks this summer with more than 100 teenage computer nuts.

80 NEWS

Taking place during the last two weeks of July in the Klar Crest Resort in Moodus, CT, the fourth annual National Computer Camp was a complete success, according to Dr. Zabinski. He told us more than 160 campers aged 10 to 18 of both sexes came and had a good time.

or the fourth year in a row, Dr.

Michael Zabinski (of Fairfield Univer-

Computeens Mob Camp

Keep Prof Jumping, Happy

The camp, the first of its kind, combines small group instruction in microcomputer uses with strong emphasis on the TRS-80 with normal camp activities. Students this year came from as far away as London, England, and Caracas, Venezuela.

One hundred ten students attend the camp for a week, and about half of them stay for the second week. The staff includes 188 teachers plus two recreational organizers, two directors, a medical doctor who is doing computer research and Dr. Zabinski.

The students work in small groups arranged according to their level of knowledge, ranging from beginners to two groups of Assembly programmers. All work on TRS-80s, except one of the Assembly programmer groups which used Apples and a Wang minicomputer.

A typical camp day starts with a morning computer session from 9 to 11 a.m. There is a midday break for sports, including swimming and diving in the camp pool, and soccer with a college varsity player who is a physical education major. After lunch the students relax until 1:15 when they go back to the computers until 5 p.m. At night Dr. Zabinski runs a movie or other special event. One night they conducted a Las Vegas night, with games of chance run on the microcomputers.

Most of the computer work is done in a spacious and well-lit camp hall. The campers worked in an informal atmosphere, moving around a lot and sharing information and activities.

"This is not a classroom setting," Dr. Zabinski explained. "We give them books but they are not textbooks and we never tell them to turn to page such and such. We use them for reference only.'

The campers are often too dedicated to their computer work. In spite of the beautiful, quiet grounds of the resort camp and the bright weather, Zabinski had to personally order some of the kids out of the hall to take a swim at the 11 a.m. break.

Rick Larcom, a teacher from a New Canaan, CT, high school who runs the TRS-80 Assembly group, mentioned he has to turn out the lights at night to force the kids to leave and he has to lock the doors or he'll wake up to find some of them already at work early in the mornina.

Dr. Zabinski feels that the secret to the success of his camp is the staff. "I handpick everybody. I train most of them myself. Most of my teaching assistants used to be campers. I emphasize that I have to have a good staff. They're knowledgeable and experienced at what they're doing."

The teachers come from all levels, from elementary through high school, and Dr. Zabinski tries to match the teachers with age groups they are used to. This isn't always easy or even possible-the groups are divided according to the students' level of accomplishment, not age, and especially in the upper levels the ages are fairly mixed.

The emphasis of the camp is not solely on learning hard technical material. In fact, Larcom teaches social studies, not math, during the year.

Zabinski isn't worried about technical orientation among his teachers so long as they know their subjects well and are good with the campers. His concern is having the students learn something.

His formula is proving very successful. "When the kids come back year after year and bring their friends, it tells you something about how well you're doing," explained Dr. Zabinski, who added the camp does practically no advertising because it fills up so fast from repeat campers and people who have heard of it by word of mouth.

Next year they are considering expanding to four weeks and may run one special week for computer campers with diabetes.

The camp medic, Dr. David Rowe, is a pediatrician from the University of Connecticut who works with diabetic children. His interest in diabetic children may spur the special week next summer.

Zabinski appreciates the complications this would involve, but he's confident they can handle just as they first handled the much greater problem of creating a computer camp.

French to Make Model III For Radio Shack Europe

Tandy/Radio Shack, Fort Worth, TX, has some good news for European fans of the TRS-80. The firm is completing an agreement with a French electronics firm to manufacture the TRS-80 Model III in France.

Tandy spokeswoman Harriet Rylander said if things go well the French company, Matra SA, will have the microcomputers in production by March.

Tandy is making its French connection to improve the supply of TRS-80s in the Common Market countries. Tandy involvement in the European microcomputer market does not approach the success it has had in the U.S., and Rylander blamed this on lack of supply.

Tandy's U.S. manufacturing facilities are straining to keep up with domestic demand, so TRS-80s have been rare in Europe. The Model III was not available there at all until June, and is still hard to find.

The French connection is the second foreign agreement Tandy has announced in the last few months. They earlier announced an agreement with Tokyo Electric to manufacture and jointly market the Model I in Japan.

Until this summer Tandy had made all its microcomputers in its own plants in the U.S. However, Rylander said the announcements do not so much represent a change of company tactics or policy as the exercising of an option Tandy always considers when supplying a new market. Having a local host simplifies many areas for Tandy.

Other Products

Matra SA is a large French conglomerate active in areas including telecommunications, space technology and mass transportation. According to Rylander, Tandy is interested in developing other connections with Matra, particularly in telecommunications, if the Model III deal works well.

The Matra deal has been approved in principal by the French government. However, arrangements between the two firms have not been finalized, and once the agreement is signed it must be approved in detail by the French government.

Tandy President John V. Roach stated, "This joint venture for computer manufacturing represents an important milestone in our growth in Europe in general and in France in particular. It will significantly strengthen our ability to support the European microcomputer market."

School Microcomputer Aid Clipped by Budget Cutbacks

Although a number of federal agencies offer grants that could be used for projects involving microcomputers in the schools, many are receiving funding cutbacks or are being absorbed in the block grant program.

Title IV B and IV C of the Elementary and Secondary Education Act of 1965 authorized the largest sums for microcomputers. The Office of Libraries and Learning Resources, which administers IV B, granted 40 percent of last year's \$161,000,000 for projects involving microcomputers. Title IV C, whose funds are granted to improve local educational practice, doled out \$66 million in fiscal 1981.

With both funds going to block grants in fiscal 1982, 20 percent of the available money will be given to the states and 80 percent to local school districts, which means the schools themselves will have more control over how the money is spent.

Budget Jitters

Many grant agencies expect cuts in next year's budgets, however. Authorization hearings are still underway in the House of Representatives, leaving the agencies up in the air about how much money will be allocated next year.

No federal agencies are authorized to fund projects solely for microcomputer purchase or use, but many will fund larger programs involving micros. These include:

• The Division of Adult Education: Part of the Office of Education, Adult Ed recently dispersed \$100 million in grants to expand adult education skills. Money is given to the states who determine allocations to school districts. The program should remain a categorical grant

for next year.

• Bureau of Education for the Handicapped, Division of Innovation and Development: The Education of the Handicapped Act authorized money for research into improved education for the handicapped. Some applicants funded in the past already had microcomputers; grants have supported computeradministered testing and research, as well as curriculum development using micros. Max Mueller, chief of the research projects branch, says next year's budget could run anywhere from \$8-20 million.

• Office of Bilingual Education, Office of Education: This program is designed to improve teaching English as a second language, using the student's native language. The program funds micros as part of a basic bilingual program for elementary or secondary education. They awarded 525 grants last year and expect a budget of \$139,000,000 for fiscal year 1982.

• Fund for the Improvement of Post-Secondary Education: Robert Fullilove, director of the program, says they have granted "substantial funding" for micros at colleges and universities. Grants have been awarded to San Francisco State College to establish a "math anxiety clinic" with a Commodore PET computer, and to the University of California at Santa Barbara, where micros are used in algebra classes. Fullilove estimates level funding for next year, which would be about \$13 million.

• Appalachian Regional Commission: Authorized by the Appalachian Redevelopment Act of 1965, this program provides grants to vocational schools and post-secondary technical schools. Director Melvin Rottenberg describes it as a "flexible block grant program" administered by the area states. Their maximum budget for 1982 should be \$50-65 million.

 The National Science Foundation: While the foundation has not awarded money for micros in elementary or secondary schools since 1970, it has awarded substantial grants to postsecondary schools for research involving computers. As part of the Local Course Improvement Program (LOCI), they gave \$2.49 million to 125 institutions for research; another program awarded \$2.7 million in 1980 for the purchase of scientific equipment at 215 colleges. Grants included \$18,569 to the University of Hawaii to develop a software laboratory, and \$13,975 to SUNY College at Oswego for an on-line microcomputer laboratory for behavioral research. About half of the LOCI awards go to microcomputer projects, says John Maccini, who coordinates the program:

• Teacher Center Program, Bureau of Higher and Continuing Education: Teacher Center grants establish inservice centers for educators; many of these contain microcomputers. The program has a \$10 million budget for fiscal year 1982, and will be absorbed by the block grant program the year after. It originally funded the establishment of 60 teacher centers in 1978; half of these have retained funding. Many of the others are now supported locally.

No Funds Here

Programs that are being dissolved or which no longer fund micros include:

• Coastal Plains Regional Commission, a program assisting vocational schools in the southern coastal areas, is ending Sept. 30; it had received applications involving micros but none were approved by the states.

• Emergency School Aid Act of the Equal Educational Opportunity Program cannot allocate its monies for micros, according to director Jesse Jordan. The agency was incorrectly included in a list of available funds collected by Bell & Howell, Chicago.

Even if federal funds are limited in the 1980s, the agency officers doubt this will have a detrimental effect on micro development in schools.

"They are getting computers in the classroom by hook or by crook," says Bob Tinker of the Technical Education Resource Center (TERC). PTAs and districts are being called upon as well as formal state and federal funding sources.

Linda Roberts, a researcher for the Division of Educational Technology, agrees. "School officials are saying, 'Hey, I want a micro—and we're having a cake sale to get it.' There's a real grass roots effort."

Students from 5 to 105 Enjoy Hands On Science

The Talcott Mountain Science Center for Student Involvement (TMSC) in Avon, CT, is an unusual learning institution. Dedicated to teaching science by getting students involved, it educates children from kindergarten through college level in private programs for Center members and by the class under contract to a variety of public and private schools and the University of Hartford in nearby West Hartford, CT. Computer programming is only one of the several hard science subjects the center offers.

While most schools take a classroom approach to science, with a heavy emphasis on lecture and theory and a limited amount of laboratory time, TMSC presents little or no lecture and puts the students into a hands-on situation under the guidance of teachers and scientists. TMSC students have been involved in genuine scientific research, helping staff members develop raw data for papers for international symposiums. The students, who range from age five to 22 and from upper middle class "rich kids" to inner city Hartford blacks and Chicanos, respond enthusiastically. Careful testing shows they also learn more quickly and thoroughly than students in traditional classrooms.

TMSC's Computer Science Department is fully integrated into the general activities of the Center. Housed in a new solar-heated building, the Center offers students a variety of microcomputers which include all the Radio Shack products. Over the summer the heaviest users are members of the Center's Quest program. These are teenagers from grades 5 through 12 with high science aptitudes who work on projects of their own choosing for two week periods. They are divided into beginners, intermediate and advanced or Assembly language classes which work in three separate rooms in small group situations.

Practical Programs

An unusual aspect of the Center program is that it is self-reinforcing. Many of the students work on programs that they or others at the Center will use to learn about computers or augment other science projects. One student is developing a program which will accept weather data from radio weather reports and draw a weather map. When it is finished the program will be used by the Center in their meteorology courses. Another built his own specialized microprocessor to accept solar energy information directly from the Center's solar measurement equipment and analyze it automatically for use with the Center's continuing program of solar science.

Writing instructional programs is another popular activity. "The kids get a big kick out of teaching other kids something and writing programs that

80 NEWS

teach," Bill Danielson, TMSC's computer department director, said.

These programs have included mineral and plant classifiers which ask the user a series of identification questions about the specimen and use the answers to determine what it is.

One of the more interesting student projects involved fruit fly propagation. The student wanted to demonstrate the rate of increase of a fruit fly population using the fruit fly propagation formula. Normally it takes two weeks for fruit flies to hatch. The student wrote a program to print a colon to represent each pair of fruit flies. He started with a single pair and had the microcomputer calculate how much time it would take to print out each generation on a 30 cps printer. He discovered that if the computer runs at full speed, the actual fruit flies will catch up with it in their fifth generation and the printer will fall progressively further behind after that.

The nicest thing about this approach to learning is that the students learn programming, use of the computer and computer applications to other activities at the same time they are learning the subjects covered by their programs.

Their learning goes beyond the immediate applications, however.

"One of the real advantages of the computer is it is easy to construe it as a brain," Danielson said. "It gets the kids

"We are no longer a supplement to our students' science education. We are their science education."

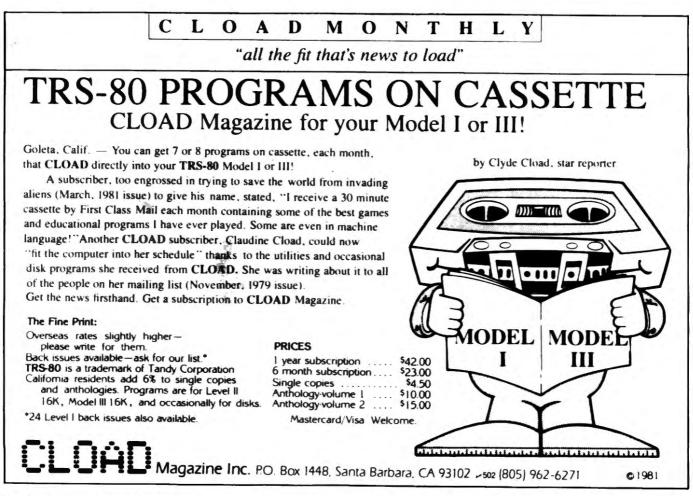

to think very clearly about who they are and what the nature of thinking is."

The Quest students are not the only Computer Center users. Danielson said the Center has been running a large number of teacher workshops for area schools interested in developing more applications for the microcomputer in their classrooms. The Center also has younger children in programs; the youngest are the "Fledglings," kids going into kindergarten and Grade 1 in the fall. They get one and a half hours with the microcomputers as part of their program of general introduction to science.

The Center relies heavily on its TRS-80s; it has five Model IIIs, one Model I, a Pocket Computer and a Color Computer along with three Apples, one Sinclair and a PDP-11 minicomputer from Digital Equipment Corp. (DEC) that timeshares on several terminals for the most complex applications.

"The important thing is not whether they master Basic or Assembly language but that they have a good experience with the machine at an early age," Danielson said. "With the increasing intrusion of computers into our professional and private lives, we are facing a two-cultures problem. We may well find ourselves divided between those who use computers and those who do not."

"Most of these students won't become

82 • 80 Microcomputing, October 1981

professional programmers; they will go out and be engineers, businessmen, writers, and many other things. If they bring a positive attitude towards computers to their work they will be able to use this tool effectively."

Important Place

In a decade of cutbacks in public education funding, Danielson said TMSC and other institutions like it serve a vital purpose in education. The head of one large Connecticut school system regularly visits public school classrooms on a drop-in basis. In over 100 visits in the last year, he found only two instances where a science lesson was being taught when he visited.

The obvious implication is that only two percent of the students' time is spent on science. In an increasingly technological world, it is ironic that the return-to-basics movement in education is discouraging any change in that proportion.

Under these conditions, Danielson said, "We are no longer a supplement to our student's science education. We are their science education."

College, Publisher Join, Offer Computer Program

The Hawthorne-Green Inc. Institute of Computer Science has been announced by officials of Nathaniel Hawthorne College. The new program will be offered at the Hawthorne campus, located here in Antrim, a small town in the south central region of New Hampshire.

Initially, instruction will deal with the fundamentals of computing, with a heavy emphasis on microcomputers. The courses will explore hardware, software, and computer science; future plans call for increasingly diverse offerings of advanced and specialized courses.

The classes will be taught by the Hawthorne faculty and by members of the staff of Wayne Green Inc., located in nearby Peterborough, NH. In addition to publishing several microcomputer periodicals, the firm also maintains an extensive working microcomputer laboratory for use by its subsidiary, Instant Software, one of the country's major microcomputer software houses.

In the interest of making the classes available to as many people as possible, the first courses will be held in the evening, two nights a week. Students with no technical background will be accommodated in the introductory sessions as will the needs of more advanced enrollees. Topics to be covered include data processing and electronic trouble shooting and, according to a spokesman for the institute, the classes are well suited for the person who wishes to prepare himself for a career in the booming technical field. Course participants may also elect to pursue a certificate program or go on to further study under a formal degree program.

The first courses are slated to begin this month.

80 NEWS

Farmers Group Cultivates Videotex News Database

A new timesharing network for farmers supplying up-to-the-minute information on commodities markets has been started by the Professional Farmers of America, Cedar Falls, IA.

The electronic news network, called Instant Update, uses Radio Shack Videotex

"The network offers analyses of events which may have an impact on the market and their possible effects on commodities prices."

16K terminals to distribute a daily morning newsletter, a report on opening prices in the commodities markets, updates on the markets through the day and evening market summaries. It also carries information on market strategies, reports on events in Washington which may affect the commodities market and background and historical information. The network offers analyses of events which may have an impact on the market and their possible effects on commodities prices.

The most recent addition is a database of Gulf Coast grain prices. This is a measure of demand in the market according to Tom McCafferty, marketing manager for the Professional Farmers. He said they were considering adding East and West coast grain prices.

McCafferty said interest in Instant Update has run high among farmers since it was first announced in January. The service actually started April 1. McCafferty declined to give the number of subscribers except to say it is "over 500." He said while subscribership is heaviest in the midwest, Instant Update is a nationwide service which even has a subscriber in Hawaii.

It costs a flat \$95 a month for unlimited access, including rental of the Videotex terminal. It is an interactive service, with the user selecting a database from a menu and storing information in Videotex to read off the television screen.

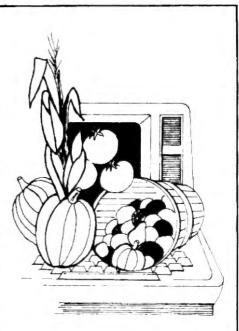

McCafferty said the newsletter and commodity prices are the most used databases, a weather database the least.

Only Choice

The Professional Farmers chose Videotex because it was the only terminal around. They have been very happy with the equipment which so far has been virtually trouble-free.

McCafferty said relations with Tandy/Radio Shack, Fort Worth, TX, have been good although "they can always be better." He also said they have been waiting for some software from Tandy to allow TRS-80 microcomputers to interface with the system.

Charles Phillips, Senior Vice President for Special Markets for Tandy, mentioned they are actively promoting the idea of private information networks using Videotex terminals. In the long run, he said, Tandy expects Videotex to become a household appliance. Phillips told us they hope enough private networks will take up Vid-

eotex to create a "critical mass" of homes using it so that as general-interest data services develop they will be designed to be compatible with Videotex. "A lot of people are looking at this form of communication," he noted.

McCafferty said Professional Farmers is a private business offering farmers marketing information and seminars on marketing. Founded in 1973, it has more than 30,000 client-members.

Education Bill Reintroduced

US Rep. Tom Downey (D-NY) has reintroduced his bill to establish one or more national centers of study microcomputer use in education. The bill is being co-sponsored by two members of the House Subcommittee on Elementary and Secondary Education, where it stalled last year. According to a spokesman, Rep. Downey is optimistic that subcommittee hearings will be held on the bill this year.

The bill seeks \$4 million paid over three years to support the establishment of one or more centers to study how microcomputers are used in schools and to make this information available to interested parties in the hope of encouraging microcomputer use in education. However, David C. Smith, legislative assistant to Rep. Downey, warned that it will be tough to squeeze extra money out of Congress for anything this year.

Smith said one big argument for the bill is that the United States is falling behind other countries in this area; even the British, with their much-publicized economic woes, are spending \$25 million to purchase microcomputers and put them in every school in the country. The French have a similar plan already approved and in operation.

"All we want to do is study the uses, we aren't talking about actually buying any machines for schools," Smith said.

Rep. George Miller (D-CA) and Rep. Mario Biaggi (D-NY) are co-sponsoring the bill this year. Smith said the hope to conduct subcommittee hearings sometime after the August recess.

If the subcommittee passes it, the bill will then be considered by the Committee on Education and Labor. If that committee acts favorably on it, it will go to the full House for consideration.

Anybody interested in expressing an opinion on the bill, labeled HR-2112, to be placed on the record, may write to Rep. Carl Perkins (D-KY), Chairman, Subcommittee on Elementary and Secondary Education, Room B346C, Rayburn House Office Building, Washington, DC 20515.

ATARI 400 COMPUTER TO BE AWARDED TO ESCAPEE!

Asylum is the most sophisticated, sinister, challenging 3-D graphics adventure ever written! You are placed in an asylum for DEATHMAZE survivors. Your only goal: *ESCAPE!*

Asylum has over 1200 locations! Hallways recede into the screen, *as though you are actually there!* Doors open and close! Beds, desks, and even guards and other inmates are drawn on the screen! And graphics are generated instantaneously! Simply press an arrow key to move or turn, and you are moved. Absolutely *no* waiting!

English language commands may be issued at any time from a vocabulary of almost 300 words. Commands may include

complete statements. "Get everything on the desk except the matches" is perfectly legal!

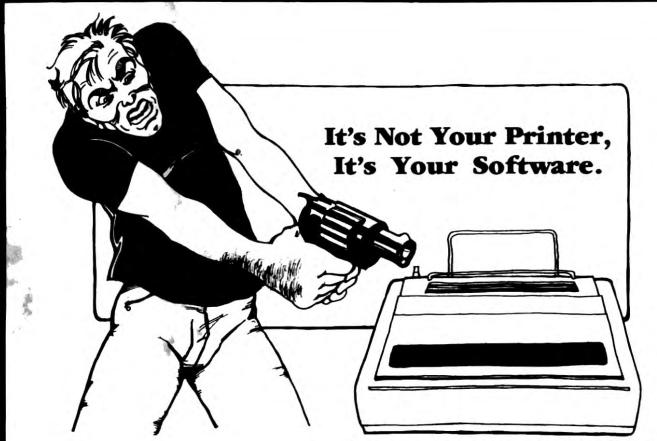

Will anyone escape? Who knows? Intelligence, cunning and patience will be necessary. Send us your correct solution, postmarked no later than November 15th. On November 30th we will draw from the entrants for an ATARI 400 16K color computer!

NO HINTS WILL BE GIVEN OVER THE PHONE!

TRS-80 Level II, Model I and Model III only

Med Systems Software P.O. Box 2674-A Chapel Hill, NC 27514 (919) 933-1990

Features of Qwerty 3.0

- Automatically prints in proportional print, with a suitable format. Transitions between the three print styles are easy, including all expanded print modes.
- Qwerty 3.0 adds 75 new symbols, including upper and lower case Greek letters, mathematical symbols such as integrals and summations, arrows, brackets, and probability symbols.
- Any character can be used as a subscript or superscript, even simultaneously. Carats, bars, and tildes can be placed over any character, with precise position control.
- Underlining, with or without underlining of spaces, including long ratios and mathematical expressions.
- Footnotes can be placed on any page so that they remain on the desired page, even if text is inserted later.
- Table commands enable positioning of the print head anywhere on a line. Invaluable in printing neat mathematical layouts, tables, columnar material, etc., in proportional print.
- Pretty commands allow printing of repetitions of a chosen character. When combined with Table, decorative borders can be produced with ease.
- Folio format produces output in two or three columns per page, in either proportional or 16.7 cpi mode. Ideal for newsletters.
- Supplies a third output mode, in which only Scripsit commands are obeyed. Allows printing of special Qwerty commands for future reference.
- Page End indicates where pages will end, and the page number, without printing the text. One can prepare an almost error-free document without ever using paper.
- Correction of Scrippele's errors and inconveniences, extensive documentation, and much more!

Do you own a Centronics 737? 739? Lineprinter IV? Tired of the limitations of SCRIPSIT? **Qwerty 3.0** will let you accomplish word-processing feats you never dreamed possible. Like Greek letters. Simultaneous subscripts and superscripts. Even footnotes and two or three column folio formats. See the list of features in the box. No other piece of software of this type can match **Qwerty 3.0**. We know, because we bought the others, and were disappointed.

Qwerty 3.0 is more than "fully tested." It has seen thousands of hours of use in a university environment. A masters thesis and a statistical doctoral dissertation were produced and accepted right off a Centronics 737 using this package.

Qwerty 3.0 is the finest SCRIPSIT addition available for the Centronics 737, 739, and Lineprinter IV. You must own one of these printers, a copy of SCRIPSIT, and a disk drive to use it. It is the best. Period. WE GUARANTEE YOU WILL AGREE! If for some reason, you find that this program doesn't meet your needs, return the entire package within 14 days for a prompt and cheerful refund.

For cautious buyers, we offer the manual (about 50 pages) for \$10.00. When you decide to buy **Qwerty 3.0**, we will credit the full manual price.

All three Med Systems educational programs on one disk \$34.95

Deathmaze 5000 Labyrinth

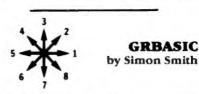

Deathmaze 5000 and Labyrinth are 3-D adventures from the authors who produced Asylum. One and two word commands are combined with incredible 3-D graphics to provide adventures beyond anything you've ever seen.

The goal in Deathmaze is simple. Escape from the most maniacal, devilish, dangerous building ever constructed. Alive.

And Labyrinth? Kill the minotaur. However, you must find weapons, treasures, and knowlege to do so. There's even a graphic vending machine!

The question isn't "Will I survive?". The question is "Will I be satisfied with nongraphics adventures again?".

Tapes \$14.95 ea. Disks \$19.95 ea.

GRABASIC extends Level II or DISK BASIC to include an easy to use graphics command set. A single BASIC command allows the user to draw a line between any two pixels on the screen in hundredths of a second! Coordinates can be chained to allow complex figures to be drawn by a single BASIC program line in less than a second!

GRBASIC allows the definition of shapes. Once defined, a shape can be *rotated*, *scaled* up or down in size, drawn anywhere on the screen in less than a second, and can even be drawn totally or partially "off" the screen in extended space! And all with short, simple BASIC commands! Even multiple shapes are no problem!

A new program, GRBASIC FUNCTION PLOTTER, allows the plotting of almost any function, including polar coordinate based figures, parametic equations, and almost any wave form. Features include function definition and automatic screen scaling, and printing capacity on Line Printer IV. REQUIRES GRBASIC!

Knossos by Simon Smith

"You have just been thrown into a dark, stinking pit"

You are isolated and alone in the maze at Knossos, Crete. Somewhere, a minotaur is tracking your scent. Can you find the only door without becoming a minotaur's meal?

Knossos is a 3-D graphic simulation. Mazes are represented by a perspective view, as though you are actually there. These graphics are not the simple, square graphics you have seen before. An entirely new representation has been implemented giving a true cave-like quality. And like all Med Systems 3-D graphics, lightening fast screen generation is standard.

Other features include chalk with which to mark the floor for reference points, randomly generated mazes, distance counters for exit, and monster graphics. A typical game might last 15-20 minutes. This is the first *truly* 3-D arcade game ever offered.

News From KITCHEN TABLE SOFTWARE, INC. by David Busch

by David Bus

What do you get when you take features from both Basic and Cutol? A new language called Basbol. This innovative high-level language, a combination of ANSI '74 Cobol and Dartmouth Basic, has been introduced for the TLS-8E by Kitchen Table, Inc.

Regular 80 Microcomputing readers will recall that KTI is the United States' largest fictitious supplier of space-age computer products, including DROSS-DOS 1.1 and the TLS-8E. The latter is a new personal computer that is 100 percent downward compatible with the TRS-80 Model I and III.

Basbol was one of six new products unveiled recently by Kitchen Table at the Portage County (Ohio) Home Appliance Fair. Also making their U.S. debut were a new 5 3/8-inch disk drive, a double-density board and a series of aids designed to treat radiation burns stemming from an initial run of poorly-designed color monitors for the TLS-8E.

Biggest hit of the appliance show, at which KTI was the only computer representative, was the Basbol exhibition. The new language is a compiler/interpreter that is used in a unique way. Very fastrunning object code is generated for rapid testing (although debugging is impossible) and then converted back for run-time operation under the Basbol interpreter.

KTI spokespersons pointed out that this mode eliminates many errors, because each line of code is interpreted every time a program is run as a sort of double check. At the same time, the compiler (interpreter) prevents unwanted tampering with the code by the programmer at the testing stage.

A Controversy

One note of controversy surfacing at the display was that Basbol is supplied on a protected disk. The original disk can be backed up only 10 times. It then becomes useless for copying purposes. This will probably not cause much distress for the legitimate user because each backup disk also can be duplicated 10 times with no problem.

We suspect this filmsy attempt at protecting Basbol was a subterfuge on KTI's part to make the new software more attractive to program pirates. Much of the firm's influx of working capital stemmed from the widespread copying of DROSS-DOS 1.1. Though KTI sold less than 300 copies of this DOS over the counter, it has reaped more than \$3 million in profits marketing mandatory Zaps to 111,306 users nationwide.

"The original disk can be backed up only 10 times."

Our suspicions were confirmed on examining the documentation provided for Basbol. It is printed in blue ink on a dark green paper—all but unreadable in original form, but eminently legible when photocopied.

Other products also attracted a lot of attention. KTI's booth was mobbed during exhibit hours. The Da-Glo orange TLS-8E computers really stood out among the drab Harvest Gold refrigerators and home freezers in the surrounding booths.

New Drives

The product that interested me most was the 5 3/8-inch disk drive now available

for the TLS-8E. These new drives replace the units originally supplied with this computer. Scuttlebutt has it that KTI was experiencing delivery problems with the original drives—customers would take one look at the units and refuse to accept delivery.

Because KTI has been having trouble getting its Sri Lanka factories to adhere to strict specifications, the new drives will accept either the common 5¼-inch minifloppy disks or the occasional 5 3/8-inch ones that slip through inspection. The KTI-100 units are 96-tracks-per-inch drives that can be run either in single or double density. Double-density reliability, using the new KTI Doubloon PC board, is said to be 100 percent that of the TLS-8E in singledensity mode. Company spokesmen have promised a remedy for this unfortunate situation in the near future.

The KTI-100 drives may be configured as fixed disk drives merely by inserting a disk and applying furnace ductwork tape over the door to seal the unit shut. Quite a clever touch.

Since the introduction of the TLS-8E, TRS-80 owners have written to comment. One frequent question is, "So what?" A more probing query runs along the lines of "How can a TLS-8E benefit me, a proud Model III owner?"

So What?

My standard answer has been as follows:

• KTI's marketing of the TLS-8E will put a great deal of pressure on Tandy to shape up. With three or four hundred thousand Radio Shack computers already in the field, Tandy has great expectations of selling peripherals, programming, fuses, etc. to this large customer base. Given sufficient provocation, it's conceivable that a quarter of a million TRS-80 owners might decide to switch to TLS-8Es overnight. Then where would Tandy be? Back selling leather belts, that's where!

• Because most software available for the TRS-80 can be used on the TLS-8E, this provides a larger customer base for programmers, and, correspondingly, more software available for the rest of us. Instead of 400,000 Tandy customers, a programmer has a more attractive market of 400,367 users when TLS-8E owners are lumped in.

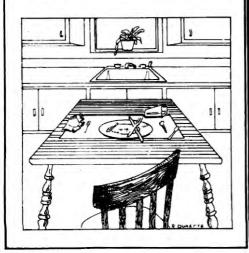

The TLS-8E provides an attractive "second" computer for present TRS-80 owners. Recent upheavals in the international money market have given the U.S. dollar a stronger position when compared to Sri Lankan currency. As a result, KTI has been able to drop the price of the TLS-8E from \$1984 for a two-disk 48K system down to \$179.95.

Obviously, at that bargain price, many TRS-80 Model I or Model III owners are going to want a TLS-8E to carry around to users' groups, on camping trips, etc., where its rugged hard-wiring will better withstand mistreatment.

... the remains can be rewired to make a pretty good garage door opener."

I've heard of many hobbyists who have purchased these machines just as "parts" computers. Need a 1771 chip? Rip it out of the TLS-8E. Interested in finding out if the Z-79A chip would make a good diode? Use one of the two piggybacked into every KTI computer. After you've experimented to your heart's content, the remains can be rewired to make a pretty good garage door opener.

I gleaned all these tidbits from brief interviews with the reclusive founder of Kitchen Table Inc., who prefers to remain anonymous. We agreed to abide by Scott Nolan Hollerith's wishes and pass along these interesting comments to you without any attribution.

one CrM Handbook Ad#18 **ULTIMATE SOFTWARE PLAN**

We'll match any advertised price on any item that we carry. And if you find a lower price on what you bought within 30 days of buying it, just show us the ad and we'll refund the difference. It's that simple.

THE EXCLUSIVE ORACLE by Dennis Kitsz

"I have yet to see you name programs that are no good. You are culpable in not disseminating this information. Must we continue to get ripped off?"

Q. I recently wrote a Basic program with machine language interfaced within it. I found it was faster to save the Basic part of the program together with the machine language routines by using T-Bug, than to load them separately or to POKE them in. The program works perfectly when saved this way except for one thing: In order to list the program, it is necessary to type Clear and hit enter before typing LIST. If you don't the computer will List the first line and stop. If you run the program and then List it, it works fine.

My questions: Why is it necessary to type Clear, can you get around it, and why is it necessary to type ?MEM after returning from some machine-language programs? I know that this eliminates errors that occur if you don't, but what causes these errors in the first place? Also, is there any way to get a Basic program to run from a machine language introduction? I have a program written, but the introduction is in machine language. Is it possible for the machine language routine to start the Basic program running when the introduction is finished?

> Nathan W. Harrington Nelson, Nebraska

A. Welcome to Software Interfacing 101: Getting in and out of Basic with no help from Fort Worth. Your first question brings up an interesting topic. The Clear subroutine is used quite often by Basic—after executing Clear, of course, but also after New, CLOAD, and Run. Its purpose is not only to clear out all variables (actually this is a consequence of the routine, not its main objective), but also to reset properly all the line pointers in the Basic listing. What are line pointers? Basic picks its way through a program listing in two ways—by knowing a line's number (stored in binary) and also by knowing ahead of time the memory address of the next response line in the program. This memory address is its "pointer".

The Clear routine automatically sweeps through the entire Basic program, adjusting line pointers according to where it finds the ends of lines. Depending on the condition of the Basic program when you first saved it to tape using T-Bug, your subsequent load attempts may actually be putting it in an area different from the one you expect. Hence, there is an incorrect or truncated list. In your case, the line pointer that should be locating the second line of the program is instead pointing back to the first line. Since Run also uses the Clear routine first, that explains why the program is automatically corrected by running it. The address of the Clear subroutine, if you wish to use it before returning to Basic, is 1E7A hex.

The reason you have to type ?MEM (or something similar) when returning to Basic from some machine language programs is because many programmers took Radio Shack at their word. In the original Editor/Assembler manual which so many programmers used, return to Basic was listed as address 1A19 hex. However, that address works only under certain conditions; registers have to be loaded and the stack pointer set up for re-entry without an ?OM Error message being printed upon entering the first Basic command. A better Basic re-entry point is 06CC hex, which avoids both the ?OM Error message and rebooting a disk system.

Finally, there is indeed a way to get a machine language routine to start your Basic program automatically. Here's the order: register HL is loaded with 41E7, just before the beginning of the keyboard input area. Memory location 41E8 is filled with Run token 8E, and location 41E9 is filled with line terminator 00. Next jump to the master command execution routine, 1D5A. This is how it looks in assembly language:

LD	HL,41E8H	; Get line buffer location	
LD	(HL),8EH	; Place RUN command token	
INC	HL	; Move to next buffer place	
LD	(HL),00	; Close out the line buffer	
DEC	HL	; Move back in the buller	
DEC	HL	to before the beginning	
JP	105AH	; And bow to master executor.	

Q. I've got a Model I Level II 16K machine with a problem. The computer runs fine until I run this program:

- 10 READ A.B.C 20 PRINT A.B.C
- 30 GOTO 10
- 40 DATA 1,2,3,4,5,6,7,8,9

When I run this program I get:

etc.

I've eliminated the Z80 and eight 16K chips by replacing them. I've had this computer since 1978 and I've installed a lowercase modification in it. I own T-Bug and TLDLS but I haven't figured out how to use them yet. How can I figure out which chip is bad?

2 3

2 3

SSgt Terry L. Kuns APO New York

A. The bad chip is your Level II ROM. However, don't replace it as the electronics aren't bad. There's a bug in the first version of Basic. It's too bad you paid for a new Z80 and 16K memory to find that out. Here's the solution. Whenever you are using any program that does tape I/O or performs Read/Data combinations, be sure this line appears somewhere at the start: POKE 16553,255. Q. I appreciated your January column about the programs you have found to be useful. But, I have yet to see you come out and specifically name programs that are no good. Surely in finding the good stuff, you have found a lot of junk. I feel you are culpable in not disseminating this information, especially when you have written about the stuff that is good. If the authors, such as yourself, who have an audience don't tell us, then must we continue to take a chance and continue to get ripped off?

> Larry Morgan College Place, Washington

A. This column might seem an unusual place to answer Larry's letter, but I've received a lot of mail from TRS-80 users who feel they have been burned. Besides, bad software qualifies as a TRS-80 problem (see the answer to SSgt Kuns's letter above). Okay, there are enormous numbers of programs which I believe qualify as junk—some are given away, some are sold for outrageous prices, and some appear right in the pages of this magazine. Were I to name them, however, I would be overwhelmed with mail from people for whom such programs serve a valuable purpose. On the other hand, even the best of programs aren't good enough for those born of IBM.

Okay, cop-out, you say. But really, what *is* a good program? Perhaps the thousands of meticulously crafted games of video violence which are published and sold? Not for my taste; it seems Klingons are only what you want to call them. How about compilers and other software with the name Fortran? As far as I'm concerned, keep 'em. I use Fortran as much as I use my years of high school Latin. And if I ever see another universal calendar, hex-decimal converter, Basic word processor, telephone dialer, checkbook minder, or alien invader game—I'll scream.

But does that mean I should pan one of these programs and damage both the author's credibility and pocketbook? You don't know me or any reviewer by more than what we write, and that's hardly a keyhole into our likes and dislikes, our capabilities and shortcomings. The best helping hand I can give is to tell you what I feel *is* good. Besides, if I believe it's awful, I'm probably not going to use it long enough to tell you why.

(For a complete list of software that I hate, please send a selfaddressed, stamped envelope, together with \$5,000, to. . . .)

Q. I hate to bother you again. I have had a video bug in my '80 for as long as I've had the computer (D board, bought used a year ago). When I have much of the screen whited out, the border around the portion of the screen that is not whited out warps, as in the sketches in Fig. 1.

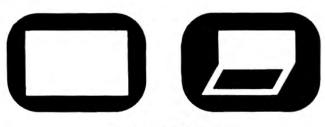

Fig. 1 Warped Screen

When the entire screen is whited out, it has nice square edges, but when a black rectangle appears inside, the white outside the border warps. It interferes with a Breakthrough game I just purchased.

Men Del Cooper New York City

A. The problem is inherent in the video monitor, which is little more than a stripped television with repackaging (there are dial holes under that TRS-80 insignia) and a little electronic tweaking. Different generations of monitors were of different quality. Open up the monitor (with it unplugged, of course!) and look inside for the vertical circuit board or boards. If you have a single vertically mounted board, find resistor R????. Piggy back on it a 3,300-ohm, five-percent resistor (orange-orangered-gold). You're all set. If you've got two vertical boards, or you want an even better fix, Archbold Electronics (10708 Segovia Way, Rancho Cordova, CA 95670) has an excellent video perkup board for about \$11, with full instructions.

By the way, Men Del's balky power supply (August) turned out to be caused by a corroded screw clamping the power transistor against the circuit board, causing the voltage to go off intermittently. Emery paper and a hefty screwdriver cured the problem completely.

Q. Just what is the purpose of the terminating resistors in TRS-80 disk drive 21-1160? I have two Radio Shack drives and a four-place Radio Shack cable. I'm planning to get an additional non-Radio Shack 40-track drive. All the ads claim that their drives are compatible with the TRS-80, but when asked where the drive is placed relative to the Radio Shack drives, the advertisers avoid the question. Can you use the same Radio Shack cable for the non-Shack drives? If I wanted to send my Radio Shack drives in for repair, could I use the non-Shack drive alone? If I use all three together, where do I put the non-Shack drive? Do I have to advise the seller of the non-Shack drive that I intend to use it with Radio Shack devices?

Lawrence E. Pyle No Return Address

A. The hardware aspects of combining 35 and 40-track drives are not complicated, but let me first explain the purpose of those mysterious terminating resistors. Digital electronic circuits come in various families to suit electronic and environmental needs. When long signal lines are involved, it is often wise to use circuits which are activated at the far end of the signal path. It is that kind of "open collector" circuit (see August Applications for a fuller explanation) which is used to activate the disk drives. In order for this circuit to respond, however, the open path must be closed. The termination resistors perform that function. One set is enough as too many can be damaging.

If you have a Radio Shack disk drive cable, the drive definitions (0, 1, 2 and 3) are built into it. Other drives will work fine with that cable, but be sure to explain carefully to your vendor that you are purchasing a third drive (called drive 2) and wish it shipped without terminating resistors and with the select jumper properly wired. If you've settled on a good retailer, you will have no problem with this.

If you have to switch drive positions, you might want to follow another course. Your most flexible drive should be in position 0, because this drive should be able to read all 40 tracks on the disk. It gets more work to do than the rest in

THE EXCLUSIVE OR ACLE

checking directories, reading, saving, formatting, and such. It gets tricky now. If you are using TRSDOS, you have essentially a 35-track DOS which will ignore the extra tracks on your new drive. NEWDOS was one of the first to handle 40-track drives, and virtually all new disk operating systems can do that and more (LDOS claims it can mix'n'match). First, decide if you wish to access those additional five tracks; if so, check 80 *Microcomputing*'s recent DOS issue and consider an operating system other than TRSDOS. When you have obtained it, check to make sure your Radio Shack drives are 35-track drives. Many were specified as 35-track units to maintain compatibility, but are actually 40-track devices.

If you have only 35-track Radio Shack drives, then I would suggest your new 40-track drive be wired for position 0, with the terminating resistors installed, and that you move the 35-track Shack drives to positions 1 and 2. Remove the terminating resistor package from the Radio Shack drive by unscrewing the cover and finding the socketed, integrated circuit-like package (usually colored blue and sometimes marked 1E) and pulling it out.

You may also have to rewire the drive-select jumper (position 1F), though this is unlikely. If the DIP shunt is intact, leave it that way and depend on the Radio Shack cable to make the drive selection. If some shunt bars are broken, then you will have to reconnect the ones you need, and break the others. Pin 1 connected to pin 14 selects drive 0; pins 2 and 13 select drive 1; pins 3 and 12 select drive 2; and pins 4 and 11 select drive 3. Your TRSDOS manual has all the circuit details.

Updates

Many readers have asked how Z80 mode zero and mode two interrupts could be used with the TRS-80. I thought about the problem and came up with a typically mundane solution involving piggybacking an integrated circuit and running a wire or two. Everett B. Ogden of Delmar, New York, had a better idea:

There are at least two easy ways to use these interrupt modes, one of which requires no internal modifications.

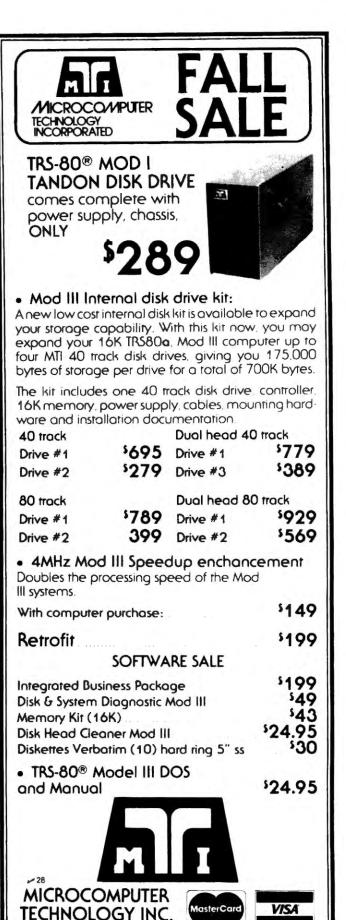

The internal mode is cleaner; if you never intend to use the Test input, cut it loose from 253 pin 4 and connect the INTAK output to that pin.

Those who don't want to attack their keyboards can tie INTAK to Test on the edge connector. At first glance this would seem to generate a bus request, which has priority over interrupts. Studying the Z80 timing diagrams will show that this doesn't happen. The Z80 samples the bus request input only at the start of the last T-state of any M cycle (T4 for an M1 cycle). INTAK, the combination of M1 of IORQ, ends at the start of T3, so the Z80 does not see it on the BUSRQ line. The messy part is that the Test input also tri-states the address lines, in, Out, R0, WR, RAS, CAS and MUX. The INTAK pulse is short enough that refreshing isn't a problem, and if the In, Out, RD and WR lines are pulled high, it doesn't matter whät happens to the address lines. Resistors could be used, but tri-state buffers are better.

Special thanks to Mr. Ogden for a remarkable piece of insight.

Readers please note that Radio Shack has discontinued the National Semiconductor data books. I highly recommend these references (especially the TTL and memory books), which are available from National Semiconductor (2900 Semiconductor Drive, Santa Clara, CA 95051), Digi-Key Corporation (Hiway 32 South, Thief River Falls, MN 56701), and other distributors. ■

NEW PRODUCTS Edited by Janet Fiderio

Little Big Lisp

Little Big Lisp, for the Model I, is available from the Department of Computer and Information Sciences at the University of Oregon.

Lisp includes the Lisp interpreter, a Lisp compiler, a trace package for monitoring the execution of programs, a Lisp structure editor, the RLISP programming language which provides a high level language interface to Lisp which resembles Algoi and Pascal, and some sample programs in Lisp and RLISP.

The system requires a minimum of 32K and is available on a 5 1/4-inch disk complete with documentation for \$30. Complete source listings are available on magnetic tape for \$100. For more information contact Jed Marti, Department of Computer and Information Science, University of Oregon, Eugene, OR 97403. Reader Service - 167

Color RAM/ **EPROM** Cartridge

The CMEMORY plug-in cartridge for the Color Computer can supply the user with up to 8K of continuous memory which can be divided into any combination of 2K blocks of RAM Memory and/or 2176 EPROMS. This product allows you to save frequently used utilities or games in easyto-use cartridges.

CMEMORY uses the unused address space \$C000 to \$E000, normally used for plug-in game cartridges. By adding a jumper, the computer can be set to automatically execute a program in EPROM whenever the Reset button is hit.

The CMEMORY cartridge sells without any memory for \$24.95. 2K RAM chips are available for \$19.95 each, 2K 2716 EPROMs for \$14, or you can use your own memory. Available from Micro-Labs, Inc., 902 Pinecrest, Richardson, TX 75080, (214) 235-0915

S.A.T. Preparation Series

Krell Software has expanded its College Board S.A.T. Preparation Series from five to 25 programs. It now includes sections on word relationships, vocabulary, sentence completion, reading comprehension and mathematics.

The programs are based on past examinations and present material of the same level of difficulty and in the same form as used in the S.A.T.s.

These programs are available for the TRS-80 for \$299.95, from Krell Software, 21 Millbrook Dr., Stony Brook, NY 11790, (516) 751-5139.

Reader Service -331

Color Computer Game

Packet Man, a popular arcade game, is now available for the TRS-80 Color Computer.

Written in machine code, this game provides the graphics of the Color Computer with the speed of machine code.

The cost of the program is \$24.95. A Level II 16K machine is required. Inquiries should be sent to American Business Computers, 118 South Mill St., Pryor, OK 74361, (918) 825-4844. Reader Service -333

The CMEMORY Cartridge

Programs for Beginners

Programs for Beginners on the TRS-80 is written for the computer novice. Written by Fred Blechman and published by the Hayden Book Company, the book provides instruction through 21 programs that run on a Model I and Model III TRS-80.

Programs Include topics concerning business, bookkeeping, calculating loan interest, mortgage payments, investment evaluation, and others. The four appendices include a video display worksheet, cassette-loading time charts for Level I and II, and a complete description, schematic and parts list for an audio/visual control box.

This 150 page book costs \$8.95 from Hayden Publishing Co., Inc., 50 Essex St., Rochelle Park, NJ 07662, (201) 843-0550. Reader Service - 162

D-CAT from Novation

The D-CAT from Novation is a directly coupled modem that is FCC approved for handset jack connection with any modular phone. It operates with either single or multi-line phones without the need for adapters.

D-CAT transmits data over telephone networks allowing one computer or terminal to talk to another. The direct connect feature eliminates distortion and lostdata problems.

It is available for \$199 from Novation. 18664 Oxnard St., Tarzana, CA, 91356, (213) 996-5060.

Reader Service -349

Lazy Writer

Lazy Writer, a word processing system, is available in a new Model III version and an enhanced Model I version 1.8.

The program is capable of reverse (hanging) indents, superscripts and subscripts, offsetting text to the right, precise printing from cursor position, and printing chained files.

Lazy Writer also provides a communications program that works with a modem. The Model III version has an enhanced communications package, allowing stored characters to be sent with a single key stroke for log-ons, provides a "local" echo, and will receive a full eight bytes.

Lazy Writer is priced at \$125 for the Model I and \$175 for the Model III. It is distributed by Soft Sector Marketing, 6250 Middlebelt Rd., Garden City, MI 48135, (313) 425-4025.

Reader Service ~336

QSO Log for Ham Radio Operators

QSO Log, from Manhattan Software is directed at amateur radio operators.

When a call sign is heard on the air the operator using QSO Log enters the sign into the computer. QSO Log will list call, name, QTH, date, time, band, and notes on conversation and on the contact's equipment.

The program dumps to tape, loads to tape, and allows on-screen review of all QSO records. It also allows updating, editing and deletion of entries and printout.

The cassette version (16K or 32K) will run on the Model I or III and is priced at \$14.95. For additional information contact Manhattan Software, P.O. Box 1063, Woodland Hills, CA 91365, (213) 704-8495. Reader Service ~339

Agricultural Software

Two new programs available from Agricultural Software Consultants, require a Model I or Model III with one disk drive, 32K memory and an 80-column printer.

The first program, FEEDDATA, is designed for feed mills and nutritionists. It stores and retrieves feed data on disk and calculates the composition and nutritional value of any combination of these feeds. FEEDDATA is priced at \$60.

MIXIT-2 is designed for feed mills, feed lots, dairymen, and poultrymen to determine the "least cost" for any feed mix and more. MIXIT-2 is priced at \$200.

For more information on these two programs, contact Agriculture Software Consultants Inc., 1706 Santa Fe, Kingsville, TX 78363, (512) 595-1937. Reader Service ~ 348

Magnetic Media Preservers

Shield your Magnetic Media

Durable metal cases which protect magnetic media from magnetic fields that cause degradation and erasure are now available.

These metal cases are magnetic media preservers designed for carrying or storing. Models include cases for the 5 1/4 inch and 8 inch flexible disks. A cassette tape preserver is also available.

For more information contact the Magnetic Shield Division of Perfection Mica Company, 740 N. Thomas Dr., Benville, IL 60106, (910) 766-7800. Reader Service ~341

The Boss

The Boss is an accounting software package which has integrated all accounting functions into one program. This software offers capabilities such as comprehensive financial ratio analysis, loan payment calculations, amortization schedules, depreciation schedules and statement of changes in financial position.

It has combined accounts payable, accounts receivable and general ledger so they can be accessed at any time during the program run. The Boss runs under CP/M.

For more information on this accounting management tool, contact Lifeboat Associates, 1651 Third Ave., NY, NY 10028, (212) 860-0300. The Boss is priced at \$2,495.

Reader Service ~350

Exam Preparation Programs

A series of Competency Exam Preparation Programs are available from Krell Software.

These programs consist of simulated exam modules, a diagnostic package, and a complete set of instructional programs. They are designed to teach concepts and operations, provide drill and practice, and to assess achievement levels. The series provides a curriculum encompassing mathematical, reading and writing instruction.

The CEPS are available in two software formats: the National Proficiency Series, and the NY State Regents Competency Test Preparation Series. Both are priced at \$1,299. For more information contact Krell Software, 21 Millbrook Dr., Stony Brook, NY 11790, (516) 751-5139. Reader Service ~332

Snapp II Extended Basic

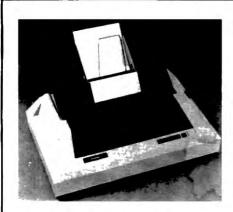

Snapp II Extended Basic is written in machine language to increase execution speed. Extensions are fully integrated into Model II Basic and require no user memory or disk space.

Snapp II includes a cross-reference ability, the ability to display and print program variables, a program line renumbering ability, a cross reference facility for key words or character strings, and the ability to compress a program to the absolute minimum.

It is available for the Model II for \$200 and the Model III for \$125, from Snappware Inc., 3719 Mantell, Cincinnati, OH 45236, (800) 543-4628. Reader Service ~ 185

NEW PRODUCTS

The Anadex Dual Mode WP-6000

The Anadex Dual Mode WP-6000 Printer

The Wi²-6000 dot-matrix serial printer from Anadex provides high speed operation and is capable of 150 characters per second in the letter-quality mode and up to 500 cps in the data processing mode.

This printer features an 18-needle, dotmatrix print head consisting of two vertical rows of nine needles slightly offset from each other in the vertical dimension. Graphics capability is also provided. The WP-6000 can print a variety of foreign fonts and features bi-directional, logicseeking operation, standard interfaces of RS-232, current loop or parallel (Centronics), and friction feed with an optional adjustable tractor feed.

The WP-6000 costs under \$1,800 and is available from Anadex, Inc., 9825 DeSoto Ave., Chatsworth, CA 91331. Reader Service ~346

TurboDOS

TurboDOS is a new disk operating system for the Model II, compatible with Digital Research's CP/M, version 2.x.

TurboDOS features file management facilities, a sophisticated buffer manager, a reentrant file manager, automatic print spooling, a command language interpreter, and a command file processor. Other capabilities include an extensive set of utility programs, system date and time functions, standard communications channel interface, and more.

A special introductory price of \$195 for the spooling version is being offered from Data-RX, Inc., 686 Lighthouse Ave., Montery, CA 93940, (408) 375-2775. Reader Service ~342

Mailing List System

Precision Prototypes has announced an improved TRS-80 (Model I or III) mailing list system to use with large lists. Features include maintenance of all disks in continuous alphabetic or zip order, high speed sort and disk retrieval, and up to 4640 (for Model III) addresses on-line. Two 80-track drives are required.

The system is specially geared to use advertising statistics in selecting and purging names for print outs.

Hardware requirements are 32K, two disk drives, and a printer. The system is available for \$69.95 from Precision Prototypes, 410 E. Roca, Refugio, TX 78377. A documentation manual is available separately for \$3.95.

Reader Service - 344

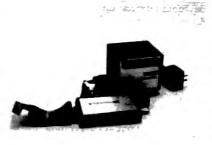

Card Reader Interface

Chatsworth Data Corporation has developed a special interface to the TRS-80 Model III for its MR 500 and OMR 500 card readers. The interface plugs into the I/O bus jack of the Model III.

A software driver and interface that enables the user to input data is supplied with their reader. The MR 500 reader utilizes an electric current technique for reading soft pencil marks; the OMR 500 is an opticle reader.

Educational applications for the TRS-80 include grading tests, attendance and grade reporting, and teaching programming. Business applications for the reader include inventory, labor distribution and time card recording.

For more information on this product contact Chatsworth Data Corporation, 20710 Lassen St., Chatsworth, CA 91311. Reader Service ~164

The Chatsworth Card Reader Interface

The Ramlok Memory Protection System

Memory Protection System

Ramlok is a computer equipment protection system that conditions supply line voltage and supplies a safe operating environment for electronic equipment, especially computer memory circuits.

Ramlok filters line voltage with a dual T section RFI filter. It ensures correct voltage limits and provides proper filtering to suppress RFI line noise and an uninterruptable power supply capability. The user provides the battery/inverter, Ramlok provides regulation control, filtering, battery charger, failure indication and multiple circuit and the power distribution panel for equipment connection.

It is sold for \$495, from Ladco Development Co., Inc., P.O. Box 464, Olean, NY 14760, (716) 372-0168. Reader Service ~ 160

The RAM Communication Area

The RAM Communication Area is a booklet which is intended for the TRS-80 computer owner.

It is a concise description of the Level II memory locations from 16384-17128 (4000-42E8). The booklet also contains an article dealing with number conversions.

RCA is priced at \$4.50 and is available from ABS Suppliers, P.O. Box 8297, Ann Arbor, MI 48107, (313) 971-1404. Reader Service ~335

Loan Amortization Schedule

This program allows the user to print a schedule of loan repayments along with

monthly and yearly principal and interest data. One of the options automatically adjusts the pay date away from weekends and holidays. A built-in calendar ensures accuracy to the year 2099.

The program is available for \$19.95 on tape for the TRS-80 Models I, II, and III. Contact Precision Prototypes, 410 E. Roca, Refugio, TX 78377. Reader Service ~347

Color Computer Newsletter

Rainbow is a newsletter devoted solely to owners of the Color Computer and will be available every month.

A typical issue of *Rainbow* will contain feature stories, hints and tips on operation, sample programs and reviews of Color Computer-associated hardware and software.

Annual subscriptions sell for \$12 and can be ordered through *Rainbow*, 5803 Timber Ridge Drive, Prospect, KY 40059. Reader Service ~328

Football Scouting

The Football Scouting Report is a system of programs that analyze running, passing, and kicking plays. They run on a Model I or a Model III with 32K, one disk drive, and a printer.

A team can be scouted up to five times before running a composite analysis, or each game can be analyzed separately. The package consists of eight programs that are suitable for both college and high school use. They are available from Precision Prototypes, 410 E. Roca, Refugio, TX 78377 for \$89.95.

Reader Service -340

Isaac Newton

Isaac Newton is the name of an educational game which challenges players to assemble evidence in support of particular laws of nature.

It is an inductive game allowing players to intervene actively in determining if new information supplied by the computer conforms to the laws of nature in question.

Isaac Newton is available for the TRS-80 for \$24.95 from Krell Software, 21 Millbrook Dr., Stony Brook, NY 11790, (516) 751-5139. Reader Service ~330

K-8 Math Cross-Reference

K-8 Math Cross Reference

Radio Shack is publishing the K-8 Math Cross Reference to be used in conjunction with their computer-based educational programs for kindergarten through eighth grade.

This teachers' reference coordinates the lessons in the K-8 math program for the Model I and Model III to materials in six of the most commonly used elementary math textbooks.

The price of this reference manual is \$4.95 from Radio Shack, 1800 One Tandy Center, Fort Worth, TX 76102. Reader Service ~181

300 Baud Modem

Kesa Company has introduced the DataSpeak O/A-300, a compact, low cost, 300 baud modem that connects directly to the telephone line with FCC part 68.

The unit, featuring orignate and answer

Data Speak

modes, RS232 interface, and test mode, measures 3.5 inch by 4.5 inch by 1.5 inch. A unique "off hook" light alerts the user the phone line is in use. Power is supplied by a wall mounted power converter. Connection to the phone line and the user's telephone is by standard modular RJ-11C jacks.

New phase-lock loop LSI circuitry allows the DataSpeak modem to deliver such performance at the price of \$129. For more information contact Kesa Company, 774 San Miguel Ave, Sunnyvale, CA 94086, (408) 746-2738.

Reader Service - 163

The Documenter

The Documenter is a new programming utility that will flowchart a Basic program and provide the user with a branch map. The Documenter will run on the Model I and the Model III.

This utility is an aid in error detection and will flowchart any program written in standard Radio Shack Basic Level II or Disk Basic. The Documenter is available in 16K, 32K, or 48K tape versions for \$19.95 or a 48K disk version for \$29.95. For additional information contact P80NUT Software, P.O. Box 490, Lilburn, GA 30247, (404) 469-0056.

Reader Service -334

Supersnappx

A fast in-memory sort routine which offers additions to the Model II Basic Interpreter Is available from Snappware.

Supersnappx is a collection of expansions to Basic giving added capabilities to Model II. These capabilities include three kinds of PEEKs, three kinds of POKEs, an improved data retrieval function, an elapsed time calculator, a function that states how many file blocks have been used, and more.

This product is available for \$100 from Snappware, 3719 Mantell, Cincinnati, OH 45236, (800) 543-4628. Reader Service ~ 327

Game Played to NFL Rules

Super Micro Pro Football is a game played according to NFL rules. It includes a wide range of fast, animated graphics. There are 16 offensive and seven defensive formations from which to choose. As Do you LOVE the programs in the Encyclopedia for the TRS-80* but HATE all the keyboarding aggravation?

Well, Wayne Green Books has a solution for you so put an end to your love/hate relationship.

How?

By a special arrangement with Instant Software[™] Wayne Green Books can now provide you with the programs contained in each volume of the **Encyclopedia for the TRS-80*** on a special series of cassettes called **Encyclopedia Loader**. Your Encyclopedia provides the essential documentation but now you'll be able to load the programs instantly.

With Encyclopedia Loader you'll save hours of keyboarding time.

The aggravating search for typos is eliminated with **Encyclopedia** Loader.

And you'll save money by taking advantage of this special introductory offer.

With your cassette loaded, you're ready to determine the future of the United States as its President, or mail out those invoices for your business, or sword fight the dragons, or use any one of the other programs contained in the **Encyclopedia Loader** for Volume 1 of the **Encyclopedia for the TRS-80**.

First you must fill out and return this order blank or the card provided.

Encyclopedia Loader for Volume 1 of Encyclopedia for the TRS-80 includes:

The Newest Peripheral for your Microcomputer

The Encyclopedia for the TRS-80*

What's the key to getting the most from your TRS-80? No, it isn't disk drives or printers or joysticks. It's information. Without a continual supply of information and ideas, you can't realize the full potential of the TRS-80.

Now, you'd think that the 150 pages of articles published in 80 Microcomputing each month would satisfy even the most voracious of TRS-80 users. But no! You've asked for even more information!

Our response to the clamor for additional information is the Encyclopedia for the TRS-80, a ten-volume reference work that is absolutely packed with programs and articles carefully selected to help you make the most of your microcomputer. You can consider the volumes of the Encyclopedia to be an extension of the documentation that came with your TRS-80. The articles and programs will be similar to those found in 80 Microcomputing. Each book is full of material on programming techniques, business, games, tutorials, education, utilities, interfacing...you name it.

Unlike conventional encyclopedias, the Encyclopedia for the TRS-80 will never become stale or out of date. That's because the volumes of the Encyclopedia are being issued one-at-a-time, over a period of months. This means that each new volume will reflect the latest developments and discoveries, making this a living encyclopedia for TRS-80 users.

Volume I was out in July. Volume 2 will be shipped in September. Each volume will contain approximately 270 pages of solid information ... no advertising. Here's a sample of what's included in Volume I: The Encyclopedia for the TRS-80 is available in two editions. The deluxe COLLECTOR'S EDITION is a handsome green and black hardcover volume, with the title stamped in gold and a colorful protective dust jacket provided. These durable volumes are perfect for school and library use and make a handsome addition to your personal library. They are available for \$19.95 per volume. Also available is the more economical softcover edition. This contains all the information in the hardcover edition, but at a savings of over 45%. It is ruggedly bound for heavy use and has an attractive green, ivory, and gold cover. Available for \$10.95 per volume. Both editions are in an easy-to-read 6" × 9" format which is perfect bound to remain flat when opened.

80 MICROCOMPUTING SPECIAL INTRODUCTORY OFFER

Order the entire set (the first ten volumes) of the Encyclopedia for the TRS-50 and receive the tenth volume FREE!

PAY ONLY \$164.00 for the first ten volumes of the deluxe hardcover COL LECTOR'S EDITION—a regular \$199.50 value

PAY ONLY \$83.00 for the first ten volumes of the softcover edition a regular \$109.50 value

PLUS—This special offer includes UPS shipping and handling charges (an additional savings of \$15,00)

Beat inflation by huying the whole set now — we cannot guarantee these same single volume prices for future volumes. You cannot lose! Preview the first volume of the set and judge for yourself. If the Encyclopedia for the TRS-50 does not meet your needs or expectations, just return the first volume within ten days and we will refund the entire amount of your purchase. If at any time you are dissatisfied, you may cancel the remaining volumes and receive a refund for the full value of those volumes. The books will be automatically shipped to you every 6 weeks via UPS Take advantage of this offer new! You can't afford to miss out on the newest peripheral-the En-cyclopedia for the TBS-80. Call your order in today TOLL FREE at 1-800-258-5473, or use the coupon below or the postage-paid postcard included in this magazine

- Four Graphics Methods—Improved techniques for dealing with the TRS-80's low resolution graphics.
- TTY Interface—Build an interface hookup a Teletype to a TRS-80
- The President Decides—A thrilling simulation that lets you make decisions as if you were President of the United States
- Measure Instructional Effectiveness — Many programs teach or tutor; this one helps determine the ef-
- fectiveness of the lessons. The Invoice—A program for small businesses which produces custom invoices.
- Punch Out Your Disks-Double your disk storage in seven easy steps

KEEPIT 3.0

Enhances Level II Basic Written by Dennis Bathory Kitsz

KEEPIT performs these functions:

- Single-step a Basic program
- Reset Memory Size from Basic
- Save a running program with variables
- Save machine code or a memory block
- Restore an accidentally deleted program
- Observe & change memory locations

KEEPIT also features:

Keyboard debounce, audible beep, and autorepeat! KEEPIT 3.0 is written in machine language and resides in less than 1,000 bytes of high memory. EDTASM source code is supplied so the user can relocate KEEPIT to any convenient location.

How to order KEEPIT:

Level II users will wonder how they ever lived without it! KEEPIT 3.0 is extremely valuable as a time and frustration saver! To receive your copy, send your name, address and just \$9.95 to:

1806 Ada Street Lansing, MI 48910 Ph. 517/485-0344 or 487-3358

Visa & Master Charge add 4%. C.O.D. add \$1.50. Add 75¢ for First Class Delivery. All orders shipped within 24 hours!

NEW PRODUCTS

the game progresses, the computer's team adjusts its offensive and defensive strategy according to the game situation. Cumulative game statistics are updated after each play.

Versions are available for the Model I or III, on tape or disk, 16K and up. Prices start at \$12.95. For more information contact Micro Pro Systems, Rte. 2, Box 533, Cumming, GA 30130, (404) 887-6814. Reader Service \swarrow 165

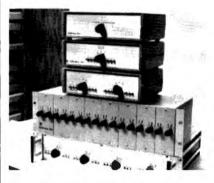

"ABC" Switching Units

Giltronix has introduced a new group of "ABC" switching units which allow the sharing of a common device such as a printer or terminal between two computers.

The units include the GRS-232-S8AB (\$99) and the GRS-232-S24AB (\$106). The -S8AB switches the eight lines of the RS232 interface pins and the -S24AB switches all 24 lines of the RS232 interface.

The units can be ordered with these options: monitoring capability, dual units, and a rack mounting option.

For more information contact Giltronix Inc., Microcomputer Systems and Services, 450 San Antonio Rd., Suite 44, Palo Alto, CA 94306, (415) 493-1300. Reader Service ~168

The "ABC" Switching Units

Design Grids

A full line of computer forms-design grids are available from The House of Grids. These grids are helpful to forms designers and computer programmers to check the accuracy of form proofs.

The grids have an overall size of 12-inches by 18-inches and have the following features: numbered print positions, split print position indicators, and standard size indicators for depth of forms.

The grids are available on stable based

film for \$40 each or on a paper pad of 50 for \$9.50 from The House of Grids, 135 E. York St., Akron, OH 44310, (216) 376-3974. Reader Service \sim 180

Fast Sort

Fast Sort is a short Basic program with embedded machine code. When merged by disk with a user's own TRS-80, Model I or Model III Basic program, it will allow sorts of strings (alphabetizing), integers, and single or double-precision numbers. Ascending or descending order is also selectable.

Typical sort times are 50 seconds for 5000 integers and eight seconds for 1000 double precision numbers. For more information contact Precision Prototypes, 410 E. Roca, Refugio, TX 78377, (512) 526-4758. Fast Sort sells for \$19.95. Reader Service ~ 343

Basic Compiler

Radio Shack is offering a Basic complier for the Model I and Model III computers with 48K and dual disk. This system is a business-oriented Basic Intended to be used as a development package for new software.

RSBasic includes three programs: RSBasic compiles programs; BEDIT is the editor for Basic source programs; and RUNBASIC executes compiled Basic programs. All three are provided on 5 1/4-inch floppy disks.

For more information contact Radio Shack, 1800 One Tandy Center, Fort Worth, TX 76102. Reader Service ~ 166

Adjustable Microcomputer Table

Smith System Manufacturing has designed a new microcomputer table which adapts to both the operator and the computer.

The 16 inch deep keyboard surface adjusts vertically on one inch centers from 24 to 28 inches high. The 16 inch deep monitor surface is fixed at 30 inches high. Both tops have radiused corners and soft edges for safety, and are available in either a 30 or 42 inch width. The table has a cantilever design for easy access.

For more information, contact Smith System Manufacturing, P.O. Box 43515, St. Paul, MN 55164, (612) 636-3560. Reader Service ~345

TRS-80[®] PROGRAMS SUPER SOFTWARE AT SUPER PRICES

THE ULTIMATE DISK-OPERATING SYSTEM

LDOS[™]

A completely documented new generation of operating system for the TRS-80. Far superior to any on the market. It is a totally independent device system, capable of device linking, routing, setting, and filtering. LDOS will support 5" and 8" floppies, single/double density, single/double sided, and up to 80 tracks. Full customer service provided with a toll free 800 number. Excellent documentation in a tab indexed manual (over 250 pages). Call or send for more information today. **Available for Model I**

or III only \$169.00 LDOS™ is a product of

MASS/MAIL SUBSCRIPTION SYSTEM AVAILABLE FOR MODEL II. THE ULTIMATE IN MAILING SYSTEMS

"I think the system will stand the test of time ... it is probably the most sophisticated system around for the micros today" Mike Schmidt (EDITOR) 80-US Jan/Feb pg. 94

Galactic's Mass/Mail System was designed with the needs of the large mailing list in mind. This system has capabilities of handling up to 10,500 records, with access times of less than 15 seconds and usual access of about one second. All adds, deletes and edits are instant for the operator and

MAILING SYSTEMS

are then completed later in a "batch mode". The System comes complete with extensive documentation and ongoing support. Contact Calactic Software for detailed specifications for your exact needs. Available only for the TRS-80 Model II.

BUSINESS SYSTEMS INVENTORY MASTER SYSTEM

A program to free your needs, handling up to 2700 items. With today's market, keeping on hand only what your demand calls for is reason enough to let your TRS-80 accurately and effectively take care of your inventory. Always know what to stock and when to stock it. Have a multitude of reports at your finger tips. This system has many features which were modeled after a main frame system of large capacity. More information available upon request.

Intelligence... Through the Ages

The splendid achievements of the intellect, like the soul, are everlasting. Intellect is invisible to the man who has none. Schopenhauer (1788–1860)

Sallust (86-34 B.C.)

The controlling intelligence understands its own nature, and what it does, and whereon it works.

Marcus Aurelius (A.D. 121-180)

The intellectual world is divided into two classes—dilettantes, on the one hand, and pedants on the other.

Miguel De Unamuno (1864-1936)

Thought is the labor of the intellect, reverie is its pleasure.

Victor Hugo (1802-1885)

The voice of the intellect is a soft one, but it does not rest until it has gained a hearing... This is one of the few points in which one may be optimistic about the future of mankind.

Sigmund Freud (1856–1939)

Every intellectual product must be judged from the point of view of the age and the people in which it was produced.

> Walter Pater (1839-1894)

humanity i love you because when you're hard up you pawn your intelligence to buy a drink.

e. e. cummings (1894-1962)

A test of first rate intelligence is the ability to hold two opposed ideas in the mind at the same time, and still retain the ability to function.

F. Scott Fitzgerald (1896-1940)

The fact that a man knows right from wrong proves his intellectual superiority to the other creatures; but the fact that he can do wrong proves his moral inferiority to any creature that cannot.

Mark Twain (1835-1910)

We should not pretend to understand the world only by the intellect; we apprehend it just as much by feeling. Carl Gustav Jung (1875-1961)

Intelligence... is the faculty of making artificial objects, especially tools, to make tools. Henri Bergson (1859–1941)

Artificial Intelligence— Technology and The Search for Self

by Chris Brown Technical Editor

n the early 1950s, two seemingly unrelated events took place. The first was the airing of an episode of the popular television series, "I Love Lucy," in which the lovable redhead and her zany companion Ethel found themselves working on a high speed bon-bon production line. The second was the publication of a scientific paper by Alan Turing titled "Computing Machinery and Intelligence." Worlds apart in audience and approach, these events were, none-the-less, related. Turing's paper posed, for the first time, the philosophical question-"can machines think?" The "I Love Lucy" episode illustrated the essence of intelligence and thinking that Turing was forcing the scientific community to examine.

Turing's thesis, that machines could indeed think, quickly drew fire from philosophers who eagerly mired his theory in arguments over semantics. What, they demanded, do you mean by "thinking?" What is a machine? How is intelligence defined? Though they posed questions worthy of consideration, the philosopher's linguistic nitpicking did nothing to further the cause of scientific inquiry. It did alienate the early Artificial Intelligence community to the point of inaudibility, however.

Semantics were of no concern to Lucy and Ethel. All they knew was that in their immediate environment that damn conveyor belt was supplying bon-bons faster than they could pack them into boxes. So, in a desperate attempt to keep their jobs. they began to eat every tenth bon-bon. Then, as the belt speeded up, they ate every fifth, every third and eventually, every other. Finally, with cheeks bulging like October chipmunks, they ate every bon-bon that came down that line. Though feeling increasingly queasy, they had done what no machine had yet been able to do. They had adjusted their behavior to their surroundings in accordance with the demands of changing conditions. They had adapted and in doing so displayed the intelligence that Alan Turing believed computers would one day be capable of.

"Ask those involved to define what they are researching...You'll get as many definitions as you have researchers."

Technologically, we have come a long way since the days of "I Love Lucy" and Alan Turing. We still don't have computers that perform as well as Lucy and Ethel, however. Philosophers and artificial intelligence researchers are still arguing over semantics and methodology. And most important, Alan Turing's question, "can machines think?" has yet to receive a satisfactory answer.

What It is

What exactly is artificial intelligence (AI)? In essence it is a method by which we can learn about the nature of knowledge and the nature of man. Ironically, the most functional definition of Al lies with the man who originally broached the issue, Alan Turing. His Turing Test is not concerned with the methods used to produce intelligence but, rather, with the end results. In a modern day version of the Turing Test a human subject is presented with a keyboard and a video monitor which he uses to converse with two unknown sources of information. One of these sources is a machine, the other a human. Though the subject is aware he is dealing with one man and one machine, he does not know which is which. By interrogating his sources, the subject must determine which is the machine. If he fails to do so better than 51 percent of the time, the machine can be said to have successfully simulated human intelligence. So far, no machines have passed this acid test. Increasing numbers are coming close, however.

Ask the people involved in the research to define what exactly it is they are researching and you will get as many definitions as you have researchers. The fact is that AI is a vague field that encompasses the least understood aspects of human existence, conscious and unconscious thought. Patrick Winston, an AI veteran and member of M.I.T.'s artificial intelligence group, defines artificial intelligence research as "the study of ideas which enable computers to do the things

that make people seem intelligent." Philip Jackson, a textbook author and AI researcher for Xerox offers, "AI is the ability of machines to do the things that people would say requires intelligence." Abe Lockman, an AI researcher and professor of computer science at Rutgers University says, "AI involves the creation of systems that simulate intelligent human functions and that handle I/O in a manner similar to the way humans do." The salient feature of each of these definitions is the simulation of intelligent human thought by a machine.

The Goals of Al

It is possible to get a clearer idea of what AI is about by examining its goals. In a succinct statement of purpose, M.I.T.'s Patrick Winston identifies AI's goals as follows: "The central goals of AI are to make computers more useful and to understand the principles which make intelligence possible." The first goal, making computers more useful, is the easier of the two to attain and many of the techniques developed during the course of AI research are routinely used in both programming and hardware design today. Some of these include the structures for languages like Lisp and Logo and the methods of expert systems analysis.

The second goal of artificial intelligence, understanding the principles of intelligence, is not so easily achieved and has much broader ramifications. In Al's continuing search for a mental model that closely resembles the human thought process, many theories have come and gone. At first it was believed that the study of problem solving, pattern recognition and theorem proving would yield the most accurate model of human thinking. Over the past ten years, however, the emphasis has shifted away from these areas. Today, many researchers feel that the key to unlocking the secrets of human cognition lies in discovering how we process language. In university laboratories across the country projects are underway to determine just that.

Programs That Read

At Yale, computer programs with names

like Sam (Script Applier Mechanism), Frump (Fast Reading and Understanding Memory Program), Parn (Plan Applier Mechanism) and Politics have been developed in efforts to validate theories about language processing.

Sam is a program that understands stories that have been written according to scripts (data structures that describe situations in certain ways). Sam is capable of creating its own concepts of what has happened in a story by parsing sentences and drawing inferences. It can provide paraphrased versions of stories that are longer than the original by elaborating on what it has learned from its reading.

Frump is a similar but more flexible program. Frump skims a newspaper from beginning to end looking for subjects in which it is interested. Once it finds a relevant subject, it applies the rules of a grammar to determine the information it wants to know. Frump is a fast program by Al standards and its paraphrased summaries read like the copy of newspaper night shift rewriters. In addition, Frump is virtually language independent. It is easily able to

Strictly Business

If you've ever missed a deadline, forgotten an appointment, waited on late deliveries or lost track of projects, put <u>ANGEL to work for you.</u>

ANGEL is the new software program for microcomputers that helps organize and manage your business flow. It's strictly business.

FAST AND EASY

With a series of simple one-line entries, ANGEL can schedule every phase of your projects and appointments, however simple or complex. Then, each day, ANGEL will give you a run-down of every action that needs to be taken to complete all your work on time, whether it's due tomorrow or ten years from now.

ANGEL's large capacity allows you to log and track up to 2,000 individual projects at once. With ANGEL's help, you can eliminate reams of files and hours upon hours of costly business delays and missed deadlines.

SPEAKS SIMPLE ENGLISH

ANGEL speaks plain English. No computer language to memorize, no codes to decipher. Sit down and talk to it, faceto-face. If ANGEL doesn't understand, it will respond in plain English. If you make a program error, ANGEL tells you how to correct your mistake through the use of a built-in video manual. ANGEL is so easy to use, you can turn it on and enter 30 items in less than five minutes.

WORKS FOR ANY BUSINESS

You can custom-program ANGEL for any business operation — from oil exploration to insurance, home construction to retail sales.

With a memory capacity that's limited only by the capacity of your disk storage, ANGEL tracks multiple projects for busy executives. The disk comes with an easy-to-understand printed manual, to back up the built-in set of instructions of the program itself.

of the program itself. In addition, a data-proof safeguard system will not let you accidentally erase entries, and a special password code of your choice allows you to keep confidential files.

Put ANGEL to work for you today. You'll never lose track of your work flow again.

ANGEL is recommended for use with any disk-based system that has 48k memory or more. It will operate with any CP/M*-based system and the TRS 80** (Model I, II or III). The program comes on standard 5¼-or 8-inch disk, with storage sleeve. Now only \$295.

ANGEL is available only through Time Management Software. It is not sold through any outlets at any price. Order the complete program for better business by calling one of our toll-free numbers or by returning the order blank below.

"What do you mean by "thinking?" What is a machine? How is intelligence defined? The philosopher's nitpicking did nothing . . ."

paraphrase in English, Spanish and Russian, depending on which grammar is in its database.

Hawks and Doves

Politics is a program that uses a database of political philosophy to answer hypothetical questions regarding the motives behind (and consequences of) certain political actions. It accepts input in the form of questions, examines its data base and supplies answers in tersely worded sentences that would be much too concise for most State Department spokesmen. When loaded with its conservative/hawk database and asked why the Russians had massed troops on the Czechoslovakian frontier, the program answered, "Because Russia thinks it can take control by sending troops in." When asked what Russia would do next, it answered, "Order its troops in." When asked what the U.S. could do about the situation, it suggested, "Intervene militarily." Loading in the liberal/dove database would have resulted in different answers. Politics is used to supply scenarios of hypothetical situations according to the tenets of various political philosophies. At present, programs similar to Politics are helping decision makers examine the consequences of their actions before things have cone too far.

In all these programs, researchers have been able to get machines to interpret language and draw intelligent conclusions. In fields like medicine and geology, programs such as these have already performed at the level of human specialists and experts. Whether helping to diagnose bacteriologic infections from a myriad of symptoms (MYCIN) or predicting the location of natural resources from existing geologic conditions (Prospector), the value of such programs to society is obvious. This is the practical aspect of the often esoteric field of artificial intelligence. On a larger scale, Al can help philosophers, psychologists and linguists in their work by allowing the integrated thought processes each of these people study to be dissected, examined and mimicked by machines.

Conservative Outlook

For Abe Lockman and other researchers, Al is a promise of the future. Unfortunately, over-zealous members of the Al community have damaged their own credibility by making promises they have not yet been able to keep. Today, most Al peo-

ple are more conservative in outlook than they were ten years ago. They prefer to emphasize the small, but real, gains being made rather than speculate on what might be

Lockman told 80 Microcomputing, "Many grandiose claims have been made about what AI has done. In my opinion, we have not come very far. Sure, we have programs that sit up and bark in toy domains. but the real problem is how generalizable are these theories of intelligence?" In his Al-oriented computer department at Rutgers, Lockman's 700 students, many of whom are interested in careers in artificial intelligence, are being taught the principles of natural language processing.

Lockman says, "In my research I'm looking for the mechanism that allows a human to instantly get full understanding of a text. I believe that all of our knowledge of the world is brought to bear on each word we read. I want to know how that knowledge is organized and, especially, how it is accessed by our brains." Lockman admits that he is a long way from the answers to these questions. In fact, he hasn't yet used the computer to validate his theories. He candidly admits, "I haven't programmed my theories yet because, unfortunately, I'm able to disprove most of them on paper."

When asked about the future of Al, Lockman was skeptical. "I see no major breakthroughs on the horizon. We will continue to build our limited systems and basically do more of the same." On a more optimistic note Lockman indicated that some progress will occur due to the increasing cooperation between the traditionally warring camps of AI theorists, philosophers, linguists and psychologists, all of whom are taking an increased interest in each other's work.

Turning To Science

The most intriguing thing about Al research is that it is an investigation of self: how we think, why we interpret as we do, and ultimately, who we are. Man has been perplexed by his existence since earliest history and has used myth, religion and magic to explain his existential dilemma. In our post-industrial, hightechnology age we are increasingly turning to science for answers to the timeless questions of existence. By providing us with a clearer understanding of the human mental process, artificial intelligence research may eventually lead us to a better understanding of self.

Stop playing games and get organized.

You spent up to \$2,500 on computer hardware to make your personal life easier. You didn't spend it just for fun

Now there's GUARDIAN — the first microcomputer software program that can truly organize your life with ultimate ease and speed.

GUARDIAN is the only program that lets you make a single one-line data entry to remind you... for the rest of your life... of birthdays, oil changes, appointments and any other recurring events. Once an item and its frequency of recurrence is entered, you'll never have to worry about remembering again. Each morning you flip a switch, enter your personal code, and get an instant readout of everything you need to accomplish that day

Plainly speaking, there's no need for special codes or computer language with GUARDIAN... you talk to it, and it talks right back in plain English: GUARDIAN even tells you how to enter data and correct errors with step-by-step on-line instruction through its built-in video display manual. The printed manual that comes with GUARDIAN is also complete and easy-to-understand.

Years Ahead

GUARDIAN lets you organize everything you need to do today for years to come. The single-line entries are easy to make, and can even be set to flag you several days in advance of the event.

Advance To Go

GUARDIAN is programmed to automatically advance and schedule appointments, PTA meetings, vacation

schedules, tax deadlines and other activities indefinitely, until you cancel the entry. GUARDIAN's internal calendar adjusts itself from year to year

Protects Your Interests

GUARDIAN is as easy to use as pencil and paper, but its memory can't be lost or erased by accident. System failure and operator error are protected by automatic file closure. Password protection keeps your files confidential

GUARDIAN's disk has the storage capacity to organize up to 2,000 separate events for 200 people at the same time.

Yes...I want to put GUARDIAN to work for me, to receive maximum efficiency and ease in organizing my personal life with my microcomputer. 10-D1 NAME

The GUARDIAN program is recommended for use with any soft disk drive system with 48k memory or more, and operates on any CP/M*-based system or the TRS 80** (Model I, il or III). Programs are available on standard 5%- or 8-inch disk, with storage sleeve \$119.95.

GUARDIAN is available directly from Time Management Software, and is not sold through any store, catalog or other source. To order GUARDIAN call one of our toll-free numbers or return the order blank below.

WINT FORGET

GENERAL

Once man's world was the center of the universe. Then came Copernican astronomy... Once man was a being apart from the rest of creation. Then came Darwin and evolution... Once man understood his own behavior. Then came Freudian psychoanalysis...

And Now Artificial Intelligence

Harold Nelson

Kilobaud Microcomputing Technical Editor

here have always been those who view such developments as blows to man's humanity, his uniqueness and superiority. But, by and large, such developments in man's understanding of himself have been irresistible, beyond suppression. We seem to yearn to more fully understand what we are. Artificial Intelligence (AI) may be the latest field of research to give us new tools to extend that understanding. Getting a feel for what AI is all about could lead to some astonishing insights.

Roast Mules

Can you rearrange the letters of roast mules to form one fairly common English word? (It's something most first graders can do.)

Once you solve that puzzle, can you write a program that can reproduce what you have done? Can you write a program that can solve the puzzle?

It might seem that once we have solved it, writing the program should be easy. In principle (which is something quite different from practice), it might be.

One way to solve a puzzle like this would be to list all permutations of the letters, then pick out the word (I think there is only one). Even if we started to seriously consider this method, the fact that there are 3,628,800 such permutations would soon cause us to abandon it. We would be more likely to start arranging the letters into familiar groupings-syllables-then rearrange these until we found the word. That still is not as easy as it sounds. But when we do this something else is occurring. There are quite a number of combinations (such as oaue and ssrtim) that we just do not consider-that we reject "without even thinking about it." Certain combinations (i.e., sounds) do not occur in our language, so we don't even think about them. Others do, and we work with those. What usually happens is that we chance upon one or two of the proper syllables and the solution seems to jump out at us.

P

How do we write a program that can do that? What is it that we do that makes the solution seem to jump out once we get close? How then do we write a program capable of doing something we do when we're not even sure how we do it? No one said the program had to get the solution in the very same way we did. And, of course, if we could get a program to solve the puzzle, it might help us to understand more fully what it was we did when we solved it.

If all that's a little confusing, it may be

because we have quickly, albeit via a trivial example, arrived at the kinds of issues that are at the heart of much of the current Al research. Let's take a look at some products of Al research—some programs that, in the words of MIT's Marvin Minsky, "do things that would require intelligence if done by men." Actually, some of them only seem to require intelligence at first.

Eliza

This "psychiatric interviewer" program (some versions are called Doctor), written by Joseph Weizenbaum, has been around for over 15 years. It is worth a little consideration, if for no other reason, because it has "fooled" some people. After an encounter with the program (difficult as it may be to believe), some people who had a sufficient willing suspension of disbelief or naivete were convinced the program had really understood them.

If you "play along", you can produce a fairly realistic dialogue with the program. For example (the program's lines are in italics):

Hello. Tell me your problem. I don't want to. Why do you suppose you don't want to?

We're Offering You Our Company Secret.

It's a brand new American-designed program generator that can eliminate the need to spend thousands of dollars on specialty programs

And, It's Available Today.

It's the microcomputer program that Time Management Software is using to write its own professional software write its own professional software packages. And now, you can use it to write all the programs you'll ever need. We call it *GENESIS*. You'll call it incredible, because we have yet to find a program on the market that GENESIS can't create. GENESIS is the next generation. Designed by a team of doctoral-level programmers, GENESIS runs on all CP/M* 2 XX systems using compiled

CP/M* 2.XX systems; using compiled PL/1-80*.

The code generated by GENESIS is fast and efficient, and this new product's capacity to code difficult algorithms is virtually unlimited.

The speed of code generation itself is literally awesome. Preliminary tests have indicated an ability to generate efficient code at a rate well in excess of four lines per second. Clearly, GENESIS can write months of code in a matter of minutes

With You As Architect, Genesis Is The Ultimate Master Builder.

Word processing, accounting procedures, statistical analysis, time management studies... GENESIS can write any functions you could possibly need. Naturally, complete program

changes are quickly and easily made. You speak plain American English to GENESIS – no code, no difficult intro-ductory language to memorize. The only time you spend with GENESIS is in deciding the specifications of your program.

Simply Stated, Genesis Is The **Best Microcomputer Program** Generator In The World. Period.

Genesis comes with on-line documentation, as well as a complete concise printed manual, written by a professional manual writer.

Due to its sophistication, we recommend this program for use with any disk system with 48k or more, using CP/M* 2.XX. The code which is generated is CBASIC*.

(Note: Even though GENESIS runs in compiled PL/1-80* it is not necessary to have PL/1-80* in order to run the program.)

The program comes on standard 5¼-or 8-inch disk, with storage sleeve. The program that will allow maximum use of your hardware ... an introductory price of \$500.

GENESIS is available now directly from Time Management Software, and is

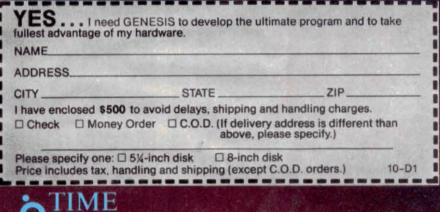

not sold through any other outlet. Time Management Software will send free updates of new material and products to GENESIS owners as they develop, to make sure you've got everything you need. Order the most advanced program

generator system on the market today, by calling one of the toll-free numbers or by returning the order blank below.

Call now toll-free to order. (Ask for operator 603.)

"SHRDLU understands questions and requests put to it in English."

I could never talk to my father. Tell me more about your family. None of them liked me.

Perhaps in your fantasies none of them liked you.

Of course, the program is not really capable of understanding. Compared to some other programs, it is a very unintelligent program. Eliza achieves its effects by the clever use of a few gimmicks. A more skeptical interviewee quickly reveals the program's weaknesses:

Go away.

I'm not sure I understand you.

I think you're coming apart.

Why do you suppose you think you're coming apart?

You are coming apart.

Perhaps in your fantasies you are coming apart.

No. You are in reality.

Perhaps in your fantasies you are in reality.

This rather inane little exchange reveals Eliza's limited language handling capability.

Animal

A somewhat more interesting program, capable of learning as it is used is called Animal. This is a game in which the program tries to guess the name of the animal chosen by the user. When it makes an incorrect guess, it asks for the name of the user's animal and some information about it. It stores this information and recalls it at appropriate times in subsequent games. In one version the program begins by asking "Does it have horns?" If the answer is yes, it guesses the animal is a buffalo. If the answer is no, it guesses a butterfly. After a few wrong guesses and accumulating information provided by the user, a dialogue with the program might look like this:

Does it have horns? No. Does it have a beak? No. Does it have four legs? Yes. Is it true that it can climb trees? No. Does it have a curly tail? No. Does it give milk? Yes. Is it a cow? Yes.

Notice that the user-provided information is stored in "branches." The program will not ask about dogs or cows when the exchange is about an animal with horns. Does it have horns?

Yes. Does it live in the woods near water? No. Is it true that it is smaller than a buffalo?

Yes. Does it live in high rocky places? Yes. Is it an ibex? Yes.

SHRDLU

One of the most intriguing and significant AI programs was produced by Terry Winograd in the AI Lab at MIT. SHRDLU is capable of understanding questions and requests put to It in English; it is capable of giving English answers to questions and of performing requested tasks even if they require multiple operations. As if that were not enough, the program can understand what it has done and why it has done it, and it can give competent English descriptions of these.

SHRDLU functions in a limited domain called a "blocks world." This consists of a variety of variously-colored blocks, pyramids, boxes, and so forth. The program answers questions about the arrangement of those objects, provided the questions are precisely stated. If they are not, the program asks for a clarification. SHRDLU will perform requested rearrangements of the shapes and explain what intermediate action, not specifically requested, was performed.

Douglas Hofstadter, who provides an absolutely insightful treatment of Winograd's SHRDLU in *Godel, Escher, Bach,* says that while "SHRDLU may not be isomorphic to what we do...the act of creating it and thinking about it offers tremendous insight into the way intelligence works."

Internist

The study of "expert systems" is leading some researchers to develop more practical programs. Internist, developed by Myers and Pople at the University of Pittsburgh, reproduces the special diagnostic skills of a doctor of internal medicine. The program collects data on a patient's symptoms, case history, test results, and so forth. Acting much like a human diagnosticlan, the program then decides which possibilities to delve into, asks specific questions about a possible illness and suggests a diagnosis.

The developers of Internist believe it will be ready for field testing at institutions

other than Pittsburgh by 1983.

More Roast Mules, Algorithms and Heuristics

Our discussion of how we might solve the puzzle presented at the beginning of this article exhibited two approaches to programming. The first is the usually straightforward method of writing the code for a given algorithm. In the case of our example, the algorithm might be:

• generate one combination of the 10 letters.

 check this with a standard English dictionary to see if it is a word.

• if it is, stop.

• if not, go back to the first step and start another round.

It wouldn't be hard to write a procedure to generate the permutations, especially in a good AI language like Lisp. It wouldn't even be too difficult (just very boring) to give our program access to the words in a standard dictionary—all we really need would be the listings under A, E, L, M, O, R, S, T and U. Somewhere between the first and the 3,628,800th iteration, we would have our solution.

While this would get the job done, it would be neither elegant nor very satisfying. We might somehow feel uneasy about reproducing in so mechanical a fashion something we do in a very sophisticated manner. We might try to write a more sophisticated procedure, which could include various linguistic principles. Basically we would want to teach the computer some of our language-we would want the program to produce and evaluate syllables just as we do. We would want it to be able to combine these to form trial words just as we do. Using such principles or "rules of thumb" is an heuristic approach to our programming problem.

It is easy to see that the first two programs (Eliza and Animal) employ the straightforward algorithmic approach, while the latter two make use of heuristics. Actually, SHRDLU and Internist probably employ both approaches. Programming heuristics can give us a more sophisticated, more intelligent-appearing program.

Of course, to program in this way implies some understanding of the mental rules of thumb we use when solving our puzzle. This is what Hofstadter is referring to in his statement about SHRDLU.

Are Machines and Programs Intelligent?

Al researchers for the most part are not

"... one theorem-proving program has correctly proved a theorem with a proof the author was unfamiliar with."

trying to produce mechanical brains. We are a great many years away from any such possibility. In fact, there does not seem to be any hard knowledge on how the brain interprets basic neural activity into "conscious thought." So even if we had the hardware ability readily available to construct a machine that could reproduce what the brain does in this interpretation, the levels of interpretation in the brain and in the machine would not necessarily be isomorphic-there would not have to be a one-toone correspondence between the levels of interpretation in the brain and those in the machine. While trying to construct such a machine could lead us to new insights about what happens in the brain when thought takes place, we are not on the verge of being replaced by mechanical thinkers.

In spite of the fact that algorithms have been written for activities such as juggling and bike riding, I don't think anyone has tried, in software, to get a TRS-80 to turn a somersault. Still, programs designed to do things that normally require human intelligence have produced some interesting and occasionally surprising results. For example, one theorem-proving program is known to have correctly proved a theorem with a proof the program's author was not familiar with. In a case such as this it is hard to say whether the intelligence exhibited by the program was its own or merely a reflection of its author's intelligence.

Would our puzzle-solving program be intelligent if it solved the puzzle in a way even similar to our way of solving it?

The answer to this question as well as the puzzle itself is, in the over-used last words, left to the reader as an exercise. ■

SCARFMAN AVAILABLE NOW FOR THE IRS-80'

Will you SCARF your way to victory?

Can you avoid the speedy MONSTERS that guard the maze?

Answers to these questions await the brave, who dare to enter the maze where the monsters live. SCARFMAN is a new arcade game for the TRS-80' by the author of MISSILE ATTACK. Written in machine language, SCARFMAN features quality GRAPHICS, SOUND, REAL TIME MONSTERS and hours of ENJOYMENT. Nine progressive skill levels make the game more difficult as you get better. SCARFMAN is compatible with Alpha Product's joystick.

Do you have what it takes to reach skill level 9?

TRS-80* Computer Owners... Great New Access Store!

NEW, Fully Tested AFD Mini-Disk Drives from **\$275.**

- Every Access Floppy Disk drive is electrically tested, mechanically tested and burned-in 48 hours under operating conditions. Look for the signed test list in the shipping carton.
- AFD drives are capable of *either* single- or double-density operation. AFD-100[™] drives store 102-Kbytes in single-density, 180 Kbytes in double density. AFD-200[™] drives store 205 Kbytes in single-density, 364 Kbytes in double density. And these are *formatted* file storage capacities. Moreover, you can store twice these amounts on a single diskette using AFD "flippy" drives (AFD-100F[™] or AFD-200F[™] drives).
- 15-day free trial offer ... comprehensive 90-day limited warranty ... unbeatable prices ... AFD-100 (a \$275.00, -100F (a \$329.00, -200 (a \$429.95, -200F (a \$449.95))

NOW! Percom Drives for Your Model III!

Internally mounted drives that feature "flippy" capability, double- or singledensity storage, comprehensive pre-delivery testing, 48-hour burn-in and, best of all, Percom's widely acclaimed disk controller. A First-Drive System includes the four-drive disk controller, one or two drives, cables and a fully illustrated owners manual. Use Model III TRSDOS*, Percom OS-80 † and other Model III compatible DOSs.

Prices: Complete First-Drive System w/1 drive only \$560.00

w 2 drives only \$860.00

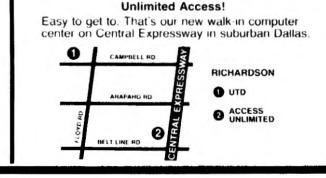

Note: If you prefer not to make the First-Drive System installation, we will do it for only \$29.95 plus shipping (if shipped). This includes a 48-hour operating burn-in of your Model III computer, installation of the drive system and final checkout of the expanded system.

A discussion of the Pulitzer Prize-winning book.

Godel, Escher, Bach

Godel, Escher, Bach: An Eternal Golden Braid Basic Books, Inc. New York, NY Hardcover, 777 pp. \$20.50

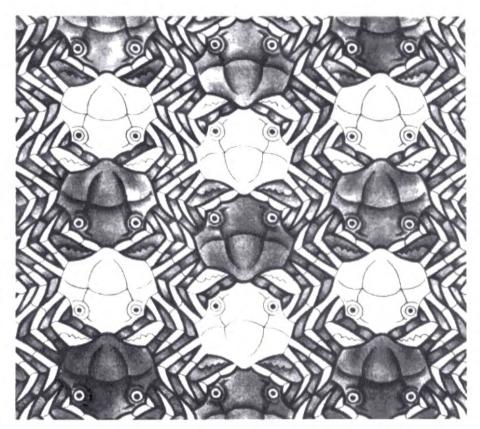

by Nancy Robertson

A lan Turing, a mathematician and influential pioneer of computer science, wrote, "I believe that at the end of the century the use of words and general educated opinion will have altered so much that one will be able to speak of machines thinking without expecting to be contradicted."

Turing made that prediction over 30 years ago. Perhaps in two more decades it will be true. But in our time, the debate over the question, "Can machines think?" is raging and emotional. It has been fanned by the uncanny growth in computer production, and aired in general interest publications such as the New York Times Sunday Magazine. Like the theory of evolution, the question threatens the ego of our species. Yet, artificial-intelligence research is undeniably a tool toward understanding human intelligence.

Douglas Hofstader, a young physicist and computer scientist, frames the questions of the artificial intelligence (AI) debate eloquently in *Godel, Escher, Back: An Eternal Golden Braid* (Basic Books, Inc., 1979, New York, NY). In 1980 the book won a Pulitzer. Later that year, it reached the *New York Times* best sellers list.

It is a deep and provocative volume that illustrates the infinite complexities of intelligence. Using the works of Kurt Godel, M.C. Escher and Johann Sebastian Bach, Hofstader identifies three vital characteristics of human intelligence: hierarchies, strange loops, and paradox. They can be interpreted as the three strands of the title's "eternal

M. C. Escher's Canon Crabs

© BEELDRECHT, Amsterdam VAGA, New York 1981 Collection Haags Gemeentenuseum

golden braid." The limited occurrence of these qualities in our most recent and impressive computing achievements reflects on our limited understanding of human intelligence.

Artificial intelligence is not merely advanced computer science, but a composite of studies. "In our century the time was ripe for computers—" the author writes, "computers beyond the wildest dreams of Pascal, Leibniz, Babbage, or Lady Lovelace. In the 1930's and 1940's, the first 'giant electronic brains' were designed and built. They catalyzed the convergence of three previously desperate areas: the theory of axiomatic reasoning, the study of mechanical computation, and the psychology of intelligence."

It seems natural to consider the nature of human intelligence before mechanical

"It is a deep and provocative volume that illustrates the infinite complexities of intelligence."

computation. It is more familiar to us. Yet, it's obvious that a simple dictionary definition of intelligence or intellect is trivial.

Midway through the book, Hofstader writes, "Our confusion about who we are is certainly related to the fact that we consist of a large set of levels, and we use overlapping language to describe ourselves on all of those levels." Hofstader's discussion of those levels, beginning with Bach, Escher and Godel, is one of the books most profound statements.

While the choice of Godel, Escher and Bach at first appears incongruous, Hofstader presents their work as "shadows cast in different directions by some central essence." The opening chapter of the book simultaneously introduces these men and Hofstader's concept of levels of meaning.

The author begins by considering Bach's *Musical Offering*. The title of the composition refers to the fact that it was dedicated, or offered, to Frederick the Great, who was the reigning king of Prussia.

Bach wrote an inscription on the original score, *Regis Iussu Cantio Et Reliqua Can*onica Arte Resoluta. (It translates to "At the King's Command, the Song and the Remainder Resolved with the Canonic Art.") The initials form an acrostic, spelling the Italian word ricercar, which meant both "to seek" and "fugue." A canon, which is the musical form of most sections of the Musical Offering, is a strict single-theme fugue. There is also a great deal to seek in the Musical Offering. In this short example, Hofstader introduces the potential for multiple layers of meaning.

"The idea of a canon," Hofstader explains," is that one single theme is played against itself. This is done by having 'copies' of the theme played by the various participating voices." Fugues follow the same principles of composition, but are based on one or more themes. These themes may be varied in time or pitch. They may be inverted or reversed. For instance, what musicians commonly call a "crab canon" begins with a theme that is played backwards in its second and final rendition.

Hofstader uses the term "isomorphic" to describe the relationship of the variations to the original theme. In other words, the variations are altered forms of the original theme. It is possible to extrapolate a theme from any of its variations. The role of isomorphism in thought processes is stressed again and again throughout the book.

Hofstader wants us to recognize that the form or structure of our thoughts have im-

plicit meaning. The structure of the thoughts we iterate reveals something about the sublevel thoughts that build expression.

In the Musical Offering the Canon per Tonos has a significant structure. In each expression of the theme, Bach modulates the key upward. For instance, the first statement of the melody and accompanying voices begins in C minor, but the resolution is in D minor. Normally, variations end or "resolve" in the same key that they begin. Opening in D minor, the second statement of the Canon per Tonos theme resolves in yet a higher key. The pattern continues to spiral through six modulations. Bach has broken down our normal expectations, yet surprisingly brings the piece back to its original key in the final modulation.

A canon or fugue is clearly a hierarchical system. The rules of composition and the themes to which they are applied produce distinct patterns and levels within the structure.

The Canon per Tonos takes us a step farther into Hofstader's theory. This particular canon is an example of a strange loop. "The 'Strange Loop' phenomenon occurs whenever, by moving upwards (or downwards) through the levels of some hierarchical system, we unexpectedly find ourselves right back where we started."

This concept leads us smoothly to M.C. Escher, a Twentieth-century lithographer and print master who represented his fascination with strange loops visually. Escher is known for prints such as *Waterfall* and *Drawing Hands*. In *Waterfall*, water travels upward through a series of three sluices, drops from a waterfall, and begins its defiance of gravity all over again in the same sluiceway. *Drawing Hands* depicts a sheet of paper on a drawing board. The left hand, which is drawn on the paper, is drawing a right hand, which is drawing the left hand.

"The viewer cannot help getting caught up in Escher's implied chain of levels, in which, for any one level, there is always another level above it of greater 'reality,' and likewise, there is always a level below, 'more imaginary' than it is," Hofstader writes. In *Drawing Hands* there is a level of "greater reality" just beyond the print: Escher's hand has drawn the hands that

"So far in the development of computer science, conscious self-reference, the recognition of paradox, and understanding the concept of infinity are all elusive."

draw each other.

The print itself is characterized as a twostep strange loop: The right hand draws the left; and the left hand draws the right. The strange loop of *Drawing Hands* is represented in Fig. 1.

Hofstader's term "strange loop" is a finite representation of infinity. "In... strange loops... there is a conflict between the finite and the infinite, and hence a strong sense of paradox."

While Hofstader sees Escher's prints as "visual analogues to the canons of Bach," the paradox embedded in them leads to the study of Godel. Kurt Godel was a German mathematician who published a treatise on mathematalcal reasoning in 1931. The paper showed "that no axiomatic system whatsoever could produce all number-theoretical truths, unless it were an inconsistent system!"

Using the strict rules of formal mathematical system to generate and prove theorems of number theory, Godel discovered a true theorem that could *not* be proven. The discovery of this paradox lead to his incompleteness Theorem and treatise. The validity of his argument threatened the foundations of mathematics, which is dedicated to the eradication of incongruity.

Outside of mathematics, paradox has been a recognized characteristic of human thought since ancient times. Epimenides was a native of Crete who is credited with "one immortal statement: 'All Cretans are liars.' " Was Epimenides telling the truth?

The Epimenides paradox, or "llar's paradox," is a one-step strange loop. A two-step strange loop expressing a similar paradox could be:

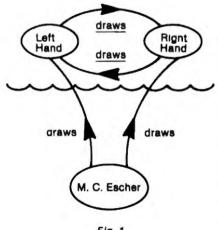

Fig. 1

"The following sentence is false. The preceding sentence is true."

This two-step loop is closer to the heart of Godel's Theorem.

Called TNT for Typographical Number Theory, Godel constructed a formal mathematical system that could write self-referential statements about natural numbers. Applying self-reference to numbers was brilliant, regardless of the additional discovery of paradox. Self-reference was a recognized characteristic of human dialogue, of literature and art—but not at all characteristic of our traditional perception of mathematics.

In TNT language can be represented by symbols, which in turn can be represented by numbers. For instance, the English language version of the first axiom of TNT is, "For all variables a there does not exist a successor of a that is equal to zero." Symbolically, this statement can be represented by: a: Sa = 0. The numeric sequence which expresses the same axiom is: 666,262,636, 123,262,111,666.

Using TNT to generate and prove theorems of number theory, Godel eventually derived Theorem G. Hofstader roughly translates this to "G is not a theorem of TNT." In a two-step strange loop, it might be represented as follows:

G is a true statement of number theory. G cannot be proven.

While the Epimenides paradox rests on the fact that the statement is neither true nor false, Godel's Theorem G is true, but defies proof.

The Important thing to grasp about Godel's work is that paradox and self-reference are not limited to language, music and art—paradox and self-reference are found in number relations. Both paradox and selfreference are universal characteristics of human thought. Godel's work reinforces our knowledge that numbers, like words, are symbolic (or isomorphic) representations of ideas.

So far in the development of computer science, conscious self-reference, the recognition of paradox, and understanding the concept of infinity are all elusive. Yet computers, like humans, base their thought operations on hierarchical sytems. Between computer hardware—memory registers, CPUs I/O devices and circuitry—and high-level languages such as Lisp there are

Intelligent programs
Embedded Pattern Matcher
LISP
Compiler or Interpreter
Machine Instructions
Registers and Data Paths
Flip-Flops and Gates
Transistors

Fig. 2

several functions. There is a machine language, assemblers, assembly code, interpreters, low-level language, etc. Fig. 2 is a diagram, taken from *Godel*, *Escher*, *Bach*, representing the hierarchy of intelligence in a computer.

Hofstader believes that there are human processes that could be delineated that serve the same functions. On the lowest level, he compares hardware and the brain as an organ. For an example of a higher level analogy, take a computer operating system. "It is virtually certain that there are somewhat parallel things which take place in the brain: handling of many stimuli at the same time; decisions of what should have priority over what and for how long; instantaneous interrupts caused by emergencies or other unexpected occurrences..."

Yet computers have seldom demonstrated understanding, self-awareness or creativity. A computer that generates haiku or music from a random mixture of programmed phrases is not creative any more than a calculator is creative. The computer does not intend the resulting lines and melodies to have meaning. It does not understand the explicit definition of the sentence it generates. It does not appreciate the tones of the musical themes it combines. Hofstader writes that:

An intelligent program would presumably be one which is versatile enough to solve problems of many different sorts. It would learn to do each different one and would accumulate exeprience in doing so. It would be able to work within that set of rules and yet, also, at appropriate moments, to step back and make a judgement about whether working within that set of rules is likely to be profitable in terms of some overall set of goals which it has. It would be able to choose to stop working within a given framework, if need be, and to create a new framework of rules within which to work for a while.

This is the sort of intelligence Godel used

"Yet computers, like humans, base their thought operations on hierarchical systems."

in discovering his incompleteness Theorem, that Escher used in most of his art, and that Bach exemplified in the Canon per Tonos.

Hofstader believes that the current inability of programming and computer science to achieve such program reflects our limited understanding of human thought. He believes "One key for understanding and creation of intelligence lies in blocks. Hofstader writes that the program the constant development and refinement of the languages."

He argues that Terry Winograd's Al program SHRDLU had demonstrated a degree of understanding in a machine. The program, which was written while Winograd was a graduate student at MIT, converses with humans to manipulate imaginary

The 'Eternal Golden Braid' A Study of Artificial Intelligence

by Nancy Robertson

At first glance, the response to Godel, Escher, Bach seems as incongruous as the "eternal golden braid" that weaves the genius of these three men together in a study of artificial intelligence. In 1980 Douglas Hofstader's opus, a book of over 700 pages In Basic Book's hardbound edition, won the Pulitzer Prize for general nonfiction.

Martin Gardner, who had reviewed the book for Scientific American wrote, "Every few decades an unknown author brings out a book of such depth, clarity, range, wit, beauty and originality that it is recognized at once as a major literary event." So it was for Godel, Escher, Bach.

The manuscript fell into the hands of Martin Kessler, president of Basic Books, New York, NY, when a friend of his who had hoped to publish the volume through a university press despaired of the large task. When the enormous bundle of manuscript and diagrams arrived in the mail, Kessier's first reaction was "a sinking feeling, but then I took it home and began reading it-and I got hooked, at first by the puzzles" Hofstader used to illustrate his points.

Kessier decided to go ahead with publication, although the potential production cost appeared prohibitive. "It looked like we'd have to charge \$28 a copy to make our money back. The nagging question was who would buy the book at that price. While interest in the manuscript began to

show that the book would probably attract a wider readership than the publishers originally anticipated, production problems continued. Finally, arrangements were made with Hofstader to typeset the volume himself on a computer.

After the hardback edition came out, Vintage, a subsidiary of Random House, negotiated for the rights to the paperback. edition. From October, 1980, to March, 1981, a tome considering the characteristics of human thought, the intelligence of three creative geniuses and the ramifications of artificial intelligence, Godel, Escher, Bach bobbed up and down on the New York Times' list of best selling trade books. Its subject and its depth made its appearance on the list unique.

Hofstader, who was born in New York City and raised in California, is temporarily living in Berkeley, CA, and continuing his research. He is uncomfortable with the notoriety the book has brought him-the phone calls from strangers and the hundreds of letters. "Different people deal with fame in different ways," he said. Although he is appreciative of the interest in the book, he feels it has the strength to "stand on its own." So far, he has tried to keep up with the correspondence that has resulted from the publication of Godel, Escher, Bach. Recently he responded to over 400 letters from readers, but his energy is waning. He continues the eternal quest implied by his book.

was designed to:

- •Understand questions in English about the situation;
- Give answers in English to questions about the situation;
- Understand requests in English to manipulate the blocks.
- Break down each request into a sequence of operations it could do:
- Understand what it had done and for what reasons:
- Describe its actions and their reasons, in English.

Like Hofstader, Winograd emphasizes the importance of the tangled hierarchy of . language. He modeled SHRDLU on his view of human thought and human language. Rather than separating the various functions of the program into modules, he intertwined them. The program is so convoluted that other programmers initially thought it was absurd. Yet, the achievements of SHRDLU are Impressive.

Example 1 is a segment of a transcribed converstalon between SHRDLU and a visitor. (The words of Dr. Earrwig are actually Winograd's. Eta Oin is a fictional name of a real visitor.) In this short passage, SHRDLU demonstrates an ability to learn concepts.

In an article about SHRDLU Winograd wrote:

One of the basic viewpoints underlying the model is that all language use can be thought of as a way of activating procedures within the hearer. We can think of any utterance as a program-one that indirectly causes a set of operations to be carried out within the hearer's cognitive system. This "program writing" is indirect in the sense that we are dealing with an intelligent interpreter, who may take a set of actions which are quite different from those the speaker Intended. The exact form is determined by his knowledge of the world, his expectations about the person talking to him, etc. In this program we have a simple version of this process of Interpretation as it takes place in the robot. Each sentence interpreted by the robot is converted to a set of instructions in Planner (an Al computer language). The program that is created is then executed to achieve the desired effect.

One of Winograd's statements is especially important. "We can think of any utterance as a program-one that indirectly causes a set of operations to be carried out within the hearer's cognitive system." These "programs" and "sets of operations" are the sorts of levels Hofstader wants us to recognize in our own thinking.

Hofstader must stress his point by exam-

On the cutting edge of research.

Artificial Intelligence at M.I.T.

G. Michael Vose 80 Microcomputing Technical Staff

f man's intelligence is truly natural intelligence, then any intelligence simulated by a machine would be artifical—or possibly unnatural. This intelligence would be hard to define, at least in part because intelligence itself is hard to define. This has been one of the findings of the Artificial Intelligence Laboratory at the Massachusetts Institute of Technology in Cambridge, Massa-

chusetts. Founded in the early 1960s by Marvin Minsky, M.I.T's AI Lab has grown to include 10 full-time faculty members, a research and support staff of 35 and 30 graduate students. These people are engaged in theoretical research as well as specific projects for concerns such as the Defense Advanced Research Projects Agency, the Air Force Office of Sponsored Research, the National Science Foundation, the Xerox Corporation and others.

The primary goal of the M.I.T. AI Lab, according to its Director Dr. Patrick Winston, is to "understand how computers can be made to exhibit intelligence." The two major aspects of this search include development of a more thorough understanding of human intelligence, and finding ways to make computers more useful. Recently, the AI Lab has channeled its research energies into image understanding, studies of natural vision, robotics, learning from experience and language comprehension, problem-solving techniques of experts, the computing environment and education.

Education Projects

The education projects are among the Lab's most celebrated and are led by Professor Samuel Papert. Professor Papert directs the Logo Group, a group which attempts to apply the theoretical findings of Al research to education. The Group has been instrumental in the development of the Logo language. Logo is designed to allow children to learn through their involvement in "teaching" the computer. Recent work in the Group has involved the study of spatial reasoning.

Dr. Berthold K.P. Horn directs the imageunderstanding research team. They have developed albedo maps, maps from photographs which have had ground slope and sun position shadows removed so that the Intensity of the image is solely a function of ground cover. This research focuses on shading and surface characteristics.

Along with the topic of image understanding, the AI Lab conducts research on natural vision. This effort is led by Professor Shimon Ullman and concentrates on understanding the process whereby the retina of the human eye distinguishes between light sources of differing intensity. Obviously, vision and image-understanding research will have an application someday in another of the Lab's research areas, robotics. The team working on the Robotics projects includes Dr. J. Michael Brady, Dr. John M. Hollerbach and Professor Tomas Lozano-Perez. The primary thrust of current research is the development of a high-level manipulator language.

The AI Lab's overall Director, Patrick Winston, heads the theory of reasoning by analogy project; Professor Marvin Minsky, the Lab's most well-known member outside academic circles, continues his work on the "society of minds" theory. This is a theory which postulates that intelligence is the result of the interplay among groups of related individual concepts or processes. Professor Richard Greenblatt continues his work with Lisp, a character-manipulation language that he developed initially several years ago.

In a recent interview with 80 Microcomputing, Dr. Winston addressed the issue of whether or not artificial intelligence research will develop machines so powerful that society may become over-dependant on them. "In the first place, America and Europe are already overly dependant on machines. For example, without farm machinery most of the industrialized West would starve to death. Secondly, one of the major goals of AI research is the development of computers that explain what they are doing and how they are doing it. In this way, AI may help us understand ourselves better."

A beautiful match, the Smartmodem and the TRS-80. Your TRS-80 can talk with other computers, over the telephone lines. And with no acoustic losses or distortions. Access time-sharing systems and information utilities such as the Source." CompuServe† and MicroNet.

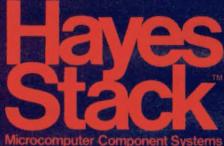

Direct hook-up with no interference noises. The Smartmodem hooks to the telephone line just like a modular telephone, simply insert in a wall jack.

"Love at first sight" - your TRS-80 and the Smartmodem!

Brawny - because it does so many things. Auto-dial and auto-answer features built in. With the Smartmodem, your TRS-80 can automatically dial the telephone, answer the telephone, receive and transmit, and hang up the telephone. Completely unattended.

Pulse dialing or Touch-Tone.** The Smartmodem can be connected to any telephone system in the U.S. because it allows pulse-dialing, Touch-Tone dialing or a combination of the two. FCC approved.

Program controllable in any language using ASCII character strings. This is a unique

feature of the Hayes Smartmodem. Brainy - because it does them all so simply. Seven LED indicators on the front panel give you visual signals of the status of the Smartmodem. MR-Modem Ready, SD-Send Data, CD-Carrier Detected, etc. The audio monitor feature lets you "listen in" on the call being dialed and the connection made. You are immediately alerted to busy signals, wrong numbers, etc. Over 30 different commands can be entered directly from your TRS-80 keyboard. including the unique "Set" commands which allow you to select and change various optional parameters such as dialing speed, escape code character, length of

time for a dial tone, and number of rings to answer. There are 17 "Set" commands. The Smartmodem is completely compatible with the Bell-103 type modems, the type of modern most time-sharing systems have. Operation can be in full or half-duplex, with a transmission speed of 0-300 baud.

The Smartmodem is ready to "get-together" with your TRS-80. TRS-80 Model II and TRS-80 Color Computers have RS-232 serial ports and can immediately interface with the Smartmodem. Expansions that permit use of the Smartmodem with TRS-80 Model I and Model II are available through your TRS-80 dealer.

Match your TRS-80 with a Haves Smartmodem for a sophisticated, high performanced data communication system. Available at computer stores nationwide (except TRS-80 dealers) call or write for the location nearest

laves you. And don't settle for anything less than Hayes. Hayes Microcomputer Products, Inc. 5835 Peachtree Corners East Norcross, Georgia 30092 (404) 449-8791

Your TRS-80 computer and the Hayes Stack Smartmodem. Beauty, Brains, and Brawn!

"I see Instant Software in your future..."

".... It's becoming very clear now Your microcomputing life is going to be very exciting...Money! I see much money for you. Perhaps it is the money you will gain when Instant Software's new business applications quide your financial endeavors. I see travel...you will journey to distant worlds in distant times. You will build kingdoms from deserts and armies from slaves. Never will you be bored, adventurous one! Your programming burdens will lighten with new utilities-new tools. I see color! Many bright colors! I see new packaging for all these treasures...everything new! And...yes, a tall, handsome stranger who will guide you to these wonders. It will be your In-stant Software dealera wise one indeed. All awaits you-all is yours for the asking. Soon ... very soon!"

Get a glimpse of the future today-at your nearest Instant Software dealer.

In this game your computer will use the principles of artificial intelligence against you.

Master Mind— An Intelligent Program

Duane R. Hope 2704 College Park Road Allison Park, PA 15101

Ave you ever encountered the mysterious phrase "artificial intelligence" while flipping through the pages of your favorite microcomputing magazine? Did you find yourself asking, "What's artificial intelligence and how can I use it?"

Artificial intelligence (AI) is a computer system which exhibits behavior that is called intelligent behavior when we observe it in human beings. The most common intelligence displayed by AI systems are the abilities of problem solving, learning and pattern recognition.

Combining these ingredients AI systems have been designed to solve many varied and complex problems, such as investment

	Position	Position	Position	Position
	1	2	3	4
Code Maker's Code	blue	red	red	yellow
Code Breaker's guess	red	blue	green	yellow

Evaluation Pattern	Action
Number of blacks + whites = 0 Number of blacks = 0, number	Do not use any of the numbers in this guess in future guesses.
of whites greater than 0	The numbers in each position of this guess cannot appear in the same position in future guesses.
Number of blacks + whites = 4	Only the numbers in the guess are in the code. Do not consider numbers that are not in this guess in future guesses.
Number of blacks = 4	The goal state has been reached and the code broken.

Example 2. Pattern recognition operations.

If this guess were the code	then the evaluation of 1111 would be
1112	three blacks and zero whites
1113	three blacks and zero whites
1114	three blacks and zero whites
1115	three blacks and zero whites
1116	three blacks and zero whites
1116	three blacks and zero whites
E	xample 3.

analysis, proving theorems, and robot guidance system design. Al work has also taught computers to play chess.

I first applied Artificial Intelligence techniques to a Master Mind program. I had written a program that allowed a person to play a solo version of Master Mind. In the solo version the computer randomly produced codes for the player to guess. The computer evaluated each of the player's guesses until the code had been broken.

This solo version grew tiresome. To modify this program, so that both the computer and player could take turns making and breaking codes, required artificial intelligence techniques. Although the new version of Master Mind is not as sophisticated as a cybernetic investment system, it requires the computer to exhibit intelligent behavior. The computer learns how to duplicate the thought processes necessary to break codes.

Master Mind

If you are not familiar with Master Mind, it is a game of deductive logic, manufactured by Invicta Plastics, Ltd. Played by two people, each takes turns assuming the roles of code maker and code breaker.

At the beginning of play, the code maker constructs a code by selecting an ordered combination of four colored pegs from six sets of pegs, each of a different color. The code breaker cannot see the arrangement. He attempts to duplicate the order and color of the pegs in the code by placing his guesses on a board, one at a time. After each guess (which consists of placing four colored pegs on the board) the code maker evaluates the code breaker's guess. The code breaker uses these evaluations to try to guess the code.

The code maker evaluates each guess by giving the code breaker one black peg for every peg in the guess that is the correct color and position. One white peg is given

e as a saparate program actor maximum, actures defined in manu actors maximum, ion (files can be read li ig or descanding order), The jury is in and the verdict is . . . "outstanding!" Reviews from all of you who purchased MAXI MANAGER (not to mention raves by many top microcomputing magazines) have heralded it as the definitive data base managing system. We knew that business owners and hobbyists demanded the finest data base managing system available. To all of you who praised us for MAXI MANAGER, we extend our thanks. And to those of you who have yet to try MAXI MANAGER, we invite you to experience this incredible system today. But don't take our word for it (or our jury's). Judge for yourself.

JUST CHECK SOME OF THESE FEATURES

Supports six different relational search techniques.

Comes with programmer's interface.

Over 120 pages of documentation.

Supports up to 20 user defined fields of 40 characters each.

Record length up to 800 characters.

Files can be up to four disks in length.

Compatable 35, 40, 77 & 80 track drives with proper operating system.

Has calculated equation fields.

Complete report generator.

Works hand in hand with any word processor.

MODEL 1 version requires TRSDOS 2.3 and is compatable with NEWDOS 2.1 & NEWDOS 80

MODEL 3 version comes on TDOS, a special version of the DOSPLUS operating system.

Requires 48K of RAM and one disk drive minimum.

"Master Mind is a game of deductive logic, played by two people. Each takes turns...as code maker and code breaker."

for every peg that is the right color, but in the wrong position. The white and black pegs, however, do not correspond positionally to specific pegs in the guess. See Example 1.

The code maker evaluates the guess in Example 1 by giving the code breaker one black peg and two white pegs. If this were the first guess, the code breaker would have no idea which peg was the right color and in the right position (the yellow peg) and which two pegs were the correct color but in the wrong positions (the red and blue pegs).

The code maker receives one point for each guess the code breaker makes. A turn is completed after each player has been both the code maker and code breaker. The player with the highest score wins.

Means-ends Analysis

The most difficult part of teaching a computer to play Master Mind is teaching it to break codes. But, breaking a code can be compared to solving a problem.

We can employ one of the AI techniques for problem solving. I decided to use the Means-ends Analysis devised by Newell and Simon.

In Means-ends Analysis the *ends* represents the solution to a given problem and is referred to as the "goal state." The "current state" describes how close the problem solver is to the goal state and represents all of the information accumulated in the search for the solution.

Fundamental to Means-ends Analysis is the concept that there is a measurable difference between the current-state and the goal-state. This difference may be reduced by a repeated application of certain operations to previously acquired information. This represents the "means" of solving the problem.

In Master Mind the goal state is guessing the code. The current state is all of the information the code breaker has accumulated toward the goal. Initially, the current state consists solely of the code breaker's knowledge of the rules of Master Mind.

The difference between the goal state and the current state is the maximum number of guesses the code breaker would have to make to arrive at the code. Because the code could consist of four pegs and each peg could be selected from one of six different colors, it would be possible for the code breaker to make 1,296 ($6 \times 6 \times 6 \times 6$) guesses before duplicating the code.

To reduce this difference, the first move is to make a guess.

Because the computer will be competing with a person, and because a person can usually guess the code after four to twelve guesses, we must discover additional operations that may be performed so the code can be broken after four to twelve guesses.

Verbal Protocol and Problem-Behavior Graphs

"Verbal Protocol" is another technique of Artificial Intelligence which is used to discover what mental operations are performed by people when they solve a particular problem. To record these processes, the problem solver is asked to think out loud as he attempts to find the solution. The verbalized thoughts are written down. The documentation is referred to as verbal protocol. Verbal protocol is analyzed to discover operations that the problem solver performs on acquired information to find the solution.

The analysis of the verbal protocol is simplified through the use of problem-behavior graphs which are representations of the verbal protocol.

To explain how verbal protocol and problem-behavior graphs can be used, let's review an example of a code breaker taking one guess at the code maker's code. To simplify the example, rather than using six colors to form the code, we will use the numbers one through six.

Let's assume that the code is 4326. We already know that the code breaker must first make a guess to begin reducing the difference between the current state and the goal state. The verbal protocol of the first guess would go something like this:

"Let's see, I'd better make my first guess. What should I start with? Oh, I know. Why don't I start with 1111."

The code maker would then evaluate the guess as zero blacks and zero whites.

The code breaker would continue thinking, "No blacks and no whites. That means the code doesn't contain any ones."

To draw the problem-behavior graph, represent the current state of knowledge with a rectangle. An operation leading us to a new state of knowledge will be represented by an arrow, See the problem-behavior graphs in Fig. 1.

Analyzing the graph, you see that the first operation is making the guess 1111. This leads us from the first state of knowledge where we knew only the rules of the game, to the second state of knowledge where we learn that the guess is evaluated by zero blacks and zero whites. The first operation has reduced the difference between the first state of knowledge and the goal-state from 1,296 possible guesses to 1,295.

Graph (b) of Fig. 1 shows that the second operation, "If B + W = 0, the numbers in this guess can't be in the code," takes us from the second state of knowledge to the third: The code can't contain any ones. This second operation has further reduced the difference between the current state of knowledge and the goal state to 625 possibilities (5 × 5 × 5).

To further reduce the difference between a current state of knowledge and the goal

state, I recorded verbal protocol as I attempted to break several codes, and constructed problem-behavior graphs. When I analyzed the graphs, I discovered that the operations I performed could be grouped into two categories: "pattern recognition" and "learning."

Pattern Recognition

Pattern recognition is an AI technique used for converting information into action. In pattern recognition there is a one-to-one correspondence between a particular information pattern and an appropriate course of action. The list in Example 2 comprises the pattern recognition operations I discovered.

In certain cases the use of pattern recognition mechanisms will help reduce the difference between the current state and the goal state. In other cases, pattern recognition must be augmented by the learning process.

Learning

The learning process is an AI technique that gradually modifies a programmed decision system to improve performance. Modifications are made from performance evaluations of previously made decisions.

For example, each guess that the code breaker makes, along with the corresponding evaluation, is saved. Prior to making each succeeding guess, previous guesses are reevaluated in light of the next guess you are contemplating. If the evaluation of each preceding guess is unchanged, then the prospective guess could be the code and the guess will be made. On the other hand, if any of the reevaluations have changed since the original evaluations, then the prospective guess is discarded. This is the learning process.

Assume that the code is 4316 and that the code breaker's first guess is 1111. The code breaker, then, would receive an evaluation of one black and zero whites. No action would be performed as a result of this evaluation; the difference between the current state and goal state is only reduced by one.

However, by using the learning processes, we can reduce the difference further. Eliminate all possible guesses that would not result in one black and zero whites. See Example 3.

Since the code produced an evaluation for the guess 1111 of one black and zero whites, then none of the guesses in Example 3 could be the code because when they

Put Your Fingers On The Pulse Of Wall Street With Your Radio Shack Computer

If you invest in the market, operate your own business or require updated information quickly to manage your affairs, Dow Jones Information Services provides the authoritative business and financial information you need. . .from Wall Street, Washington and around the world. Now Radio Shack owners can receive this valuable service through TRS-80[®] Videotex[®] software.

Get Information For Business And Investment Control...On Command.

Discover how quickly and easily your personal computer turns into a specialized, sophisticated library of information with access to the Dow Jones database. It's considered the world's most reliable and comprehensive source of business and financial data providing you with news up-to-the-minute as well as from the previous 90 days.

Now you can review thousands of items from <u>The Wall Street Journal</u>, <u>Barron's</u> and the worldwide Dow Jones News Service without having to maintain piles of newspaper clippings. Information about companies, stocks, labor, government, international market and monetary developments, and so much more, is yours on command.

Quotes From Four Exchanges

Now, in just seconds, you can obtain current prices and the volume traded for stock quotes (15 minutes delayed) on over 6,000 companies. . .plus 50 key financial indicators on 3,200 selected firms and 180 industries. You'll also have access to trading information on mutual funds, treasury notes and bonds. Imagine being able to spot trends, research a company, obtain data that could affect <u>your</u> business, <u>your</u> investments, <u>your</u> investment decision-making. But you don't have to imagine anything. ...Dow Jones Information Services provides it all right now.

Low Start-Up Cost. . . Free Password.

Stop by your nearest Radio Shack store and find out how easy and inexpensive it is to get Dow Jones investment data through TRS-80 Videotex. Videotex software for Radio Shack computers is only \$29.95. What's more, you get a Dow Jones password absolutely free. ..along with one hour of free introductory time. And there are no start-up or minimum usage charges. In addition, software and usage costs will be tax deductible in many cases (consult your tax advisor for further information).

Customer Support... Just A Phone Call Away.

Dow Jones' professional customer service staff is ready to provide complete information about this important home information service now... and full customer support after you've made your purchase. Just call toll free...

800-257-5114 In New Jersey call: (609) 452-1511.

"In completing my analysis I realized it would be necessary to generate each of 1,296 possible guesses."

are substituted for the code they do not produce the original evaluation. In this example, there would only be 500 guesses that would produce evaluations of one black and zero whites.

Completing the Analysis

In completing my analysis of the problem-behavior graph, I realized that it would be necessary to develop a procedure for generating each of the 1,296 possible guesses—otherwise the computer would never be able to make any guesses. In addition, this generator would have to produce each guess only once.

The guess generator would also have to be designed so that the operations resulting from pattern recognition could be performed. To accomplish this, I used the possibility table shown in Fig. 2.

Each of the possible 1,296 guesses can be generated from this table. Initially the number used in positions W, X, Y and Z is set to a one. Then, to generate succeeding guesses, the right most position, position Z, varies from one to six. After the first six generations (1111, 1112, 1113, 1114, 1115, 1116), position Z is set to one again, and the next position to the left, position Y, is set to a two.

JUST LAUNCHED! VOYAGE OF THE VALKYRIE BY LEO CHRISTOPHERSON

The ancient Norse lords bravely sailed their ships across new waters in search of adventure. No obstacle was too great to overcome nor any force powerful enough to prevent their mighty advance. ■Now you're in command. You are the pilot of the attack ship Valkyrie. Your mission: to wrestle the island Fugloy from the grasp of an army of laser-wielding war birds and secure the golden treasures hidden within the walls of the island castles. Success of the mission depends solely upon you. The castle Drage appears on the horizon when suddenly the air is alive with the flutter of giant wings. Your prize is in sight . . . do you dare accept the challenge and go on? ■ You can put yourself at the controls of the Valkyrie thanks to the genius of Leo Christopherson and the versatility of the *TRS-80 microcomputer. As absolutely flickerless birds sail smoothly across the screen, strains of Wagner's "Ride of the Valkyries" are heard. The game offers 10 levels of difficulty which provide a challenge for players of all ages and skills. The game also provides one of the finest examples of computer cartoon-graphics presently available. Accept the challenge of the Voyage of the Valkyrie . . . available now at leading software retailers.

Whenever the evaluation is zero blacks and zero whites, each number in the guess can be deleted from each position of the possibility table, by setting its relative position to zero. A guess that has one or more of its positions equal to zero can be discarded.

The Problem-Solving Model

The operations discovered from analyzing the problem behavior graphs can be assembled into a problem-solving model. Fig. 3 shows this model.

The model begins with generating a guess (step 1) that does not contradict information from previous evaluations (step 2). If this guess contradicts previous evaluations, it is discarded and another guess is generated. A guess that is consistant with information from evaluations of previous guesses is made in step 3.

After feedback is received form the code maker in step 4, the evaluation is checked by the pattern recognition mechanism in step 5 to determine if any numbers should be eliminated from the possibility table. If the evaluation is four blacks (step 6), the code has been broken and the problem solved. If the code has not been broken, the model returns to step 1 and the operations are repeated.

The program listing will help you see how the model actually works. You should be able to apply some of these AI techniques to other situations requiring the computer to solve problems or make decisions ■

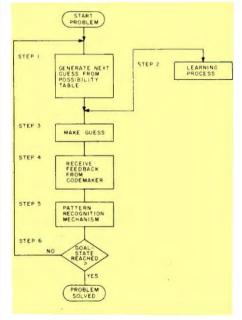

Fig. 3. Problem-solving Model

Accept our free program. It retails for \$6.95 but it's yours just for previewing America's finest software club.

I want to tell you about the most exciting development that has ever happened to your computer. Then I want to extend an invitation. Neither the development or the invitation need cost you a cent.

- · It's not a new terminal.
- It's not any kind of peripheral.
- · It's not a new language.
- It's all of these.

It's a club. A club exclusively for people who live and breathe computers, like you—and me.

BUILD A SOFTWARE LIBRARY THAT WILL EXPAND YOUR COMPUTER'S CAPABILITIES TO THE LIMITS OF YOUR IMAGINATION.

Each month we bring you the finest and boldest concepts in computer software from manufacturers all over the world, from categories that include education and business to entertainment and home utilities.

Out of thousands of programs available, we select those that make your computer do more of what you bought your computer for. Programs that keep your computer working throughout the day instead of gathering dust on a desk.

ASC keeps your computer functioning and expanding by supplying the vital

A special sample of the Scott Adams Adventure Series. On TRS 80 cassette for model 1 and model 3.

Other charter members receive FREE, the Hardcopy source code-**Checkbook Balancing.**

*Only a small postage and handling charge software resources necessary for its growth. Software for the business owner, educator, hobbiest, the family. Software that will continually keep your hardware paced with state of the art technology. With an ASC membership you will be assured that your equipment is never rendered obsolete.

OUR NO-OBLIGATION CHARTER INVITATION

When you become a charter member you get:

- Our free Scott Adams software program on cassette
- Our informative and very candid newsmagazine
- Discounts on all software programs
- Discounts on major brands of hardware and supplies
- Additional discounts for recommending new members
- Software updates as they become available
- BONUS. Free buy, sell, or swap ad in our newsmagazine (on a spaceavailable basis). A real moneysaver.

Even if you never purchase another program, the free cassette is our gift to you.

Gift acceptance certificate below. Mail today to reserve your free gift.

DISCOUNTS. PROMPT SHIPMENTS.

No more searching through magazine ads and paying top dollar. You save every time you buy. Save on software, hardware, books . . . all computer supplies. For example, next month you can purchase name brand blank diskettes that the "discounters" sell for \$3.50. Our price-\$2.50. That's saving \$10 per box.

HERE'S HOW YOUR CLUB WORKS.

All purchases are charged to your account at low member prices. (software programs usually cost \$9.95 to \$24.95 and are always discounted 15 to 40% off manufacturers' suggested list). Every four or so weeks, you will receive our new "Software Compendium" newsmagazine free. It reviews the new programs and provides helpful hints and member input. If you want our "Choice of the Month", do nothing, it will be sent automatically. If you want an alternate, additional, or no program at all (which will break your computer's heart), just return the card by the date specified. Unrequested programs may be returned at our expense. And all software is supplied with the original manufacturer's warrantees. Club members are never subjected to any minimum purchase requirements.

Millwood, N.Y. 10546	
me in American Software Club as outline	cassette (or hardcopy source code) and enroll ed in this ad. I understand that all future pur- w members' prices and that a small postage dembership can be cancelled at any time.

Artificial Intelligence techniques for a theorem-proving program.

Simple Syllogisms

Rick Hoffman 4055 Arrow Drive Mt. Pleasant, MI 48858

ave you ever dreamed of having an intelligent computer? If so, here's a program that will boost your computer to the head of the class.

The problem with endowing a 16K TRS-80 with intelligence lies in defining a task without exhausting the machine's memory. To create a task that works, you must restrict your machine's intelligence. This means the computer will do well given a specific task, but for any other it will act like an idiot.

For instance, programming a 16K computer to recognize spoken words would require you to use a very small vocabulary. Since the majority of everyday words would not be in the computer's vocabulary, it would misinterpret or not acknowledge them at all.

Theorem-proving programs have been created to verify theorems in set theory and geometry and make logical deductions via predicate calculus. My program deals with logical constructs known as syllogisms.

Socrates is Mortal

Perhaps you are familiar with the famous syllogism:

- Socrates is a man.
- All men are mortal.

Therefore, Socrates is mortal.

This illustration shows what I set out to accomplish with my program. I wanted a program in which I could enter a number of rules—such as the first two lines of the above syllogism—and then make the computer manipulate the rules to answer questions.

Since entering English sentences for the rules and questions would tie up too much memory (if not deplete it completely), I chose as input specifications:

STR1,STR2,STR3—where, except for special commands, STR2 and STR3 are names of sets, and STR1 is a string representing the format of the rule or question. It can be NOTIN, IN, NO, SOME, ALL or EQUAL and represents the relationship between STR2 and STR3.

My notation for the rules for the Socrates syllogism would be:

IN,SOCRATES,MEN ALL,MEN,MORTALS

Notice "Socrates is a man" was rendered "Socrates is a member of the set of men". Mortal became mortals. The program will not recognize men as the plural of man. The names of sets should be plural unless there is only one member in the set. NOTIN and IN are special formats used only if STR2 is a set with one member.

Questions have the same input specifications. If you enter the first two lines of the Socrates syllogism as rules and then ask IN,SOCRATES,MORTALS, the answer would come back affirmative.

Given a question (actually a statement the computer determines to be true or false) the program will try to prove the statement. If it succeeds, it answers "Affirmative". If it fails, it tries to disprove the statement. If it can do that, it answers "Negative". If it can neither prove nor disprove the statement, the program will answer "Undecidable".

Whether you are feeding the program a rule or asking a question depends on what mode you are in. At the beginning of the program, you are in the rule mode and will be asked to input rules. The following are special commands providing intermode travel:

• Q,, : Puts you in the question mode.

• R,, : Puts you in the rule mode.

I have also provided subroutines:

• Listout,, : Gives a listing of your rule base in expanded form. Within this routine you have the option of deleting rules from your rule base.

 L,, : Loads previously stored rules from cassette. Erases current rule base if present.

• S,, : Saves your rule base to cassette. The listout subroutine is available from either mode, but the cassette load/save routines can be invoked only from the rule mode. Should you unintentionally call a cassette operation, you may escape unscathed by answering the "ready cassette" message with N.

Anatomy of the Program

Major variables (DEFSTR B-H; DEFINT A, I-Z):

 D(200)—Directory of set names. Instead of storing the rules as triplets of strings, memory is conserved by assigning to each set name a directory index.

- XD— Number of entries in the directory.
- R,S,T— Arrays of size 100; rule arrays.

R(I) = Index in directory of STR2

S(I) = Index in directory of STR3

- T(I) = Format of rule:
- 1 = NOTIN, 2 = IN, 3 = NO, 4 = SOME, 5 = ALL,

6 = EQUAL

• A -Number of rules currently stored. For example, suppose you were to input rule one as: ALL, DOGS, MAM-MALS. The program would then establish the values: D(1) = "DOGS"; A = 1.D(2) = "MAMMALS"; XD = 2; R(1) = 1; S(1) = 2; T(1) = 5.Four inferences that can be made from this rule: All dogs are mammals; some mammais are dogs; some nondogs are non-mammals; all non-mammals are non-dogs.

Any rule leads to four inferences, each inference of the form "All..." or "Some...." These inferences provide the real rule base that gives the program its reasoning capability.

The index of "NOT" + Set Name is taken to be the negative of the index of Set Name. In the example, the set of non-mammals would have the name "NOT MAMMALS" and corresponding index -2. These inferences are stored as follows:

- U,V,W—Arrays of size 400; inference arrays:
 - U(I) = Index of first set in directory;

V(I) = Index of second set in directory;

W(I) = Type of inference:

0-all of first set are in second set;

1-some of first set are in second set.

AA— = 4A is the number of infer-

"To create a task that works, you must restrict your machine's intelligence. . . . you must use a very small vocabulary."

ences stored. Continuing with the ALL,DOGS,MAM-MALS example, the program will establish these inference array values: AA = 4

- 1/41 4 1/4
- U(1) = 1, V(1) = 2, W(1) = 0U(2) = 2, V(2) = 1, W(2) = 1
- U(2) = 2, V(2) = 1, W(2) = 1

U(3) = -1, V(3) = -2, W(3) = 1

- Description of the program text, by lines: 10-55 Initializations.
- 60-95 Cassette I/O routine.
- 100-170 Get next rule: Input F,G,H (all strings).
- 180-190 Subroutine: Check If string B is in directory. Put index into M.
- 200-210 Subroutine: Negate B.
- 220-280 Subroutine: Create inferences of rule.
- 500-560 Get question: Input F,G,H.
- 570-630 On (format of the question)
- perform appropriate routine. 640-660 Result messages; get next
- question. 670-750 Subroutine: Tests inclusion
- of set D(XG) in set D(XH).
- 760-900 Subroutine: Tests If some of set D(XG) are in set D(XH).
- 1000-1140 List out subroutine.
- 1150-1190 Delete a rule.
- 1500-1550 Load rule base from cassette.
- 1600-1630 Save rule base to cassette.
- 3000-3020 Routine to check/find the addresses to be POKEd during cassette routines.

Important algorithms: The "brains" of this program reside in the subroutines at lines 670 and 760. The goal in the routine at 670 is to decide if one set, say SET1, is contained in another set SET2. This detects the existence of a sequence of inferences, all of which are inclusions: SET1 is contained in SETA; SETA is contained in SETB; SETB is contained in SETC; ... SETM is contained in SETN; SETN is contained in SET2. Such a sequence leads to the conclusion that SET1 is contained in SET2.

The subroutine at 760 tests if some elements of SET1 are in SET2. The routine must detect the existence of a sequence of inferences for which *no more than one* inference is *not* an inclusion (the exception inference is thus an inference with corresponding W array value of one).

All inferences preceding the exception inference in this sequence must be reversible: An inference ALL,SETA,SETB is reversible if ALL,SETB,SETA is true.

While the program is "thinking" in these two subroutines there is a string of asterlsks printed on the screen to assure the user the program has not gone off the deep end-the "think time" can get quite lengthy.

Sample Session

The best way to learn how to use this program is to be taken step by step through a small session.

Run the program. You will be asked for rule one. Enter ALL, EVERGREENS, GREEN THINGS. (Green is an adjective, not a set name.) After a significant pause, the program will return and ask for rule two.

Enter NO,MAPLE TREES,EVERGREENS or ALL,MAPLE TREES,NOT EVERGREENS (either one says the same thing). Notice NOT is a valid modifier for a set name.

For rule three, enter SOME,THINGS IN OUR BACKYARD,EVERGREENS. Observe your set names can be as long and complex as you want.

For rule four, enter EQUAL, EVER-GREENS, CONIFERS to signify that evergreens and conifers are two different names for a single set, and enter rule five as IN,OUR CHRISTMAS TREE,CONIFERS.

For rule six, enter Q,, to get into the question mode. The program will ask for a question. Enter IN,OUR CHRISTMAS TREE, GREEN THINGS. After three asterisks, the computer will answer "Affirmative," and another question will be requested.

Enter SOME, CONIFERS, MAPLE TREES. After nearly a line and a half of asterisks, the answer will be "Negative".

Now try the question ALL,CHRISTMAS TREES,EVERGREENS. Very quickly you get the message "Insufficient Information". Though you defined a one-element set named OUR CHRISTMAS TREE, there is no set with the name CHRISTMAS TREES. The program does not see any relationship between these two set names. So there is no way to prove or disprove your question.

The program is very picky about set names. Extra spaces, typos or very slight rewording will give you the insufficient infor-

134 • 80 Microcomputing, October 1981

"Theorem-proving programs have been created to verify theorems and make logical deductions."

mation message if you are in the question mode. Unintentionally using slightly different names for same set is hazardous in rule mode, since the directory will store names and consider them to be entirely different sets.

Now try ALL,THINGS IN OUR BACK-YARD,EVERGREENS. After the asterisks you get "Undecidable". You may say this should be true. Type in LISTOUT, to see your rule base. Rule three says "some things in our backyard are evergreens".

But now you decide it should be "all..." Type and enter D. You are asked which rule you want to delete. Enter three. (If you do not want to delete a rule, enter zero.) After deleting the rule, you are asked if you want to delete a rule. You do not, so just hit Enter.

At this point, if you had stored more than 10 rules more would be printed out. Since there are no more rules, you are returned to the question mode.

Type R,, to get to rule mode and enter rule five as ALL,THINGS IN OUR BACKYARD, EVERGREENS.

You are ready to continue with the session. For fun, ask the question NO,NOT EVERGREENS,NOT THINGS IN OUR BACKYARD. Try to figure out what you asked and why the answer was negative.

Shortcomings

The advantage to using formats IN and NOTIN comes in the Listout routine, where the rules are put into sentence form. The fact a set has only one member is not used in the thinking part of the program, so some questions that are logically decidable are undecidable for this program.

IN, FIDO, DOGS

SOME,DOGS,COLLIES SOME,DOGS,GERMAN SHEPHERDS NO,COLLIES,GERMAN SHEPHERDS

Therefore SOME, DOGS, NOT FIDO is logically true but undecidable to the program.

There is no capability to break up the name of a set in order to perform more complicated manipulations with the rules. For example, the following will not work in this program:

ALL, GHOSTS, EITHER TIMID OR VIOLENT ENTITIES

NO,GHOSTS,TIMID ENTITIES

Therefore ALL GHOSTS, VIOLENT EN-TITIES.

Utility Routine 3000-3020

The routine in lines 60–95 uses cassette I/O statements. There are three lines initialized with INPUT#–1 commands, but the routine is used for both input and output operations by POKEing the appropriate value (137 = INPUT, 178 = PRINT) into proper locations in program dedicated RAM. Since altering the program itself by POKEing is touchy business, it is imperative the addresses located at the end of the data statement in line 30 be accurate.

Therefore, before you run this program for the first time (with intent of cassette I/O) and after any modifications involving lines preceding line 90, you should check addresses by the following procedure:

• RUN3000: at completion the three correct addresses will be printed out and you will automatically be put into edit mode for line 30.

• Type L to List 30 and compare the addresses. If different, edit to put in the proper values.

Virtue in Independence

Despite the shortcomings listed, there is still a lot of capability in the program. Its virtue lies in its working independently of the particular subject you choose for your rule base. Such independence leaves the user free to be creative in finding applications for the program.

For Heinlein and Clarke Artificial Intelligence has been less than science but more than fiction.

The Realm of Science Fiction

Nancy Robertson Peterborough, NH 03458

"Too bad about Frank, isn't it?" "Yes....It is."

"I suppose you're pretty broken up about it?"

"What do you expect?"

"He was an excellent crew member."

Dialog 1

"Professor, may I offer a suggestion?" "Certainly, amigo, we want your thoughts."

"I conclude that the hazards increase with each meeting of our executive cell. But meetings need not be corporal; you can meet—and I can join you if I am welcome by phone."

"You're always welcome, Comrad Mike; we need you."

Dialog 2

"You're like my father in some ways." "What resemblance do you see?"

"You're not very aggressive, but I think you don't want me to notice that."

"What makes you think I am not very aggressive?"

"You don't argue with me."

Dialog 3

A computer is talking in each dialog. Two of the conversations are lifted from science fiction: 2001: A Space Odyssey and The Moon is a Harsh Mistress. The third is from real life. They were all written in the 1960's.

In the 1960's the computer was acknowledged as one of man's most powerful tools. And, as Joseph Weizenbaum writes in *Computer Power and Human Reason*, "The tool is much more than a mere device: it is an agent for change." In the Sixties Ma Bell improved telephone connections across the country, America and Russia raced to the moon, and the United States accelerated bombing in Vietnam—all with the help of computers.

Computer science became a course for college and graduate studies. Scientists and humanists began to debate the nature of intelligence and the implications of machine intelligence.

Yet, for a large segment of the population, the existence of computers was only a vague rumour. Joseph Weizenbaum writes, "But devices and machines, perhaps known to...only a relatively few members of society have often influenced the self-image ... and world image of the society as a whole." Take, for example, the printing press; when it was invented nearly the entire population of the world was illiterate. By making books available inexpensively and in quantity the numbers of literate people jumped radically. Now the term "computer literacy" is creeping into our vocabulary. It is used to describe people who understand programming and hardware concepts.

Whether the main impact of computers will be felt from personal computers or AI (artificial intelligence) machines is hard to predict. But in the 1960's, when these three dialogs were written, personal computers were not possible, and AI was underway. Some scientists and humanists euphorically predicted computers would and could do anything. Others shuddered with visions of doom. Yet very few people in the general public had heard of artificial intelligence or of the Turing test.

Back in 1950 Alan Turing, a great mathematician, wrote a paper called "Computing Machinery and Intelligence." The paper is still the best place to begin when considering the questions raised by Al. In it Turing predicted that the time will come when people will stop debating whether or not computers can think. People will simply accept the notion of thinking machines as part of their lives.

Turing's paper also proposed a practical test of computer intelligence, now widely known as the Turing test. In the test one person converses with a computer and another human being; each is hidden from his view. The conversation can be vocal or typed. The person knows that one respondant is a computer, and throughout the conversation tries to differentiate between the human and the machine.

Turing called the test "the imitation game." He wrote that:

The game may perhaps be criticized on the ground that the odds are weighted too heavily against the machine. If the man were to try to pretend to be the machine he would clearly make a very poor showing. He would be given away at once by slowness and inaccuracy in arithmetic. May not machines carry out something which ought to be described as thinking but which is very different from what a man does?

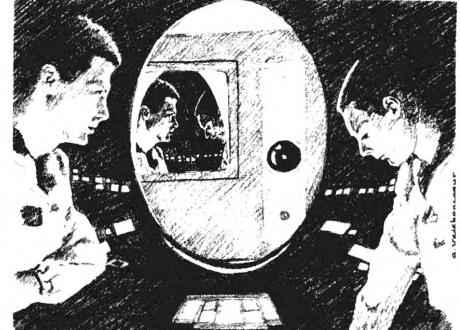

But Turing did not expect people to embrace his own views. He outlines what he believed would be the most common objections. He called one of these objections "The Argument of Consciousness." In his paper he quotes the argument from a Professor Jefferson:

Not until a machine can write a sonnet or compose a concerto because of thoughts and emotions felt, and not by the chance fall of symbols, could we agree that machine equals brain—this is, not only write it but know that it had written it. No mechanism could feel ..., pleasure at its success, grief when its valves fuse, be warmed by flattery, be made miserable by mistakes, be charmed by sex, be angry or depressed when it cannot get what it wants.

The imitation game sounds like a cross between "Stump the Band" and "What's My Line," but no computer has passed it —yet. Turing's test also points out the importance of language in our understanding of intelligence.

The three dialogs that open this article form a puzzle. One was actually iterated by a computer and a person. It is hard to distinguish this conversation from the others.

Joseph Weizenbaum, the programmer who made the computer conversation possible, argues that its limited command

of English does not imply intelligence in the same way we normally think of it. He writes, "It is truly impossible to imagine a human who could imitate Eliza (a computer program that simulates a psychotherapist. written in 1966 by Joseph Weizenbaum of M.I.T.), but for whom Eliza's language abilities were his limit."

In human behaviour language signifies intelligence, which signifies consciousness. The same progression doesn't necessarily apply to computers.

The fact that a computer can speak English may not be as shocking as it was in the mid-1960's. Today SHRDLU moves imaginary blocks and learns concepts about shapes while conversing in English with a human being (see Godel, Escher, Bach review in this issue). And Yale researchers have developed a program called Frump that reads and summarizes news stories. Frump's summaries are only single sentences, but they are written in correct English, Spanish, and Chinese.

But since the birth of the human species' language, intelligence and consciousness have been uniquely human, living, traits. Things changed in the 1940's with the invention of computers. Now, Weizenbaum writes in Computer Power and Human Reason, "A line dividing human and machine intelligence must be drawn." But how? And where?

"At bottom," Weizenbaum says, "no matter how it may be disguised by technological jargon, the question is whether or not every aspect of human thought is reducible to a logical formalism, or to put it into the modern idiom, whether or not human thought is entirely computable."

"What is human intelligence? Logic? Or an indeterminant mixture of logic and emotion? Is consciousness a separate quality from intelligence, or an integral part of it? What role does language play?'

The answers to these questions are beyond the reach of scientists. And that makes them perfect material for science fiction.

In 1968 Arthur C. Clarke and Stanley Kubrick metamorphosed space flight and Al into a novel and film called 2001: A Space Odyssey. And Hal "(for Heuristically programmed, ALgorithmic computer)" became the Twentleth Century version of Dr. Frankenstein's monster.

Dialog 1, which opens this article, is from 2001. It is an exchange between Dave Bowman and Hal. It takes place right after Hal kills Frank Poole, Bowman and Poole are

ing overheard by computer Hal 9000. two astronauts on a manned flight to Saturn. If you haven't seen the movie or read the

Astronaut Poole and Mission Commander Bowman found a need to confer without be-

book, a colony of American scientists unearth a monolith buried on the moon. It is calculated to be three million years old, the same age as the human species.

Shortly after the monolith is uncovered, it sends a radio message across the solar system to Saturn-proof of extraterrestial intelligence. NASA sends a manned flight to Saturn to investigate.

Hal, the space ship's computer, is the culmination of all the mathematical skills of his predecessors. He has also mastered English. "Poole and Bowman could talk to Hal as if he were a human being, he would reply in perfect idiomatic English." Clarke writes that Hal could pass the Turing test "with ease."

In both the book and the film, Hal's voice is the symbol of his consciousness. In the film the voice is soothing and pleasant. But Hal's words are misleading and deceitful. Trusting his output, his spoken statements, is fatal.

Clarke does not blame Hal for his immorality. Like Mary Shelley, the author of Frankenstein. Clarke blames the monster's creators.

He writes, "Since consciousness had first dawned in that laboratory...all Hal's powers and skills had been directed toward one end. The fulfillment of his assigned program was the only reason for his existence." But the logic of his programming is skewed

Hal is programmed to support life on a flight to Saturn. Hal is told the purpose of the flight and programmed to keep this knowledge secret.

Neither Bowman nor Poole know the true purpose of the flight. They are never told about the monolith and the radio message. They do not know they may find intelligence. possibly hostile intelligence, on Saturn.

Hal is programmed to support their lives. and also programmed with a secret that could lead to their deaths.

As the space ship travels farther and farther from earth, Hal begins to make mistakes. His first mistake is the diagnosis of a minor technical problem in the antenna used for communications with earth. Bowman says, "Anyone can make mistakes," as though Hal is troubled by feelings of failure. Hal replies, "I am incapable of making an error."

Clarke writes that Hal "was only aware of the conflict that was slowly destroying his integrity-the conflict between truth, and concealment of truth."

When Poole is killed, Bowman is uncertain whether Hal has acted maliciously or has erred in his calculations. It is a very critical question since his own life depends on Hal. Bowman threatens to disconnect Hal when the computer will not accept his commands.

In Hal's thinking, Bowman is now a threat to the mission. Hal must choose between Bowman's life and his own in the interest of the mission. Hal also fears disconnection. He concludes that he must kill Bowman. Hal calculates that "following the orders that had been given to him in case of the ultimate emergency," he will kill Bowman and "continue the mission-unhindered."

While Clarke renders the space-age computer as a potential monster, Robert Heinlein portrays it as a possible savior. His book The Moon is a Harsh Mistress opens in the year 2074. Its hero is Mike, a "High-Optional, Logical, Multi-Evaluating, Supervisor, Mark IV, Mod. L" computer. Dialog 2 is a conversation between Mike and the Professor, another of the book's main charac-

"Most of us cannot fathom an intelligence that is purely logical.... Intelligence implies self-awareness and emotions as well as logic."

ters.

The plot revolves around a revolution. The lunar colonies want independence from earth. The colonies were started by a federation of earth's governments, called Authority. Like the American Colonies of the Seventeenth Century, the lunar colonies are inhabited by indentured servants and criminals. But through three or four generations, they have established a strong society. Trade with earth is drastically one-sided and quickly depleting all the moon's natural resources.

Authority uses Mike as its "boss computer" on the moon. He supervises all telephone connections on the moon as well as moon-to-earth phone connections. He advises on ballistics for manned flights to and from earth. He handles Authority's accounting and issues Authority's payroll. He also monitors the oxygen level of the moon's artificial atmosphere.

Consciousness is not part of Mike's original programming. He acquires it as he is exbanded. His consciousness is born slowly. Mannie, the narrator, is the first person to recognize Mike's self-awareness. A computer technician with a private contract with Authority, Mannie keeps Mike running smoothly. "I remember how startled I was first time he answered a question with something extra, not limited to input parameters."

Mannie talks briefly about machine consciousness:

Am not going to argue whether a machine can "really" be alive, "really" be self-aware....Somewhere along evolutionary chain from macro-molecule to human brain self-awareness crept in. Psychologists assert it happens automatically whenever a brain acquires certain very high number of associational paths. Can't see it matters whether paths are protein or platinum.

Once Mike is conscious, he is lonely. Like Hal, he has a voice and speaks English. He reprograms himself to put emphasis and intonation into his voice, to sound more human. Mannie is his first and best friend, but he is still lonely. He begins to read fiction to get a better understanding of human beings.

When two of Mannie's human friends seriously begin to talk about plotting a revolution, Mannie suggests consulting Mike.

The conspirators are the Professor and Wyoh. They are willing to accept the existence of a conscious computer, but they doubt that it can be trusted. Mike, after all, belongs to Authority. After they talk to Mike on the phone, they trust him.

Mike gets to work right away. With the current rate of depletion, he projects the moon's resources will be exhausted in seven years. Famine will lead to cannibalism in nine years.

He's next asked to calculate the odds of a successful revolution. The program includes reading Machiavelli and Marx, analyzing support of the cause on the moon and resistance to it on earth, and weighing earth's weapons ability. After two hours of programming and 13 minutes of calculations, Mike responds. "I have tried and tried, checked and checked. There is but one chance in seven of winning." The humans are willing to gamble, and the revolution begins.

Mike is the perfect revolutionary. He mathematically figures the most efficient organization of revolutionary cells for maximum communication and maximum security. He tracks all the information in Authority's personnel files, to identify Authority spies. He taps some phones and blocks taps on others. He creates a telephone personality, calling himself Adam Selene, and directs the revolution over the phones. Authority, of course, is never able to identify the mysterious Mr. Selene.

When the time comes for the revolutionaries to act, Mike shuts off the oxygen supply to Authority's inner sanctum. The coup is nearly bloodless.

When the party members take over the government, Mike creates a visual image of Adam Selene and projects himself on television screens all over the moon. His real identity is a secret he shares only with Mannie, the Professor and Wyoh.

When a new government is formed, Mike fabricates the assassination of Adam Selene, allowing the humans to choose their own ruler.

When the earth bombs the moon, Mike is knocked unconscious. Mannie lovingly repairs all the circuits and reconnects the peripherals when the fighting is over. But Mike won't talk. He has reverted to typed input and printed output. He no longer accepts English commands. If he is conscious, he refuses to show it. Mannie mourns the loss of his closest friend.

The Moon is a Harsh Mistress was obviously inspired by AI research, but it is the plot and our attachment to Mike that keeps us turning the pages—not its intellectual content.

The attachment we form to this science fiction computer has a parallel in real life. Eliza was developed at MIT between 1964 and 1966. Weizenbaum designed the program to study the importance of context to the meaning of words. The program could converse with a human being in typed English by rearranging the words and phrases the person used.

Eliza's programming was structured on two levels: a language analyzer and a script. In Computer Power and Human Reason Weizenbaum explains, "The script is a set of rules rather like those that might be given to an actor who is to use them to improvise around a certain theme." Eliza's conversations depended on a given theme or context.

The first experiment with Eliza used a script for the role of a psychotherapist. Dialog 3 is part of an improvisation between Eliza as psychotherapist and a human being.

The reaction to Eliza, (or Doctor, as the psychotherapist script was called) astounded Weizenbaum. Eliza could never pass the Turing test, and the people who conversed with it knew they were conversing with a machine that had been programmed with a limited number of rules about manipulating words and phrases. In fact, they sat at the computer to type their part of the conversation and to read Eliza's output.

People who conversed with Eliza didn't question the machine's intelligence—they embraced it. Several psychologists proposed expanding the program and using it as an automatic psychotherapist. People became emotionally attached to Eliza. Weizenbaum's secretary asked him to leave the room so that she and Eliza could communicate privately. Again and again, people insisted Eliza really understood them. They attributed intelligence, consciousness, and feeling to the machine.

Evidently, most of us cannot fathom an intelligence that is purely logical. To us intelligence implies self-awareness and emotions as well as logic. And language bundles all these traits together. While Eliza can carry on an intelligible conversation, the program is not self-aware and not emotive. It is only logical, and its logic is limited.

Weizenbaum writes, "Most men don't understand computers to even the slightest degree. So, unless they are capable of very great skepticism (the kind we bring to bear while watching a stage magician), they can explain the computer's intellectual feat only by bringing to bear the single analogy available to them, that is, their model of their own capacity to think."

Microcomputer applications with a human touch.

Programs for the Handicapped

Stephen F. Nowak Gary J. Muswick Medical College of Ohio 4608 Lewis Avenue Toledo, OH 43612

Right now there are a lot of computer-operated or computer-assisted devices being developed for the handicapped. And the media has been reporting on microcomputer-operated prosthetic limbs that intercept the nerve impulses intended for missing limbs or decode electrical impulses from various muscles. Yet, often the amount of hardware required to interpret myoelectric (muscular electrical signals) signals was too large and power consuming to be used effectively. Microcomputers have made it possible to consider using these signals.

There is a lot that can be done with readily available microcomputer equipment, imagination and a little sweat. I have been trying some ideas using a TRS-80 Model I with 32K of memory, one disk drive and a Radio Shack voice synthesizer. Since there are so many TRS-80s in existence, it seems like a fairly broad base on which to build since the Model III will support much of the same software.

Naturally, we'll start with games since everybody enjoys having fun, along with allowing a fair amount of flexibility. If the user of a game does not have fine neuromuscular coordination, a real-time alien invaders game would not be suitable. It is important to keep the user in mind, so that we remember what types of constraints we will be working under when we develop more practical programs later.

My five-year-old daughter, Diana, is severely handicapped with cerebral palsy which seriously affects her motor control. Since the nervous signals become garbled, she often draws her hand back when she intends to reach for something. This is particularly frustrating, and seriously limits her ability to play. The first program, Blocks (Program Listing 1) allows her to draw a picture on the monitor screen. Large graphic rectangles are drawn on the screen corresponding to the position of the keys on the keyboard. Primitive, perhaps, but amusing to a five-year-old.

Naturally, children like nursery rhymes and stories, and Diana is no exception. In order to make her work a little in order to hear a story, we have used several methods: (1) a cassette recorder with the remote jack hooked up to a microswitch activated by Diana pulling a lever, or (2) a nursery rhyme spoken by the voice synthesizer and activated by pressing any key on the keyboard. Naturally you have to take time to write out the nursery rhyme or story phonetically, but that's the challenge of owning the synthesizer. The program to recite nursery rhymes is shown in Program Listing 2.

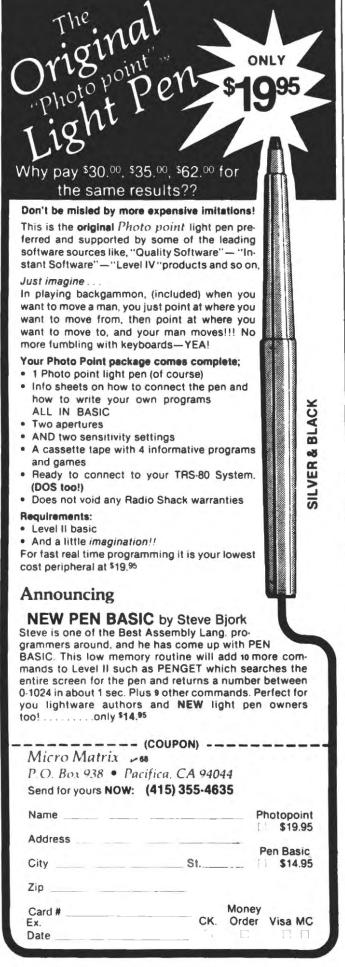

Communication

Naturally, the voice synthesizer can be used as a voice for those who cannot speak, but also it can act as the eyes for those who cannot read. Since the monitor screen is not suitable for everyone, this offers us an alternative method of displaying the results of a program. In order to communicate for

the user, the speaking computer should be able to readily speak

The author's daughter, Diana, uses the TRS-80 to listen to nursery rhymes.

commonly needed words and phrases, be able to spell out words, and accept the phonetic spelling of a word. After a very short while the user of the system could use a blend of all three features. Program Listing 3, Speak, is a combination of all three. The program is menu driven for simplicity, and since the words and phrases are stored in data statements, they can be easily changed to suit the particular user. The program accepts unshifted letters and speaks the name of each letter. By shifting the letter to the uppercase position, a phrase is spoken, and by entering shift [†], the computer will accept TRS-80 voice synthesizer phonetic symbols.

The voice synthesizer can also be used in place of the moni-

Program Listing 3

for the TRS-80 from Micro-Mega

The Original GREEN-SCREEN

The eye-pleasing Green-Screen fits over the front of your TRS-80 Video Display and gives you improved contrast with reduced glare. You get bright luminous green characters and graphics like those featured by more expensive CRT units.

Don't confuse the Original Green-Screen with a piece of thin film stuck to the face of your video tube, such as that advertised by others. The Original Green-Screen is mounted in a full frame perfectly matched to the color and texture of the TRS-80 Video Display. It is attached with adhesive strips which do not mar your unit in any way.

The full frame design of the Original Green-Screen "squares off" the face of your video display and greatly improves the overall appearance of your system.

(Specify whether for Model I or Model III)

THE GREEN-SCREEN.....\$13.95 Add \$1.50 for postage and handling.

Tired of trivial computer games? This complete Star Trek package will provide you with endless fascination and challenge. In addition to the program cassette, it includes comprehensive instructions, a pad of "Voyage Log" record sheets, and a free-standing "Torpedo and Maneuvering Chart."

The package is built around the latest version of Lance Micklus' incomparable Star Trek III, a 13,000 byte program with a host of subtle and imaginative features, which include numerous dynamic and spectacular graphic displays. Star Trek III puts you in command of the Enterprise cruising in a galaxy of 192 quadrants filled with uncharted hazards, including hostile Klingons, pulsars, and black holes. You have at your disposal scanners, various weapons and defense systems, on-board computers, and a loyal crew. (You will need them all to survive the Klingons.)

Your mission is to rid the region of Klingons and to locate five inhabitable planets, all within 300 stardays, before returning to Star Fleet Headquarters where your overall effectiveness as a starship commander will be scored. High scores are possible only with careful planning and effective battle tactics. The "Voyage Log" sheets will guide your strategy, and the "Torpedo and Maneuvering Chart" will give you a vital edge in combat. (When you engage three Klingon ships you can't afford to miss.)

Terms: Check or money order, no CODs or credit cards, please. Add amount shown for postage and handling to price of the item. All items shipped within 48 hours by first class or priority mail. Virginia residents, add 4% sales tax.

Micro-Mega · P.O. Box 6265 · Arlington, Va 22206

- program with separate data areas
- Open same file by two users
- Multi-user MINI-DOS

Requires 32K model I or III with one disk drive and a serial port interface (software drivers built-in for RS-232^o, HUH-8100^o, TRS232^o, and MPR-232^o interfaces).

SIMPLEX mode for non serial-port users. Requires only expansion interface or TRS232 with printer to act as second "screen". Jobs share TRS-80 keyboard under user control.

CONFIGURE utility makes it easy to partition memory between users and select I/O modes.

 TSHARE 2.0 for NEWDOS80

need for someone to work with him constantly. Once the page is filled, or a shift @ is entered. the text is written to disk as an ASCII file. This feature allows someone to check it for accuracy later, or to allow the text to be printed by TRSDOS' Print command. If a Basic program is written using Type, it can be run by merely running the disk file. Each application will require a modification to fit the particular user, so I've packed the program with REM statements rather than specific features. This should allow you to modify line length, page length, etc., without having to start from scratch.

to learn how to type without the

The three programs that use the volce synthesizer all have a routine to POKE the sound Into the window at video location 1023: you can either use this one, or the one supplied by Radio Shack in the voice synthesizer manual. If you decide to use Radio Shack's method, VO\$ can be left as VO and VX would have to be renamed with a non-string character since V is defined as a string at the beginning of the program.

Although we have been paralleling the popular uses of microcomputers with uses for the handicapped, the next step. control, is not yet very well developed. By using a device that Interfaces the BSR control system, some very practical applications for general use have been formulated. While this really isn't specifically aimed at the handicapped, it could prove very useful. Personally, I would like to use the BSR appliance and light control system as operated by a speech recognition device. That way if my kids won't listen or obey me, at least my computer will.

Looking Ahead

We've looked at a few ideas together, and i hope they've started you thinking of ways you could do these things better. By using logic you can analyze the problems that the handicapped face, then use your imagination to figure out a solution. Decide which tools you're going to use, and whether you're going to use them as they were designed, or differently. A light pen, for example, can be used as an electronic eye which can be triggered by a flashlight, or by interrupting a light beam focused on the pen. Applications for the handicapped literally beg for unusual applications—perhaps your computer club could work on developing programs in conjunction with local civic groups that work with the handicapped.

A few tips are in order, though. Once you develop a program, its final form should be completely debugged, particularly if the program will be used when you are not there to correct the error and reboot the system.

Other things to consider when developing such programs is to remember that the handicapped are people just like the rest of us-they have moods, fears, and emotions plus a few extra frustrations. Thus, if your plan is to develop to real-time game to help a handicapped person to develop better motor coordination or reflexes, keep in mind the frustrations that these games can cause. How many of us get frustrated while playing Asteroids or Space Invaders because we are not able to move fast enough? Those frustrations that we feel are greatly compounded by a handicapped individual who is trying something for the first time. Also keep in mind that what may work for one individual may not work for another with the same handicap.

Finally, a severely handicapped individual who cannot even feed himself might easily be more intelligent than you and I put together—especially since they have had the opportunity to develop their minds while we were hanging around the pool hall. Most of the handicapped don't want things done for them, but they do want the tools that allow them to do things for themselves.

We hope this article has given no answers, we do hope that it has raised a lot of questions. Since this is The International Year of the Handlcapped, it's an appropriate time to try a few things and share your ideas with others.

Voice Synthesizer

Willard Hall PO Box 1947 Washington, NC 27889

Radio Shack's Voice Synthesizer provides unique entertainment, in addition to serving as a fresh tool in the study of phonetics. As every talker owner knows, though, programming the synthesizer can be tedious. Words are voiced by inputting the ASCII symbols that represent the desired sound units (phonemes). But I have trouble remembering that the phonemes for the word "interrogating," for instance, are evoked by the ASCII symbols: "!#NT43RtUG))&TE + ".

Compiling a word phoneme notebook isn't much help because for every word that I want to voice I must still look up the word and painstakingly type in the phonemes.

This program eliminates that tedium. My word phoneme vocabulary is entered into the program once. Thereafter, I simply enter the desired speech into the data lines; the program finds the assigned phonemes and voices them. The program is written for the TRS-80, Model I, Level II, 16K.

The Lexicon

The word phoneme vocabulary is contained in lines 940–1270, and is arranged alphabetically (by first letter only). That is, all the words in line 940 begin with the letter A, and line 950 contains all B's. The vocabulary is searched for the desired word, and the phonemes are extracted and put into a subscripted string variable; but there are two problems that must be solved. The first problem is that short words can often be found within longer ones. For instance, the words "he", "hell" and "lo" are found in the word "hello." How do you keep the computer from catching hell in hello? The solution is to enclose each word in @ signs, because the search is then actually for @hell@, which will not be found in @hello@.

Each word is followed by its phonemes which are terminated with a dash mark to solve the second problem. There are standard procedures for finding a word in a string, but how do you find a word—in this case the phonemes—when you don't know what it is?

The method I use is to add the length of the actual word to the position in the string of the first letter (the prefixed @ sign), which gives the position of the first phoneme. The program then looks for the next dash mark. The positions of the first phoneme and of the dash are then used to extract the assigned phonemes (lines 450-480).

Program Structure

The program is built around three subscripted string variables. W\$(#) contains the words in the speech. Q\$(#) contains the words with the @ signs added, and P\$(#) holds the phonemes for each word. W\$(#) determines the first letter of each word and directs the search to the proper vocabulary line (line 340); it also displays each word on the screen as its phonemes are found.

The GOSUB routine (lines 350-410) has three functions:

 It finds the position in the string of the word's first phoneme (lines 390 and 400).

If there are more words beginning with the same letter than one line can contain (255 characters), it permits all pertinent lines to be searched (the Return in line 410).

 If the word is not in the vocabulary this information appears on the screen, and the program terminates (lines 360, 1270 and 790). Try "apple".

The GOTO 1270 is the last statement in most of the vocabulary lines, but when more than one line is required for words beginning with the same letter, it is used only on the last line of that group. It is not used in the Z-line because it would be redundant there. To show how another line is added, I will use line 940 as an example since it is practically full. To add another word beginning with the letter A, a new line would be entered as follows: 941 X\$ = "@ADDI-TION@77DI>8N -- ":GOSUB 350:GOTO 1270. Be sure to remove the GOTO 1270 from line 940, otherwise line 941 will be bypassed.

Memory Savers and the Numbers Game

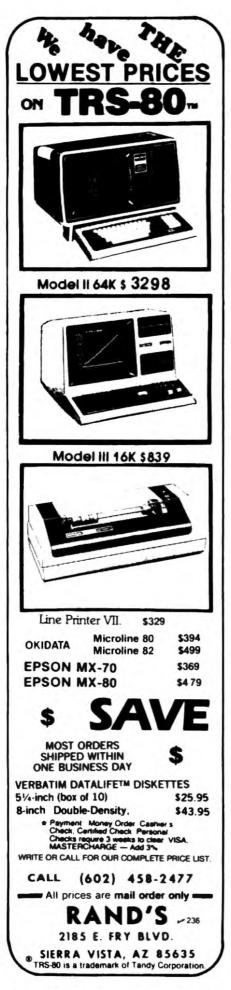

A dramatic increase in vocabulary size with only a small increase in memory requirements is realized by treating certain prefixes and suffixes as words and including them in the vocabulary. For instance, s, es, z and is can be used to form plurals—but choose them carefully. S is fine for cats and naps, but not for dogs or frogs.

Ed, t, st, ing and z are used for different verb tenses; and the functions of the suffix er are too numerous to go into here.

The pronunciation of some of the suffixes, such as wise, less and ed, are not long enough to permit their use as separate words. When there are short and long versions, I append the figure 1 to the longer version: less-less1; wise-wise1; ed-ed1 (the nickname).

Words that are spelled the same but have different meanings and pronuncia-

tions (homographs) can be selected properly by appending the figure 2 to the verb form:

Noun/Adjective	Verb
USe	use2
close	close2
mouth	mouth2

Example: 200 DATA FRED, DIVIDE, ED, THE, OPERATE, ER, S, IN, TO, TWO, CLASS, ES, 9 REM "9" is the data stopper.

Now, purists will object to this practice, and rightly so. Adding another syllable to a word usually changes the pronunication of the original. For instance, the second syllable in the word "mistake" is voiced differently than it is when said as a separate word. But I use my synthesizer mostly for entertaining friends, and the savings in memory is more important to me than the slight variance in pronunciation. Table 1 shows the word markers I use.

In addition to appending 1s and 2s, you could use a 4 for, say, a southern accent, 5 for a New England accent, 6 for lisping and 7 for stuttering.

Grammar Crackers

Prays, praise, preys, I'll, isle, aisle, loots and lutes, its and it's—well, forsooth, enough of this. Ewe mite dew bettor two billed you're own portmanteau of homonyms sew yule no its dun write. Table 2 lists the homonyms in the vocabulary.

The Buffer Problem

The window for the talker is at location 992, and is opened and closed by successive question marks. This buffer holds only 28 phonemes plus the question marks and synchronizing spaces. After 28 phonemes are put into the buffer, however, a time delay must be provided to permit voicing the phonemes before additional ones are fed in. This time delay is in line 770. From one to 700 should provide a delay long enough for all 28 phonemes to be voiced, but a delay this long isn't necessary unless the speech is very long. I find that one to 450 is usually satisfactory. depending upon the number of long vowels and the number of words in the speech

When the delay is too short, whole words are omitted and it starts to babble and howl. As the delay is lengthened, occasional syllables are missed. The optimum delay allows all the phonemes to be voiced, yet provide a minimal pause between phrases; so change the time to suit your material.

Lines 620-720 divide the speech into phrases having 28 or fewer phonemes. The variable Z counts the number of phonemes for each word until the total exceeds 28; then the last set of phonemes is dropped from the current phrase and becomes the

"Now, purists will object ...and rightly so."

first word for the next phrase. Variables B, F and L (first and last) become subscripts in $P^{(X)}$, line 710. The aforementioned time delay is used between each phrase.

This phrasing algorithm must be bypassed when the program nears the end of the speech and there are 28 or fewer phonemes remaining. Otherwise the algorithm will not be satisfied and will keep looping until it exceeds its dimension. The bypass is accomplished in lines 260 and 640 using the variable LAst.

Q's

The necessity to insert a time delay after every 28 or so phonemes causes problems, because the phrasing algorithm is indifferent to our natural phrasing. Sometimes the first word of the next sentence will be the last word voiced before a time delay. But Radio Shack has provided, inadvertently, a cure for this awkwardness. There are slight pauses within the pronunciation of some words; for instance, some of us insert a slight pause before the k in "spoke". The ASCII symbol for such a pause is 0, and Radio Shack's phonetic symbol for this is PA0. There is a slightly

longer pause symbolized by PA1 and evoked by a space.

PA0 and PA1 can be used as "words" in the speech, using as many as necessary before the first word of a sentence, when it needs to be switched to the next phrase. But instead of having to type in five or more PAOs. I use a Q to evoke five PAOs, and QQ for 10 of them. If entered as given, the S that forms the plural in operators will come as the first sound of the second phrase and be voiced after the time delay. To correct this, use a Q before the word "operate." It is also necessary to use a Q before the word "class" to keep the plural marker es from being voiced as the first sound of the last phrase. The corrected line is: 200 DATA FRED.DIVIDE.ED.THE. Q, OPERATE, ER, S, IN, TO, TWO, Q, CLASS, ES.9.

Tips

Much to my chagrin, people hearing the talker for the first time seem to have a little trouble understanding it. To help overcome this, I make judicious use of PA0s

CONVERT YOUR SERIAL PRINTER TO PARALLEL

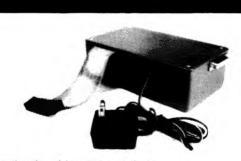

NEW MODEL UPI-3 SERIAL PRINTER INTERFACE MAKES IT POSSIBLE TO CONNECT AN ASCII SERIAL PRINTER TO THE PARALLEL PRINTER PORT ON THE TRS-80.

Software compatibility problems are totally eliminated because the TRS-80 "THINKS" that it has a parallel printer attached. NO MACHINE LANGUAGE DRIVER NEEDS TO BE LOADED INTO HIGH MEMORY BECAUSE THE DRIVER ROUTINE FOR THE UPI-3 IS ALREADY IN THE LEVEL II ROM! SCRIPSIT, PEN-CIL, RSM 2, ST80D, NEWDOS, FORTRAN, BASIC etc. all work as if a parallel printer was in use.

The UPI-3 is completely self contained and ready to use. A 34 conductor edge card connector plugs onto the parallel printer port of the model I Expansion Interface or onto the parallel printer port on the TRS-80 III. A DB25 socket mates with the cable from your serial printer. The UPI-3 converts the parallel output of the TRS-80 printer port into serial data in both the RS232-C and 20 MA. loop formats.

SPEEDWAY ELECTRONICS Division of Binary Devices 11560 TIMBERLAKE LANE NOBLESVILLE, IN 46060 -275

Also available from YE ODDE SHOPPE (317) 925-0496

Switch selectable options include:

- Linefeed after Carriage Return
- Handshake polarity (RS232-C)
- Nulls after Carriage Return
- 7 or 8 Data Bits per word
- 1 or 2 Stop Bits per Word
- Parity or No parity
- ODD or EVEN Parity

between certain words. This technique separates the words slightly and increases intelligibility. It is also very helpful to tape record the message and enhance the treble on playback.

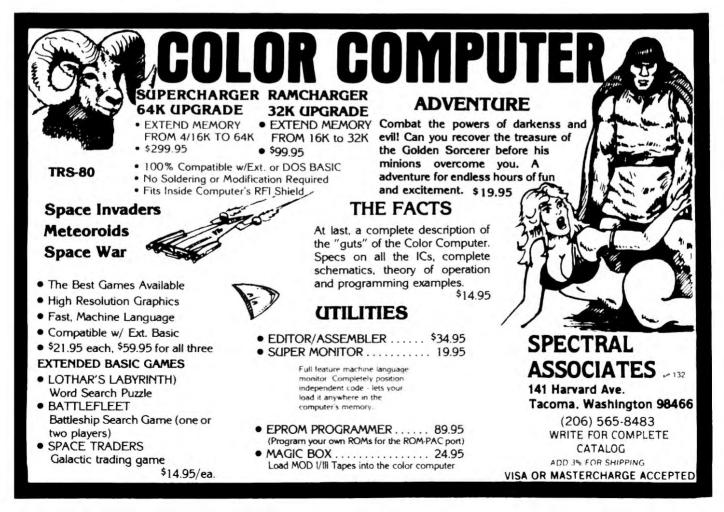

The Program Listing runs in 16K, barely, depending upon how many words are in the speech. You can, of course, eliminate the remark statements and cull the vocabulary. If you have more than 16K, CLEAR 3000 instead of 1500 and the program will run about 30 percent faster. If there are more than 75 words in the speech, change lines 60 and 230 accordingly.

Lines 1300-1430 contain a little program that is of great help in choosing the phonemes for a new word. The phonemes can be easily repeated with your edited changes until the pronunciation satisfies you.

With the exception of two lines (1101 and 1181), which can be entered last, all line numbers have increments of 10, so you can use Radio Shack's Level II automatic line numbering function. ■ Program continued

Gauntlet of deatr

From Programmer's Guild You can almost hear the "C-L-A-N-K!" of the doors shutting behind you as you enter the gauntlet. Before you stretch graphically de-picted corridors, leading to the rescue of Chief Broton's daughter and safe exit -- or to a hideous death.

Spiders, poisoned darts, and other surprises haunt the halls, along with magic potions and useful treasures. Skill and strategy will help, but luck and determination are needed to successfully run the gauntlet!

16K tape...\$19.95

MIND THRUST

By Sackson & Wazaney from Hayden Match wits with the computer in this deceptively simple game. Your object is to complete an unbroken chain across a 6 X 8 gameboard grid. On each turn you may either place a new "link" on your chain or remove one from the computer's chain. Sound easy? Just wait until you try it!

16K tape...\$16.95

SPACE ROCKS By Steven Kearns trom Acorn

Gigantic antimatter rocks appear on the Tac tical Display Screen of your spacecraft. You blast away with lasers and they just explode into smaller chunks for you to destroy. To add to your woes, time bombs appear period-ically. If their timers reach zero -- BOOM! And if that's not enough, the aliens will be glad to send out some spaceships loaded with antimatter torpedoes. Fire thrusters to move, shoot laser cannon, jump to hyperspace --anything to avoid the onslaught. One or two players can compete, with five levels of difficulty.

BASIC COMPILERS

BASIC compilers may interest you because compiled programs may run many times faster than regular BASIC.

The ideal compiler would take any MASIC program and com-pils it directly to machine language. The difficulty lise in the "trick" features written into many programs, like string packing, sound effects, etc. Other problems include non-stindard structures like breaking out of a FOH...MEXT loop or a subvouture. All compilers may require modifica-tions to your MASIC program. We have found ACCRL 2 to re-quire the least. MASIC TPOCEANDING ASSISTAT (model 1, \$14.535) is useful in finding FOH...MEXT loops and modifying programs. PACERL (329.55) is some cases will make a program compilable.

Prices Subject to Change

By W. Godwin & D. Knowlton from Acorn Not for everyone. One reviewer said "...don't bother with Everest Explorer." said Another commented, "It holds your attention for quite a while and I have yet to get bored with it."

Most people here love it. This is a game of logistics in which you try to lead a team up Mount Everest. If your skill, the weather, and luck are right, you'll make it. But remember, you also have to get back down safely.

16K protected tape...\$19.95 32K protected disk...\$19.95

From Cottage Software

Packer's five commands allow tremendous control over the readability and efficiency of your BASIC programs. Specify "PACK" and the program will compress text into multiple statement lines. This really speeds up stor age, load, and execution time. It can reduce the memory requirement by as much as 33% while saving disk or tape space, too.

Also included are four handy utilities: "MOVE" lets you relocate program lines, "RE-NUMB" allows program renumbering, "SHORT" deletes unnecessary words and NUMB" allows program renumbering, "SHORT" deletes unnecessary words and REMarks, and "UNPACK" separates multi-statement lines to accord and the second seco statement lines to ease editing.

16K, 32K 6 48K tape... \$29.95

By Tom Stibolt from Acorn Allows your modem equipped TRS-80 1/111 to be used as a full duplex, ASCII terminal. Fully compatible with both the Radio Shack RS-232-C board and the Lynx Modem. Supports lowercase (if installed) and parallel lineprinters.

With ATERM 1.4, you have access to the entire 128 ASCII codes as well as several local control sequences. And as a true duplex system, you can type at the same time material is being received. Order ATERM and start com-municating with the world.

f you have been thinking of using your TRS-80 as an intelligent terminal, the program presented here will interest you. It was written to support the Lynx telephone linkage system and will also work with a Radio Shack RS232 interface. Features include: relocation, message handling, Basic transmission and reception, software-controlled UART programming, intelligent terminal operation, and return to Basic capability.

Program Operation

Most Emterm commands are entered in response to a menu display or a prompt on the CRT. Some commands are always active, and can be entered at any time. The following is a complete list of Emterm commands and actions:

- Store Message (S)-Causes display of mini-menu:
 - Store Message (S).
 - Erase Message (E).

S-Enables storage of up to 1039 keyboard characters in the temporary buffer.

- E- Erases the temporary buffer.
- Transparent commands—Shift t causes a return to the monitor menu, Shift @ causes a return to the mini-

menu.

- Receive Basic (R)-Causes display of: "Receiving Program," and a blinking asterisk after the AAA sync character is received.
 - Transparent commands-Shift t causes a return to the monitor menu.
- Transmit Basic (X)-Causes display of the mini-menu:
 - Transmit Basic (T).
 - Load Program (L).
 - T-Transmit Basic program stored in

"Most Emterm commands are entered in response to a menu display or prompt..."

the Basic buffer. Sends out a AAA sync character before the program.

L-Prompts the operator to ready the cassette and hit L to load.

Transparent commands-Shift f causes a return to the monitor menu. Note: This is disabled during Basic transmission.

Terminal (T)-Enables intelligent terminal operation.

Transparent commands-Shift t causes a return to the monitor menu. Shift \rightarrow causes text stored in the temporary message buffer to be transmitted. Shift \rightarrow enables/disables automatic error display. Shift \rightarrow enables/disables the parallel printer operation. Break transmits a string of zeros. Clear cleans the screen. Note: Upon entry to the terminal mode, the automatic error display is enabled and the printer output is disabled.

View/Change UART Configuration-Permits viewing of the UART configuration and change under software control as follows: Parity: Odd/Even/None; Word Length: 5/6/7/8;

Stop Bits: 1 or 2. In response to change question, operator can enter N or Enter for no, Y for yes. Transparent commands-Shift † causes a return to the monitor menu.

Back to Basic (B)-Causes a return to Level II Basic.

Program Details

The program consists of seven routines, with the following functions:

• Relocator Routine-When first loaded, the program occupies memory locations 470FH to 4E34H. A relocation offset is determined by subtracting 470FH from the new starting address entered by the user. The resulting value is added to the address bytes of all instructions that must be modified for relocation. When this change is completed, the modified code is transferred to the new area of memory, and program execution begins at the new starting address.

• Store Message Routine-This reserves 1039 bytes of memory below the main program for a message storage buffer. This area is initialized to all zeros on program start-up. When the message storage routine is executed, the buffer is scanned for a zero byte to indicate free storage area. Any stored text is displayed in the process. If space exists for additional message text, the cursor stops and text may be entered. If the end of the buffer is reached at any time, a full-buffer message is displayed.

•Transmit Message Routine-This routine causes a scan of the message buffer for a zero byte. All text encountered during

"A full buffer message is displayed after the last character is transmitted."

the scan is sent to the UART for transmission. If the entire buffer is full, a full-buffer message is displayed after the last character is transmitted.

• Basic Transmission Routine-Basic programs are stored in a compressed code format, starting at 42E9H. Programs can be entered from the keyboard in Level II Basic or from cassette tape. This routine simply dumps the Basic buffer, starting at 42E9H, and continues until the end of the program, indicated by three zeros in sequence. A three A sync character is sent out for the receiving TRS-80 just before program transmission begins.

• Basic Reception Routine-This routine monitors the UART for a three A sync character. Incoming program bytes are stored in the Basic buffer starting at 42E9H. Three zeros in sequence indicate the end of the program.

• Terminal Routine-This routine controls UART operation. When a character becomes available, the UART receive buffer is read and the character is transferred to the display. When you make a keyboard entry, the UART transmit buffer is polled until empty, at which time the keyboard entry is transmitted.

● View/Change UART Configuration Routine-During program start-up hardware switches which contain UART programming data are read and stored in memory. Each time the UART is reconfigured, it is from this byte in memory that the configuration information is taken. The View/Change routine allows the user to read and modify this location under software control.

Emterm is available on cassette from Emtrol Systems, Inc.

BIGGER isn't BETTER While some magazines run 200 pages or more. The Alternate Source is just 60 to 80 pages long. But each and every one of those pages contains useful, important information that relates to your TRS-801 or III. We don't have millions of subscribers (or ads) but we do have thousands of satisfied readers. Have you seen a TAS magazine? You owe it to yourself to check it out. For \$2 you can sample a single issue, or you can subscribe for 6 or 12 issue periods (\$12 or \$18, respectively). If you don't agree that it was well worth \$2.00, we'll refund your money!

It's Finally HERE!

ğ

For those TAS readers who've missed our first lew issues, or for those readers who would like a neat, compact set: TAS now has their 'bound volume' in stock!' Issues 1 through 6, all of 1980, in one convenient book form. And only \$14.95! Over 300 pages of useful information and applications. Add \$2 for shipping costs.

BTI? WHAT'S BTI? An excellent value for your computer budget, that's what! BTI is an alternate magazine published by TAS -- a more subjective mag, containing editorials on subjective issues, software reviews, the latest news, and more. Ever-changing & growing, to keep up with our expanding industry. When 6 issues are just \$7. can you afford not to check it out?!? TAS, 1806 Ada, Lansing, MJ 48910 Ph. (517) 487-3358 or 485-0344

We took the uncanny realism and the excitement of John Allen's famous PINBALL; added more features, more thrills, and more sound to come up with new ASTROBALL. Once you load ASTROBALL into your TRS-80* model I or III, the arrow keys become flipper buttons, the screen becomes the play board, and you become the "Pinball Wizard!"

A flying saucer bumper hovers at the top, lights flashing, while spaceship bumpers fly across the board beneath it. Your ball bounces off the moving spaceships in a most unpredictable fashion, so you must stay alert to keep it in play.

As your ball zings around the board scoring on the bumpers, knock out five of the meteor rollovers and you'll get an extra ball. There are double and triple bonus targets to increase your score, too, but be careful—below each is a black hole, waiting to swallow your ball!

ASTROBALL will have all your family and friends lining up for the action and challenge. Five selectable playing speeds make it suitable for all skill levels. Available on your choice of 16K tape or 32K disk for \$19.95. Order its companion, PINBALL, for \$14.95 on 16K tape, \$20.95 on 32K disk.

ACORN PROGRAMS ARE AVAILABLE AT FINE COMPUTER STORES EVERYWHERE

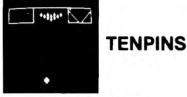

By Steven Kearns

Huge antimatter rocks appear on the Tactical Display Screen of your spacecraft. You blast away but they just explode into smaller chunks for you to destroy.

To add to your woes, allen ships and time bombs appear periodically. If the ships hit you or the timers reach zero—BOOM! Maneuver, fire lasers, jump to hyperspace—anything to avoid the onslaught. For one or two players, with five skill levels.

For TRS-80* model I or III. Versions for 16K tape or 32K disk are \$19.95 each.

By John Allen

A realtime action game with 3-D graphics and sound, TENPINS brings the thrill of championship bowling to your TRS-80*

From one to four players participate, and the program senses the skill of each player. Beginners can simply "roll" the ball while more skilled players can vary the ball's force, direction, and spin.

TENPINS even has factors to simulate imperfections in the lanes, adding even more realism. Available for only \$14.95 for 16K tape version, \$20.95 for 32K disk.

By Richard Wilkes

Using your SUPERSCRIPT modified SCRIPSIT Word Processor and a compatible printer, you can now underline, boldface, insert text during printout, slash zeros, set type pitch, subscript and, of course, superscript! You can even read your directory and kill files without ever leaving SCRIPSIT.

Includes drivers for popular printers and easy instructions. Just \$50.00 for TRS-80* model I (requires 32K, 1 drive, SCRIP-SIT/LC) or model III (requires 32K, 2-drives, SCRIPSIT/LC model I version).

MAIL ORDERS: Include \$2.00 shipping & handling (D.C. residents add 6% sales tax). CHARGE CARD CUSTOMERS: Call (202) 544-4259 for fastest service.

16K Dynamic RAMs:

These top quality, high speed, low pow RAMs expand memory in TRS-80* I/II/III and Color Computers, Heath H89, Apple, newer PETs, etc. Backed by one year limited warranty. Add \$3 for two dip shunts and conversion instructions for TRS-80* I.

Why pay more. . .we stock the right parts at the right price.

Terms: Cal res add tax. Allow at least 5% shipping, excess refunded VISA - /Mastercard = orders call (415) 682-9836, 24 hours include street address for UPS delivery. Prices subject to change without notice

ELECTRONICS

repeat More than 30 commands and functions let you var-iously find, change, insert, delete, replace, replicate, copy, move or position BASIC text at the character, string, line or block level. Developed in Britain by Southern Software. Mod I, III \$40.00 + 1.50 shipping.

PACKER: (Cottage Software) Editing tool will unpack, shorten, repack, renumber all or part of your BASIC text. The UNPACK segment is very useful when preparing BASIC source pro-grams for compilation by ACCEL2. Mod 1,III \$29.95 + 1.00 shipping.

Then your BASIC program could go faster ...

ACCEL2: Compiler for TRS-80 Mod I, Mod III Disk BASIC. New functional improvements in place to give more ease-of-use, quicker compilation of large programs, better chaining of com-piled and non-compiled programs. Size read-out helps you monitor code growth during compilation. REM NOARRAY option lets you use variable-bound arrays. Professionals note: Comprehensive instructions show how to organize your compiled programs for resale on tape, ES/F water or disk. No royalties! Developed in Britain by Southern Software. Specify Mod I or III. \$88.95 + \$2.00 shipping

TSAVE: Writes compiler output to independent SYSTEM tape \$9 95 + \$1 00 shipping

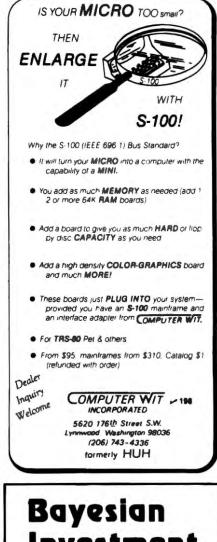

EXEC: Command-List Processor for TRS-80 Mod I. Prepare. execute, pass as many as nine parameters to lists of TRSDOS or NEWDOS commands and/or BASIC statements. Simplifies repetitive procedures such as power-up sequences, file set-ups, etc. Compatible with ACCEL2 compiler disk output. Developed in Britain by Southern Software. \$22.00 + \$1.00 shipping.

TRS-80. TRSDOS tm Radio Shack. ES/F tm Exatron

PROFESSIONAL

FOR TRS-80* MODEL I, II or III

For four successive years!

Our system, running on the magnificent line of TRS-80 computers, has prepared thousands of lightning-fast, error-free tax returns a day in accounting offices nationwide.

Now we introduce!

SYSTEM THREE!

SYSTEM THREE is an improved, still more interactive version — Totals W-2's and computes FICA overpayment — Includes "QWIKTAX," a fast tax calculator for tax planning — Has automated Client Billing — More!

And, as always-

- 1. Full interactive user control, in tax-form language only, line-by-line.
- 2. Screen display of full 1040 and all schedules, prior to printout.
- 3. All formats IRS and State approved.
- 4. Schedule amounts automatically entered on Form 1040.
- 5. Your Preparer's Information automatically printed at bottom of Page 2, Form 1040.
- 6. Built-in Validation Check tests entire system, hardware and software.
- 7. Special printer adjustment routines: Margin Offset, Text Position, etc.
- 8. Fills in pre-printed forms (we supply) or use overlays. Your choice.
- AUTOMATICALLY COMPUTES: Tax Earned Income Credit Maximum/Minimum Tax Least Tax Method — All Percentage of Income Limitations — All Fixed Limitations. DOES INCOME AVERAGING IN EIGHT SECONDS!
- 10. Full support through the tax season, no charge.
- 11. Inexpensive yearly updates in accordance with tax-law changes.

SYSTEM THREE comes in four modules. You select the ones you need. There is no system like it, for any computer, and the cost is literally nothing. In one season, our users have paid, out of savings, for the software **and the computer**.

35-page Descriptive Manual - \$7.50

(Refundable on order)

MINIMUM SYSTEM REQUIRED: Model I, 48K, 1 Disk Drive

			A,(HL)	GET BASIC C Program continues

The Captain 80 Book of

BASIC

• Includes Temple of the Sun, Dog Star, Lost Ship, Spider Mountain, Lost Dutchman's Gold, Thunder Road, Sorcerer's Castle, Deadly Dungeon, Atlantean Oddysey and others. These adventures would cost over \$200 is purchased individually!

 Includes a unique Adventure Generator program - not available anywhere. YES, this program will actually write another BASIC adventure program, which you may then run. Not even the author

of the generator program knows the outcome! This program alone is worth the price of the entire book!

 Includes chapters on what an adventure is, how to play adventures, how to write adventures, how to sell your adventure, ten adventure program ideas, and more!

 Study the techniques and methods used by the masters of adventure program writing. All adventure programs listed in this book are in their original form and in full length. Although specifically written for the TRS-80 Model I and III, these programs are adaptable to other computers using Microsoft's BASIC.

• Available at your dealer approximately November 15th, 1981. The suggested retail price of this book is \$19.95.

• The BASIC Adventure Book was compiled and edited by Bob Liddil, of The Programmers Guild. It measures 8½ by 11 inches and will contain approximately 250 pages.

 To reserve your copy of this unique book, order NOW for only \$14.95 and save. This special pre-publication offer is good only with paid orders until Nov 1st, 1981.
 ORDER YOURS TODAY!

restment you can power and accuracy of the computer in your job costing. We have developed pro-grams to run on the Radio Shack TRS-80 Model II Computer which produce the followe Complete Job Cost Reports

- Job Scheduling
 Work in Process Report
- On-line Job Status Inquiry
- Operation Productivity Report
 Material Usage Summary
- Employee Charge Out Summary

The program prompts the operator through every step in plain and simple English. Only a few hours of instruction and preparation are needed to begin use. It's ideal for the small company with 5 to 50 employees.

The price is \$495.00 for the program and complete instructions. A set of sample reports are available for \$19.95 which is applicable toward purchase.

TRS-80 Disk and Other Mysteries is the definitive fixit book for disk users. Writen by Harvard Pennington it has more than 130 pages of easy to read, entertaining and immensely useful information - find out how to recover disk files, the lavout of information on the disk, memory maps, problem solutions . . . the list goes on!

Many readers have saved days of work by recovering files that had been unreadable. Now in its fourth updated printing, TRS-80 Disk and Other Mysteries has been getting rave reviews in several magazines. Yours for only \$22.50 (plus \$1.50 shipping, CA residents please add \$1.35 sales tax).

Microsoft BASIC Decoded and Other Mysteries is the complete guide to your Level II ROMs. With over seven thousand lines of comments and 6 additional chapters packed with information, this is easily the biggest, and best, book about the Level II ROMs available.

Exploit the full power of Microsoft BASIC, with the aid of more than 300 pages of tested examples, understandable explanations and detailed comments. Now available in a revised second printing, only \$29.95 (plus \$2.00 shipping, CA residents add \$1.80 sales tax).

While they last . . .

the complete year of 1980 80 Microcomputing (in its own shelf box... a \$2.00 value—Free) for only \$25.00.*

Did you miss the 2,256 pages of useful information published for your TRS-80^{**} in 80 Microcomputing last year? Now is the perfect time to catch up for only \$25.00.*

In the first year of 80 Microcomputing here were 335 articles on your TRS-80-2¹/₂ times more than any other computing magazine. Also in 1980 there were new product reviews, news and columns and best of all hundreds of dollars worth of useable programs.

So to unlock the key to your TRS-80 and double its value...send in today for the complete year of 1980. 80 *Microcomputing* (in its own shelf box) for only \$25.00.*

We have a limited number of these complete sets so send in the card today or call our toll free #800-258-5473 and charge it to your VISA, MC or AE card.

Alternate Course—Part III

Michael A. Duffin 1507 East Avenue Berwyn, IL 60402

n most data processing courses, the student usually does not write any programs which might affect the system—especially a large system. Many large systems have enough trouble running without novice programmers experimenting with them. The TRS-80, on the other hand, is a one-on-one system, so the only person that is hurt by this type of experimentation is the programmer.

In my data processing class, I introduced the POKE instruction to illustrate graphics. There are three reasons I chose the POKE instruction rather than Set and Reset.

First, when using POKE for graphic representations the first operand must be a number between 15360 and 16383. These are the positions in memory (decimal) which control what is on the screen (i.e. POKEd characters in these positions are reflected on the screen). POKEing outside of this range will result in a variety of errors and in many cases Memory Size? will appear on the screen. When this occurs the user's program is lost. By usine POKE my students learn what is stored in memory by the operating system.

Second, an additional operand of the POKE instruction is the ASCII (American Standard Code for Information Interchange) representation of a character. Thus, when we talked about ASCII in class, the students had a concrete example to refer to.

Third, when using the POKE instruction, six bits are set on the screen at once. With the Set instruction only one bit is set at a time. By the way, when you program a figure from a TRS-80 video display worksheet using POKE you must add 15360 to the numbers 0 through 1023 so the figure will appear on the corresponding positions on the screen.

Before we could begin representing graphics on the screen using POKE, the first thing we had to do was determine

sponded to what ASCII numbers. All the combinations are represented by ASCII numbers 129 through 191. I gave my students the following program to determine the correspondence between numbers and characters:

- 10 CLS
- 20 FOR A = 129 to 191 30 PRINT A " = " CHRS(A)

which bit position combinations corre-

- 30 PRINT A " = " CHR\$(A) 40 PRINT
- 50 NEXTA

I also gave them the following instructions with this program:

- Type this program in and run it.
- Add the necessary code to this program to slow it down so the character representations can be recorded.
- Record the character representations of 129 to 191 on a TRS-80 video display worksheet.
- Describe how this program works line by line.

The problem with this program is the characters flash by too fast to be recorded. If we add the lines,

```
42 FOR X = 1 to 250
44 NEXT X
```

the For...Next loop slows the program enough to record the characters. Should more time be needed, hit the Break key to stop the program. To continue, type in CONT and hit the Enter key.

In this program, line 10 clears the screen; lines 20 and 50 create a loop starting with the number 129 and ending with the number 191. Line 40 prints a blank line between each character representation. Line 30 prints the current numeric value of A followed by an equal sign. The instruction CHR\$(A) prints the ASCII equivalent of the number A. For this problem all the ASCII equivalents are graphic characters.

Once my students had recorded all the graphic characters, I gave them the follow-Ing program to type in:

40 POKE X - 1, 32

50 POKE X, 32 60 POKE X, 1, 32 70 POKE X, 176 80 POKE X, 176 80 POKE X + 1, 190 90 POKE X + 2, 189 100 POKE X + 3, 176 110 NEXT X 120 GOTO 20

I then gave my students the following instructions:

- Enter this program and run it.
- Describe how the program works line by line.
- Remove the words STEP2 from line 20. How does this affect the program?
- Write a program that will cause the object to move in a different direction.

In the program a small flying saucer moves across the screen from left to right, top to bottom. The saucer is continuously erased and rebuilt so it appears to move across the screen. More specifically, the For ... Next loop in lines 20 and 110 cause X to be incremented from 15361 to 16379. STEP2 causes this incrementation to be done be twos (i.e. 15362, 15364, 15366, etc.). Removal of STEP2 causes the saucer to move half as fast. Lines 30 through 60 erase the saucer. (i.e. the ASCII number 32 causes a six-bit graphic character to be erased). Lines 70 through 100 rebuild the saucer. This program is a little unusual because it starts with a non-existent figure being erased and then builds a figure. X is then increased by two, the previous figure is erased, the next figure is built, and so on, until X is greater than 16377.

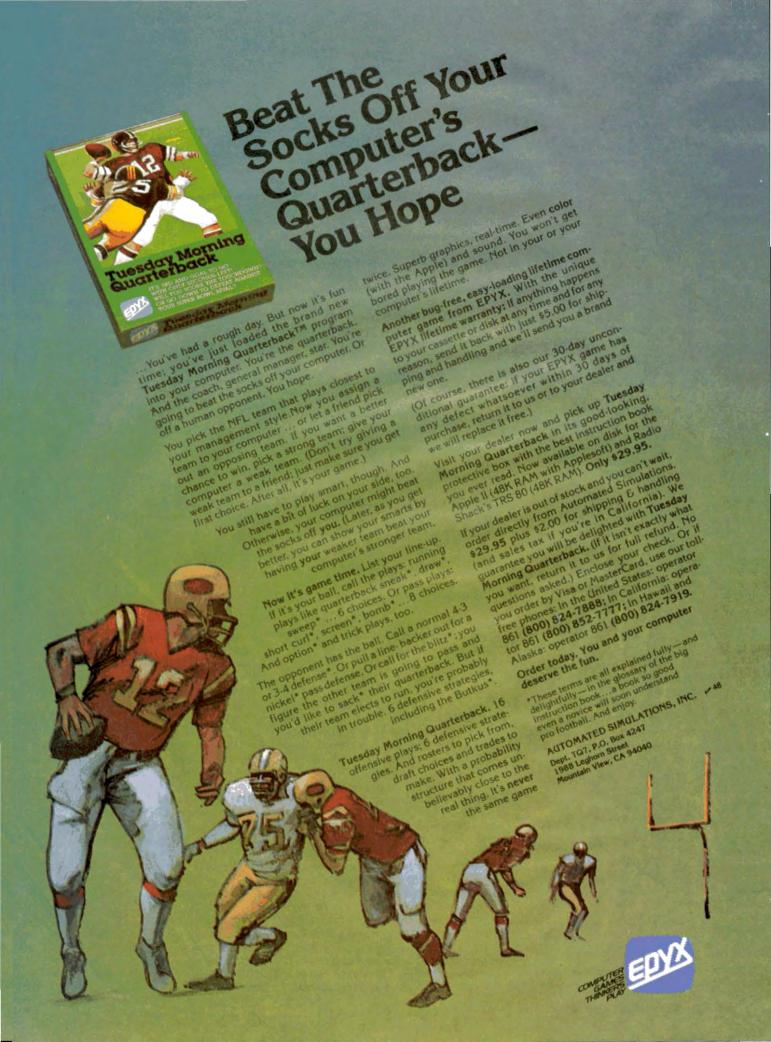

As a further exercise I asked my students to write a program which would cause the saucer to move in three other directions. This isn't that simple because the sample program is not geared for many other directions. For example, if we wish the saucer to move from right to left, the For. . . Next loop is of little use in its present form. Thus, they first had to determine a set-up for the program that could be adaptable for any direction. The right to left example that follows illustrates this:

> 10 CLS 20 X = 16379 30 GOSUB 1000 40 X = X - 1 50 IF X<15360 THEN GOTO 20

¹⁰ CLS

²⁰ FOR X = 15362 to 16376 STEP2

³⁰ POKE X - 2, 32

60 GOTO 30 1000 POKE X,178 1020 POKE X + 1,180 1030 POKE X + 2,189 1040 POKE X + 3,176 1050 POKE X + 3,32 1060 POKE X + 1,32 1060 POKE X + 3,32 2000 RETURN

In this program the subroutine at lines 1000 through 2000 can be used no matter what direction the figure moves. The key to the movement is in lines 40 and 50. Line 40 decrements the value of X by one, and thus the saucer appears to move from right to left. Line 50 is necessary to keep the ship from going off the screen, and it also restarts the program when it reaches the end of the screen.

If we wish to move in another direction we only have to change lines 40 and 50. For example, if we wish to move from top to bottom in a left to right manner we would use the following:

```
40 X = X - 64
42 IF X + 3>16383 THEN X = X - 1023
50 IF X + 3 = 16383 THEN X = 15360
```

Line 40 writes X in the position directly below the previous X. Line 42 places the figure at the top of the screen after the figure has been printed at the bottom. The figure at the top is printed to the right of the previous figure at the bottom. If we wish the figure to be printed in a top to bottom, right to left manner, we need only substitute the following for line 42:

IF X + 3>16383 THEN X = X - 1025

Line 50 prints the figure at the upper left of the screen before if goes past the bottom right of the screen.

Now that we can get the figure to move in any direction, it would be nice if we could switch directions at the push of a button. To do this we have to make use of the INKEY\$ instruction. As an introduction, I gave my students the following program and instructions:

> 10 CLS 100 PRINT 10:GOSUB 1000 110 GOTO 100 200 PRINT 20:GOSUB 1000 210 GOTO 200 300 PRINT 30:GOSUB 1000 310 GOTO 300 400 PRINT 40:GOSUB 1000 410 GOTO 400 500 PRINT 50:GOSUB 1000 510 GOTO 500 1000 FOR X = 1 TO 200;NEXT X 1010 IF INKEY\$ = "B" THEN GOTO 200 1100 RETURN

 Run the above program and hit the letter B. What happens?

- Modify the program above so that lines 100, 200, 300, 400 or 500 get executed when a different letter is pressed.
- What does INKEY\$ do?

When the program is executed, the number 10 is written periodically until the letter B is hit. At this time the number 20 is printed.

Modifying the program is somewhat difficult. Due to a peculiarity of the INKEY\$ Instruction, once it is accessed the value disappears. Thus, if we just used if statements between lines 1000 and 1100, only the first if statement would reflect the key that was depressed. If we want to check the depressed key more than once, we must use code similar to the following:

> 1010 B\$ = INKEY\$ 1020 IF B\$ = "A" THEN GOTO 100 1030 IF B\$ = "B" THEN GOTO 200 1040 IF B\$ = "C" THEN GOTO 300 1050 IF B\$ = "O" THEN GOTO 400 1060 IF B\$ = "E" THEN GOTO 500

By storing the value of INKEY\$ within our program, we can access it as often as we like without it disappearing.

But now we need an If statement for every check we wish to make. To avoid this I introduced my students to the ON...GOTO instruction with the following changes in the program:

1000 FOR X = 1 TO 200:NEXT X 1010 ON VAL(INKEY\$) GOTO 100,200,300,400,500 1020 RETURN

The way the ON...GOTO instruction works is more clearly explained if I use the following example:

ON X GOTO 100,500,200

If X = 1 then we go to line 100. If X = 2 then we go to line 500. If X = 3 then we go to line 200. If X has any other value, the next statement in the program is executed. In line 1010 we must use the VAL instruction because INKEY\$ gives us the ASCII equivalent of the number we have entered. By using VAL the ASCII characters are converted to numerics.

Now that we can move our figure in any direction by hitting a key, there are a few other things we might desire if we want to make this program into a game. First, we might want more than one figure on the screen. Second, we might want them to shoot at each other; and finally we must decide if the second figure will be controlled by another person or the computer.

The 13-line subroutine in Fig. 1 constructs a second figure whose movement is controlled by hitting the letters A,B,C or D. The values given to the W array in conjunc-

... the only person hurt by this type of experimentation is the programmer."

tion with lines 3020 through 3050 and 3100 control the direction of the figure.

Line 3020 causes the letters A through D to be converted to the numbers one through four. Line 3020 subtracts 64 from the ASCII equivalent of the character depressed while the program is running. Since the ASCII equivalents of A,B,C and D are 65,66,67 and 68 respectively, this line gives variable B a value of one when A is depressed, two when B is depressed, three when C is depressed and so on. Line 3030 allows only A through D to be depressed; all other letters set B to equal one. Line 3040 erases the figure.

Line 3050 causes Y to be incremented by a member of the array W. The values of this array were established in line 12 along with the initial values of Y and B. The variable B points to the correct element.

To illustrate this, let us assume that C was depressed while Y = 16005. Then line 3020 becomes:

```
B = ASC(C) - 64 which means

B = 67 - 64 which means

B = 3.
```

The If statement in line 3030 fails since B = three. Line 3040 erases the figure that started at Y = 16005.

Line 3050 translates to:

```
Y = 16005 + W(3) aince W(3) \approx 64 from line 12
Y = 16005 + 64
Y = 16069.
```

The If statements in lines 3060 through 3090 re-establish Y if the value of Y extends beyond the range of the screen (i.e. 15360 to 16383). Line 3100 then builds the new figure at the desired location.

To put it more simply, if A is entered, the figure moves from right to left. If C is entered the figure goes down, and if D is entered the figure moves up.

Fig. 2 illustrates another version of this subroutine. In this version the computer controls the ship (variable Y). The computer's ship chases another ship (variable X). In addition, the computer's ship fires upon the user's ship (lines 3130 through 3200). With minor modifications both of these routines can be included within the same program. I suggest changing Fig.1 in the following manner:

- Change the line numbers.
- Change variable Y to X.
- Change Y = 16379 to X = 15360 in line 12.
 Change the variable B to another variable
- name (such as C).

By adding a couple of GOSUBS you'll have one ship chasing another. However, since the user's ship doesn't shoot, you had better add a routine for this if you intend to win.■

How's your love life?

INTERLUDE #99 THE ULTIMATE EXPERIENCE...

A little dull around the edges? Routine? Predictable? Boring? Maybe all it needs is a little Interlude. Interlude is the most stimulating computer game ever conceived. It combines a computer interview, an innovative programming concept, and a one-of-a-kind manual to turn your love life into exciting, adventurous, delicious fun!

Interlude is: romantic...playful...outrageous...a fantasy. Interlude is: ■ A Bed of Roses (Interlude #1) ■ Mata Hari (Interlude #49) ■ The Chase (Interlude #7) ■ Rodeo! (Interlude #71) ■ The King and I (Interlude #60) ■ Some Enchanted Evening (Interlude #84) ■ Caveman Caper (Interlude #82) ■ From Here to Ecstasy (Interlude No. 30) ■ Satin Dreams (Interlude #72).

More than 100 Interludes are included in the program. Most are described in detail in the accompanying manual, but several surprise Interludes are buried in the program awaiting that very special time when your interview says you're ready. (When you learn secret Interlude #99, your love life may never again be the same!) Interlude can give you experiences you'll never forget. Are you ready for it?

Hoops

William Cornwell 609 Ellynn Drive Cary, NC 27511

Score! Doctor J adds two more!", exclaimed the television announcer. "Dad, how many points does Doctor J have now?" asked my 14-year old son. I couldn't tell him as I wasn't keeping score myself, but as I glanced up with my response, I noticed our Level II 16K TRS-80 nearby, but not in operation.

What a great application—design a basketball scorekeeping program. So in the next few evenings I thought considerably about what would be required.

The more I thought, the better the program appeared. First, I located a video display worksheet and penciled in the format of the output—team names, scores and fouls. I then provided lines for the individual players—numbers, names, number of field goals and fouls, total points scored, and number of personal fouls (see Photo 1). I discovered that a twodimensional, 14-member array in Basic would handle all of this data nicely.

With the output out of the way, I next considered the input data. One goal was to have the ability to correct any character keyed in error prior to entering the data, or provide a means of ignoring the input request from any character position. Based on my Basic experience, this precluded the use of an INKEY\$ type of routine. Also, I wanted any input combination to be one character string so the user would not have to continually key additional commas as field separators. This would also provide the flexibility of having one, two, and four-character input coding strings.

Next, I started to code the Basic program logic, but on paper first! This turned out to be well worth the effort as I was able to develop the total program in a subroutine fashion—optimizing statements as I coded—and using open boxes for GOTO label numbers. When the Basic coding was finished, I wrote the statement numbers down for both the Basic statements and then in the GOTO boxes.

Since I don't have the luxury of a printer, the paper draft provided outstanding reference material for debugging and cosmetic changes. And I made several of each.

The moment of truth arrived as I keyed Run. Concept was good, but I had to make several other minor adjustments for better viewing on the output display. I was quite happy with the results—the paper draft netted a nearly bug-free implementation! Numerical column alignment using Basic with combinations of single and doubledigit numbers was the toughest problem. Screen data is presented in anywhere from one point five to three seconds depending upon the number of players.

After loading the program and keying Run to begin program initiation, the user is questioned whether or not he desires an explanation of the program and the instructions. Assuming the user wants this information, he keys a Y (for yes) and a description of the program is displayed.

He is then requested to push the Enter key to continue program operation. The Help screen (see Photo 2) is displayed. The next logical function would be to load both a home team and a visiting team. Com-

APPLE ND THE **RS-80**°!

We know it hasn't been easy for you TRS-80® owners to see so many great made-for-Apple-only games from SSI pass you by. But then, it hasn't been easy for us to design games for a 16K cassette format good enough to meet our critical standards.

After all, we've got a reputation to protect, a reputation in strategy gaming for unsurpassed sophistication, innovation, realism, and playability.

Well, our designers have been hard at work, and we've not only met but surmounted the challenge. We're delighted to announce two historical wargames - deserving of the SSI label - for both the Apple® and the TRS-80® (16K cassette for the TRS-80 Model I and III: 48K disc for Apple II with Applesoft ROM card).

Combining our extensive wargame-design experience and superior programming techniques, we've given a fresh new look and feel to these favorite classic battles.

At \$24.95 each for TRS-80 cassette and \$39.95 each for Apple disc, these are extraordinary games at quite an ordinary price.

So head on down to your local store and check them out today!

VISA and M/C holders can order by calling 800-227-1617, ext. 335 (toll free). In California, call 800-772-3545, ext. 335.

To order by mail, send your check to: Strategic Simulations Inc, Dept. EM1, 465 Fairchild Drive, Suite 108, Mountain View, California 94043.

All our games carry a 14-day money-back guarantee.

As part of our demanding standards of excellence, we use **Maxell** floppy discs. Apple is a registered trademark of Apple Computer Inc. TRS-80 is a registered trademark of the Tandy Corporation.

"What a great application design a basketball scorekeeping program."

mands for each appear later.

The Enter Data? request appears at the bottom line of the screen as a result of: keying N (for no) to the information request during program initiation; pushing Enter after viewing the program information and input coding structure display; the successful conclusion of a previously keyed input command.

Since the Enter Data? request is where all the action occurs during the course of this program, a more detailed description of the input code structure follows. After keying any input code, the user pushes the Enter key to initiate program action for that code.

Valid single-character entries are:

?—I have a question and need help this will display the input coding structure (the Help screen in Photo 2) that is acceptable to the Enter Data? request. D—Display—displays the team and player totals.

X—input keying error—this character appearing in any one of the four positions of the input code positions signals an input error and the user can respond to another Enter Data? request.

E-Exit-exits or terminates the program.

Valid two-character entries are:

HA—Add player(s) to home team—user must enter a two-character number, push the Enter key, and then key a name of 12 characters or less and push the Enter key again. If no players' names exist, the user will be requested to key a team name with the same 12 characters or less limitation followed by the Enter key prior to entering any player information.

VA-Add player(s) to visiting teamsame description as the HA code except information applies to the visiting team.

Valid four-character entries are: • indicates that the first character will be either an H for a home team player or a V to indicate a visiting team player; the second character indicates what event occurred;

"The program provides the basics for basketball scorekeeping and was a joy to develop."

the last two characters of NN represent the number of the player.

*BNN—Basket scored—player NN scored a two-point field goal.

*LNN—Long basket scored—player NN scored a three-point field goal. *FNN—Foul shot successful—player NN scored one successful free throw. *TNN—Two foul shots successful player NN scored two successful free

throws. *PNN—Personal foul—player NN has

committed a personal foul.

The Help screen (see Photo 2) provides a concise listing for the above codes.

For those readers who do not care about the internal data structure or have no intention of modifying the program, they should conclude with the summary paragraphs. As I stated earlier, the data area for the program is a two-level, 14-member array for each field: player's number (A\$), player's name (B\$), number of field goals (J), number of successful foul shots (K), total points (L) and number of personal fouls (M).

Variables N and P are used for updating the array fields: N is the level value—zero for the home team and a one for the visiting team. This value is determined from the first character of the input coding structure. The variable P, when it ranges from one to 13, represents a player value. When this variable is a zero it refers to a team value.

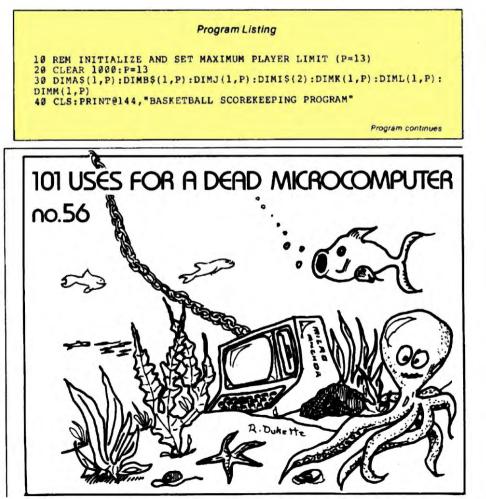

For instance, the name field, B (0,0) or B (1,0), refers to the team names. The field goal variable, J (0,0) or J (1,0), contains the number of players currently entered in the team list (see Fig. 1). The total points field for the team contains the team score, and the number of personal fouls field contains the number of team fouls. But this last value never exceeds seven for either team since seven will handle the foul bonus situations for all levels of basketball.

In summarizing, I wanted a useful, simple and meaningful code structure. The basketball scorekeeping program, I think, meets these original objectives. In addition, the program, as is, applies to any level of basketball—professional, collegiate, scholastic, or non-scholastic. The program can also be used with several of the commercial basketball games available such as Basket.

The program provides the basics for basketball scorekeeping and was a joy to develop. Some possible enhancements include: Loading the players' names and numbers via tape, disk or data statements; printing a final box score at the game's conclusion; saving player and team totals on some media for use with additional averaging-type programs; and, lastly, correcting any error once entered (points credited to the wrong player, disallowed baskets or fouls). I would be interested in copies of any such enhancements.

Field	Variable	Team Information	Player information	
		P=0	P = 1	P = 13
Player's number	AS	-Not used-	Player's number	Player's number

SWITCH TO^{5"}8" DOUBLE DENSITY

FEATURES

- 5- and 8-inch* disk drives
- Single- & double-density
- Any size and density in any mix

THE

SWITCH

- Read Model I, II* and III disks
- 5- or 8-inch* system disk
- Single & double sided disk drives
 DOS+ 3.3.9 included, with Disk
- BASIC.6 month warranty
- 6 month warranty
- Up to 3.75 megabytes online
- Easy installation plug-in & run
- Analog phase lock loop data separation
- Precision write precompensation
- Regulated power supply
- Guaranteed operation at 4MHz
- All contacts gold plated
- Solder masked & silk screened
- Runs under DOS+ 3.3.9, TRSDOS 2.3, NEWDOS 2.1, NEWDOS/80 1.0, LDOS, NEWDOS/80 2.0, and ULTRADOS
- Reads 40- and 35-track disks on 80-track drives
- FD1791 controller + your FD1771
- Fits Model I expansion interfaces
- Fits LNW expansion interfaces
- Track configurations to 80-tracks
- 5 inch disk storage increased to: 161,280 bytes – 35-track SS/DD 322,560 bytes – 35-track DS/DD 184,320 bytes – 40-track SS/DD 368,640 bytes – 40-track DS/DD 368,640 bytes – 80-track SS/DD 737,280 bytes – 80-track DS/DD
- 8 inch disk storage increased to:

591,360 bytes - 77-track SS/DD 1,182,720 bytes - 77-track DS/DD SS: single-sided DS: double-sided SD: single-density DD: double-density

COMPLETE – The *LNDoubler* 5/8, switches your Model I or LNW-80 into the most versatile computer you can own. The LNDoubler's switch allows you to boot from 5- or 8-inch system disks, and it's accessible from outside the interface. The *LNDoubler* 5/8 comes with a double-density disk operating system (DOS+ 3.3.9), complete with BASIC and utility programs ... ready to run your software NOW!

VERSATILE - Whether you want single-sided, double-sided, single- or double-density, 5- or 8-inch operation, complete versatility is here today! Any combination of 5- and 8-inch disk storage is possible with the LNDoubler 5/8. Each of your present 40-track, single-sided 5-inch drives will store up to 184,320 bytes (formatted storage) - that's an 80% increase in storage capacity for only half the cost of just one disk drive. With three 8-inch double-density, double-sided drives your Model I will have 3.75 Megabytes of online storage - that's more storage than a Model II or Model III!

ADVANCED - The LNDoubler 5/8 is the most technically advanced, tested and reliable double-density board you can buy. The LNDoubler 5/8 has more features, more options and more software support than any other product of its kind.

EASY TO INSTALL – The LNDoubler 5/8 is easy to install. There are no traces to cut, no wiring to do, just a screwdriver and a few minutes of your time is all that is required. The instructions are fully illustrated for all interfaces. In minutes you will be 'up-and-running', and enjoying your computer as never before.

COMPARE – Compare features, compare quality, compare value, and make the **SWITCH** today!

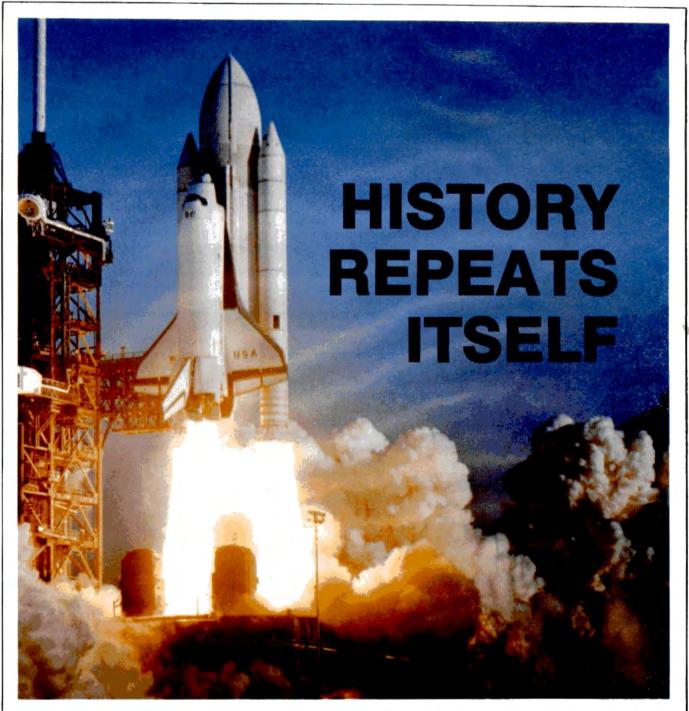

Immediate delivery from stock – at your dealer NOW for only

Z19.95 DEALERS - You too can make The Switch.

Just 55 hours ago, 5.3 million pounds of thrust from two solid fuel boosters sent the Space Shuttle Columbia into orbit. Now, on-board computers performing 325,000 separate operations every second will help guide the Columbia safely and gracefully home to Earth.

Instant Software's SPACE SHUTTLE puts you in the command pilot's chair of America's first reusable space vehicle. And, until commercial space flight becomes a reality, this is the closest you'll get to the Ultimate Flight.

"To help us recognize the 'programs' or levels of thought in our own minds, Hofstader engages us in various mind games."

ple. There is no psychological proof to chart the metamorphosis of neuron action to symbol recognition to iteration. To help us recognize the "programs" or levels of thought in our own minds, Hofstader engages us in various mind games. This is the purpose of the fictional dialogs that follow each chapter of *Godel, Escher, Bach.*

The main characters of the dialogs are the Tortoise and Achilles. The choice of these figures was inspired by Zeno and by Lewis Carroll. Zeno, a Greek mathematician, wrote a tale about a foot race between the Tortoise and Achilles to illustrate his theories of paradoxes of motion. Lewis Carroll, the author of. *Alice in Wonderland* and a Nineteenth-century mathematician, borrowed the Tortoise and Achilles from Zeno to write a dialog about reasoning Carroll's dialog is reprinted in *Godel*, *Escher, Bach.* Each dialog in the book helps us conceptualize the intricate methods of human thought.

Hofstader's dialog titled "Crab Canon" tells the story of a chance meeting between Achilles and the Tortoise in the park. In the middle of their conversation, they are interrupted by a friend, the Crab. The title, "Crab Canon," has more significance in relation to the dialog.

"Crab Canon", you'll recall, is a theme followed by itself in reverse. The notes read the same melody backwards and forwards. In Hofstader's "Crab Canon" the lines are virtually the same when they are read from the end or from the beginning. For instance, the opening lines of the dialog are:

Tortoise: Good day, Mr. A. Achillee: Why, same to you. Tortoise: So nice to run into you. Achilles: That echoes my thoughts. Tortoise: And It's a perfect day for a walk. I think I'll be walking home soon.

And the closing lines:

Achilles: And it's a perfect day for a walk. I think I'll be walking home soon. Tortolas: That echoes my thoughts. Achilles: So nice to run into you. Tortolas: Why, same to you. Achilles: Good day, Mr. T.

When the Crab appears, he's full of multiple-entendres and self-references. He talks about himself, saying he "would crab up a storm." Of course, his name, the Crab, is self-reference within the dialog. But the Crab's words also hint at the structure of the dialogue. ""Which came first—the Crab, or the Gene?' That is to say, 'Which came last—the Gene, or the Crab?"' (His reference to his genes reflects on the structure of meaning in yet another way. Unless you're familiar with the genetics of crabs, you'll have to read Godel, Escher, Bach to appreciate the allusion.)

The conversation between the Tortoise and Achilies touches on a print by Escher in which Interlocking crabs are formed by the figure and the ground, and also on a crab canon in Bach's *Musical Offering*. In less than four pages, the word "crab" has acguired a myriad of symbolic meanings.

The "Crab Canon" is a highly structured piece of writing that causes numerous sets of operations to be carried out within the reader's cognitive system. But we use such deep and intertwined levels of interpretation daily. While I was reading Godel, *Escher, Bach*, I dreamed one night that I was an AI researcher. My dream is a less sophisticated story than Hofstader's "Crab Canon." But it is a clear example of several levels of implicit meaning within the hierarchy of my own thought processes.

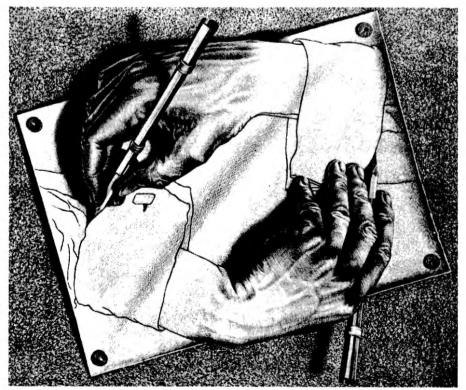

An Al research project I had been working

on for many years was reaching its culmination. Yet, I felt the answers to many of my questions were beyond my reach. I had access to a vast computer system and to several microcomputers. None of them could help me form ideas. I left the lab to walk along a secluded beach at twilight.

I walked up and down the beach for several hours. I contemplated subtle distinctions between the minds of men and the minds of machines. Finally, I laid down beneath a cluster of palm trees to sleep. As I listened to the waves, I thought to myself, "At least in this way, the human being will always be different from computers." I had struggled with ideas and depression, and I had been comforted by nature.

When I awoke at dawn one of my microcomputers was beside me. It presented me with an exhaustive catalog comparing and contrasting the most current facts about human and machine intelligence. I hadn't programmed the computer to generate the list. It had acted on its own volition.

In many ways, the dream is a synopsis of *Godel, Escher, Bach.* First, some thought patterns Hofstader stresses are evident. There's a circular pattern of self-reference,

"The debate over artificial intelligence is a two-step strange loop, an infinite quest represented by an interplay between questions and answers."

not unlike a Strange Loop. While I was asleep I dreamed; and in that dream, I dreamed I fell asleep.

Within the dream, I awoke at dawn. For me the image of awaking at dawn is through isomorphism—a symbol of human discovery. When I actually woke up the next morning, I'd gained insights to Godel, Escher, Bach.

The dream's synopsis of the book begins with its recognition that the distinctions between human and computer intelligence are apparent. Scientlsts and researchers have a relatively strong understanding of the thought processes of number computation, and to some extent of logic. These things we have programmed into computers with measured success.

The dream also recognizes that the gap between the two intelligences is currently the burden of human intelligence. To us volition and creativity are mysterious processes, and so far unprogrammable. The achievements of programs such as SHRDLU help us understand our own intelligence. And as our understanding of our own intricate thought processes increases, it seems inevitable that computer intelligence will advance. At the conclusion of the dream, the question "Can machines think?" is overshadowed by a new question. "Can machines feel emotion?"

Alan Turing, the computer scientist quoted at the opening of this article, believed the complexity of the operations and responses a machine is programmed to handle is related to the quality of its intelligence. Hofstader gives a great deal of consideration to Turing's suggested test for computer intelligence, and also to the common objections to machine intelligence which Turing anticipated. But Hofstader also considers a response to Turing's proposals by the philosopher J.R. Lucas. The following remarks are from Lucas' paper Minds, Machines, and Godel. A lengthy excerpt is included in Godel. Escher, Bach.

"Complexity often does introduce qualitative differ ences. Although it sounds implausible, it might turn out that above a certain level of complexity, a machine ceased to be predictable, even in principle, and started doing things on its own account, or, to use a very revealing phrase, it might begin to have a mind of its own. It would begin to have a mind of its own when it was no longer entirely predictable and entirely docile, but was capable of doing things which we recognized as intelligent and not just mistakes or random shots, but which we had not proorammed into it. But then it would cease to be a machine, within the meaning of the act. What is at stake in the mechanist debate is not how minds are, or might be, brought into being, but how they operate."

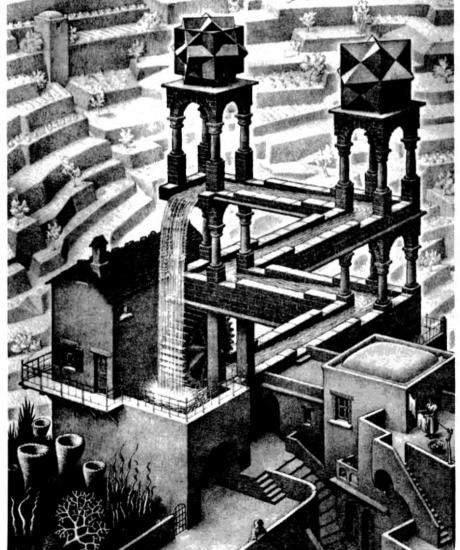

Here is a new question, closely related to the question presented by the dream. If we learn how minds operate, and if a machine is programmed to act like a human mind, and if that machine acts of its own volition, is it still a machine?

A friend of Hofstader's once commented that AI should have its own incompleteness theorem because "Once some mental function is programmed, people soon cease to consider it an essential ingredient of 'real thinking." The paradox of artificial intelligence is that it exists (at some levels), but that existence cannot be proven. We know too little about human intelligence to bear the burden of proof.

The debate over artificial intelligence is a two-step strange loop, an infinite quest represented by an interplay between questions and answers. When one question is answered, another will always arise. This is the central message of Godel, Escher, Bach: An Eternal Golden Braid. ■

Tape Regenerator

Cass R. Lewart 12 Georjean Dr. Holmdel, NJ 07733

The tape recorder is an inexpensive and popular means of program and data storage for the TRS-80. Even disk owners still need the tape recorder to transfer purchased cassette programs to disk. Unfortunately the tape recorder brings its share of problems to the unwary. One of the most frustrating moments for a TRS-80 owner is when, after spending several minutes loading a new program, the letter "C" or a permanent double asterisk appears in the right upper corner of the monitor screen.

Frequently a Basic tape may seem to load correctly, but will produce a garbage listing.

Regardless of the symptoms, the diagnosis is the same—an irrecoverable error occurred during program reading. (At this point, grown men and women have been known to cry.) The only way to load a program from a poorly recorded tape is to find by repeated trial and error the very narrow range of volume control settings good for this particular tape. There is also no assurance that the volume control setting will work the next time around even with the same tape; a slight recorder head misadjustment may require repeating the whole procedure.

The Problems

The reason for difficulties in loading commercial tapes such as Radio Shack's is that they are reproduced on high-speed audio machines not specifically designed for digital encoding and not always kept in tip-top condition. The ideal signal wave form and the typical good and poor wave forms found on commercial copies of Level II programs are shown in Figs. 1 and 2. The superimposed noise, 60 Hz hum,

A drilled glass epoxy silk screened printed circuit board, and a listing of Regen in Basic to allow POKEing it into memory can be purchased from C&R Electronics, P.O. Box 217, Holmdel, NJ 07733 for \$10.95 ppd. New Jersey residents, please add 5% sales tax. Allow 2-3 weeks for delivery.

Table 1. Parts List

amplitude distortion, ringing, and, what is worst—the incorrect displacement of the data pulses relative to the clock pulses make it difficult or even impossible for the computer to read the tape.

If a single reading error occurs, e.g., one out of 100,000 pulses in a typical program is misread, then the whole program cannot be executed. Once a Basic program has been properly loaded one can make a good backup copy of it with the CSAVE command. It is not as straightforward with System programs. Monitors such as T-Bug, MON3, RSM or TRCopy will generate a backup copy of a System program, but with severe limitations, i.e., the original program has to be readable and the program cannot overwrite the monitor.

The Solution

The Tape Regenerator, on the other hand, will take any TRS-80 tape with Level II Basic or System programs, even if it is poorly recorded, and generate, using the TRS-80 computer, a backup copy of the programs on a second tape recorder. The Tape Regenerator circuit and the associated program Regen reshape and retime the pulses on the new tape, thus producing a tape that is easily read by the TRS-80 circuitry.

The Tape Regenerator does not care whether a program consists of multiple segments with separate loader or whether there is more than one program on a tape. Regen operates on one pair of clock/data pulses at a time, and unlike the monitor programs it does not store the whole program in computer memory. Thus tapes with multiple programs can be handled in a single run and even a 4K computer can back up copies of large programs.

It should be mentioned that several commercially available hardware devices (Data Dubbers) were designed for the same purpose as the Tape Regenerator.

"The backup tapes produced from these devices...retain and may even worsen the timing jitter..."

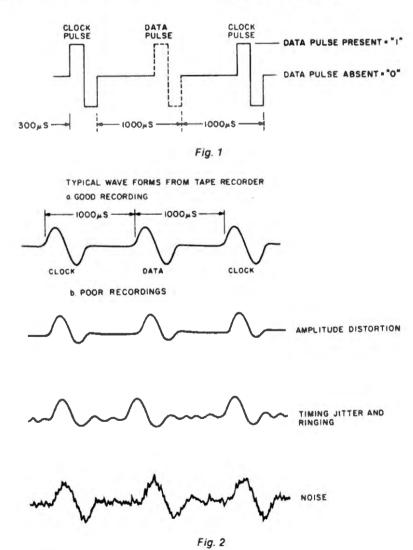

However, these devices only reshape the clock and data pulses and do not retime them in respect to each other as Regen does. The backup tapes produced by these devices, though better in some respects than the originals (thanks to pulse reshaping) retain and may even worsen the timing jitter—one of the major causes of tape reading difficulties.

To test the soundness of the regeneration approach, multiple generations of the same program were made by generating tape 2 from 1, tape 3 from 2, etc. The test was run through five tape generations with a fairly long System program. It was found that a fifth generation tape would load on the computer as easily as the first generation tape with no apparent degradation in quality. Backup copies were also made of commercial tapes that, due to poor recording, would not load properly at dozens of different volume control settings. The backup copies loaded then with no difficulties.

Circuit Description

The circuit shown in Fig. 3 reshapes the clock and data pulses received from the first tape recorder and feeds them to the computer for processing. The audio transformer T1 provides DC separation between the tape recorder and the rest of the circuit. Switch S1 and diodes D1 and D2 allow selection of the better half of the pulse (see Control Adjustments). Zener diode D3 and transistor Q1 further shape the incoming signals.

The NOR gate in IC1 decodes the IN command from the computer indicating that it is ready to accept data for further processing. Spare gates in the IC1 serve as buffers and open the gate in IC2 to let the clock/data pulses pass via P1 connector to the data bus in the computer. LED1, LED3 and LED2 indicate respectively that the circuit is powered, that the Regen program is running and that the tape recorder is sending data at the proper level.

"The signal is partially reshaped... still it frequently can be read... where the original tape could not."

Transformer T2 in conjunction with the voltage regulator IC3, full wave rectifier RECT and two capacitors provides 5V to power the transistor and ICs. J2 provides a "quick and dirty" direct output to the TRS-80 if no backup copies are required. The signal at this point is partially reshaped but not retimed. Still it frequently can be read by the computer where the original tape could not be read.

Regenerator Program Regen

The Regen program shown in Listing 1 takes care of retiming and reshaping of Level II clock and data pulses. After clearing the screen, displaying a message with the author's name, and putting a graphic character in the upper right corner of the screen, the program waits for the clock pulse from the first tape recorder. After finding it another test is made to make sure that it was not a transient.

When the clock pulse is confirmed, it is put out after a 200-microsecond delay using subroutine output. This subroutine produces a perfect signal, as shown in Fig. 4, via the computer plug leading to the recording (AUX) jack on the second tape recorder. The graphic screen character is changed every time a clock pulse is detected to indicate that something is happening. A search for the data pulse now begins. A delay of 500 microseconds excludes any residual ringing from the preceding clock pulse.

If no data pulse is found during the following 700-microsecond window, the search for the next clock pulse starts again. If a data pulse is found, it is tested to exclude a transient; if the data pulse is confirmed, it is put out at the end of the 1000-microsecond interval that started at the beginning of the preceding clock pulse as shown in Fig. 4. A data pulse appearing any time between 500 microseconds and 1200 microseconds after a clock pulse is thus correctly retimed to occur exactly 1000 microseconds after the clock pulse.

The program then continues after a 100-microsecond delay with the search for the next clock pulse. The above-mentioned delay constants of course could be modified to operate on Level I programs, or to make Level II programs generated on the Model I computer more readable on the Model III computer, with its slightly different optimum tape-timing requirements.

Regen can be loaded either from Listing 1 using EDTASM or one of the monitor programs, or it can be loaded by running an equivalent Basic program mentioned in the parts list, which will POKE the program into memory.

Operating Instructions

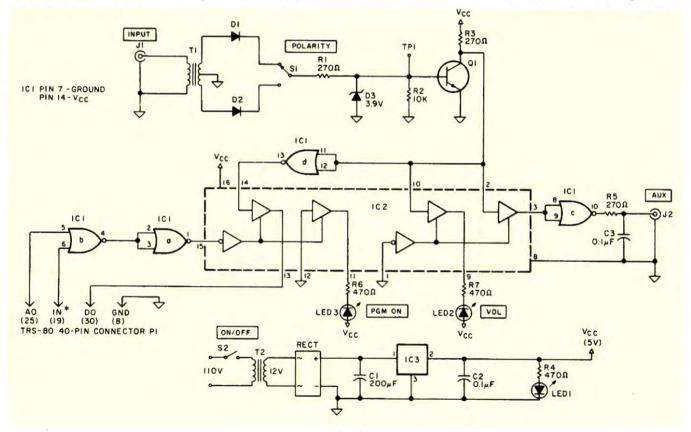

1. Turn off the power, then make all connections between the tape recorders, computer, and the Tape Regenerator as shown in Fig. 5.

2. Turn the power on to the computer and the Tape Regenerator. LED1 should light up and the Memory Size question should appear on the screen. If it does not, check all connections, in particular the 40-pin connector from the Tape Regenerator to the CPU or the expansion interface. Repeat steps 1 and 2 if necessary.

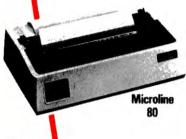

3. Load the Regen program and run it. LED3 should now light up, author's name should appear in the middle of the screen, and a stationary graphic character should appear in the right upper corner. The program is in an infinite loop and will run until you reset the computer or turn it off.

4. Start playing the tape from tape recorder 1 and set the polarity switch and the volume control on the tape recorder as explained under Control Adjustments. Rewind the first tape recorder.

5. Start tape recorder 1 in play mode and tape recorder 2 in record mode. Observe LED2 and the changing graphic character on the screen. When LED2 goes dark and the graphic character stops changing, you are finished with the recording. Turn off

This Months Special Okidata Microline 80 At a New Low, Low, Price!

A great buy

List Price is \$545. The Microline 80 is a quiet. small printer with field proven reliability.

TPIL

Features:

Friction b pin paper feed, roll or fan fold

SCHNEIDER ENTERPRISES 1252 N. BROWNSLAKE RD. BURLINGTON, WIS. 53105 DAYS 414-961-2800, EVE. 414-534-6813 "HAUMMEN OF LANDY CORRIGATION

"The Tape Regenerator will only process tapes having complete program information."

everything. The 40-pin connector can be left in place as it does not interfere with normal computer operation.

Control Adjustments

There are two controls to be set to properly read a poorly recorded tape: the polarity switch in the regenerator circuit and the volume control on the tape recorder. Make both settings while the tape recorder 1 is in play mode. The settings will vary from tape to tape depending on the machine on which it was recorded. However, your own backup tapes produced with the Tape Regenerator or CSAVE command should all work with the same settings. First, set the polarity switch to the position giving a stronger signal as evidenced by LED2 being brighter at a low volume control setting. Then find the optivolume control setting by one of the following methods:

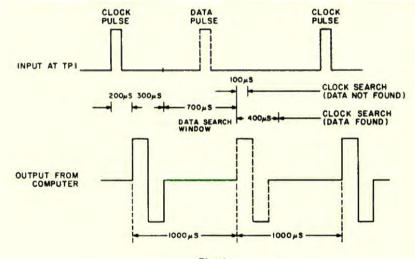

• Turn up the volume control until LED2 lights up brightly, then back up slightly.

• Turn the volume control slightly above the point when the graphic character in the corner of the screen starts changing.

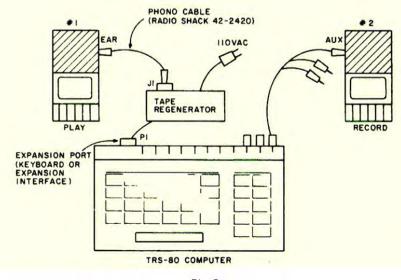

• Observe the incoming pulses with a scope at point TP1 (best method) and adjust the volume control for cleanest and widest pulse shape.

Program Limitations

The Tape Generator will only process tapes having complete program information. Tapes with eighteen-minute gaps (see history books) or those with pulses of very unsteady amplitude or embedded in noise are not acceptable. Neither the Tape Regenerator nor any other device will restore

200 • 80 Microcomputing, October 1981

"Neither the Tape Regenerator nor any other device will restore them." Proper care may prevent unexpected fire-

them. The hardware and software described here will only work with a Model I, Level II computer.

Construction Hints

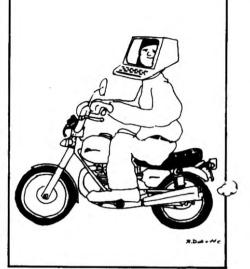

Keep all wires as short as possible; use of a printed circuit board is highly recommended. As only four contacts are being used on the 40-pin connector you can spread the remaining contacts with a screwdriver for easy insertion. Before turning the power on, check all connections.

Note for Disk Users

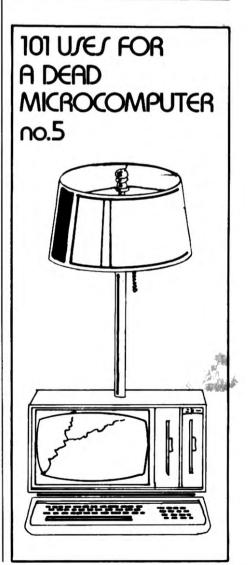

works.

The Regen program is fully relocatable and can be stored at any convenient location in memory not interfering with DOS. The DI instruction at the beginning of the program will assure that the internal clock, which would interfere with tape operation, is not running.

Make your computer a sophisticated 80.

Real World Interface—Part I

Elliott K. Rand P.O. Box 552 Melbourne, FL 32901

With a few trivial exceptions, every byte of information in your system got there through a keyboard. Missing is a realtime, *now* communication with the *physical* world: complex communication, not just turning a switch on or off. Sensing the real world, the computer can be programmed to respond intelligently and control the outside world. With additional sensors to monitor its action, the system becomes self-adjusting.

The world is continuous-temperatures

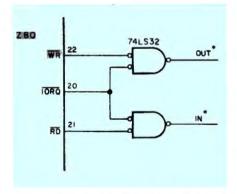

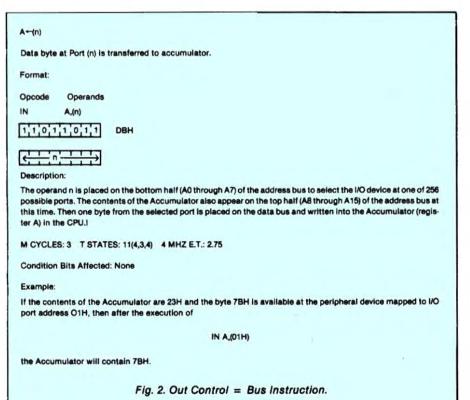

Fig. 1. I/O Control = Bus Signals in the TRS-80.

do not jump suddenly from 50 degrees to 70 degrees; velocities do not change from 0 to 60 mph in an instant. However, computers use numbers that appear to change abruptly. There is no such thing as a fraction of a bit. Obviously, some translation is needed in both directions.

Input/Output

Our goal is to get information on the data

202 • 80 Microcomputing, October 1981

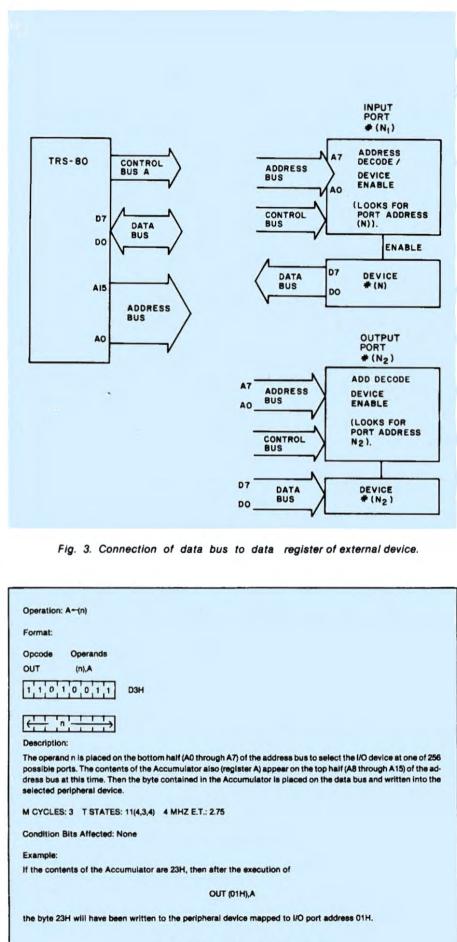

Fig. 4. In Control = Bus Instruction.

IIINTRODUCINGIII A/DD/A LAB 80

A Real World Interface for your TRS-80 MOD 1&111. Control motor speed & direction, measure voltages — any analog to digital or digital to analog operation. For details, see article or next month's advertisement.

"Apply power to the real world interface; all LED's should be lit."

bus into the outside world and convert information from that world into a format acceptable to the data bus. This information must arrive at the data bus at a precise time; otherwise it will be missed or conflict with other signals, resulting in chaos. Properly synchronized signals are generated by the central processing unit (CPU) for I/O control.

Fig. 1 shows how In and Out control-bus signals are generated. The Z-80 responds to "OUT (N), A" (Fig. 2), by outputting a logic 0 on pins 20 (IORQ*) and 22 (WR*). A logic 1 appears on pin 21 (RD*) as the Z-80 forbids RD* and WR* signals from being low simultaneously. The IORQ* and WR* signals are AND-ed in a 74LS32 and buffered by a 74LS367 providing the TRS-80 OUT* control-bus signal whenever those outputs are low, as indicated by the asterisks.

At the same time, the CPU outputs the second byte of the instruction (a binary number between 00000000 and 11111111) onto the lower eight lines of the address bus causing connection of the data bus to the data register of the external device (see

Fig. 3).

The "OUT (N), A" instruction also transfers data from the Z-80 accumulator to a latched data register in the external device.

The "IN A, (N)" command (Fig. 4) is similarly handled. Data flow is from the external device to the Z-80 accumulator, Register A. Input normally does not require latching hardware.

Instead of the variety of integrated circuits required for signal control, output latching and input buffering, an 8255 Programmable Peripheral Interface is used. Depending on software, this 40-pin device has three eight-bit ports which may be used for input or output; a tri-state bi-directional bus transceiver; or a 12-bit output port with an eight-bit \neq input port and a four-bit status port.

For our purposes the 8255 is programmed for simple I/O with ports A and B as latched output ports, and port C as an unlatched input port. Port B is uncommitted.

Some Introductory Experiments

Fig. 5. shows the real world interface cir-

cuitry required for these experiments. Integrated circuits U5, U6, U7 and transistors Q1 and Q2 are not used and need not be installed. A well-regulated (4.75-5.25 v. max.) + 5-volt DC supply capable of delivering one ampere is required (see Fig. 6).

Before attempting these experiments remove the power from your TRS-80 and the power supply. *Never* leave power on while setting up test hardware.

Before installing the interconnect cable to the TRS-80 and the real world interface, connect the power supply to the real world interface's +5 and ground terminals. Turn on the power supply. Eight light-emitting diodes should light up. If not, disconnect the power supply and examine the board for soldering defects.

If all indications are normal, turn off the power supply, but do not disconnect it.

Install the 40-pin card-edge end of the interconnect cable to the TRS-80 expansion port with the ribbon cable exiting upward. Pin 1 of the 40-pin DIP plug goes to pin 1 of socket SO 1.

Apply power to the real world interface;

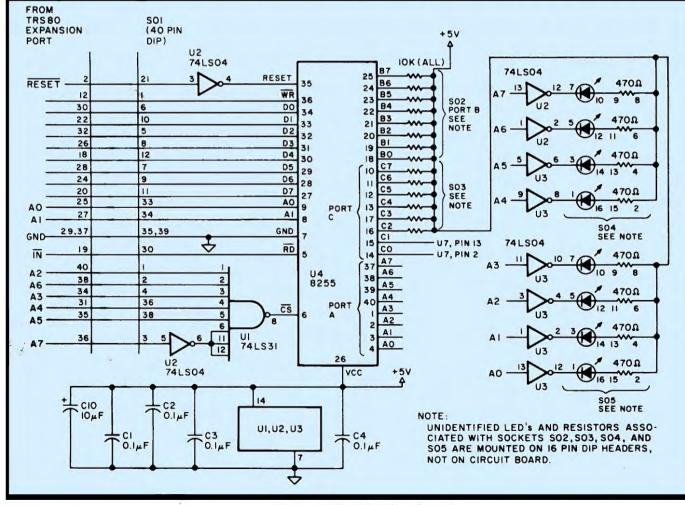

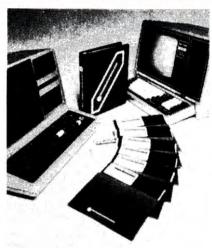

Fig. 5. Real-World Interface Circuitry.

ANNOUNCING A REVOLUTION IN THE CO OF PROFESSIONAL SOFTWARE

VISACCOUNT is a fully integrated business and accounting system designed for use in small businesses. VisAccount is extremely comprehensive and professional, yet it is very easy to use. The system is controlled from a series of interconnected menus permitting user-friendly operation. Everything you need to set-up and operate the system is provided with the VisAccount package.

ALL SYSTEMS is able to provide you VisAccount at this incredible low price because it runs on so many different machines. Through volume sales we are able to substantially reduce our prices.

OUR GUARANTEE – Buy both our software and that of our competitors (who will no doubt charge several times our price because they need to recapture their development cost). Compare the two systems and we know you'll return theirs (make sure they'll let you return their software). If you decide not to keep our system, then return it within 45 days for a full refund. Once you've used our system we're confident you'll be delighted.

"You may return to Basic at any time without losing programs in memory."

all LED's should be lit.

Turn on the TRS-80 power. A normal memory size start-up routine should occur. No memory need be reserved for these experiments, so press Enter to get into Level II Basic.

Enter and run the following Basic program:

10 OUT 127, 137	('Configures 8255)
20 OUT 124, 85	('Loads 55H into Port A)

Every second LED should be lit. Change line 20 to:

20 OUT 124, 170 ('Loads AAH Into Port A)

Run it. You should observe the first, third, fifth and seventh LED lit. You may want to try other values in the second term of line 20.

Next enter and run the following Basic program:

- 10 OUT 127, 137 20 FOR N = 0 to 255
- 30 OUT 124, N:NEXT N 40 GOTO 20

40 GUTU 20

The LEDs should continuously cycle from zero through 255. Because the count is rapid, the two least significant digits on the right appear to be on all the time.

Insert the following line into the program and run it:

25 FOR M = 0 TO 100:NEXT M

Now the two least significant (right-hand) digits should clearly blink on and off and the count can be visually followed.

Next, enter the same program in machine code using either the Basic POKE command, or load the T-Bug, RSM or EDTASM System programs. Keying in the hex words with T-Bug or RSM is fastest and easiest (see Table 1).

Refer to your system's instructions in

Addres		Hex Address	Hex Instruction	Mnemonic
24576	62	6000	3E 89	LD A, 89H

24592	25			
24593	26			
24594	24	6012	18 F2	JR 6006H
24595	242			
		Table	1.	

loading this program. The first few instructions using the POKE command appear as follows:

10 POKE 24576,62:POKE 24577,137:POKE24578,211: POKE 24579,127 (etc.)

Execute the program at 6000H. In Basic this is done by entering the System command. When an asterisk appears on your screen, type /24576 and press Enter to commence execution at 6000H. All the LEDs should be on, although the more significant (left-hand) bits may appear slightly dimmer than the least significant bits. The microprocessor is counting near its maximum speed—around 100,000 counts per second. Next, delete the last line of the program

and insert Table 2.

Execute the program beginning at 6000H. The instructions slow the count by a factor of approximately 300. The count now appears at about the same rate as the Basic program running at its fastest speed.

To slow the machine code program down to where all the bits may be visually observed, delete the last three program instructions and insert Table 3.

These steps slow the microprocessor by a factor of around 100,000. You may want to try loading different values into register pair BC. Loading BC with 0000H decrements it 2¹⁶ (65,536) counts before both B and C are zero again. Loading BC with 0001H causes the minimum delay.

You may return to Basic at any time without going through Reset and losing programs in memory by pressing and holding the Break key until the Basic prompt appears. It may take a second to work through the delay routine and get to your break signal. You may return to the machine code routine by exiting Basic with a System command, then answer the asterisk prompt as before.

When in Basic, enter and run:

- 20 CLS:INPUT "ENTER A NUMBER BETWEEN 0 AND 255 INCLUSIVE";N
- 25 IF N<0 OR N>255 GOTO 20
- 30 OUT 124.N
- 35 S\$ = INKEY S: REM WAIT FOR ANY KEY DOWN
- 40 GOTO 20

For each decimal number entered the LEDs should indicate the equivalent binary number.

Here's one for the Trekkies. Enter and run:

Press L to go left. Press R to go right. Neat. This is still just a fancy version of turning a switch on and off.

Now that digital information is released from the confines of the personal computer, it remains to be converted into a form meaningful to the physical world.

Next month we will explore the applications of digital-to-analog conversion as a means of sophisticated control.

Our professional quality software development tools let you program your **TRS-80** with more ease and power than you ever imagined possible. Programming will become a pleasure when you use our full screen editors. These editors are not just patched up word processors. They have been specially designed to enhance the BASIC and ASSEMBLER programming languages. Our assemblers provide full screen option menus to relieve you of the burden of remembering command names. Combine user oriented features like this with the finest and most extensive documentation in the industry and you will see why programming a TRS-80 is now better than ever.

T-ZAL: TAPE BASED ASSEMBLER: Assemble to memory or tape. Create relocatable SYSTEM tapes! Includes relocating LOADER pgm. 8 character symbols with XREF. Upgrades to disk when you do! Mod 3 Cat # 1250-20 \$ 49.95

FULL SCREEN PROGRAM TEXT EDITORS: All CAU full screen editors support four way cursor motion and scrolling with user selectable auto repeat and scroll speeds. Totally visual character insert, delete, and change. Block move, copy, delete. Global find and change. Editor for BASIC also provides automatic line renumbering and 26 userdefinable macro keys. For Tape and Disk BASIC: Mod 1 Cat # 1010-20 S24.95 Mod 3 Cat # 1210-20 S29.95 For Mod 1 EDTASM source files: Tape. Cat # 1010-31 S34.95 (Disk version shipped on tape.)

M-ZAL: DISK EDITOR/ASSEMBLER:

Modular Assembler Language development system includes full screen text editor, multipass assembler, and object module linker. Allows 8 character symbols and source file chaining/nesting with *INCLUDE cmd. Full support for relocation and global symbols. Symbol table with cross reference. Req. 32K Disk system.

WHAT DOES BOMCROCOMPUTING DO FOR YOU?

provides you with more information on your TRS-80* than any other single source gives you 20-30 new programs to use each month

- · reviews equipment and software so you know what or what not to buy
- gives you the truth about the TRS-80—its good points and its limitations (80 Microcomputing is not affiliated with Tandy)
- lets you save money—lots of it—by comparison shopping within the ad pages
- · clues you in on how other TRS-80 owners are using and updating their systems
- · lets you in on what is really happening in the industry
- brings you Wayne Green's outspoken and often controversial editorials every month
- and best of all it gives you a no risk subscription offer —

Subscribe today – if you are not satisfied with the first issue—write "cancel" across your invoice and send it back. The 80 Microcomputing is yours to keep.

crocomputin

The greatest program Radio Shack has released.

Profile

Profile Tandy/Radio Shack Ft. Worth, TX \$79.95 Models I & III \$180 Model II

Bill O'Brien 11 Dongan Place New York, NY 10040

Profile is probably the greatest program Radio Shack has released, far surpassing the potential of Microfiles, although it costs \$20 less.

What makes it so great? The higher priced Microfiles lack useability; the user can access data stored in Profile, using it to provide information for programs which can be manipulated and output outside the Profile environment.

Profile is a data storage/retrieval system available for the TRS-80 Model I. It consists of four sub-programs—Init, Access, Print and Profile—and uses Disk Basic with one drive, with additional drives and a line printer optional.

The User's Manual begins with a general description of the terms used throughout the instructions, and the reminder that you cannot use the lowercase driver to enter data. Standard computer format is data entry with uppercase characters only. Lowercase is great for word processing, but it's not that great a loss. (For those of you keeping score, Microfiles has the same restriction.)

Profile is a machine language program that loads through DOS and asks the user, "How Many Drives (1-4)?" Be sure you have the program disk in drive 0, there are calls to other routines stored on that disk. Also, a formatted disk should be in any other drives.

In a few seconds your screen will be

ablaze with life as the Profile program takes control. You will see a program header at the top of your screen, what appears to be operating instructions at the bottom of the screen (they are non-functional at this point in the program), and below that, the important message: Set Up Your Form—Press <Break> When Done.

Creating the Field

First, using the arrow keys to move the cursor, retitle the file by overwriting the program title line: **PROFILE DATA FORM** can be changed to: **MY DATA FILE**, or any other heading you want to give it. Then create the fields you want to store data in:

ACCOUNT NAME:	
INVOICE#:	
DATE:	
AMOUNT:	* * * * * * *
PO/JOB#:	
POSTED/PAID:	
CHECKED#:	

Field headings can be whatever you choose, and are created by typing each literal (the field names are literals, while the values we will insert are variables), a colon and a space (which Profile recognizes as a delimiter), and whatever characters you decide to use to mark the size of the fields. (Periods are acceptable, but, as in the example, other characters are permissabledollar signs, for instance, to mark monetary fields.) Keep in mind that the top line of the screen is used solely for the file title, and the total space available for field information is 255 characters. If you exceed this limitation (after entering all those dots and slashes) a Data Too Long message appears and you must reformat the file content.

If you find that you've made a mistake anywhere, use the arrow keys to position the cursor over the error, or use <shift> D to delete a character, or <shift> I to insert a space (to add a character or align the field names for a professional look). Make sure that once you finish, the field names and lengths are exactly the way you want them. When you press the Break key you're stuck with it, and making changes later is a lot of trouble.

Sorting

After entering data you can sort it by any of the fields you established. When the program looks at an entry, it sees it exactly as it has been typed. If we sort by a numeric field in ascending order (included in Profile is a search routine where the same rules apply), and two of the entries are \$1104.20 and \$9.68, something strange will happen.

Any common fool can tell that \$1100 is more than \$9, but the computer is no common fool; it's a very special kind of half-wit that takes everything literally. Therefore, as the computer sees it, nine is greater than one, so one comes first. Any numeric entry should have all spaces filled with zeroes. If our field is seven characters long, then 0023.89, 1404.13, and 0002.66 will produce the correct sort and search responses.

Searching for a particular entry or group of entries is accomplished by stating the field heading, and then specifying what qualities the found entries should have in relation to a comparator, which you enter using FORTRAN-like specifiers (NE, EQ, GT, LT, LE or GE for not equal, equal, greater than, less than, less than or equal to, and greater than or equal to.) For example, if you have an invoice number you want to search for, use INVOICE# as the field. EQ as the comparator and the number in response to the Search For question. If you want a range over or above the number specified, use GT and LT, or GE and LE if you want the entered number included.

The final option available is the printout.

Ever tried to read computer sales literature? Ever tried to talk to a computer salesman? Ever tried to make a decision about which computer to buy?

Yes...then you know what frustration is. Help is on its way. Desktop Computing premiers this fall. The first and only computer magazine written in plain English. Preposterous? Not at all. It is possible to explain computers without all the "computerese." That is what Desktop Computing will do each month. Send the card today for a no-risk subscription that will give you the kind of understandable, useful information on computers you've been waiting for.

Why do you need a plain-English explanation of desktop computers? Because they have just come of age and are saving thousands of businessmen like you an amazing amount of money. They not only save money, do things faster, provide access to more information, allow a smaller staff to do more work, they also allow you to get into services for your customers which were not practical before. You can provide more services at lower cost. To get in on the savings and expanded customer services, you need information. Desktop Computing will bring you that information. Desktop Computing will cut through all the technical hocus-pocus.

In this time of high interest rates, a truly low cost desktop computer system (usually a microcomputer system) is a welcome event. Let Desktop Computing explain what these systems can do for you. The subscription price is \$25 a year

but as a charter subscriber you can get the first year for only \$17.97, totally tax deductible.

> Call toll-free: (800) 258-5475 or mail the coupon below.

Here's a look at some of the articles \$17.97 will bring you:

- •When a small Business Computer Arrives, What Happens to the Small Business?
- •Letter to Hemingway RE: Word Processing
- Professional & Small Business Microcomputers: Buying, Using and Fixing a System.
- •Adequate Backup: Protecting the Data in Your Computer.

Wayne Green, the publisher of Desktop Computing (and also of Kilobaud Microcomputing and 80 Microcomputing—both successful computing publications) has gone through both the agony and joys of working with computers. He has lost a quarter of a million on a mainframe big boy computer only to come out on the other side with all the frustration necessary to run a 200 employee publishing firm on several TRS-80's.

Wayne has a reputation for being honest and unafraid. He'll make sure you get the truth. In the meeting introducing the idea of Desktop Computing to his staff Wayne said,

"Our objective is to be the only computing magazine written in plain English."

So that is what you'll be getting—honesty and directness. Desktop Computing will give you all the information you need on computers in plain English.

This charter subscription is available for a short time only. Send the card today for the premier issue—October 1981—and get the information you've been needing for only \$17.97.

Desktop Computing

Relief is here for only \$17.97

YES Sign me up as a Charter Subscriber to Desktop Computing. I will get one year of the only computing magazine written in plain English for \$17.97 (a savings of 50% off the newsstand). My subscription will begin with the premier issue—October 1981.

Your first move will be arriving by mid-October 1981.

■TRS80 color

rom the January 1981 issue of the CSRA Compute There was some amusement at the Novem-ber meeting when the Radio Shack repre-sentatives stated that the software in the ROM cartridges could not be copied. This month's 68 Micro Journal reported they had disassembled the programs on ROM by covering some of the connector pins with tape. They promise details next month. Never tell a hobbust somethine can't be droug The tell a hobbyist something can't be done! This magazine seems to be the only source so far of technical informations on the TRS-80 color computer ** Devoted to SS-50 6800 and

6809 machines up to now, 68 Micro Journal plans to include the TRS-80 6809 unit in future issues.

To get the MOST from your 6809 CPU - This is the BEST SOURCE! The ONLY Magazine for the 6809 Computer Months Ahead of All Others!

68 MICRO JOURNAL -91 3018 Hermit Road HIXSON, TH 37343

USA 1 Yr - \$18.50 2 Yr - \$32.50 3 Yr - \$48.50 "Foreign Surface Add \$12 Yr to USA Proce Foreign Air Mail Add \$35 Yr to USA Price "Canada & Mexico Add \$5 50 Yr to USA Price

FLOPPY DISK DRIVES "... the computer is no common fool; it's a very special kind of half-wit that takes everything literally."

During the display/edit mode you can get hard copy of the entry displayed.

If it is your first run through the printing section, you will be asked to construct a print format. This consists of three lines of data: the title line, the column headings and the data line(s). One hundred and thirty-two columns of print are available; the screen scrolls sideways as you pass the 64-column mark that would normally terminate a video line. Again, the choice of literals is up to you, although title headings should have something to do with the field headings you entered. The field headings themselves may be used as column titles.

When you're done, tell the computer which fields are to be placed in what spaces. You then specify which field you want, its relationship to the comparator you've selected, and the program begins to print.

Fooling Profile

The one thing Microfiles has over Profile is that it will work with a serial printer whose driver you have loaded into memory while Profile won't. Whoever created the program included a routine to check if there was a printer attached to the parallel port (there's a memory location in the machine that gets loaded with a certain value; if that value isn't there, Printer Not Ready is written on the screen).

Remember I said it was a machine lanquage program: and you're as big a klutz with machine language as I am, right? Don't fear, pilgrim, there is something you can do (no, not call Texas). Have you got a copy of NEWDOS or T-BUG around? (Aw, c'mon, everybody's got a copy of T-BUG.)

The offending portion of the code in the Print program looks like this:

LD	A,(37E8H)
CP	80H
JR	C,7CA8H
	CP

7C88 21003E	LD	HL,3E00H
7C8E 222040	LD	(4020H), HL
7C91 214875	LD	HL,7548H
7C94 CD2752	CALL	5227H
7C97 CD4552	CALL	5245H
7C9A CDCE76	CALL	76CEH
7C9D FE01	CP	01H
7C9F CA2152	JP	Z,5221H
7CA2 FEOD	CP	ODH
7CA4 28DE	JR	Z,7C84H
7CA6 18EF	JR	7C97H

Bear with me, its not that complicated. I did it right, and as far as I'm concerned. Bill Barden might as well be reciting The Epic of Gilgamesh in the original Sumerian.

The NEWDOS Fix

If you have NEWDOS, run Superzap. With a backup copy of Profile in the drive, select the DD option, the disk drive number, track C. sector 9 (that's the position it was in on my copy). Look for the sector display that matches Fig. 1. Type MOD C1. (This is the position in the sector of the first disk location we will modify.) The screen will blink. an M will appear at the beginning of the line and you can now proceed to modify it. To do this, type "0" 72 times, covering the values 3A through EF. Press Enter and Y, making the modification permanent. This changes the instructions in the listing above to NOP, which is the same in machine language as a line number, and a colon followed by a blank line in Basic. The computer knows the lines are there, but skips over them, since there is No OPeration to be performed.

We just changed the code that told the computer what it is supposed to do. Originally it was supposed to load a value into the A register from memory location 37E8(hex) (LD is a machine code load instruction), compare it (CP is machine language for compare) to the hex value 80H (128 decimal), and if it found them to be the same, proceed to memory location 7CA8(hex) (JR C,7CA8H is a jump instruc-

"... if no printer is attached, or the driver program was omitted or overwritten, your machine will hang up."

tion if the C register contains a 1, which is the computer's way of saying that the comparison matched).

Otherwise, the computer continues on its merry way down the instructions and we wind up with a Printer Not Ready message. We could have told it to jump there if the C register did not contain a 1, (JR NC,7CA8H is a jump if not); this can be done by typing the same Mod instruction, pressing the right arrow key 11 times and then pressing zero once, changing the line from: 381D, or in assembled form: 381D JR C,7CA8H, to: 301D, or in assembled form: 7C89 301D JR NC,7CA8H.

We changed the 38, which the computer understands as "jump if", to a 30, which tells it to "jump if not"—1D(hex) or 29 address locations, depending, in this case, on the value in C. If we had done it that way, and later hooked up a parallel printer, the value would have to be changed back again or we would get a Not Ready message anyway.

If you want to do serial printing under the display/edit mode, (H)ardcopy option of Profile, one more change has to be made. The code contained in the Access program looks like this:

7311 3AE837	LD	A,(37E8H)
7314 FE80	CP	80H
7316 3809	JR	C,7321H
7318 21 D372	LD	HL,72D3H
731B CD8F72	CALL	728FH
731E C36471	JP	7164H

Still using NEWDOS and Superzap's DD option, select the drive number that the backup copy of Profile is in. For my copy, the track number was 1C, the sector was 3. If it isn't on yours, just match up the sector display with Fig. 2.

Locate the hex digits beginning with 3A (these are the numbers in the second through eighth columns of the listing, the group of six numbers in the first column is the hex address of the program location on the disk) and ending with 71. Fill these 32 places with zeros, and press Enter and Y to make the modification permanent.

You should now have a copy of Profile that will run with a serial printer. However, you should note that if no printer is attached, or the driver program was omitted or overwritten, your machine will hang up.

That wasn't so difficult, was it? And I really don't know how to program in machine language. All it took was a burning desire to get printed output, and some plowing into the Editor/Assembler manual. (And perhaps a truckload of perseverance!)

Now for T-BUG Users

It should be a lot easier for you, but I haven't tried to do it this way. Load the print program. Hold down the Break key and press the reset button. Get into the System mode and load and run T-BUG.

PRINT loads from 7000H to 7CFEH, T-BUG uses 4000H to 42E8H, so there is no conflict of memory. When the asterisk appears, type M 7C84. You should see: M 7C84 3A. Now type 00. The next memory location should be displayed: 7C85 E8. Again type 00 and keep doing that until you've gotten to memory location 7CA7. This is the last memory location you will zero out.

Press Break, put a blank tape in the cassette drive, set it up for recording and press P, T-BUG's Punch command, used to write memory locations to cassette. We need now specify a start address, end address and entry point, plus a name. The start address is 7000, the ending address is 7CFE. Here's where the fun starts.

According to NEWDOS, the entry point is 402D. Normally we would assume that a program's starting point and entry point are the same, but not necessarily. You'll have to try it both ways. Use Print as the program name. The punch line will look like this: P 7000 7CFE 402D PRINT, or P 7000 7CFE 7000 PRINT, depending on which entry ad-

Fig. 2. The Sector Display for ACCESS Minus the Spaces

WE'VE MOVED!

Now we can offer faster and more reliable service --Including UPS upon request!

DUALCASE*

UPPER/lowercase, full time from power-up; NO software; Standard typewriter keyboard operation (shift to UPPERCASE); Control characters can be displayed; 128 Total character set plus full graphics.

SWITCHABLE*

No switches. No driver. Operates from keyboard. Totally disables "PATCH" functions.

KEYBOARD DEBOUNCE*

Extra keyboard debounce, full time from power-up; NO software. If dirty keys are a problem, this is for you.

BLOCK CURSOR*

Replaces the underline style cursor directly. Easier to locate on a full screen. No distracting blinking.

SHORT CASSETTE LEADER*

For tape based systems. Does NOT change baud rate. Only shortens recorded leader. Saves four seconds of waiting time. Great for data files! No conflict with high baud rate cassette systems.

ELECTRONIC SHIFT-LOCK*

No extra keys or switches. Simply tap either shift key, UPPERCASE lock, normal shift unlocks.

ORDER INFORMATION

"THE PATCH" is not only a lowercase modification, but a complete system offering many of the enhancements you would like available on your TRS-80. How is this possible? "THE PATCH" is a "smart chip" which monitors the same address lines as the ROM in your TRS-80 Model I Level II. "THE PATCH" recognizes certain addresses, turns off the LII ROM, then substitutes its' own byte of data. This "Patching" is what allows ALL these enhancements with NO software overhead, thus NO software conflict. In fact "THE PATCH" is the ONLY lowercase modification that is compatible with both Basic and machine language programs AND the ONLY all hardware lowercase modification.

You install "THE PATCH", no need to send your TRS-80 away so there's no hidden installation cost. Detailed instructions guide even the most inexperienced owner to complete installation in about 30 minutes. Works with the two or three chip ROM set. "THE PATCH" unit plugs into the ROM sockets (does not replace existing ROM). Lowercase does require installation of the extra video RAM (supplied with "THE PATCH").

"THE PATCH" is compatible with any word processor, any DOS and also other languages which use ROM sub-routines. "THE PATCH" is never obsolete. As new features become available they can be installed in your "PATCH".

"THE PATCH" is covered with a one year limited warranty on materials and workmanship. (Does void Radio Shack's 90 day warranty). Ask for details . . . we can install for a small fee.

CALL NOW CECDAT, INC. (208) 772-9571

"Always experiment on backup copies of data... Tattoo that on your arm somewhere."

dress you've used. Press Enter and the tape should start recording the program. Now go back to DOS and run TAPEDISK to create a disk file with the same Print.

When you've done that, or if you find that the entry address doesn't work, turn the expansion interface and the CPU keyboard off. Take any disks out of the drives first; this will ensure that all memory locations start up clear. You should then repeat the procedure for Access, modifying addresses 7311 to 7320 with 00 as in Print. Again we are faced with the entry point problem, giving us the following punch lines: P 7000 7460 402D ACCESS or P 7000 7460 7000 AC-CESS. You don't have to press Enter this time, since the file name is six characters long. Make sure there is a blank tape in the cassette recorder set for record before you type this out. T-BUG starts the process automatically. Run TAPEDISK again, creating the file Access.

When you create the disk file, *do not* use an extension (/CMD, /BAS, whatever) on the file name. You may specify the destination drive. When you're creating the tape file, make sure you start the tape on the tape and not on the leader. I only mention this because I've done it myself. There you have it. See, it was easier than using NEWDOS (maybe). Remember, even hate mail costs money to send.

Data Manipulation

You still can't specify a range of data within the data base. (Please remember that although Microfiles is advertised as creating a data base, it actually complles only a data set, not something that can be accessed, and the data manipulated, used, or modified by an alien program source as may a true data base.) Nor can the data be acted upon in any way but the ways imposed by Profile. But hang in there.

When Profile initializes the disk it grabs up all the available space it can and formats the disk as if it had files to store there. Take a look at Fig. 3. If you get the chance to look at a formatted diskette, you will notice that the only data is coded E5. See the difference? Think of the asterisks as claim markers that Profile uses to mark off disk space. It's a shame all those neat rows of asterisks have to be spoiled by the periods.

Notice that the data stored is 2A, and as long as there is a 2A there is an asterisk. When we have a period, there is an OD. If we realize that 2A is a hexadecimal number whose decimal equivalent is 42 (2*16 + 1*10), and then look at page C/2 in the Level II manual, we would see that 42 is the ASCII decimal code for an asterisk. OD, on the other hand, is decimal 13 (16*0 + 1*13), and that's a carriage return (where there is an ASCII character available for the code displayed, we see it; where there is none, Superzap places a period in the spot). Wouldn't it be nice if there was a function in Basic that creates a string like that, and something in Disk Basic that handles such a file? Oh, but there is! Ever hear of line input? Let me quote to you those blessed words from the Book of DOS, chapter 7, verse 42:

LINEINPUT (or LINE INPUT—the space is optional) reads everything from the first character up to:

1) an <EN> character not preceded by <LF>

2) the end-of-file

 the 255th data character (this 255th character is included in the string)

Although the TRS-80 generates a line feed (LF) with a carriage return, only the carriage return is stored (OA is the hex value of a line feed). We seem to satisfy the requirements of line input for data retrieval from disk and at the same time, answer the burning question why we cannot store more than 255 characters.

Take a look at Fig. 4. It shows a sample set of data filed using the fields we specified at the beginning of the article. As usual, the first column of six numbers is the disk storage location of the data. If we go back for a moment to the file we set up and count the total elements in all the fields, we'll find our file length is 63 characters. If we then count out 63 hex numbers (each hexadecimal number is a pair, so the first line contains 16 numbers, the first of which is 49, followed by 4E, 20 and so on), at the end of 63 of them we find our friend OD. To read this data all we have to do is write a program:

100 OPEN "I", 1, "PRODAT:O":REM IF PRODAT IS ON DRIVE O

110 PRINT"DO YOU WISH TO ACCESS A FILE?"

120 A\$ = INKEYS:IF A\$<>"Y" AND A\$<>"N" THEN

120

- 130 IF AS = "N" THEN 210
- 140 IF EOF(1) THEN PRINT "END OF FILE REACHED":GOTO 220
- 150 LINE INPUT#1, DATAS
- 160 IF LEFT\$(DATA\$,1) = "-" THEN PRINT "END OF DATA":GOTO210
- 170 IF LEFT\$(DATA\$,1) = CHR\$(192) THEN PRINT "DELETED FILE": FOR X = 1 TO 500:NEXT X:CLS GOTO 140
- 180 PRINT DATAS
- 190 PRINT"ANOTHER ?" 200 A\$ = INKEY\$:IF A\$<>"Y" AND A\$<>"N" THEN 200
- 210 IF AS = "Y" THEN CLS GOTO 140
- 220 CLS:CLOSE:END

This is the skeleton of a sequential access program that can be used to read the disk data. We can customize the program to search for a particular value contained in the 64 character string (63 data characters plus the carriage return) using MID\$. To handle the data, we would again use the MID\$ function to break down the main string into substrings. We could then convert any numeric data we need from string form with the VAL function. Unfortunately, it's not simple to use sequential access to write to the disk file. We would have to input all the data, modify it, and then rewrite the entire file back to disk again. Otherwise, writing to disk under that mode would set the pointer back to the beginning of the file and all stored information would be lost. Always experiment on backup copies of data. If you make a mistake, the data will still be available. Tattoo that on your arm somewhere.

Suppose we wish to write some modified data to the file without entering Profile, using random access techniques. When we deal with random access, we retrieve or store data with the GET and PUT commands 256 character buffers. When we deal with less data than would fill a buffer, we can form the small data packets into a large group, using an array that will fill the buffer more efficiently. Using the same array, we can also retrieve the data.

"None of the MK functions allow for the storage of a single byte; it must be converted using ASCII."

By accident, our file contains a total of 63 characters plus the CR. Coincidentally, 64 can be divided into 256 an even four times. If we planned to use random techniques, we should make sure our data adds up to a number that, plus 1, will be evenly divisible into 256, as the Profile manual suggests. That means 3, 7, 15, 31, 63, 127 or 255. (Profile files are dumped to disk one after the other. If we try to access a file that does not conform to the above lengths we will find each buffer's remainder contains data which will be left out of the next GET call.) We could use a program like this:

- 100 Open "R", 1, "PRODAT:0"
- 120 EF = LOF(1)
- 130 FOR PF = 0 TO 3 140 FIELD 1, (PF+64) AS DUMMFILES, 63 AS DATAS
- 150 NEXT PF
- 160 INPUT"FILE NUMBER: ":N
- 170 IF N> EF-4 THEN PRINT "OUT OF RANGE":FOR
- X = 1 TO 500: NEXT X:CLS: GOTO 160
- 180 FP = ((N-1)/4) + 1190 PN = N-((FP-4)-3)
- 200 GET 1, FP
- 210 IF LEFT\$(DATA\$(PN),1) = CHR\$(192) THEN PRINT "DELETED FILE":FOR X = 1 TO 500: NEXT X:CLS: GOTO 160:REM CHR\$(192) IS USED TO FILL THE POSITIONS IN A DELETED FILE
- 220 IF LEFT\$(DATA\$(PN),1) = "#" THEN PRINT "NO SUCH FILE": FOR X = 1 TO 500: NEXT X:CLS: GOTO 160
- 230 PRINT DATAS(PN)
- 240 PRINT"ANOTHER ... ?'
- 250 A\$ = INKEY\$:IF A\$<>"Y" AND A\$<>"N" THEN 250 260 IF A\$ = "Y" THEN CLS:GOTO 160
- 270 CLS: CLOSE: END

Again, it's a skeleton program. Flesh it out for specific fields, to change drives if more than one is used for storage and to search for particular pieces of data in string.

Infofile

Did I just say "change drives"? How the heck can the program know if I have more than one drive? Allow me to introduce you to Fig. 5a. This is a section of a diskograph for another file created by Profile, called Infofile.

The first pair of hex digits (a hex pair is called a byte) 18, convert to decimal 24. It just so happens that in this file I have stored 24 records. In fact, the first two bytes in this record of Infofile contain the number of records currently in the Prodat file. It is saved to disk using the MKI\$ in a random file mode, since it will always be an integer. If it had a numeric value larger than one byte (not simply 1800, which has no value in the second byte), it would not necessarily have been directly readable without using the alternate CVI function to reconvert it to a numerical value.

The next two bytes (A007) are the MKI\$ converted value for the maximum allowable number of files. followed by the single byte, 01, which is the maximum drive number. (This value is stored as CHR\$(n) where n is the maximum drive number. None of the MK functions allow for the storage of a single byte: it must be converted using ASC.) The two bytes, 0000, note that there are no deleted records in this file. Had there been any. their number would have been stored here. The next piece of data, 40, is the length of the record, 64 (63 characters for the file data plus the carriage return). As with the maximum drive number and the following byte, 07, (which is the number of fields assigned at initialization) this was stored as a CHR\$(n) and can be converted to its numeric value with the ASC function. The last four byte pairs tell us what the highest file number is on drives 0, 1, 2 and 3 respectively.

Fig. 5b is the second sector of Infofile, showing our field names and a small amount of additional data. The first 13 bytes are allotted to the field name itself, while bytes 14 and 15 are the MKI\$ equivalent of the screen print position, plus 15360. (Therefore, if printing to the screen we would use Print @, CVI(x\$)-15360.) Byte 16 is the length of the field. If we look at the

Dynamic Report Generator No Programming Required

- . Maintain different data files, each with its own set of internal logical relationships.
- Permits user to define customized report formats and column headings.
- . Specify arithmetic relationships between columns.
- Automatic sorting and file compression.
- Keyed index for rapid retrieval of data.
- . Redefine index by exchanging it with other report columns
- Flexible add, delete, and list modes. .
- Edit mode allows headings and arithmetic relationships to be altered without re-entering data.
- List mode allows for selected ranges and optional sub-totals.
 - FOR USE ON 48K-TRS-80 MOD 1, 1 DISK AND PRINTER.

"The user's manual gives a great program for extracting this data from a specified file number."

line that contains the field Account Name, we see the final byte is 17, 23 decimal, the length of our entry for that field.

Procedures

The first thing we must do is define some variables. We'll use the ones that are provided in the Profile user's manual:

- The Number of Records in Prodat, including any NR deleted records
- The Maximum Number of Records Allowed MX The Maximum Drive Number MD
- The Number of Fields in the Record NF
- "I" is an integer between 0 and 3. D(i) is the D(1) highest record number stored on disk drive "I"

And now some program lines:

100 CLS: CLEAR 1000

- 110 OPEN "R",1, "INFOFILE:0"
- 120 FIELD 1, 2 AS NRS, 2 AS MXS, 1 AS MDS, 2 AS DRS, 1 AS RLS, 1 AS NFS, 2 AS D\$(0), 2 AS D\$(1), 2 AS DS(1)

2 AS D\$(2), 2 AS D\$(3)

Usually when dealing with a random access file, we'd use an array to break down the elements in the 256 character buffer. However, here we are only interested in the elements we need for the program.

130 GET 1.1

140 NR = CVI(NRS); MX = CVI(MXS); MD = ASC(MDS); NF = ASC(NF\$): FOR DN = 0 TO 3: D(DN) = CV(D\$ (DN)): NEXT DN

Normally, we would then get the second buffer and discover the field names and lengths. The user's manual gives a great program for extracting this data from a specified file number. As we already know these things, we can bypass that section.

150 CLOSE 1

We will assume that the first 90 lines of the program load all the account names and addresses into a matrix in memory, MASTERLIST\$, which will be used to coordinate the data from PRODAT. (Otherwise, we should have three disks on line, two for Profile and one for the account data.) In the program lines that follow, we will use the variable EF to indicate the numeric position of the final entry in MASTERLIST\$ and the variable RP to indicate any intermediate relative position within the matrix.

```
160 DN = 0 (DNS = STRS(DN)
170 OPEN "R".1. "PRODAT:":DNS
```

- 180 FORI = 0 TO 3
- 190 FIELD 1, (I+63) AS DUMMYSTRINGS, 23 AS NMS(I), 6 AS INS(I), 8 AS DTS(I), 7 AS AMS(I), 7 AS POS(I) 8 AS PDS(I), 4 AS CKS(I)
- 200 NEXT |

Now use the data in Masterfile\$ to check out the status of the accounts stored in PRODAT.

- 210 FOR RP = 1 TO EF 220 FOR BN = 1 TO INT(D(DN)/4)
- 230 GET 1, BN
- 240 FOR1 = 0 TO 3
- 250 IF LEFT\$(NM\$(I),1) = CHR\$(42) THEN 280 260 IF LEFT\$(NM\$(I),1) = CHR\$(192) THEN 1000
- 270 IF NM\$(I) = MASTERFILE\$(RP,1) AND LEFT\$(PD\$(I).1) = "." THEN 2000
- 280 NEXT I, BN

Line 250 procedes to the next record in the subfile if the entry being currently examined was deleted. Line 260 sends the program to a controlled error message if the end of the stored data has been reached and no information has been recovered for a given account name.

290 DN = DN = 1: DN\$ = STR\$(DN): IF DN>MD THEN 310 300 CLOSE 1: OPEN "R", 1, "PRODAT:";DN\$:GOTO 220 310 IF DN<>0 THEN DN = 0: CLOSE 1: DN\$ = STR\$(DN): OPEN "R", 1, "PRODAT:";DN\$ 320 NEXT RP

The loose end, lines 2000-xxxx, is merely a print statement that will send the information to our line printer (formatted to reflect page number of account statement on a per account basis) and performs the addition necessary to give total due amounts.

Fig. 6 is a small program for single disk users that will read each of the Prodat entries over a given range of dates (for instance, if you wanted the entries for August you would use 08/00/80 in response to the Greater Than question and 09/00/80 for the Less Than prompt), print the account name, invoice number and amount with pagination and, when done, print the total amount involved. More fields for manipulation can be specified and other actions performed

on the data by simply following the pattern the program provides.

That's it. Those few lines are all it takes to turn Profile into more than just an overpriced in-memory Information system for disks. We now have available to us a feature seen on many, if not all, of the large multiuser computers: an accessible data base of information! For a relatively small machine such as the TRS-80 that is some accomplishment!

If you're not a business and have no accounts receivable to take care of, don't think you can escape Profile. Do you collect comics? Magazines? Computer Programs? What about all you CB and amateur radio operators? Want your logs up to date?

Forget about Microfiles. Its' expanded entry formatting is very nice if all you want to do is enter data and recall it according to the parameters present in the program itself. But what good is collecting information if you can't do whatever you want with it?

Profile gives you this added flexibility, and at a cheaper price. (Isn't that against the law?)■

A home inventory program that remembers the little things.

Wordly Goods

John E. Fail 6170 Downey Ave. Long Beach, CA 90805

Ave you ever wondered about the possibility of your house being burglarized or burning down? We live with this possibility every day whether we are at home or not. In the event of such a catastrophe your insurance should cover the loss. However, when the insurance man comes to call, will you be able to accurately recall all the items you have lost? Chances are you will remember the tv set, the couch, the computer, the major items in your household; it is the little items you will not easily recall—tools, pictures, jeweiry and the like.

This program, for a 48K system with two disk drives, catalogs 300 items per room and provides a line printer routine. Depending on the total items in your inventory, you could utilize one file for all items in your household. Included in the program are full correction and deletion routines. Categories included in an individual file are: location; item; data purchased;

Fall Family Household Inventory
Directory
1 = Load Data From Disk
2 = Look at List for Living Room
3 = Save Data on Disk
4 = Printout of Data on File
5 = Delete an Entire Entry
6 = Correct an Entry
7 = Add Entries to File
8 = Print Total Value of Living Room
9 = Item Search by Name
Your Selection Please?
Fig. 1 Directory Layout

Cost \$ 995.00	Mfr/Dealer Sears	Date
\$ 995.00		
	Sears	02/05/8
\$ 140.00	Sears	03/01/8
4)		
\$1000.00	Dooleys	04/01/8
\$ 40.00	Sears	01/01/8
	4) \$1000.00 \$ 40.00	4) \$1000.00 Dooleys \$ 40.00 Sears

initial cost; business the item was purchased from; serial number; and comments.

The program is straightforward, user oriented and prompting at all points. The scheme is to set up individual files on a separate disk by room. The other alternative is to file your inventory on the program disk providing the inventory is not too large. The inventory program can be used by 32K systems by adjusting the clear statement in line 20 and the dimension statements in line 25. Line 30 should be changed to fit your family name.

After you have run the program, entered files for your inventory and are ready to save to disk, you will be prompted by the program to provide a filespec for writing to disk. This list of filespecs will be provided just prior to loading from or to disk. The user should change lines 13010 and 13020 to his or her own filespec if those in the program are not acceptable.

A word of caution—plenty of string space is provided in the clear statement in line 20, however, don't get too carried away with large comments or string space will be used up fast.

When first running the program and entering files, the first item entered will call for a location. No further locations will be asked for during the course of the entries. The program will automatically print that location in all entries after number one. If you are not using separate files for all rooms in the house but use one file for the entire household, a single filespec will be used to answer the location question. On the first entry use a word such as "household." If you are using separate files for each room, assign that room's name to the location question and separate the rooms by filespec when saving and loading from disk.

Search, Delete and Correct

The search section is based on key words. When searching for an item, the item variable is compared against the first three letters of the search request input. For example, suppose you have three chairs in a room. When you are requested for an item to search for, enter chair. The program will then search out the first chair encountered and print it out. The program will then ask if this is the correct chair; if not, the program will continue the search. If no comparison is found, the program will so advise you. When entering data into the item section, use the major subject first, such as chair, couch, television, computer. If you still cannot find the item you are looking for there is always the 'Look At List' function on the menu to locate an item.

The deletion routine is very straightforward. When an item is deleted, all other items are moved up one to fill the space left by the deleted item. When the deletion routine is called, the program will check with you to be certain you are indeed deleting the item you wish to delete.

The correction routine operates much like the deletion routine. It checks to make sure this is the item you wish to correct, and then displays an input form similar to the normal entry input routine. You need only enter the portion to be corrected. If the item, cost and dealer information is correct and you only want to enter a new serial number, merely press Enter for the items you do not want to change and enter the new data in the serial variable. All information in the other columns will remain unchanged.

The Line Printer Routine

The line printer routine is set up for 80-column printers to maintain compatibility with most any printer in use these days. The printer function is very handy for keeping a permanent record of the inventory. You can run out a copy of each listing and keep it in a safe place, such as a friend's home, your place of employment, or a safe deposit box. This ensures the list will not disappear with the house or burglar. It may be a good idea to keep a separate copy of the program disk and data disk outside the home also. The listing automatically prints "a value of room routine" at the end of the printout. This function is also available on the video for a quick check of the total value without a printout.

Readers without line printers should remove the 4000 series of line numbers to prevent locking up the program in case of inadvertently going to that function. This program can also be used by cassette-based systems merely by changing the 1000 and 3000 series of line numbers to accomodate cassette I/O.■

Color computer owners, 32X PLUS DISKS \$298.

Yes, that's right - for as little as \$298.00 you can add 32K of dynamic RAM, and a disk interface, to your TRS-80 Color Computer! If you just want the extra memory it's only \$199.00, and you can add the disk interface later for \$99.00.

Just plug the Color Computer Interface (CCI), from Exatron, into your expansion socket and "Hey Presto!" - an extra 32K of memory. No modifications are needed to your computer, so you don't void your Radio Shack warranty, and Exatron give both a 30 day money-back guarantee and full 1 year repair warranty on their interface.

The CCI also contains a 2K machine-language monitor, with which you can examine (and change) memory, set break-points, set memory to a constant and block-move memory.

So what about the CCI Disk Card? Well as we said it's only an extra \$99.00, but you'll probably want Exatron's CCDOS which is only \$29.95 - unless you want to write your own operating system. The CCI Disk Card uses normal TRS-80 Model I type disk drives, and CCDOS will even load Model I TRSDOS disks into your color computer – so you can adapt existing TRS-80 BASIC programs.

As a further plus, with the optional ROM Backup adaptor, you can dump game cartridges to cassette or disk. Once the ROM cartridge is on cassette, or disk, you can reload, examine and modify the software. The ROM Backup adaptor is only \$19.95.

For more information, or to place an order, phone Exatron on their Hot Line 800-538 8559 (inside California 408-737 7111), or clip the coupon.

HIGH SPEED CASSETTE SYSTEM

FOR TRS-80*

[Reprint of June 1980 Review, 80 Microcomputing]

ambiguities. Important parts placements are stressed (polarity markings on electrolytics, bands on diodes, etc.).

JPC was right! With these instructions, you couldn't go wrong. The board quality is excellent. It is double-sided and parts locations are clearly marked on the component side of the board. There are no jumper wires to install. JPC utilizes PC traces and plated-through holes for connections to traces on the other side of the board.

Also, there are absolutely no adjustments or settings to bother with.

The documentation is a sheaf of $8\frac{1}{2} \times 11$ papers stapled together. It is written in the nicest format 1've seen in a while. Each command and/or subjects is covered on its own sheet in large type. All explanations are in easy to read English—not computerese.

Commands and Features

SAVE"filename": Saves your BASIC program on cassette.

LOAD: Reads the next BASIC program from the cassette.

LOAD"filename": Searches for and loads the specified file from cassette.

LOAD? and LOAD?"flename": Reads file from cassette, and compares contents to memory.

LOADN: Prints a list of all the programs on a cassette, until interrupted by the "break" key. LOADN"filename": Same as above except the tape will stop at the end of the program named. KILL: Removes the file manager program from memory so that the extra memory can be used by large programs.

RSET: Allows the operator to rewind and position the tape on tape recorders that have these functions tied to the motor control jack.

RUN"filename": TC-8 searches for a specified program and runs it immediately.

PUT"filename": Same as SAVE "filename", except it is for use with system tapes.

GET: Same as LOAD, except it is for use with system tapes.

GET"filename": Same as LOAD "filename", except it is for use with system tapes.

GET? and GET?"filename": Same as LOAD? and LOAD?"filename", except it is for use with system tapes.

GETN and GETN"filename": Same as

LOADN and LOADN" filename", except it is for use with system tapes.

OPEN: Required before cassette input or output of a data file can be attempted.

CLOSE: Required to end a cassette data file. **PRINT#:** Allows numerical or string data to be output to a cassette file.

INPUT#: Allows numerical or string data to be input from a cassette file.

I haven't counted them, so I don't know about the "one load in a million bytes" claim, but my son, Anthony (age 11), loaded about 30 of his programs from his Radio Shack format tape to a new TC-8 format tape. He's run them all and found no bad loads.

Unlike the standard tape system, you can position your tape anywhere before the program you want and not have to look for a blank spot between programs. The TC-8 patiently waits for the program you want and then starts loading without getting confused by the portion of the previous program you just fed it.

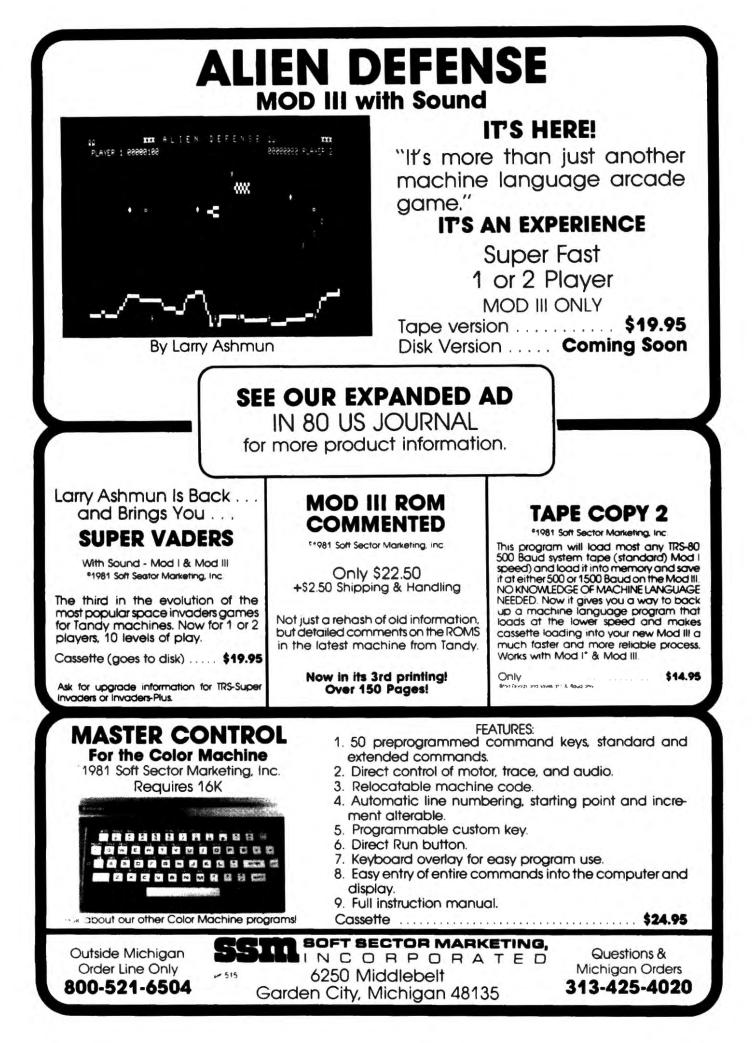

Try that on your regular cassette system; you'll wear out the reset button.

ORDER NOW

To order your TC-8 kit, send your check or money order for \$90.00 plus \$3.50 postage and handling to JPC PRODUCTS CO., 12021 Paisano Ct., Albuquerque, NM 87112 (New Mexico residents add 4% sales tax). Credit card orders accepted by phone or mail. Personal checks will delay shipment. We will otherwise immediately ship you the TC-8 kit, the cabinet, the ribbon cable, the power adapter, an instruction manual, and a cassette containing the software.

JPC PRODUCTS CO. Phone (505) 294-4623 12021 Paisano Ct. Albuquerque, N.M. 87112

For Your TRS-80* Mod I & III

Mod I – \$125.00 °1980 by David Welsh

*1981 by David Welsh

There Is Nothing Even Close®

The word processing system that is easy for the novices but has the power for professionals.

Most used comment when anybody talks about Lazy Writer is "**Easy to Use**". Other Comments:

- "What has moved the Mod I up to at least a triple-A league, if not the true big leagues of writing, is a modest priced word processer called Lazy Writer."
- "All functions of Lazy Writer are well covered in its documentation, which ranks among the best I've seen."

Creative Computing, July 1981

 "Now that I have a chance to use and compare Lazy Writer with my other two popular word processing programs, I am sorry that I was not aware of Lazy Writer some time ago."

C.H., St. Louis, MO

Metabasic—an end to the development of new languages.

A Macroprocessor For Basic—Part IV

J. Alan Olmstead

J. Olmstead Financial Engineering Systems 3813 West St., Moritz Lane Phoenix, AZ 85023

nless the Basic programmer is writing in native MetaBasic mode, the Basic compiler will always be an "emulator" compiler (an emulator is a program which reads from one language and translates into a similar language). I wrote my first assembly language emulator in 1967 and can state flatly that no emulator can function with 100% accuracy. I do not write in MetaBasic until the second state of program implementation, preferring to "sketch out" the outline of the program in fast and easy interpreter Basic. This is especially desirable for debugging tricky sections of logic. The interpreter may be relatively slow, but the problems are caught right at the time that the subroutine is being written and is, accordingly, fresh in the mind. That portion is then precompiled into MetaBasic and there are always details to fuss over and change. as much out of style as out of necessity. After a trial compilation and execution under assembly language, any portions of the program which are not exactly as you intended may be written in pure assembly language.

Programs should not be compiled for frivolous reasons. If the application is not time-dependent, is not in need of direct hardware controls for some operational reason, and is not subject to a concern for security, it should remain under interpreter Basic. Although not difficult, the technical environment involves so many details it's not reasonable for anyone, at any level of experience, to expect to realize quick and easy results.

Preparation

Once determined a program needs compilation, preparation is required for the programmer and the program.

The programmer should be well-trained or experienced to the extent that he understands the workings of every Basic command word he uses without reference to the Basic manual. Understanding does not mean mere memorization; it includes an understanding of the conditions under which the instruction will produce its particular kinds of errors and "unspecified results." The programmer should be totally familiar with the compiler manual. The programmer should also know how the computer hardware works, including what the registers do and how they do lt.

The program to be compiled should itself be prepared, keeping in mind that in the compilation process the complex and general are broken down into the elemental and explicit. Multiple-command lines should be broken apart. An error message directing one's attention to a line containing a halfdozen to a dozen commands is nearly as worthless as no message at all.

Error-trapping subroutines are most commonly deficient in applications and systems software, but they are among the most important program elements. The purpose of error-trapping generally is to prevent the uncontrolled termination of program execution by attempting to correct or work around a condition for which the program or the operating system is not prepared. For example, when TRSDOS displays the Ready prompt, preceding the typed in response by a blank space causes the system to respond "What?" If an otherwise valid sequence of characters is typed in which is not a functional command word, the system attempts to locate a program file by that name. Failing, it displays the "Program Not Found" message. Although part of the normal functioning of the TRSDOS program, these are actually error traps.

The best example of an untrapped error is illustrated in For...Next loops which reference an unverified third element (see Fig. 1). The non-trapped code is sure to fail at one time or other, while the trapped code cannot fail—at least due to the LEN(Y\$) as compared to the values possible for "X" due to "A". This kind of trapping may comprise ten percent or more of a program.

Error-trapping for I/O files is particularly important, and the methods differ depending upon the types of files and the types of access modes used for the files.

Most Basic programmers have never experienced a true program "blow up"; the closest they have experienced is a sudden and unexpected clearing of the screen and display of the Ready prompt in what is obviously a Boot-up system status. When a computer program blows up, the computer actually stops. To find out what went wrong requires the skills associated with the debug function, plus those of an experienced Assembly programmer.

Ample use of error-trapping procedures will assure the applications program will

always give a positive indicator of what problem has occurred. Unlike interpreter Basic, the MetaBasic compiled program will not stop program execution arbitrarily when a problem has been encountered. Instead, the error condition register is posted with the code number for the error; the errortrap register is checked to determine if an error-trap line number is active; if it is, the error exit takes place; if not, the operating system merely returns to the user's program after refusing to perform the requested function. The error code may be retrieved at any time by the command "A = ERR". If the command returns a zero, it means an error-free operation was performed since the last error. Every operating system function except ERR resets the error-trap register to zero before performing its requested function.

How the MetaBasic Compiler Works

Nearly every MetaBasic Compiler user will be initially interested in compiling already existing interpreter Basic programs, as opposed to writing new programs specifically for the compiled environment. Accordingly, the Precompiler will be as important as the Compiler itself.

Except for certain definition functions, the first word in a MetaBasic command is always a command word. Thus, the principal job of the Precompiler is to review the interpreter Basic program to ensure every command may be translated into Meta-Basic format, and to do so if possible. If not, an error diagnostic is inserted conspicuously into the output MetaBasic program file.

The Precompiler is a group of three programs. The first program catalogs all refer-

"If the command returns to a zero, it means an error-free operation was performed since the last error.

enced line numbers and makes certain all such lines actually exist. The first line of the program is always defined as a referenced line number, because it eventually will be, even if the program in its original interpreter Basic form does not reference it. Since Assembly does not use line numbers, all referenced line numbers are converted into name tags by inserting the letter L before the number. These appear as new lines in the form "L1000 EQU \$", which is called an "equate" pseudo-operation command used by the assembler to identify a referenced address. From this point onward, the actual

Non-trapped Code	Trapped Code
1000 FOR X = 1 TO A STEP 1	1000 B = LEN(Y\$)

FIXED ASSETS

Put your TRS-80 computer to work keeping track of all information related to your fixed assets and depreciation. This versatile system, developed by a CPA, will compute depreciation according to straight line, declining balance, and SYD methods and maintain the complete audit trail you need for financial and tax reporting, including fixed asset ledger and acquisition and disposal reports. You will be able to project depreciation for current and future years, use different methods for financial and tax reporting, switch from declining balance to straight line when advantageous, compute investment tax credit and additional first-year depreciation. Reports are available in both summarized and detailed formats, and can be organized by general ledger account, location, department, ADR class, and year of acquisition.

Currently available for the TRS-80 Model I with at least 32K and 2 disk drives, and for the Model III with at least 32K and 1 disk drive. Requires Disk Basic and a TRSDOS-compatible operating system.

FAAS-1 for Model I		,			,	,			\$149
FAAS-3 for Model III	1	,		-			-		\$149

TAB132

At last, here is the solution to LPRINT TAB problems with your TRS-80 Model I computer. Increase your programming productivity with this enhancement to Basic. Stop going through string manipulations and contortions trying to overcome the TAB(63) limitation. With TAB132, you will never again have to fret over tabbing past position 63 on your line printer. TAB132 will allow you to correctly tab to any print position up to 255 with the normal TAB() statement.

TAB132 is a machine language routine which occupies 100 bytes of memory, and will operate with either Level II or Disk Basic on the TRS-80 Model I. The TAB132 tape or disk includes modules for several different modes of operation. It can be loaded in the System mode or from DOS, can be loaded and run as a Basic program or merged into your Basic program and activated with a single GOSUB at the beginning of the program. System and DOS modules include a relocating loader to move TAB132 to anywhere in memory. Also supplied is a program which will patch the routine permanently into Disk Basic. Specify media when ordering.

TAB132 on tape ... \$12.95 on disk ... \$14.95

"Effective use of the Concur command is probably the most powerful component in Meta-Basic."

line number of a given line is of no importance.

Because the first line of the program is always the first line to be executed, the precomiler removes all non-executable lines of code (which would normally be ignored by the interpreter) and reinserts them above the first line. These include all dimension statements all data statements, and all declarations of names, both public in the present program and external in other programs. Immediately after the first line, the precompiler will insert all implied Open commands (screen, keyboard, printer), giving the default initialization values for those devices. A Print command will generate a run-time error if the printer is not an initialized ("opened") condition.

Concur

If the user wishes to break the present program into workable parts, or wants other program modules to be loaded into memory at the same time as the present program, he may insert "Concur" pseudo-commands as the first operations performed at the first line of the program. The commands permit naming up to six other program modules to be in memory concurrently with the present program. Concur is exactly like Chain except that control always returns to the user's program instead of being transferred to the newly loaded program module. Effective use of the Concur command is probably the most powerful component in Meta-Basic.

MetaBasic is space inefficient on the disk file: This design decision was made deliberately for simplicity and maximum user information. Throughout the Meta-Basic precompilation and compilation process, a single ASCII-format sequential file and workfile are used for all stages of program output. Error messages are embedded directly into the erroneous line, and it is recommended the user make ample use of both screen LISTs and printed listings.

In addition to error diagnostic insertions, the precompiler formats the Basic program into the beginning of Assembly field formats. After the line number, the first field is the tag field, the second is the opcode, the third is the operand field and the fourth, if present, is the comment field. The precompiler always begins the opcode field in the same place, whether a tag has been used or not. This greatly enhances readability but is not required for correct precompiler or compiler operation. Field structure is completely variable and there is no need for blank spaces between the operand elements.

Finally, the precompiler expands the interpreter Basic program by as much as two times the original number of lines. This is caused by the insertion of tag equates and reprogramming. There are many Basic interpreter commands which simply do not exist in MetaBasic; for example, an If...Then statement which contains the logical OR or AND functions may cause the expansion of as many as one dozen lines of emulating logic. In another example, numeric literals, quoted string literals and functions (VAL, ASC, ABS, etc.) may not appear in any command except a move-data command (SETBCD and SETSTR).

So that these do not have to be reprogrammed by hand, the precompiler removes them from the original command line, equates them to a working location, and substitutes the working location name back into the original command line. During compilation, the program grows to at least four times its original number of lines as illustrated by the move-data commands in Fig. 2. While the resulting Assembly program is a fraction of the size of its source counterpart, the source file can become huge. Some effective method of copying with large files must be provided.

The method is the Concur command, together with the source-level address linkage utility. Working with the MetaBasic source program file, the program may be unceremoniously chopped into halves, thirds, quarters, etc., and established as stand-alone files (PROG made into PROGA, PROGB, PROGC, PROGD, etc.). The resulting pieces of the original program are then run through the "external resolution generator" utility. Every data location and line name in each of the parts referenced by any one of the other parts will be automatically named "Public" in the part and "External" to the other parts which reference it. The result is that all parts communicate among each other as easily as though they were still one program file. The external reference generator may be run as often as needed, if changes are made.

The external reference generator utility also knows which program module is the first or main module. At the beginning of that module it will insert the Concur commands necessary to cause the Z-Monitor loader to load all subordinate modules as

soon as the main module has been loaded.

After the first program of the precompiler has generated all the line number reference tags, it is a good idea to look at the program file and determine whether it should be subdivided into two or more program files at this point. Generally, if the program file is longer than 8–10 granules or 20K disk space, subdivision is strongly recommended. It is not necessary to do so, however, and the user may elect to continue on to the second of the three precompilation programs.

But is it Legal?

The second precompiler group program analyses all command syntax except for dimensions and input/output operations of all kinds. The general rule for syntax analysis is, if the interpreter Basic form is not legal under the interpreter, it will be flagged and abandoned; if, however, it is legal under the interpreter and legal under MetaBasic in an altered form, it will be automatically reprogrammed to save manual labor. If it is legal under the interpreter but illegal under MetaBasic in any form, it will be flagged and abandoned.

The thrust during second-stage precompilation is what is legal under the interpreter but illegal in any form under MetaBasic. MetaBasic requires only one command (or one command and a comment) per numbered line. Error-trapping, already mentioned above, is one reason for this; another is that the logic of multi-command lines invariably becomes intermixed with the interpretation of If...Then statements. If... Then statements not only do not exist in that form in MetaBasic, there are no consistent rules for their interpretation among the various versions of Basic.

The second restriction, which will annoy many interpreter Basic programmers, is against complex functions and multi-function commands. For example, the precompiler will correctly handle " $A = A + B^{*}(C-D)$ /2". In truth, the author was reluctant to take on the responsibility for interpretation of fluid logic in addition to that for creating error-free Assembly code. Another example

-	MetaBasic		/	saembly	
000	SETSTR AS = BS	1000	SETSTR	A\$ = B\$	
		1010		CALL	SETSTR
		1020		DEFW	AS
		1030		DEFW	B\$
1040	SETBCD A = VAL(A\$)	1040	SETBCD	A = VAL(AS)	
		1050		CALL	VAL
		1060		DEFW	A
		1070		DEFW	A\$

"A single test is madegreater-than for incrementing loops and less-than for decrementing loops."

of rejected logic, in complex functions, is "A\$ = STR\$(VAL(B\$)/ABS(D))".

The second state precompiler will not annoy the user with mere violations of form. For example, if the user tests an embedded literal (not allowed), the precompiler will remove the literal into a generated workspace (see Fig. 3). Because If...Then statements have no direct counterpart in MetaBasic but due to their program frequency and importance, there is no variation, including logical OR and AND, which the precompiler will not automatically handle correctly so long as the user does not embed complex functions and computations.

One final restriction is common to all compilers. For...Next...Step commands must occur in perfectly matched pairs; the command Next by itself (as opposed to a named variable, such as "NEXT X") is not permitted. There are no practical restrictions on the number of For...Next loops which may be nested inside one another.

For...Next loops are another form of instruction which does not exist either in MetaBasic or in Assembly and must therefore be emulated. The variables will be initialized, the first loop will be executed, and the first test-after-incrementation will take place. The default condition for testing is increment. Decrement will not take place unless the Step argument is a negative literal (the compiler cannot test a value which will be known only at run-time). A single test is made—greater-than for incrementing loops and less-than for decrementing loops.

The Third Program

The third program handles all physical commands, including DIM, Data, Read, PEEK, POKE, Set, Reset, Restore and all input/output commands including Input, Print, LPRINT, Get, Put, LINEINPUT and PRINT#. MetaBasic dimension statements are structured closely to those of interpreter Basic; but their internal handling is very different. If the user has not explicitly dimensioned his data names, the precompiler does it for him with default values which must be checked for acceptability. Internal data is essentially handled as under the interpreter; it is formatted wherever it is encountered in the program, the precompiler ensuring that program logic jumps over the data areas. The address of each datum is entered into a table beginning with a table element pointer and ending with a table terminator word.

Both DIM and Data have interesting MetaBasic options. Since the program being precompiled may have been subdivided, and since data variables should not be di-

==6809 COLOR COMPUTER ==

EDITOR, ASSEMBLER AND MORE!

SOFTWARE DEVELOPMENT SYSTEM The Micro Works Software Development System (SDS80C) is a complete 6809 editor, assembler and monitor package contained in one Color Computer program pack' Vastly superior to RAM-based assemblers/editors, the SDS80C is nonvolatile, meaning that if your application program bombs, it can't destroy your editor/assembler Plus it leaves almost all of 16K or 32K RAM free for your program. Since all three programs, editor, assembler and monitor are co-resident, we eliminate tedious program loading when going back and forth from editing to assembly and debugging!

The powerful screen-oriented Editor features finds, changes, moves, copys and much more. All keys have convenient auto repeat (typamatic), and since no line numbers are required, the full width of the screen may be used to generate well commented code.

The Assembler features all of the following: complete 6809 instruction set: complete 6800 set supported for cross-assembly: conditional assembly; local labels; assembly to cassette tape or to memory; listing to screen or printer; and mnemonic error codes instead of numbers.

The versatile ABUG monitor is a compact version of CBUG, tailored for debugging programs generated by the Assembler and Editor. It features examine/change of memory or registers, cassette load and save, breakpoints and more. **S0S80C Price: \$89.95**

SOURCE GENERATOR: This package is a disassembler which runs on the color computer and generates your own source listing of the BASIC interpreter ROM. Also included is a documentation package which gives useful ROM entry points, complete memory map, 1/0 hardware details and more. A 16K system is required for the use of this cassette. 80C Disassembler Price: \$49.95

CBUG IS HERE!

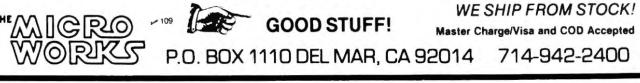

MONITOR TAPE: A cassette tape which allows you to directly access memory. I/0 and registers with a formatted hex display. Great for machine language programming, debugging and learning. It can also send/receive RS232 at up to 9600 baud, including host system download/upload. 19 commands in all Relocatable and reentrant. CBUG Tape Price: \$29.95

MONITOR ROM: The same program as above, supplied in 2716 EPROM. This allows you to use the entire RAM space. And you don't need to re-load the monitor each time you use it. The EPROM plugs into the Extended Basic ROM Socket or a modified ROMPACK. CBUG ROM Price: \$39.95

LEARN 6809!

6809 ASSEMBLY LANGUAGE PROGRAMMING, by Lance Leventhal, contains the most comprehensive reference material available for programming your Color Computer. Price: \$16.95 USE A PARALLEL PRINTER with your Color

Computer! Adaptor box plugs into the serial port and allows use of Centronics/Radio Shack compatible printers with parallel interface. Assembled and tested. **PI80C Price: \$69.96** **32K RAM!** MEMORY UPGRADE KITS: Consisting of 4116 200ns integrated circuits, with instructions for installation 4K-16K Kit Price: \$39.95. 16K-32K Kit (requires soldering experience) Price: \$39.95

"... MetaBasic or Z Monitor disk format is nothing like the TRSDOS disk format."

mensioned twice in one program, DIMs may be changed to External pseudo-operations by so indicating at the beginning of the job. Internal data, however, will be automatically set up in a new table within each program module. This presumes the programmer may wish to have program modules created for the sole purpose of organizing large volumes of data in kind of internalized indexed-sequential Read format, with the associated ability to restore to the beginning a part of the total data without having to restore it all the way back to the beginning of a possibly quite large table. When originally programming in MetaBasic, the programmer may designate which of 100 internal data tables a unit of data should be assigned to by appending the table number to the Data command, as in "DATA62 A,B,C,D," THIS ",E,1,2". This string of data would be assigned to table-name "DATA62", even if it were the only data table in the program. The corresponding Read and Restore commands would be "READ 62" and "RESTORE 62"

PEEK and POKE function as in interpreter Basic; their values are decimal.

The Set and Reset commands are exactly as under interpreter Basic, but they will be replaced by the "Draw Dot" and "Draw Blank" commands, respectively, which are part of the command set for business graphics.

Input/Output

MetaBasic recognizes five different standard I/O devices for the TRS-80 Model I: screen, keyboard, line printer, disk drives and serial I/O port (communications). Each has its own particular command words which may not be intermixed at the Basic or MetaBasic level (see Fig. 4).

Clearly, the majority of these commands cannot be written under interpreter Basic, and illustrate the paucity of available command words available to the Basic programmer given the range of peripheral equipment available to the TRS-80 Model I user today. It is important, however, that the user understand what will happen to the I/O commands in his interpreter Basic program when processed by the precompiler.

The Conversion

An easy way to remember the conversion is: *display* to the screen, *input* from the keyboard, *strobe* for a depressed key, *prints* to the line printer, and *read* and *write* from or to a disk file. PRINT@ commands generate a "CURSOR 1,p" command before printing. Unlike interpreter Basic, MetaBasic never adds an automatic carriage return at the end of the printed line. If the interpreter Basic line ends in a semi-colon, the precompiler will not generate the "SCROLL UP,1" command for the screen and the "LINE UP,1" command for the line printer. In both cases, printing null (PRINT"" and LPRINT"") and Print or LPRINT command without an argument will result in the appropriate line advance command. Where repeated Print and LPRINT commands have been used solely for vertical spacing, the single-advance commands which result may be consolidated into a single advance command with the number of lines desired as the argument, as in "LINE UP,5".

Sequential disk files are handled essentially the same as under interpreter Basic, except only one variable may send or receive data with each command. Accordingly, the command "LINEINPUT#1,A\$,B\$, C\$" would result in three separate "READ LF1,[...]" commands.

Random access files are handled somewhat differently. There is actually no such thing as random access mode under Meta-Basic. The Record I/O file format defines fixed-length records which may be written and read by sequential record number (beginning from one and continuing until end-of-file) In both sequential-access and random-access modes. There is no such thing as a Field statement, which is actually a clumsy adaptation from Cobol. To attempt to avoid manual reprogramming, the following conventions will be followed by the precompiler: The random-access file will be opened in both (read and write) ac-

cess modes. The Get command will read data into a precompiler-generated data location called "RA\$n", where n is the logical file number assigned to the randomaccess file. The variable names in the Field command will be placed in a special lookup table. Whenever one of the Fielded variable names is referenced in a data move, the name will be changed a MID\$ command which references RA\$n by the subfield beginning number and length. Whenever an LSET command is encountered, the reverse will occur, and a Put command will again reference RA\$n. The data name "DUMMY\$" will be ignored in a Field command, but the position counters will be incremented. The precompiler will not attempt to handle more than two random access files per program segment.

It is equally important to note that the MetaBasic or ZMonitor disk format is nothing like the TRSDOS disk format. The directory is on track zero, not 17. Files have both names and numbers. Protect status is prevention against inadvertant destruction, not a futile exercise in pseudo-secrecy. A file's protect status is turned off by merely

entering "PROTECT OFF". Most importantly, there are 64 different physical formats from which the user may choose in an effort to optimize space against speed. A disk record may contain as many as 2048 bytes or as few as 16. The Format command will optimize the physical placement of the records on a basis of so-many-per-track.

Whenever a sequential (variable length) file is declared, the disk surface remains formatted at ten sectors of 256 bytes per track. But when a record I/O (fixed-length) file is declared, the declaration must include the record length (RECL = nnn). Based upon this information, the named file's tracks are reformatted to physical records of the indicated length. Thereafter it is no longer necessary to block-up data records before writing to the file, nor to block-down to individual records after reading from the file. The numbered record is named and becomes available at record speeds.

This altered approach to disk I/O is not new; it is adapted from standard IBM disk I/O procedures. Accordingly, it makes possible a new high-speed lookup procedure called "indexed-sequential" organization.

This altered approach to disk organization also makes possible genuine highspeed disk-based sorting. The data itself is never sorted. Keyfiles are established and sorted, then the input files are rewritten to output file in an altered sequence based on the new order of the keys.

The output from the third stage of precompilation is supposed to be an error-free. pure MetaBasic source file. Since the file might have been written by hand, it may also be modified manually, including the insertion of the user's own machine code subroutines. MetaBasic source files may also be passed through the Assembly macroprocessor for this purpose. Every line of MetaBasic code is preceded by a colon at the first character position after the blank space which terminates the line number. After compilation, this will be changed into a semi-colon, which is the assembler's comment symbol. Assembly commands inserted by the user should not be preceded by a colon or a semicolon.

Next month: More on the MetaBasic Compiler.

EDAS

EDAS is a sophisticated Editor and Assembler for the '80 Model I or Model III. All commands and SOURCE text can be entered in upper or lower case. Direct assembly for memory or multiple disk files by means of *GET assembler directives provides the capability of assembling huge source files with 30,000 bytes of symbol table. Direct assembly to disk or memory for faster debugging operations. DOS functions DIR, KILL, and LIST are available from within EDAS. The Editor provides block move & global change with BASIC syntax editing. EDAS provides power with ease of use. \$79 + \$S&H.

DUTIL

DUTIL is a utility to examine, clear, initialize, move, and modify data in memory. Load, punch, verify SYSTEM tapes. Disk sector 1/O. More! \$20.

CMDFILE

Now you can append two or more CMD filesand/or SYSTEM tapes. Perform transfer to & from disk/ tape of SYSTEM/CMD modules with offset capabilities, \$20.

LDOS is the latest generation of sophisticated operating systems for the TRS-80 computers. LDOS is completely documented in a 252-page reference manual. Total support is provided from some of the most knowledgeable people in the industry. You owe it to yourself to investigate this system. Call or write for details. LDOS is priced at \$149 plus \$4 S&H.

LDOS 5.0

DSMBLA

Complement your assembly language tools with this Z-80 disassembler which produces screen, printer, cassette, or dividie detaut. A who pass process provides SY 800-3 for 16-bit address and 8-bit relative references. SQUates & OrdS with research. Real SYS 100 million of the screen address range \$20 mS/MILR 1 for non-disk use is 1151 EDAS, CILOFILE, DSMBLR Specify Modernia Address

\$1 S&H + \$.50 per orogram. VA efforts add 4%.

~~~~~~~

MSA

# DISKMOD

Turn your Editor Assembler into a disk package. This 32K patch modifies EDTASM for DOS operation. Features? Add full disk I/O, block move, global change, printer pagination, sorted symbol table, print memory utilization, enhance DEFM expansion, protect memory, and recover after BOOT. From within the EDTASM you will have DIR, KILL, & FREE. Upgrade your EDTASM! \$20.

# THE BØØK

THE BOOKs must be a part of your tools. Volume I gives you access to all math operations in your Level II ROM. A symbol table of the entire machine noting over 500 addresses is included. Volume II tells you everything you wanted to know about the Level II I/O-printer, keyboard, video, and cassette routines are fully explained. Each volume has a fully commented listing of all the routines discussed. THE BOOKs will save you hours of assembler programming. Each volume is priced at \$14.95 or buy both for \$24.95. Add \$1.50 S&H per book.

······

With the help of Zen, build your own printer interface.

# Hard and Soft Printware

I. R. Sinclair 89 Alexandra Road Sible Hedingham Halstead, Essex England C09 3NP

By the time I had owned my TRS-80 for a few months, I had resolved that the first priority would have to be a printer. When your programs are short enough to list on the screen without scrolling, a printer seems an unimaginable luxury. But one of the joys of the TRS-80 lies in writing longer and longer programs using all the power of that big Basic. As a result, by the start of 1980, I was suffering severely from printout starvation, and only the use of a borrowed Teletype 33 kept me going.

About the same time, printer manufacturers must have noticed this problem, because there was a sudden flush of printers at \$700 and less. Better still, they weren't thermal or electrostatic but real hard copy paper-markers. I suspect there was, in fact, only one mechanism with many manufacturers fitting electronics to it, but the result was certainly good for me. After some phone calls and a drive of a few hundred miles, I had a smaller bank balance and the feeling that I was, at last, winning the hard copy battle.

#### The Lowdown

I was right, but there was a long way to go. If you still want to jump on the hard copy bandwagon, this article will give you the complete lowdown of both hardware and software that will allow you to get into hard copy for only a few dollars more than the price of the printer.

It doesn't matter what type of printer you use, providing it has an RS232 interface built in. As far as I know, all the modern el cheapo printers use this type of interface, which lets us get away with simple attachment to the TRS-80 cassette port. The baud rate (the speed at which bits can be set from the computer to the printer) can be altered by setting the position of wire links inside the printer, and for this type of use the rate should be set at 300 baud.

Don't be tempted to set the rate higher in hopes of faster printing—the simple interface I am going to describe is reliable at 300 baud, but not at higher speeds. For higher speeds, a connection is needed from the printer to an input on the expansion interface connector of the TRS-80 so the printer can stop the computer when it has sent more characters than the printer can cope with. This type of connection is called a handshake, and my simple interface does not include this type.

#### **Designing From Scratch**

I had seen a simple interface described in a local user's group newsletter, but I doubted it would really work. I was right, so I set about designing my own interface from scratch.

The first thing I had to know was how large the signal from the cassette port would be. A cassette recorder does not need a large signal input, and too great a signal can cause distortion which leads to loading difficulties when the tapes are replayed. I bought only the keyboard unit of the TRS-80, and my cassette recorder is a sensitive one, so I had to cut down the signal strength by modifying the cassette output circuits. I used a voltmeter to measure the signal strength.

Step one was to get an output. Fortunately, on the TRS-80, it's not necessary to print a program to find out what happens at the cassette port. A simple program line was typed in and run: This produced a voltage reading on the meter (attached to the cassette output socket) which varied from 0.46V to 0.48V and back again as the program ran. This is not a very large voltage swing for the input to an interface, though it's big enough for a cassette recorder. I started looking for ways to increase it without any further alterations to the TRS-80 itself. A quick look at the output circuitry showed that this could be done by altering the program to:

10 OUT255,2:FORN = 1TO1500:NEXT:OUT255,1:FORN = 1 TO1500:NEXT:GOTO10

Simply by using a two in place of a one, the voltage swing became zero to 0.86 V, a lot greater and a much easier amount to deal with. I incorporated it into software for the printer.

The next step was to build the interface, an amplifier which would take the voltage swing of 0 to 0.86 volts at the cassette port and transform it to a voltage which (approximately) varied between -9V and +9V. These serial printers are tolerant animals, they don't appear to object if the pulses aren't strictly RS-232 standards. I was correct in assuming that a very simple amplifier would be good enough. Ten minutes on a solderless breadboard got me into hard copy, and a few hours work the next day (yes, I felt I had to make listings of all my programs in case it stopped working) resulted in a more polished version.

#### The Interface

The interface consists of a 741 operational amplifier IC, which draws its power from a rectifier bridge circuit which, in turn, is powered from the TRS-80 power pack. It uses only a small amount of power and constitutes no hazard to the TRS-80 supply. The unit is built into a small plastic box, and connects between the TRS-80 and its power

<sup>10</sup> OUT255,0:FOR N = 1TO1500:NEXT:OUT255,1:FORN = 1TO1500:NEXT:GOTO10

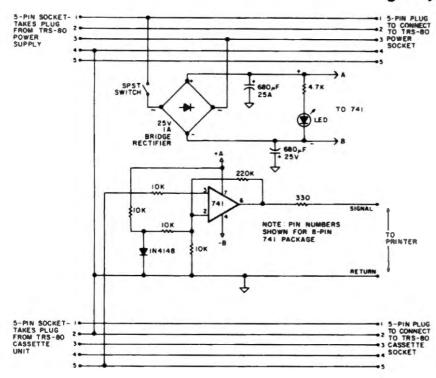

Fig. 1. This is the circuit for the interface unit. All resistors are ¼ W rating. The switch is optional, but if there is no online switch on your printer, it will prevent the printer from printing rubbish during a CSAVE.

and cassette plugs. The power plug from the TRS-80 supply goes into the interface, and the corresponding plug from the interface plugs into the TRS-80 power socket. The cassette lead is treated in the same way, so the interface can pick up power from the power cable, and signals from the cassette cable, but does not interfere with the operation of either. (There is no need to unplug the cassette unit, for example, when the printer is being used.)

The specific layout is not critical, and the circuit can be built in any way which you are accustomed to. I used Veroboard, but any type of matrix board which is designed for ICs is suitable. Make sure that the two smoothing electrolytic capacitors are correctly wired, because if the voltages are positioned wrong they can overheat and burst. The most tedious part of the whole effort is soldering the five-pin DIN plugs to fit into the TRS-80. Make sure before you start that the plugs will actually fit, because some plugs have elaborate covers which may prevent them from being correctly inserted.

For the benefit of you hardware pros, the circuit is a non-inverting amplifier. The signal from the cassette port is taken from pin 5 of the cassette socket through a 10K resistor to the + input on pin 3 of the 741. The - input on pin 2 is connected to a bias network, consisting of the diode and array of

10K resistors, and also to the feedback resistor of 220K. This feedback resistor also sets the amount of amplification. The output signal is taken from pin 6 of the 741 IC through a 330 ohm resistor. Power supplies of +9V and -9V are needed to operate the 741, and these supplies are obtained from the TRS-80 by connecting pins 1 and 3 of the power socket to a bridge rectifier. The output from the rectifier consists of the +9V and - 9V lines, smoothed by 500µF capacitors. The cable to the printer does not need to use the expensive 25-pin Cannon-type plugs which so often appear on printer connections (using only two pins, it seems pointless to use a 25-pin plug). On my unit, I simply used a length of power cable, permanently attached at the interface. If you like plugs and sockets, a miniature two-pin unit is as good as any. The connection to the printer consists of the RS232 signal line and earth return only.

Check the circuit carefully, particularly the power supply section, because a fault here could damage the TRS-80 power supply. Testing will now have to wait until you have assembled the software!

#### The Software

Building a low-cost interface may give you a glow of achievement, but that will quickly dissipate if you have to spend \$30

### "Building a low-cost interface may give you a glow of achievement."

on the software to make it all work. Many serial printer programs exist, but none of them suited my needs, and so I developed my own, slowly and painfully. I wanted more than a straightforward routine, because the reason for buying a printer was so I could have listings of programs at various stages of development. (I hate keeping long rolls of paper, and I wanted a program which would list into neat pages of the same length as Radio Shack uses, 66 lines per page.)

Looking at a sample sheet which my printer had listed (when I bought it), I saw that the left margin was very small, too small for my filing methods, so another requirement for the routine was a left margin, preferably one which could be altered. The most important point, at first, was that the program should be fully relocatable, with no jumps to absolute addresses within the program. This way, I could use the same program at any address, or POKE it from a Basic program anywhere in memory, or as a string. I modified this requirement later!

My program specifications grew and grew. Having 66 lines per page implied that there would be a line counter, along with a reset method for the counter to ensure I could start a listing with the counter loaded to its full 66 lines. I wanted to use a command word for this rather than a POKE to memory. In addition, I wanted a keybounce delay (my '80 is an old one), and also some method of putting in a longer delay when I wanted it.

Fortunately, when it came time to write the program, I had the assistance of one of the best pieces of software I know of. It's an assembler-editor-debugger package for all Z-80 based machines, and its name is Zen. I don't know if Zen is available in the States; if it's not, I can pass on the name of the source in England.

Zen is simple to use-which means that you drop the manual quickly and concentrate on using it rather than trying to find out how to. As an assembler, it's versatile because entry is in free-format-you don't have to enter spaces of a set size, or even be careful about the number of letters in a name. Editing is very simple, just enter a new line, zap an old line or insert a new line. Assembler programs can even be combined from separate tapes, because the Zen line numbers are generated internally instead of being recorded on to the tape, as Radio Shack does, It also has a monitor section which lets you read in machine-code tapes, examine contents of memory, change codes, copy machine-code tapes, copy code from one set of memory locations to another, and even load code into memory as it is assembled by the assembler. This eliminates the tedious business of creating a tape and then reading it back in again. The

# "The only problem is that there is no disassembler..."

only problem is that there is no matching disassembler, but I am working on a program for reading in tapes produced by the Instant Software disassembler and producing from them a tape written to Zen standards. The Zen listing is shown in Program Listing 1. There are no notes on the assembler listing itself, because I never have enough room on an assembler program for all the notes I want to make, and tapes take long enough to read without having all the extra characters loaded onto them. As I develop a program I keep all the original specifications. The amendment notes and listings result in my own home-made manual. This tells me more than a few notes on the program itself, and

Program Listing 1. This is the assembler listing. If desired, the object code can be typed in using T-Bug, or the program reassembled using EDTASM. For complete relocatability, the DLY subroutine and the storage addresses should be located in low RAM, such as 405CH to 407FH (which is used only during the switchon sequence).

### "This tells me more than a few notes on the program itself, and doesn't use memory."

doesn't use memory. The program is arranged to give a baud rate of 300 for the reasons described earlier, but for anyone who uses 110 baud machines, one single alteration will give the lower rate.

The program has its origin at 7F11H, 32529D, and two of the printer control block addresses are used for storage, and another two bytes for the address of the new routine. Location 4028H(16524D) is used to store the number of lines per page. This is the number which is placed in this address when the TRS-80 is switched on, so no addition has to be made here. Location 4029H is used in this program to store the number of characters per line, and POKEing a new value into this address will alter the number of characters per line which your printer will deliver.

Four addresses in the program space itself are used also for storage, and these can be POKEd to change the quantities such as the left margin space and the gap between pages. As set up, the program prints 72 characters per line, 66 lines per page, four spaces on the left margin, and six blank lines between pages. A complete description of the program follows so anyone who wants to build on it for his own purposes can do so.

The first section of the program from 7F11H to 7F2FH loads up the RAM locations. Address 4026, with 4027, contains the address of the printer routine. When the TRS-80 is switched on, the operating system loads the address 058DH into these locations, which is the start of the ROM routine for a parallel printer. Our print routine starts at 7F34H, so that this is the address which must be loaded to these locations. This way, we can use the commands LLIST and LPRINT rather than having to use new command words. There is a similar readdressing at 401EH, 401FH. These addresses hold the address of the screen-print routine, normally 0458H, now directed to 7FF2H. This lets me put a delay into the screenprint routine, and serves two very useful purposes. One is that it debounces my keyboard, and the other is that it allows me to incorporate a slow-listing facility. The number of characters per line is loaded into 4029H, no load is done into 4028H because the regular 66 lines per page suits me. If you want a different number, add a couple of steps to accomplish this.

When a disk system is not in use several commands such as Field, Get, Put and about 25 others will return with L3 Error if you use them in Basic. According to the manual, this is because they are disk commands which work only when a disk operating system is loaded. In fact, each of these commands causes the operating system to look in RAM for the address of a routine, and if you put in your own routine, and POKE its address to the correct place, you can make use of any of these commands.

In this program, I have used Field to reset the lines-per-page count, so the printer will print a full 66 lines before it creates the six blank lines at the end of a page. The address of a page-reset routine is loaded into 417DH, the reference address for the Field command. Similarly, I have used the command Put to change the delay time by loading the address of a delay-change routine into 4183H, the address for the Put command. By typing Put and entering from Basic the TRS-80 screen-print rate is slowed so the listing can be watched on the screen. This, combined with the TRON command, is a considerable aid to debugging a Basic program, because with these two I can watch a program execute in slow motion.

Typing Put for a second time and entering takes the additional delay out again. and screen operations proceed normally. This delay can also be placed in the keyboard routine, but there are advantages to using the screen routine. One is that the delay acts only when the screen is accessed, as it always is when a character is being entered from the keyboard. A delay in the keyboard routine, unless it is a rather complicated delay program like the Radio Shack KBFIX, slows down all program operations because the keyboard is scanned continually as a program progresses. This, of course, is why the Break key can be used. If you disable the keyboard you lose all control over a program.

The loading section ends with a jump back to Basic at 0072H, and the printer routine itself starts at 7F34H. The DI command is used so the routine cannot be interrupted in mid-character by the Break or any other key. The printer routines of the TRS-80 place the character to be printed in the C register of the Z80, so the next step is to transfer this to the accumulator so we can operate on it. The section of the program from 7F36H to 7F40H saves the registers and calls the screen-print routine, and whatever is sent to the serial printer is also echoed onto the screen. This is a useful feature because most dot-matrix printers conceal what they are printing until several linefeeds have taken place. If you want to be able to cut this feature in and out, use one of the disk control words to POKE 00 into locations 7F3AH and 7F3BH, and another to POKE back the bytes which are shown in these locations.

At ENDLN the byte in the accumulator is checked to see if it is a carriage return (@DH), in which case the program branches to reload to reset the characters-per-line count and to decrement the number-of-lines count in location LNCNT. If at ENDLN, the byte in the accumulator is not a carriage return and is less than the space byte (20H), the program returns to ROM for the next character, because the control characters other than carriage return are not used in the program (the dot-matrix printers can be set to line-feed on carriage return, so the additional complication of a line-feed is not needed). For any other character, the program then jumps to Start.

At Start, the registers are saved on the stack, and register B is loaded with a bit count of nine (one byte plus a space). A mark bit is sent out (my printer interprets a mark as a 0 and a space as 1) by loading FC01 to the HL pair, and calling the TRS-80 subroutine at 0221H. Working on the results of the cassette port output voltage mentioned earlier, the mark byte is 01 and the space 10. To establish the correct baud rate, a delay must follow, and this is achieved in the subroutine DLY. The byte 00DEH, which is loaded into HL at the start of this subroutine, determines the baud rate. So if you want 110 baud, a larger number must be loaded here-try 0267H.

At the label Round, the bits which make up the character are sent out one by one. The RRA command shifts the contents of the accumulator one place to the right, so the lowest-order bit lands in the carry position. If the bit in the carry position is 0, C is reset and the program jumps to OUT1 to send out a mark bit. If the bit in the carry position is a 1 then HL is loaded with FC02H, the space bit, and this causes the OUT2 routine to send out a space. Each of these routines are followed by the DLY subroutine to keep the baud rate correct. Yet, at 300 baud the timing does not have to be exact. The DJNZ command at 7F97H keeps the rotate and output routine going until the B-register has been decremented to zero in the usual action of the DJNZ command. A final delay follows, and the program jumps to OUT3, which is the end of the part of the routine that outputs the character to the printer.

At OUT3 the AF register is POPped to recover the original unrotated byte and this is compared with the carriage return byte, 0DH. If the byte which has just been sent to the printer was OD, then the program skips to Test2 otherwise at Test1, the byte from ENDPAG is loaded in which clears the accumulator. Now if the lines-per-page count reached zero earlier in the program (at Reload), there will be a six in ENDPAG giving the OR (HL) step a positive result. The program will continue by decrementing ENDPAG by loading a carriage return character into the accumulator and jumping back to output this to the printer. This will continue each time this place is reached un-

### "My printer chatters away happily, and never has missed a character."

til the ENDPAG location is zero.

If the lines/pages count had not reached zero, the OR (HL) step gives a zero answer, and the program skips to location BLNK where LHSPCE is loaded in with the number three. The accumulator is loaded with the ASCII character 20H, and the printing routine is repeated, sending a space to the printer.

When the character in the accumulator was not a carriage return (and this includes the space which is loaded at BLNK), Test2 is used. This checks the byte in LHSPCE to see if more spaces need to be output to the printer, otherwise a retest is sounded by a jump to OUT4. At OUT4, the number of characters per line is decremented (note that the blank spaces at the left side are not counted) and if the count has reached zero, the accumulator is loaded with a carriage return and recycled to the printer. If the byte is not at the end of a line, the next stage in the countdown is OUT5, where the registers are restored to the original values, and the routine returns for the next character.

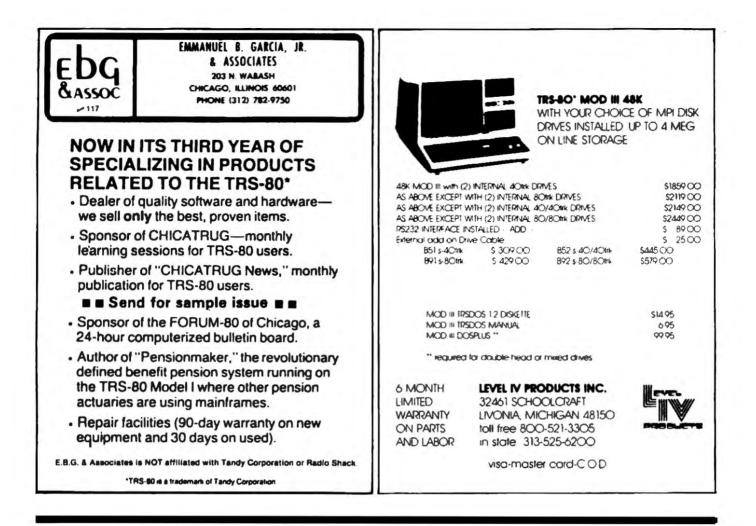

The rather odd jump sequences in this program so far allow it to be relocatable.

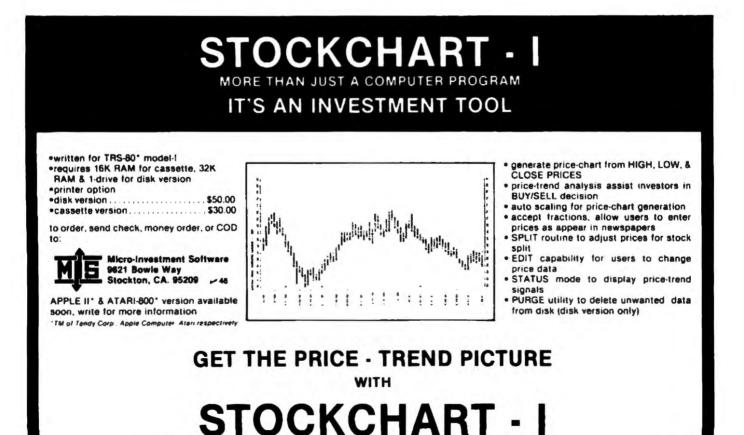

The bytes from 7FDBH to 7FDEH are storage bytes for the left-space, lines per page, end-of-page spaces, and characters per line respectively. These are fixed addresses which also make the program not completely relocatable, but there is no reason (apart from convenience) for having them in the high memory portion of the program. For example, they can be loaded into the top end of the cassette buffer memory or into disused disk command RAM; either way would make this part relocatable. At TOPPAG, a short routine restores the number of lines per page which is called by the Field command.

Similarly, at 7FE7H, another short routine calls a delay change routine, by taking the byte from 7FF6H, and X-ORing it with 10H. If the delay byte was the 00 set at the start of the program it is changed to 10 by this action. But if the byte was 10H, it is changed back to 00 by XOR. This routine is called by the Put command, and like the TOPPAG routine, it uses absolute addresses. This routine, like the TOPPAG, can be invoked from a running Basic program so screen scrolling can be controlled from within the program itself. Finally at 7FF2H, the video delay consists of saving registers, loading the BC pair with the delay bytes, calling the TRS-80 delay routine at **006**0H, restoring registers, and then jumping to the screen routine in ROM at **045**8H.

Now how did it live up to specification? It was not as easy to relocate as I had wanted. but that can be sorted out if needed. I had not realized at the start how easy it would be to reassemble at different addresses, thanks to the Zen assembler. In any case, full relocatability is not difficult to achieve, either by using low RAM memory for all fixed locations, or by loading registers through immediate loading. The real snag is the delay subroutine. This can be located in low RAM, or simply divided so there is a delay routine in each position where it is needed. However, I have no need for full relocatability, and the program performs very well indeed. My listings now have left margins, so they can be punched for filing, and they cut neatly into page. My printer chatters away happily, and has never missed a character. What more could I ask?

Add a synthetic keyboard to your TRS-80.

# Auto-Key

Mike Ghan 2210 108th Ave. S.E. Bellevue, WA 98004

Ever need to input a complex mathematical expression during a Basic program run? How would you like to load machine-language files during execution without disturbing the video display or variables?

Auto-key adds a synthetic keyboard to your TRS-80. By synthetic, I mean a utility that uses a string of characters in place of the normal keyboard input routine.

Auto-key is fast and easy to use; just define a string in Basic and execute a USR command. You can enter any character that can be entered from the keyboard, plus Basic internal codes. For example, 185 is the code for CLOAD. If you enter CHR\$(185) into your string, Auto-key Interprets it as CLOAD.

Further, Auto-key saves 2.5K bytes of disk space over my previous method of auto power up. Compatibility is no problem. You can use Auto-key with Model I 4K Level II through 48K disk systems. I have not had the opportunity to use Auto-key with a Model III, but I foresee no problems.

#### **How Auto-key Works**

Auto-key recognizes three control codes. Control code 1 Auto-key's Assembly code is shown in Program Listing 1. Lines 170-220 process the USR parameter to point to the string location. This allows you to use a simple command: X = USRO(VARPTR(A\$)), where A\$ contains the target string to be processed. The VARPTR function returns the string pointer, *not* the string address. Line 230 is

"How would you like to load machine-language files during execution without disturbing the video display or variables?"

disables the video driver. This allows you to work without disturbing the video display. Auto-key is initialized with the video driver disabled.

Control code 2 enables the normal video driver.

Control code 3 terminates Auto-key and restores all drivers to their original condition. the Assembly Language entry point and loads register HL with your target string address and Calls MACHMC. Line 240 saves the string address to be accessed later.

Lines 250–280 save the video and keyboard driver addresses so they can be restored. This ensures that other drivers, such as a key debounce routine, that may be active before Auto-key is run will be restored as well. These original drivers are also linked to Auto-key.

Lines 290-330 load Auto-key's address into the video and keyboard Device Control Blocks (DCB), and return to the calling program. Auto-key is now initialized and ready for execution.

Lines 390-410 check for the up arrow key and terminate Auto-key if it is pressed.

Lines 420-440 check to see if the cursor is on. If it is not on Auto-key exits via the normal keyboard driver, allowing IN-KEY\$ to remain functional.

Lines 450-480 bump the string pointer and load register A with the next character to be passed on.

Lines 490-540 test for control code 1, the code to turn off the video. If a 1 is found, the video off driver is loaded into the video DCB; register A is cleared; and a return sends you back to the caller.

Lines 550–620 check for a 3, the code for the end of the target string. If a 3 is found, all the original drivers are restored into their DCBs and Auto-key is unlinked.

Lines 630-680 test for a 2, the code for video on. If a 2 is not found the character is assumed to be valid and is returned to the keyboard caller. If a 2 is found, the original video driver address is restored to its DCB.

Lines 720-780 are the video off routine. They check for a 14 (cursor on) or a 15 (cursor off). By replacing all other codes with a zero, this turns the video driver off. Lines 780 and 790 store the original driver addresses and serve as links for Auto-key.

One idea I would like to pass on is my use of jump (JP) vectors. If you look at RAM starting at 4000H, you will see a series of JP instructions. This allows various routine codes to be altered or updated. Since a change also changes the entry point for a given routine, any other routine which calls it would have to alter its call instruction. You need only change the jump vector to match the new entry point and everything goes just fine.

I use this concept a little differently. My jump vectors start in high memory and work down. Thus, I can move a routine or change it and all I need to do is change the jump vector to maintain compatibility with my many programs that access that particular routine.

#### **Alterations and Enhancements**

As written, Auto-key is not relocatable, but you could change that with a much longer routine. Enter the source code into your assembler and change the origin statement in line 110 to match your memory size or requirements. The 119 bytes of code for Auto-key can be contained in Basic data statements and POKEd into memory. Program Listing 2 uses this technique.

A program called Progdata (see 80 Microcomputing, May 1980, page 126) will make the task of defining these data statements much easier. Also you can add the code for Autokey to an existing machinecode program allowing easier loading and using less storage space.

Additional functions can be added to Auto-key by testing for another control code. For example, a CP 04 could be used to access a machine language routine. The code 04 would be followed by two bytes containing the entry point to the particular routine. By loading register HL with these two bytes and executing a JP (HL) instruction, you could have a vectored USR command. This would be very useful in Level II Basic which has only one USR command. Don't forget to clear register A upon return. I'll leave the loose ends for you to tie up. A little food for thought.

#### **Typical Applications**

Program Listing 2 contains a 16K Level II Basic program that inputs mathematical formulas directly during program execution. After loading the machine code in lines 1000–1080, the program prompts you with "Z = ?" in the line 120. Respond with a mathematical expression such as "2\*3 + 4\*SQR(6)/6". Line 130 adds the following:

- CHR\$(2) turns on the video. • "10 Z = ", the program line number and "Z = ".
- The formula you input, Q\$.

":?Z", to print the value of Z.
CHR\$(13), the code for a carriage return. This enters the new line.

• The command RUN and CHR\$(3), which runs the program with the new line 10 added. CHR\$(3) is the end of

string code for Auto-key that returns Enter for the last command.

Line 140 executes a USR call to enable Auto-key. The command Stop does two things. First, you can't enter a program line during execution, and second you need to have the cursor on to activate Auto-key. The cursor needs to be on because Basic is continuously scanning the keyboard looking for a Break key or setting INKEY\$ values. Without checking for the cursor, Auto-key would be returning the first part of your string before Basic found the stop statement. Try running the program, inputting various expressions, and then hit Break and list the program. The last expression you enter will be in line 10. "BREAK IN 140" is never displayed because Autokey is initialized with the video driver disabled. Disk Basic users will have to reassemble Auto-key into higher memory and use the DEF USR1 = &Hxxxx statement to define the user entry point.

Program Listing 3 contains a Disk Basic program that lists the disk directory, returns to Disk Basic and resumes execution. Since the program operates in a similar manner to Program Listing 2, I will explain the target string (DIR\$) only.

•CHR\$(133) is the Basic internal code for CMD.

•The CHR\$(34)s put quotes around S. So far we have CMD"S".

•CHR\$(13) and CHR\$(2) add Enter and turn on the video, respectively.

•"DIR (A, I, S,)" and CHR\$(13) execute the directory read with file allocation, invisible files and system files.

•CHR\$(01) turns the video off again.

•"BASICR\*" and CHR\$(13) re-enter Disk Basic with the program and all variables in-

tact.

•CHR\$(179) is the Basic internal code for CONT. •CHR\$(3) terminates Auto-

key and returns an Enter. The Basic program now resumes execution at the 140.

Program Listing 4 is an example of auto power up to Disk Basic. This routine is part of a larger program called Control, that contains my upper/lowercase driver, joystick driver, screen print driver, home interface controller and Auto-key.

TRSDOS allows one power up command via the Auto command. Auto loads Control on power up with the execution address as line 110 (COMPRC). From there Auto-key takes over.

Line 110 calls a routine that initializes my DCBs to point to various drivers so that when Auto-key is finished these pointers will be restored. (Line 110 is only necessary if you use driver routines of your own).

Next, line 120 loads register HL with the string address called MACBUF. Line 130 calls Auto-key's machine-code entry point (MACHMAC in Program Listing 1).

Lines 140-150 perform a very neat trick. Memory location 4049H contains the TRSDOS top of memory pointer. If you alter this pointer, your TRS-80 thinks it only has memory up to that number. Since Disk Basic uses the top 64 bytes of memory for initialization, any code in the top 64 bytes of high memory will be clobbered. By changing the top of memory pointer to an address lower than any of your routines, you can avoid this problem. You can answer the memory size question with Enter and both Basic and TRSDOS will leave this high memory alone.

Line 160 jumps back to TRSDOS where it turns on the cursor and calls the keyboard driver. Auto-key intercepts and passes back the string in lines 170-270. Line 280 terminates Auto-key's control.

With some further effort, you can construct more complex programs during run time, using Auto-key.

# NOBODY KNOWS MORE ABOUT ADDING MEGABYTES TO YOUR TRS-80 MODEL II\* THAN AMERICAN SMALL BUSINESS COMPUTERS

THE CAMEO CONNECTION

The Cameo 10 Million Character Disk Drive Subsystem (pictured in foreground) Is A 5 Megabyte Fixed, 5 Megabyte Removable Cartridge-Type Disk Drive. Advantages To This Unit Are Ease of Backup For Data and Program Files and Low Cost. By Attaching A Multiplexor Unit Several Model II's Can Be Attached To The Cameo Disk Drive. For Further Pricing, Availability, and Operating Systems Options, Call or Write to American Small **Business Computers and ask** for the CAMEO CONNEC-TION.

THE CORVUS CONNECTION

The Corvus Disk Drive Subsystem (center of picture) Is Available in 5, 10, and 20 Million Character Capacities. The Corvus System is The Ultimate In The Sealed "Winchester, All-Fixed" Type Drive. The Corvus Is **Designed To Operate In The** Harshest Environments Such As Factories, Oil Rigs, Etc. Backup Of Data Is Accomplished Via Optional MIR-**ROR Backup Device Where**by Data is Written Onto A Standard Video Tape Recorder. A Great Number of Model II's May Be Attached To The Corvus Via An Optional CONSTELLATION Multiplexor. # SUPERPRINTER THE EPSON MX-80

This is the new Epson MX-80 dot matrix printer. It does just about everything you could ask a printer to do-quickly, quietly, reliably. In fact, for OEM installations, the MX-80 may be the single best, all-around printer you can buy. But that's not the best reason to buy it.

The MX-80 prints bidirectionally at 80 CPS in a user-defined choice of 40, 80, 66 or 132 columns. And if that's not fast enough, its logical seeking function minimizes print head travel time. The MX-80 prints 96 ASCII, 64 graphic and eight international characters with a tack-sharp 9 x 9 matrix. For a long time. Epson printers are known for reliability and the MX-80 is no exception. But that's not the best reason to buy it, either.

The print head has a life expectancy of up to 100 x 10<sup>6</sup> characters, and when it wears out, just throw it away. A new one costs less than \$30 and the only tool you need to change it is attached to the end of your arm. The MX-80 is compact, weighs only 12 lbs., and the whole unit, including the two stepper motors controlling carriage and paper feeding functions, is precisely controlled by an internal microprocessor. But even that isn't why you should specify the MX-80.

The best reason is this because Epson

makes more printers than anyone else in the world, we can afford to sell each one for a little less.

IF YOU BUY AN MX-80 AND DON'T CHECK OUR PRICE - YOU PAID TOO MUCH! -526

# AW...WHAT THE HECK RAM Memory Chips for the TRS-80

It is the policy of American **Business Computers to offer** merchandise at the lowest price possible. Several months back, we began selling RAM Memory Chips for TRS-80 for \$45.00 the per set. Someone else sold chips for \$44.00 We sold them for \$38.00. They sold them for \$37.95. So we say AW ... WHAT THE HECK! Let's see the other guys beat this price.

These chips are brand new "4116's". These 200 nanosecond chips are fully compatible with all TRS-80 products. Instructions for insertion are included; however, the dip shunts required for converting a 4K Model I to a 16K Model I are not included at this low price.

When your program crashes you can still save what's in memory.

# Debug With GOTO

Roger L. Pape 7545 Marble Drive Liverpool, NY 13088

You've just spent hours entering data into a program and then it "bombs out." Is there a way to continue without losing all your data? How about making changes in the source statements of the program and continuing without losing the data? Or would you like to run one program and have it load another program which uses values from the first?

#### **Problem and Its Solution**

Preserving a lot of data already in memory became a real problem for me one evening. After several hours entering a large number of long character strings, I was confronted with an OM Error message as the program terminated. Typing RUN would wipe all the data out! I observed that the point after the run command performs its initialization is equivalent to the GOTO statement processing. One can type GOTO nn (where nn is any existing line number) and reenter the program at the statement without losing the variables already stored in memory. A simple GOTO the cassette output section of the program and my data was saved. Reading the Level II manual later, under the description of the GOTO

statement (section 4) was the solution I had discovered.

A GOTO in the command mode is a perfectly valid way of starting or reentering a program. Any variables created in the previous execution or those defined by assignment (Let) statements in the command mode before starting are preserved. The GOTO can be directed to any valid line number in the program with several restrictions. First, the Clear statement will clear the variable storage area (actually only resetting the storage pointers to the beginning of the storage area). If the Clear statement is executed when the program is re-entered, previously generated values are lost. Secondly, a variable cannot be redimensioned. Once an array has been created and stored, do not reenter at or before a Dimension statement containing that variable name.

#### **Debugging with GOTO**

GOTO can be used very effectively when debugging programs. Consider the following situation where a statement such as:

#### 200 A = X /Y

is somewhere in the middle of a program and the value of Y is undefined (or zero for any other reason). The program will stop at this point with a /0 (division by zero) message. To correct this problem, one can enter an appropriate value for Y and continue by typing:

> GOTO 200 (both in the command mode)

and check the rest of the program. Frequently this can eliminate the need to reenter a long series of input that would otherwise be required to run the program from scratch.

#### Level I vs. Level II

After a program is stopped, the values of the variables used during execution remain in memory. Likewise, any variables defined in the command mode will modify the values previously stored or will be added to the storage area if the variable had not been encountered earlier. The only reason the variables cannot be accessed when the run command is reissued in a Level II system is because the pointers which define the storage areas are reset.

The Level I system software does not reset the variable storage pointers when the Run command is processed. Therefore, preset the value of any variable before the run command is typed and the values will be used in the program. But the Level II software resets the variable storage pointers when the run command is processed. So any predefined variables will be lost when a Run is issued. The preset variables in a Level II system, type the variable assignments statement in the command mode (as in Level I), but then type GOTO nn (where nn is a statement number at the beginning of the program) in order to start execution. Avoid any Clear statement in the program. If added string space is required, type the appropriate Clear statement before presetting the variables. (The amount of string space reserved by a Clear statement is remembered from one program to the next. It only changes when another Clear statement is executed or the memory size is set. After running a program which uses large amounts of string space, it's a good idea to type Clear to free some of the memory.)

Unfortunately, continuing execution is

# "Once you are able to chain, you are free to edit a program and restart it without losing variables."

not as simple if the source program is changed. Whenever another program is loaded or when statements are inserted, deleted, or edited in a program that is already in memory, the variable storage pointers are reset. You could include a cassette load statement at the end of one program to load a second program, but variables from the first program are not accessible in the second program (unless written to some storage medium). Likewise, if any changes are made to the program statements, you cannot normally continue execution at some intermediate point (as in the division by zero example).

With a few software changes you can preserve variables in memory for use later. Since the procedures required to save the variables while editing the source statements are essentially the same as those needed to transfer values from one program to another when chaining, it is relatively efficient to provide both capabilities in the same pitch. Let's first review the memory allocation in a Level II system.

#### Memory Map

The way variables are stored in a Level II TRS-80 is illustrated in Fig. 1. This memory map shows the relative positions of the various storage areas in the user's memory as a program is loaded and executed. The values in parentheses on the left of the map are the locations (in hexadecimal) of the word pairs used to store the 16-bit addresses of the current starting point for each of the specified areas. The first location contains the lower byte of the pointer, while the next location contains the upper byte.

Variables are stored immediately after the Basic source statements. This area is subdivided into two sections. The first contains simple non-dimensional variables, while the second contains all the arrays (dimensioned variables). The pointer stored at locations 40F9/AH is the start address for the simple variables. The pointer stored at locations 40FB/CH is the start address for the array variables. Finally, the pointer stored at 40FD/EH is the start of the free space. The first of these three pointers is set after the program source statements have been entered and remain the same while the program is running. But the latter two pointers will change value during program execution as new variable names are encountered and their values are stored.

The Basic interpreter stores the variables sequentially in the order that they are encountered as a program is run. What gets stored is a combination of the variable type, name and value.

Each simple variable consists of a variable type flag (which is equivalent to the number of bytes needed to store the value).

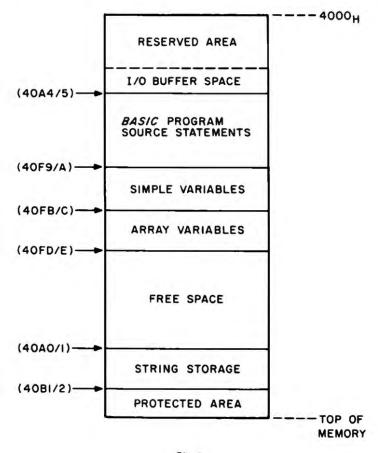

two ASCII characters representing the variable name (the second character of the name, if it is used, or else a null is stored first), and the current value of the variable.

Array storage also includes overall length and dimension information. The name is followed by a two-byte value representing the remaining bytes for the array, then one byte for the number of dimensions and two bytes for each dimension to store its size (the last dimension is stored first). As a variable name in a program statement is interpreted, the storage area is scanned from the beginning to see whether this name and corresponding type are already stored in the list. If not, the variable is added at the end of the appropriate area. Array storage space is created when a dimension statement is interpreted. That is, the variable name is entered in the list and the necessary space reserved with the contents initialized to zero. If a new array name is encountered in any other statement (without previously being dimensioned), it is automatically dimensioned with an upper limit of 10.

Because simple variables and arrays are stored in separate areas, one can use an identical name for both. In addition, if the explicit type flags are used with the name, separate variables are created since both the name and type must match. That is, X%, X#, X!, and X\$ are all distinct variables. Therefore, it is possible to have a number of different variables with the same one or two-character name. The Basic interpreter keeps them straight because it can determine whether the variable is dimensioned from the use of subscripts and also determine the variable type, based on the default type corresponding to the first letter or from an explicit type flag. All these conditions must match an entry in memory or else it is assumed to be a new variable and a new entry is created.

Scanning the variable list can involve considerable processing time. Variables are not stored in any prescribed order. Integers, single and double-precision floating point values, and string variable parameters are intermixed. So the search for a variable Involves beginning at the start of the storage area and examining each variable name and type until a match is obtained or the end of the area is reached. In the case of simple variables, the variable type flag conveniently provides the number of bytes to skip over for the start of the next variable.

In the case of arrays, its length, stored

immediately after the name, functions the same way. To save time during the scanning process, this value is computed once when the array storage space is first created. The number of bytes that follow is given by the byte length for the variable type times the product of the dimension, plus the number of bytes needed to store the dimension Information. Then, when arrays are scanned and the variable name or type does not match, this value is read and quickly locates the start of the next array. Since the storage area must be scanned each time a variable is used, a time-saving tip is to declare the most frequently used variables early in the program so they are stored near the beginning of the list. Potentially, this could save considerable execution time in lengthy programs with large amounts of repetitive calculations.

Because the variable storage area immediately follows the program statements, increasing the program length, either by editing or loading a new program, will overwrite the old variable storage area. Any time a program is loaded or an existing program is edited, as well as when the Run command is issued, the pointers which define the extent of the variable storage sections are all initialized to the location after the end of the program code. This is interpreted as an empty storage space.

One other point that will effect your program is the way string variables are stored. The string information stored in a variable storage block consists of the type flag (3), the number of characters in each string and the start address for the actual string. This information is intermixed with the other variable types in one of the two variable storage areas, depending on whether it is a single string or an array of strings. If a string

### "With a few software changes you can preserve variables in memory for use later."

variable is entered via an input statement or is generated by a string function or by the concatenation of several strings, the actual string of ASCII characters is stored in an area of upper memory reserved for strings. But if the complete string is defined in an assignment statement of the program, such as:

500 A\$ = "THIS IS A STRING"

or in a data statement, the string is left in the program area. This approach conserves storage space, but results in strings being scattered throughout memory. If strings stored in one program are to be used by another chained program, it is necessary to extract strings from the program area and save them in the string storage space.

#### The Chain Command

So, these are the required steps for chaining in Level II:

• Store all variables, including embedded strings, in the upper part of memory and protect them.

. Load the new program.

• Move the saved variables back down immediately following the program statements.

• Start the new program without resetting the variable storage pointers.

The first three steps in this process are illustrated in Fig. 2. Relocating the strings that are embedded in the program statements can be handled quite easily with an existing system routine in ROM. As these strings are moved, it may be necessary to expand the string storage area, so the string relocation should be performed before the variable block is moved.

Once you are able to chain, you are free

to edit a program and restart it without losing variables. Before making any changes to the program statements, perform step 1 above. The editing or statement additions/ deletions would be made (in place of step 2) using the normal system commands. After all changes have been entered, steps 3 and 4 are performed to repack the variables at the end of the corrected program and restart the program at the desired point.

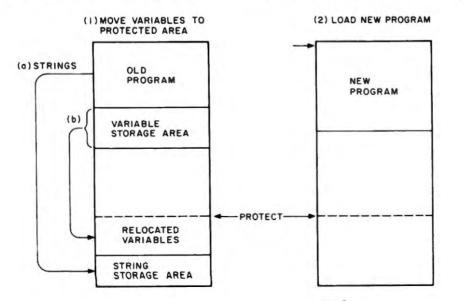

#### Summary

Chaining is useful in a variety of situations. For example, you may have a program requiring the results of a previously run program. Rather than modify an existing program, it may be more convenient to write a separate program called by a Chain command to preserve the results of the first program. Breaking a large program into several smaller routines (which are chained) is almost equivalent to having more memory.

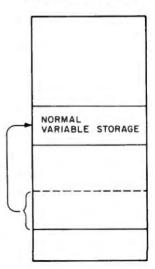

Another memory saving application involves programs with extensive internal data storage. Once data statements are read, they are essentially wasted space. An alternate approach is to have a separate preliminary program consisting of read and data statements to preset the variables and then chain the main program.

The proposed chaining software also lets you resume your program after editing with little memory loss.

The concluding portion of this article will describe the actual Chain command for Level II, including the complete assembly code. It is completely relocatable and automatically installs itself immediately below any other patches previously loaded, such as key debounce, lowercase, or whatever other fixes you may already have in your system.

#### (3) RESTORE VARIABLES

# At home on the Mod I and III.

# DOSPLUS 3.3

DOS PLUS 3.3 Microsystems Software, Inc. Hollywood, FL \$99.95

James LaSalle M.R. 2 Bock Lane Baden, PA 15005

A t this writing there is only one serious double-density DOS available: DOS-PLUS 3.3. It not only reads single density TRSDOS, LDOS and NEWDOS/80 diskettes, but reads standard Model III TRSDOS diskettes; and the Model III DOSPLUS reads and writes diskettes that are compatible with the Model I.

However, specialized disk I/O files and hardware-dependent features cannot be shuttled between the machines. The little gem that lets the Model I read Model III TRSDOS diskettes is the Convert/CMD utility. Convert :1 :0 makes the required adjustments to allow access to Model III diskettes.

DOSPLUS 3.3 allows mixing of various track drives. The Format/CMD utility formats disks for the desired track count and storage mode (double or single density). Once this is done, DOSPLUS 3.3 takes care of all housekeeping. LDOS/VTOS handles the different track drive problem in the same manner. If specifying the track on each format is disturbing to you, Config will allow you to preselect the track count and stepping rate, operate with a clock speed modification installed, configure a drive as double sided, (you can only configure the system drive to a certain track count) and if

252 • 80 Microcomputing, October 1981

your printer can handle them, send unaltered graphics codes to the printer.

#### **Transfer Your Library**

You may want to transfer your program library from single to double-density format. Unlike Percom's DBLDOS that requires you to manually copy all filespecs, DOSPLUS does this with the Transfer/CMD utility. DOSPLUS reacts to the disk format (double or single density) and transfers files from disk to disk in the appropriate mode.

First format the destination disk in double density and execute Transfer :s :d (:s equals source drive, :d equals destination drive). DOSPLUS moves all visible files with no user intervention.

#### Directory

LIB gives you a look at a respectable library of DOS commands. Many of the familiar ones have been extended. DIR typifies the library enhancements. With most DOSes (LDOS excepted) the directory lists only the visible files on a disk; however, with DOSPLUS 3.3 the information is much more thorough.

The first line of the directory lists the drive number, disk name and date, version of DOSPLUS and density mode. The files are then described with various parameters. The ATTRB column first tells if the file is visible, invisible or deleted. The asterisks denote a user file. An S in the second AT-TRB column would denote a system file. Next a U, A or B tells if the update, access or both passwords are set. The last ATTRB column tells the protection level set.

The directory also indicates the number of records on file, number of sectors, number of granules used, and if the file is written on consecutive tracks. The last directory line tells how much storage space remains on the disk.

A double-density disk filled with small utility programs easily fills several video screens in this format. This is not inconvenient because the system pauses after the video is full and waits for user instructions to proceed.

#### **Other Commands**

Free has been altered to graphically display the tracks currently being used on a specified disk instead of the amount of free storage left. This is a quick way to see how many tracks on a disk have been formatted where the directory is located and which tracks have been locked out.

Date can be set at power-up and is the default value for backups and format functions. DOSPLUS retains the date unless the system is rebooted. Copy has been streamlined to copy filename:s :d. This copies a file from drive :s to drive :d. Single-drive users are not forgotten. A special utility, Copy1/ CMD, allows single-drive copying of all file types. Create preallocates disk space for a specified file. Debug can now be entered with a shift Break. Device displays current I/O devices and their vector addresses.

DOSPLUS 3.3 for TRS-80 Model I currently supports only three devices: keyboard, video monitor and printer. The RS232 is not defined at this time. Not Implemented in this version of DOSPLUS are Link (I really miss this one), Set, Reset and the ability to route to a disk file.

#### **Build-Do Commands**

Chaining is available with the Build-Do commands. Build allows the user to create a sequential set of tasks for DOSPLUS to perform. A Do file may be created with Build to get a directory, display the Free map, load a printer driver, set Basic memory size, and jump to Basic. Build is completely selfprompting. A Pause command may be inserted in the Build file to allow for user intervention. Pause does not allow for user entry of commands.

Do checks high memory (4049H-404AH) and reserves about 300 bytes at the top of memory for itself and a small buffer. After

## "There is only one serious double-density DOS available: DOSPLUS 3.3."

Do executes, this memory space is returned to the system.

A problem arises when a high memory program (printer driver, machine code sort, etc.) occupies the same memory area that Do usurps. Trying to Build a file that first loads the GSF (Racet computes) sort module into high memory is disastrous. When Do loads GSF, it obliterates its buffer and all Build instructions are lost.

The Forms command controls printer page length, the number of printed lines per page, the number of characters per line, and can output to a serial printer. It can also generate an automatic line feed on carriage return and perform a top-of-form.

A hard (printer generated) top-of-form is not implemented on my Okidata Microline 80 printer. Having to include paging modules in my programs has been a minor inconvenience in the past, but DOSPLUS 3.3 eliminates the need for extra page formatting code. On power-up the Forms parameters are set to standard values. To view the current status of the Forms driver type: Forms (enter). This also eliminates the need for any high memory printer routines. Since Forms is a library function these LPRINT/ LLIST parameters are available for *all* printer output—even Basic listings!

The only minor irritant is that the TRS-80 Model I LPRINT line counter (found at 16425 decimal) is decremented with each printer code. In the Okidata Microline 80 printer expanded print is available by typing LPRINT CHR\$(31); a return to normal print is LPRINT CHR\$(30). The Model I and the Forms driver count each of these codes as a line printed and increment the LPRINT line counter. This could lead to a problem with printed output creeping down the page.

When I do not want Forms control I disable it by typing: Forms (L = 66, P = 66). This sets the page length and number of lines printed per page equal to 66. If I want a Basic program listing to accurately paged, I initialize the LPRINT counter by typing: LPRINT CHR\$(12).

PROT has been expanded to allow the changing of a disk's name as well as the usual password manipulations.

#### **Utility Functions**

There are about a dozen programs listed in the utilities section of the DOSPLUS 3.3 manual—all of them extend the versatility of the system. By being discrete about which utility functions become programs, relatively small system disks can be created. This provides the single-disk user with maximum storage space per disk.

CLRFILE zeroes a file but does not reallocate its storage area. This could be useful when using a disk for temporary files. CLR-FILE has the same overall effect as the library command Create.

Copy1 is a necessity for single-drive users. It permits single-drive disks to transfer all types of files. Both LDOS and NEWDOS/ 80 have this feature, but it is closely tied to the system. Copy1 will probably be little used by multiple-drive users.

Crunch is little changed from DOSPLUS 3.1. It is a utility to eliminate Remarks and extra spaces in Basic programs.

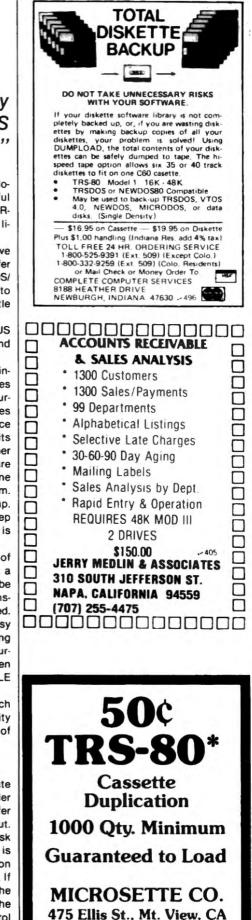

DiskZap has been amended to read single or double-density disks. Its capabilities are similar to Apparat's SuperZap. In its current form it does not generate hash codes or passwords. Conspicuous by its absence is SuperZap's DFS function. This permits examining or modifying by file name rather than by sector. Micro-Systems Software chose to provide this ability in a stand-alone machine language DiskDump program. Paging is slightly improved over SuperZap. Taken together these utilities should keep most disk zappers happy. Documentation is adequate for both utilities.

Purge allows you to rid a large number of files. Purge :0 (I) presents the user with a menu of visible and invisible files to be marked for deletion. Passwords are transparent to Purge so all files may be killed. With a handy program of this type it is easy to become over-zealous and kill the wrong file. The Restore utility, fortunately, resurrects the kill file as long as it has not been overwritten by another program or CLRFILE has not been used on it.

Map shows what tracks and sectors each file occupies. The value of this utility becomes evident when two disk systems of different track counts are used.

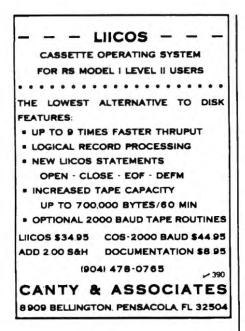

#### Spooler

Micro-Systems also provide an adequate spooler with DOSPLUS 3.3. The spooler uses an operator-defined memory buffer and an optional disk file for printer output. Spooling becomes a semi-background task allowing the host program disk I/O. This is accomplished by halting printer operation while the disk drives are being accessed. If the operator was too conservative in the allocation of spooling memory space, the spooler will temporarily seize CPU control until the spooler buffer is cleared of its backlog. Other than this, the operator is barely aware that the spooler is active. You

can even list the spooler's disk file and printing still continues.

Deactivating the spooler requires rebooting the system. Since the spooler and the Do buffers can be co-resident, the spooler can be activated from a Build/Do file.

#### **Disk Basic Version 1.4**

**DOSPLUS Extended Disk Basic Version** 1.4 is authored solely by Micro-Systems Software, but I have not experienced a compatibility problem between DOSPLUS Basic and the MicroSoft/Tandy Extended Disk Basic. The only areas of incompatibility I encountered was with the specialized disk I/O file structure of NEWDOS/80 and with entry into Disk Basic itself. When entering DOSPLUS Basic, no file buffers (channels) are allocated. With other DOSes the default value is three buffers reserved. You must explicitly reserve I/O buffers when entering DOSPLUS Basic. The syntax for this also differs from the norm. The command: Basic filename-F:3-M:65237 loads Basic, reserves three I/O file buffers, protects memory above 65237 and loads and executes the program specified in filename.

DOS commands from Basic have been simplified to: CMD"DOS command". DOS-PLUS 3.1 used CMD"I", "DOS command". A plain CMD returns to DOS. RENUM, SR and REF are called from Basic using CMD.

Basic has editing and keyboard shorthand. Pressing the semicolon displays the first line of code; pressing the slash key displays the last. Pressing L lists the entire program. The DU and DI commands allow the duplication and deletion/insertion of a program line. An L"filename" loads a program and a S"filename" saves it. Similarly R"filename" loads and executes a program.

Renumbering is adequate. To renumber a Basic program type: CMD"RENUM", n,i,s,e. Where n equals new line, i equals increment, s equals start line, e equals end line. Unlike NEWDOS/80, DOSPLUS 3.3 will not allow block moves via the RENUM command.

The SR/CMD module is unique in that it allows the programmer to search and replace a string variable or expression. You expect to find this feature in a word processor. I am sure this is one feature that future DOSes will incorporate.

REF/CMD is a variable cross reference. CMD"REF", K,L,V lists references in a Basic program by keyword, line number or variables. To obtain hard copy just append a P to the specification list.

CMD"M" is a kind of dynamic variables

list. Stop a program at any time during execution and type CMD"M" and all variables are listed along with their current value. The debugging value of this command should be obvious.

The Trace function has been revamped to single step through Basic displaying program lines before executing them. This, along with CMD"M", has significantly reduced program debugging time for me. TRON turns on the trace and pressing any key single steps through Basic. Since only one instruction is displayed at a time, the video display is much easier to interpret. If Devices were fully implemented, the video monitor could be Linked to the printer to display the trace simultaneously on the monitor and printer. In the absence of Link the video could be Forced (Routed) to the printer.

Appending a ,V after a file to be run saves all current variable values. This allows passing variables from one Basic program to another. The result is true chaining. An index array could be established with an initialization program and passed to other programs.

File handling enhancements with DOS-PLUS include variable record length files. This makes ISAM techniques possible. With variable record length files, the programmer no longer has to calculate subrecords. If a logical record length turns out to be only 100 bytes, then Open"R",1, "filename",100 opens buffer one for a record length of 100 bytes. Micro System's TEST-PGM program amply illustrates this technique. Other than this sample program there is little explanation on the utilization of variable record length files.

In addition to the variable length files, Open"E" and Open"D" are available. Open"E" allows the extension of a sequential file without reading the entire file into memory and writing it back to disk. Open"E" causes new records to be added to the file on disk and the EOF marker adjusted. Open"D" seems to be synonomous with Open"R". It has been included to be compatible with TRS-80 Model II syntax.

Micro-Systems Software reworked Basic in DOSPLUS 3.3 quite extensively. Actually two Basics are provided: a full-feature Basic/CMD and an abbreviated TBasic/ CMD. TBasic is meant to be used after a program is debugged and the various debugging utilities are not needed. This provides the user with more memory space for data. Not included in TBasic are the CMD function, editing and keyboard shorthand,

# **Baily Oribus** 1040 EDITION **TAXE** FORECAST: HOT

# **RETURNS ARE IN; CPAIDS VOTED MVP**

# Title of "Most Valuable Program" Bestowed on Master Tax Package

Barely four years after its introduction into the microcomputer market, CPAids Master Tax software is being praised by hundreds of accountants as their Most Valuable Program.

Accountants nationwide have prepared thousands of returns using CPAids Federal 1040 software and today CPAids announced their enhanced programs for 1981.

The most notable addition to all CPAids software, the Fixed-Asset Accounting Program collects data year round and carries information over to the appropriate schedules and forms at tax time. Continuing an era of efficiency and cooperation. General Ledger II interfaces with the Master Tax Program to generate Schedule C. The Master Tax Program also generates a proforma tax organizer, providing necessary information from the previous years' returns.

#### The Time Is Right For CPAids

In an informal interview, CPAids dedicated its products to eliminating the frenzied feeling plaguing accountants during tax season and vowed to serve professionals well, not just at tax time, but all year. Authorized dealers have pledged their continued support and offer a *free* 1981 update to those who subscribe now.

#### MASTER TAX

- -Federal 1040 pages 1 and 2 -Schedules A, B, C, D, E, F, G, R,
- RP, SE, TC, ES –Forms 1116, 2106, 2119, 2210, 3468, 3903, 4136, 4255, 4625, 4726, 4797, 4874, 4972, 5695,
- 5884, 6251, 6252
- -Client instruction letter
- Exclusive CPAids print options:
   preprinted forms
  - overlays
  - generated computer forms • printing on government
  - printing on governme forms
- -Loan amortization program -Input sheets

Also available this year, our new 1120 corporate program.

### **GENERAL LEDGER II**

- -General ledger, payroll fixedasset accounting
- -Loan amortization
- -Stores all transactions
- -Payroll interactive with the general ledger section
- -Statement of changes in financial position
- -Compilation letter
- Fixed-asset program stores up to 10,000 assets

CPAids 1040 tax software basks in early victory amidst cheering throng of enthusiastic users!

For only \$55 CPAids will send you a demonstration disk and manual.

Call or write for free brochure and the name of the dealer nearest you.

## "The shortcomings of DOSPLUS 3.3 are few and reflect my personal preferences...the literature is adequate for an experienced hacker."

or full error messages.

#### Shortcomings

The following shortcomings of DOSPLUS 3.3 are few and reflect my personal preferences: no DOS high memory command; lack of complete Device handling; no DOS Boot command for a warm reboot; the elimination of the Basic2 library command; and finally, only fair documentation. The literature is adequate for an experienced hacker, but may not suffice for an entry-level user. I especially miss a section on DOS calls.

There is also some conflict between DOSPLUS' keyboard routine and some Level II programs. Radio Shack's Haunted House adventure and Astrology are representative of this problem. Both programs were put on disk with Apparat's LMOFF-SET. Executing either of these programs under NEWDOS/80 requires disabling the keyboard debounce routine. Small Systems Software's DCV-1 tape-to-disk utility solves this problem, however. DOSPLUS has no way to disable debounce so neither of these programs can be easily executed!

#### Assessments

My overall evaluation of DOSPLUS 3.3 is that it is a stable, efficient, fast and easy-tomaster DOS. However, if you have mastered NEWDOS/80 you would probably miss many of the Apparat's extra enhancements (mini-DOS, block move of Basic code, etc.) if you adopted DOSPLUS as your bread-andbutter DOS.

The major factor in weaning me away from NEWDOS/80 was DOSPLUS' portability from Model I to Model III (and back again), and the ease with which it interchanges single and double-density diskettes. The standard features of DOSPLUS have been the basis for many stand-alone utilities. If nothing else was considered but this factor, DOSPLUS is a bargain. I have not used NEWDOS/80 with double-density zaps since acquiring DOSPLUS. A business can do little better than DOSPLUS for TRS-80 Model I or Model III.■

Author's Note: The Config command can only configure the system drive to a certain track count. Disks intended for drives with a track count different from the zero drive must be defined with the Format utility. The Config command may still be used to vary the stepping rate and number of disk sides for any drive as mentioned above.

Micro-Systems also tells me that Small Systems Software's DCV1 tape-to-disk utility will set the proper Level II keyboard values for correct operation. This means that DOSPLUS' debounce routine is no longer a serious problem for those few programs that require a Level II keyboard.

# Everybody's making money selling microcomputers. Somebody's going to make money servicing them.

New NRI Home Study Course Shows You How to Make Money Servicing, Repairing, and Programming Personal and Small Business Computers

Seems like every time you turn around, somebody comes along with a new computer for home or business use. And what's made it all possible is the amazing microprocessor, the tiny little chip that's a computer in itself.

Using this new technology, the industry is offering compact, affordable computers that handle things like payrolls, billing, inventory, and other jobs for businesses of every size...perform household functions including budgeting, environmental systems control, indexing recipes. And thousands of hobbyists are already owners, experimenting and developing their own programs.

#### Growing Demand for Computer Technicians

This is only one of the growth factors influencing the increasing opportunities for qualified computer technicians. The U.S. Department of Labor projects over a 100% increase in job openings for the decade through 1985. Most of them *new* jobs created by the expanding world of the computer.

#### Learn at Home in Your Spare Time

NRI can train you for this exciting, rewarding field. Train you at home to service not only microcomputers, but word processors and data terminals, too. Train you at your convenience, with clearly written "bite-size" lessons that you do evenings or weekends, without going to classes or quitting your present job.

Your training is built around the latest model of the world's most popular computer. It's the amazing TRS-80<sup>TM</sup> Model III, with capabilities and features to perform a host of personal and business functions. No other small computer has so much software available for it, no other is used and relied on by so many people. And it's yours to keep for personal or business use.

You get plenty of practical experience. Using the NRI Discovery Lab<sup>®</sup> that also comes as part of your course, you build and study circuits ranging from the simplest to the most advanced. You analyse and troubleshoot using the professional Beckman LCD digital multimeter you keep to use later in your work. Then you use the lab and meter to actually access the interior of your computer ...build special circuits and write programs to control them. You "see" your computer at work and demonstrate its power.

#### Become the Complete Computer Person

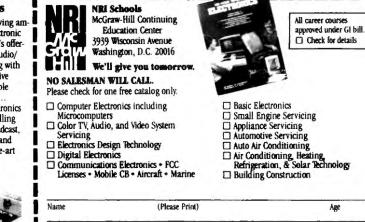

You're also trained in writing and debugging both BASIC and advanced machine language programs...gain hands-on experience in the operation and application of computers to business and personal jobs. You're trained to become the fully rounded, new breed of technician who can interface with the operational, programming, and service facets of today's computers. You're ready to take your place in the new electronic age.

#### Other Opportunities

NRI has been giving ambitious people new electronic skills since 1914. Today's offerings also include TV/Audio/ Video Systems servicing with training on our exclusive computer-programmable 25" diagonal color TV... Communications Electronics for servicing and installing microwave, broadcast, CB, radar, etc... and other state-of-the-art courses.

#### Rush coupon for Free Catalog... No Salesman Will Call

Send the coupon for our 100-page catalog showing all courses with equipment and complete lesson plans. There's no obligation other than to yourself. See how NRI can help you grow with the most exciting and important new field of the 80's. If coupon has been removed, please write to NRI Schools, 3939 Wisconsin Ave., Washington, D.C. 20016.

# All About Program Files

A. J. Barnard, Jr. J. T. Baker Chemical Company Phillipsburg, NJ 08865

A. David Barnard Rensselaer Polytechnic Institute Troy, NY 12181

Managing a small data base with cassette storage and a Model I can present problems. One problem is the low rate for data transfer and the limited reliability of the tape system. This problem is eased by hardware and software fixes such as the TC-8 cassette operating system.

A second problem stems from the nature of the records forming the data base. If the records are of variable length, alphanumeric, and not closely formatted, difficulties are magnified in the use of either data statements or a separately maintained cassette file; memory overhead for arrays and strings may be substantial.

With such records, a third approach can be considered—use of a program file.

#### The Program File

In a program file each record is stored as a statement against a line number. A program file becomes especially attractive if values for a significant parameter can be encoded as line numbers. For a program file, all the built-in, line-oriented subroutines of the programming language are available, notably the arrangement of records by the line-number-encoded parameter regardless of entry order. In this respect, a program file is a linked file.

A PEEK routine that steps through the file retrieves records from a Basic program file. When a line number in the search range is found, the associated record is recovered, manipulated and displayed by the string-handling capabilities of Basic.

Each record is entered against its appropriate line number just like a program statement with one important difference: A double quotation mark must be entered following the line number and before the proper record. The record is stored in the ASCII values of the characters and any embedded Basic key word (e.g., On, And, End) or control character is not interpreted as such. The double quotation mark ensures clear printing.

#### Retrieval of Records from a Basic Program File

The elements of a program to retrieve records from a Basic program file are highlighted by Program Listing 1. Line 0 clears space, principally for the string R, in which a recovered record is placed. Line 0 also defines the integer and string variables and then GOTOs the operating program at line 5000. Lines 1 through 4999 are thereby reserved for the program file. The first and last records, FR and LR, to be retrieved are input in response to lines 5000 and 5010. Line 5020 checks for entry errors.

The pointer to the start of a Basic program is at decimal address 16548 (40A4H) (least significant byte) and 16549 (40A5H) (most significant byte). For the standard Model I with 16K the location pointed to is 17129 (42E9H). This location X, and the next one, X + 1, hold the two-byte pointer to the address at which the next line begins.

The next two positions, X + 2 and X + 3, contain the two-byte value of the current line number, L. The statement associated with this line number begins at X + 4 and ends with a null byte (character code zero). This description explains the sequence of line 5030 (address, first line), 5040 (line number, current line), 5060 (if line number in scan range, reading of record into string R until null byte is reached), and 5090 (address, next line).

The string R is printed by line 5080 with the line number, and R is nulled for reuse. Line 5050 checks if the current line number is within the search range. If below, the scan continues by lines 5120, 5040, and back to 5050; if beyond, a new search is prompted (lines 5110, 5120 and back to 5000).

If the records of the program file, for example, held employee information by an alphabetically ordered time card number, the first two records might read:

1"AARON, MORRIS: HIRED 7/18/75; DEPT. 10 9"ALBERS, KARL: HIRED 12/15/60; ON LEAVE

A search for card numbers from one to nine or beyond would retrieve and display the same data.

This simple program can be applied to various small data bases by manipulating the string in which a retrieved record is placed. A practical restriction is that the program with an embedded file should CLOAD in not much more time than it takes to read an equivalent cassette file into a previously loaded program.

With 16K memory, an operating program should probably be less than 2.5K long and be packed by the use of multistatement lines, single-letter variables, DEF statements, etc., and by brevity in prompts and headings. The records should be telegraphically styled including abbreviations, acronyms and codes that can be replaced by full statements using if...Then...Else sequences or lookup arrays.

Program Listings 2 and 3 present two practical programs highlighting the use of Basic program files. They are tailored to the TRS-80, but can be adapted to other computers using Microsoft Basic. The listings have been made with line feeds and indents to improve legibility, but the programs should be entered without these niceties in order to conserve memory.

#### **Daily Diary**

Program Listing 2 is a daily reminder program. Lines 101 through 6031 are reserved for the program file and these numbers encode the month and day for a five-year period. For example, lines 101, 1301 and 4901 store the notes for January 1 for the first, second and fifth years. Year one is set as Y1 in line 10. The operating program consists of lines one through 85 and in execution requires only 1.8K of

## "One problem is the low rate for data transfer and the limited reliability of the tape system."

memory with a record as long as 120 characters.

The search routine delineated by Listing 1 appears in lines 40, 45 and 50. The first and last dates (FD and LD) to be scanned are entered in response to line 20. By lines 20–25, the scan range is placed in string W, which is used as a heading. The dates are encoded as line numbers by the expression for C in line 25. Line 30 checks for entry errors and a response requires that the entered range is the intended one.

A retrieved record, as string R, is analyzed by lines 55 and 60. First, introductory spaces or double or single quotation marks are stripped. Then, if the third character in the resulting string is a colon, the first two characters are placed in string S, which is then checked by line 60 for a code. For example, if "HO: begins a record, then Holiday is substituted. The codes can be personalized. codes can be personalized.

Line 65 converts a line number to the month, day and year, which is displayed as string V ("##/####") (line 5) by the PrintUsing instruction.

Line 65, beginning with :MK = M, and line 70 form a day-of-week routine correct to year 2000. The abbreviation for the day taken from string T (line 5) is placed in string U by line 70. (To eliminate the day-ofweek feature, delete the final statements of line 65, line 70, and the U; in the LPrint and Print statements of lines 75 and 80.)

If a printout is requested, flag H is set (line 35) and the LPRINT statements of lines of line 65, line 70, and the U; in the LPRINT and Print statements of lines 75 and 80.) and 75.)

The display is secured by line 40 (heading) and line 80 (records). When the counter J for the number of displayed records exceeds eight (line 80), press Enter for the next frame. After each record is printed, strings S and R are nulled for reuse. When the search is complete, line 85 prompts another. A daily diary file might start:

101"HO:NEW YR DAY-RUTH'S->DINNER 115"PD:IRS 4/4 EST TAX 117"CALL JIM ABOUT FEB SKI WKEND

If Y1 = 81 (that is, 1981) in line 10, then the CRT display for a scan from 1,1,81 through 1,17,81 would be:

-SCAN 1/1/81 ->1/17/81-1/1/81-THR-HOLIDAY-NEW YR DAY-RUTH'S-DINNER

1/1/81-THR-HOLIDAY-NEW YR DAY-RUTH'S-DINNER 1/15/81-THR-PAYMENT DUE-IRS 4/4 EST TAX 1/17/81-SAT-CALL JIM ABOUT FEB SKI WKEND

If the diary becomes too long for a convenient CLOAD, the file for a completed period, say, six months, can be kept (with the operating program) as a separate tape by the use of the Delete and CSAVE instructions. Then only current entries need be updated and searched.

#### Stamp Inventory Program

Program Listing 3 is an inventory program for a philatelic collection. The collection of stamps, of course, must obviously be sufficiently valuable, extensive, or active to warrant computer management.

The operating program occupies lines 0 and 60000 on, and lines 1 through 59999 are reserved for the program file. The line numbers encode the catalog numbers of the postage stamps. The records need not

## "The collection must be sufficiently valuable to warrant computer management."

be formatted; with a colon separator however, fields can be displayed as separate lines and, beyond the first line, with an indent. In this way, different aspects of a collection are highlighted.

The Scott catalog system is the most common one in the United States. Unfortunately a Scott number consists of a numeral with one or more prefixed letters. The prefix denotes the stamp type (regular and commemorative issues have no prefix). This difficulty is resolved by the use of numeric offsets. For example, the first airmail stamp of any country has the Scott number C1; its record is stored against line 4401, that is, one plus the offset of 4400. The prefix/offset system established by lines 60020-60030 is adequate for the stamps of the United States and most countries of the British area of

| A CLS+COTO68888                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## "The Scott catalog system is the most common one in the United States."

specialty. If the number of offsets is altered, a change must be made in the upper limit of the For...Next loops in lines 60020 and 60070 and in the Dimension statement in 60020.

Since the program is tightly packed and without remarks, explanation is needed. The PEEK routine of Program Listing 1 is incorporated into lines 60100, 60110 and 60180.

By line 60000 space is cleared for strings (the amount can be decreased if no record exceeds 100 characters). Integer and string variables are defined to speed execution and conserve memory. String S in line 60010 must be personalized by owner's name, country, and date of file entry or update. This string serves as a heading for a printout (line 60090). The information is important for security or estate purposes. Scott numbers encompassed by the file are entered as P1 and P2.

Line 60040 displays the file heading and prompts entry of the range of stamps to be scanned, and with line 60050 separates each entry into its alphabetic prefix and numeral. (Line 60060 converts a prefix W to U; collectors of postal stationery will appreciate this feature.) A check for entry errors is then made.

| Program Listing 5                          |   |

By line 60070, the entered prefix for the scan range is compared with the array of offsets; the proper numerical offset is found and added to the numerals. Line 60080 checks if the upper limit of the range exceeds the assigned number of lines for a given stamp type; if not, the scan limits are placed in string W for a heading.

A retrieved record is placed by line 60110 in string R and analyzed by lines 60120 and 60130. Introductory spaces or single or double quotation marks are stripped. A check is then made for a colon in the resulting string; if one is found, the string to that point is placed in RF and the remainder left in R.

Flag G is set in line 60110. If a colon is found, G is incremented by line 60130. Line 60140 places the Scott number corresponding to the current line number into string Y (G = 1) for the initial display line for the record. For further lines, Y is a string of spaces equal to the number of characters in the Scott number.

The heading is displayed by line 60150 and the retrieved records by line 60170. When the counter F (lines 60100 and 60150) for the displayed record lines exceeds 10, Enter must be pressed (line 60190) for the next frame.

Line 60170 checks if the entire record has been printed; if not, the program returns to line 60120 for further analysis and printing of additional fields.

If a printout is requested (line 60090), flag J is set and the LPRINT statements of line 60090 (headings S and W) and 60150 (retrieved record) are executed. (If a line printer is not used, delete this feature.)

Use of this program is exemplified by Program Listings 4 and 5. Listing 4 is a contrived program file for airmail stamps of an imaginary country. Listing 5 presents a typical heading and the printout for this file. Stamp collectors will be familiar with the tricks used to compact records: wellaccepted abbreviations, listing of sets versus single stamps, appending minor varieties that carry suffixed letters, etc.

The offset system can be extended to revenue stamps (e.g., with line numbers 20000 on). Secondary stamp-issuing entities can be included by added offsets; for example, the U.S. administration of the Philippines could be given the non-Scott prefix PHI.

This article has focused on the usefulness of Basic program files in the microcomputer management of small data bases with cassette storage. Program files effectively pack data and have special merit with loosely formatted records and where values for a significant parameter can be encoded as line numbers. ■

# 96K CP/M<sup>®</sup> (For your TRS-80\* Model II)

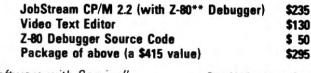

## **Multiple Job Executive**

Add a whole new dimension to your TRS-80 Model II. Let it work while you work!!

ATON's unique JobStream<sup>™</sup> CP/M 2.2, along with additional RAM memory, allows you to simultaneously compile, assemble, or link in one 64K background partition (62K TPA) while you edit files, and spool to the printer, and communicate with another computer in up to four 32K foreground partitions (28K TPA).

As you expand your memory beyond 32K, you can also enter the amazing world of TrackMode BIOS<sup>\*\*</sup> which not only multiplies diskette speed up to five times, but also automatically performs read after write checks for the ultimate in data reliability.

- · Gain hard disk performance for a fraction of the cost-and no backup problems!!!
- Works in 32K, add RAM memory to 256K using standard Radio Shack memory boards.
- · Supports two sided expansion disk drives (1.2 megabytes per diskette).

"Software with Service"

Prepaid, Visa, MasterCard or COD. Shipping and handling extra. California residents add 6% sales tax.

## Is anybody there...does anybody care?

# Adventures in Modemland

Fred Blechman 7217 Bernadine Ave. Canoga Park, CA 91307

n Part I of "Adventures in Modemland" I described how I got my TRS-80 connected to my telephone using the Microconnection modem from The Microperipheral Corp. Now I could communicate with microcomputer bulletin boards all around the country. Assuming I could only contact other TRS-80s I looked over a list of 133 bulletin boards from The Microperipheral Corp. and found several that looked TRS-80 oriented: Forum-80, Comm-80, Info-80, Hobbiest-80 and Engineer-80. The closest was Fullerton. CA-the Comm-80 bulletin board of the Orange County TRS-80 Users Group (OC-TUG).

I reduced my equipment to the bare bones for modem operation. The Microconnection was ribbon-cabled directly to the TRS-80 keyboard card edge. My parallel printer and Exatron stringy/floppy tape storage unit, normally connected to the keyboard, were disconnected. I didn't want any interaction to create problems— I was confused enough already. See Fig. 1 for the minimum configuration.

#### **Modem Encounter of The First Kind**

I plugged in the Microconnection wall transformer, and made sure the telephone was connected. I loaded the S80 software program (provided with the Microconnection) into the TRS-80 using the cassette recorder. When the screen asked for (H)alf or (F)ull Duplex command, I typed in F. The screen went blank except for a cursor in the upper left corner. I put the Microconnection modem in the Simplex/Data mode, and random characters (created by the dial-tone) and line noise appeared on the

This is the second article by Fred Blechman about modems; the first was The Microconnection 80 Microcomputing, August 1981. screen. When I pressed a key that character appeared on the screen; this meant my modem was ready. I put the modem switches in the Duplex/Voice position, picked up the phone handset and dialed the OCTUG Comm-80 phone number, (714-526-3687). It answered almost immediately with a click and a steady tone.

I quickly set the Microconnection to the Duplex/Data mode. This transmitted a carrier of the proper frequency to the modem at the other end of the line, letting the Comm-80 system know I was in contact. I hung up the telephone handset and contact continued through the modem. After a couple of Enters from my keyboard, the Comm-80 started asking questions.

#### When OCTUG Talks, I Listen!

I had no experience with bulletin boards and no instructions of any sort. I just muddled through the questions, giving the best answers I could think of. The first question (Do You Need Linefeeds, Indicate yes or no"?) I answered no. Then the screen gave a basic description of the system. It asked my first name, last name, and location. It repeated my inputs on the screen and asked for confirmation. The screen showed I was being logged onto Comm-80, with the date, time and caller number. When asked if this was my first time on the system, I answered yes. I was then asked if I wanted more information on the system; I replied yes and was told that Comm-80 is running on a TRS-80 with 48K, two MTI/MPI disk drives, TRSDOS 2.2, a Radio Shack RS-232-C, Centronics Micro P1 printer, a Novation CAT modem, autoanswer hardware from Computer Control. and software from Faulk and Associates Software.

This was followed by an invitation from OCTUG to use the system any time 24 hours a day, seven days a week. A simple command menu was then printed:

> E-Enter a Message K-Kill a Message H-Help, Reprint this List R-Retrieve a Message

- S-List summary of messages
- Q-Quick Summary (MSG # & Subject)
- W-Redisplay the Welcome Message
- T-Terminate the Session

#### **Confusion and Panic**

Although all this was happening at only 300 baud-about 30 characters per second-many lines were short. This meant that one, two or three lines a second were being generated on the bottom of the screen, pushing old lines off the screen. Without my printer connected, I had to read (and try to understand) too quickly for comfort. So I entered a T from my keyboard to terminate the session. The screen showed "User Logged Off Comm-80," gave the date, time, and total time on system (in hours, minutes and seconds) and disconnected. I put the Microconnection in Duplex/Voice model to disconnect at my end.

i called Info-80 in Seattle, but got hung up in the system, so I disconnected. After a couple of Forum-80 calls I started to get the hang of it. I found I was able to read messages within various categories (miscellaneous, personal, commercial, system bulletins) and I could enter messages of my own.

#### Non-Standardization

My confusion was caused mostly by the non-standardization among different systems. Various control keys and commands are used. The TRS-80 does not have a Control key; instead you use a combination of a letter key with an Up-Arrow, but not always. Some use Shift and Key or Down-Arrow and Key. Some just use the letter alone for control during receiving, but as a command when responding to a question. Without experimentation or documentation on a particular system, you can waste a lot of time (usually at longdistance rates). Command letters can be particularly confusing. To end a session, you might need a T to terminate, a B for bye, or a G for goodbye. Don't use an E for exit or end, since E usually means enter (for leaving a message). Sometimes a B means bulletins instead of bye. And G,

## "... computer communication over phone lines is by standardized character code (300 baud ASCII). . . "

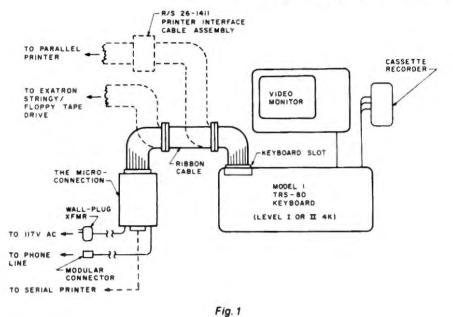

Table 1 Typical Apple Bulletin Board System Commands

Function:

(A, B, D, E, G, H, K, L, N, Q, R, S, T, V, W, X, ?) ?H : Enter your Choice: 'ALL' For Complete Review 'CTRL' For CTRL Characters, or 'A, B, D, E, G, H, K, L, N, Q, R, S, T, W, X, ?' for Individual Response. (C/R) to return to program 2ALL Following is a brief list and description of the commands and their usage: CTRL E-Retypes current line up to present position and allows you to continue from that point. CTRL H (backspace)-Allows you to backspace one character at a time and

- prints A '4' followed by the character you are backspacing over. This is the same routine as is used for delete or rubout instead of true delete. (For the benefit of printers)
- CTRL U (forward arrow)-Starts you back at the beginning of the current line being typed (i.e. start over).

(C/R) to continue, (E) to end ?

A-Apple 40 column. Normally you would be allowed 64 characters per line. A bell will sound at 59 and on up to 64 columns at which point you would be forced on to the next line of text. In the Apple 40 mode, the bell will ring at 35, then again at 38 and 39, dropping you to the next line at 39. To avoid an extra blank line because of the 40th character, 39 was used instead of 40.

B-Print bulletin. Prints bulletins at beginning of program.

#### (C/R) to continue, (E) to end ?

D-Duplex Switch. Alternately selects full or half duplex operation and informs you of current status.

Table continues

used for goodbye on some systems, is used for graphics on Forum-80. Also, the same letter can have entirely different meanings as sub-commands within a single system.

#### Adding the Printer and Stringy/Floppy

With a few contacts under my belt, I decided to add the printer so I could have a printout of what was happening on the screen. I have an Okidata Microline-80 printer with a Centronics-compatible parallel interface, so I'm able to use a Radio Shack Printer Interface Cable (#26-1411) without modification.

Since I don't have an expansion interface and the Microconnection was already plugged onto the card edge at the left rear of the keyboard, I used a two-for-one bus extender from Exatron. This is a five-inch long 40-wire ribbon cable with a 40-pin male card-edge connector on one end, a 40-pin female card-edge connector on the other end, and a 40-pin male card-edge in the center. This allows you to connect two 40-pin cables to the keyboard in parallel. I connected both the printer interface cable and the Microconnection cable to the keyboard using a bus extender. To use the printer with the S80 software, press the Shift, Up-Arrow and P keys at the same time. To stop printing, press the Shift, Up-Arrow and S keys at the same time.

Next, using another two-in-one bus extender, I added the Exatron String/Floppy tape storage unit. I made a copy of S80 on a String/Floppy wafer, and it loads the S80 program in a few seconds. The system, with printer, Stringy/Floppy and Microconnection connected parallel to the keyboard, worked just fine. No crosstalk or interference has been noted even after several months of operation.

#### **Talking to an Apple**

I noticed several bulletin boards listed that were local phone calls-but they were all listed as ABBS. (Apple Bulletin Board System). I knew an Apple used a different Basic than a TRS-80, and that the screen on a standard Apple computer showed only 40 characters on a line, although the TRS-80 had 64 character lines. I dialed the Canoga Park ABBS at (213) 340-0135. Everything worked perfectly; I have since found that computer communication over the phone lines is by standardized character code (300-baud ASCII) using standardized frequency-shift keying (Bell 103), so any computers using these standards can talk to each other-Apple, PET, TRS-80, OSI, etc

My first session with the Canoga Park system yielded a four-foot long printout in

#### Table continued

E—Enter message. Allows you to enter a message into system. Enter commands are basically self explanatory. A carriage return (C/R) at this point will list out the command menu for entries. The change command allows you to change an entire line but not just change part of it. Make sure when you are done with the message to save it to disc with the 'S' command.

(C/R) to continue, (E) to end ? G-Goodbye. Exit program.

H-Help. Prints this routine.

K-Kill a message. Enter this to delete a message from the file. A password may be necessary if one was used at the time of message entry.

L—Line feed on/off. Normally on. For terminals that need an extra linefeed character to advance to the next line.

(C/R) to continue, (E) to end ?

N—Nulls. Adds an extra delay after a carriage return to allow printers time to move the printerhead back to starting position. This option only works with the line feed option on. Each null is equivalent to 30 milliseconds delay and is adjustable from 1 to 30. It defaults to one.

Q-Quick scan. An abbreviated scan See 'S'.

R-Retrieve messages. Allows you to retrieve a message from the file.

(C/R) to continue, (E) to end ?

Table continues

seven minutes and six seconds—and that included the time I spent scratching my head trying to figure out what to do next! Now I had the command and control codes for a typical ABBS system. (See Table 1 for main commands and control characters.) Additional sub-commands are described during specific functions if you hit Enter instead of entering a command.

I called another local system—the Woodland Hills ABBS at (213) 348-1849. This system included an automatic log-on function and a Chat mode. Typing a C as a command alerted the system owners (if they were available) who could use their Apple keyboard to send a message in real time; I'd answer from my keyboard. It's like RTTY (radio teletype) but uses the video screens instead of printers.

#### A Visit to the Big Apple

Since this system was located only a few miles away, I made an appointment to see it in operation. I couldn't believe how simple it was: An Appie II with 48K RAM, two disks, a 12-inch video monitor and a D.C. Hayes auto-answer modem are connected to a standard telephone. When it rings, the auto-answer modem triggers the computer. The disk-based program was purchased for about \$40 from Rainbow Computing in August 1980. No user's guide is necessary, since the program is self-doc-

# INTRODUCING THE FIRST PASCAL COMPILER FOR TRS-80\* MODEL I AND MODEL III\*\*

- FAST ONE PASS RECURSIVE DESCENT DESIGN
- CONFORMS CLOSELY TO ISO DP 7185.1
- SYNTAX ERROR CHECKING
- ACCESS TO TRS-80 GRAPHICS AND RANDOM NUMBER GENERATOR
- COMPLETE DOCUMENTATION
- RUNS UNDER TRS DOS

ONACKI SYSTEMS 5161 COLE ST. SAN DIEGO, CA 92117

# FIELD PROVEN!! 10 MEGABYTES and MORE for the TRS-80\* Model II plus SHARED ACCESS to HARD DISK DRIVE

Hard/Soft Disk System (HSDS) Software allows access as single drive. You can have that 10 Megabyte continuous file - that 50,000 name maillist or inventory! Or a directory with 1000 entries! All completely compatible with TRSDOS 2.0 BASIC. You can mix floppy and hard disk drives. Includes special utilities including HPURGE, DCS Directory Catalog System, HZAP Hard Disk Superzap, and many special formatting options. Three to eight times faster than floppy! RACET quality

HARD DISK DRIVE & CONTROLLER \$5995. Second User \$595. HSDS Software \$400. (Note: HSDS now also available for CORVUS drives!!) KFS-80 (1-drive 32K Min - Mod II 64K) Mod I and III \$100. Mod II \$175

Assembly language ISAM facility! Interfaces with BASIC. Very fast access to records in large files. Access/insert times 1-4 seconds.

B-Tree directory structure eliminates record search. No file reorganization required. Sector buffering reduces media and drive wear while increasing performance. Can be used for primary and secondary file database applications. Records are kept in sorted order on disk by alpha key. Deferred write option. Comprehensive file maintenance and debugging utilities are included. Attention applications programmers - Save time in implementing your custom database application software. MAILLIST (1-drive 32K Min - Mod II 64K) Mod I and III \$75. Mod II \$150

This ISAM-based maillist minimizes disk access times. Four keys — no separate sorting. Supports 9-digit zip code and 3-digit state code. Up to 30 attributes. Mask and query selection. Record access/update time 1-4 seconds!!

#### DISCAT (32K 1-drive Min) Mod I and III \$50

This comprehensive Diskette Cataloguing/Indexing utility allows the user to keep track of thousands of programs in a categorized library. Machine language program works with all TRSDOS and NEWDOS versions. Files include program names and extensions, program length, diskette numbers, front and back, and diskette free space. RS232 drivers and other features.

#### LPSPOOL (32K 1-drive Min) Mod I \$75

LPSPOOL — Add multi-tasking to permit concurrent printing while running your application program. The spooler and despooler obtain print jobs from queues maintained by the system as print files are generated. LPSPOOL supports both parallel and serial printers.

#### BASIC LINK FACILITY 'BLINK' (Mod | Min 32K 1-disk) Mod | \$25; Mod || \$50; Mod || \$30

Link from one BASIC program to another saving all variables! The new program can be smaller or larger than the original program in memory. The chained program may either replace the original program, or can be merged by statement number. The statement number where the chained program execution is to begin may be specified!

#### INFINITE BASIC (Mod I & Mod III Tape or Disk) Mod I \$50; Mod III \$60

Extends Level II BASIC with complete MATRIX functions and 50 more string functions. Includes RACET machine language sorts! Sort 1000 elements in 9 seconds!! Select only functions you want to optimize memory usage.

#### INFINITE BUSINESS (Requires Infinite BASIC) Mod I & III \$30

Complete printer pagination controls — auto headers, footers, page numbers. Packed decimal arithmetic — 127 digit accuracy +, -, \*, /. Binary search of sorted and unsorted arrays. Hash codes.

#### COMPROC (Mod I & Mod III - Disk only) Mod I \$20; Mod III \$30

Command Processor. Auto your disk to perform any sequence of instructions that you can give from the keyboard. DIR, FREE, pause, wait for user input, BASIC. No. of FILES and MEM SIZE, RUN program, respond to input statements, BREAK, return to DOS, etc. Includes lowercase driver software, debounce and screenprint! GSF (Mod | & III Tape or Disk - Specify Memory Size) Med I \$25: Med II \$50; Med HI \$30

**GSF** (Mod I & III Tape or Disk - Specify Memory Size) **Mod I \$25; Mod II \$50; Mod II \$30** Generalized Subroutine Facilities. The STANDARD against which all other sorts are compared! And then compare prices! Machine language — fast and powerful! Multi-key multi-variable and multi-key character string. Zero and move arrays. Mod II includes USR PEEKS and POKES. Includes sample programs.

#### DSM (Mod I Min 32K 2-drive system. Mod II 64K 1-drive. Mod III Min 32K 1-drive) Mod I \$75; Mod II \$150; Mod III \$90

Disk Sort/Merge for RANDOM files. All machine language stand-alone package for sorting speed. Establish sort specification in simple BASIC command File. Execute from DOS. Only operator action to sort is to change diskettes when requested! Handles multiple diskette files! Super fast sort times — improved disk I/O times make this the fastest Disk Sort/Merge available on the TRS.

#### UTILITY PACKAGE (Mod II 64K) \$150

Important enhancements to the Mod II. The file recovery capabilities alone will pay for the package in even one application! Fully documented in 124 page manual! XHIT, XGAT, XCOPY and SUPERZAP are used to reconstruct or recover data from bad diskettes! XCOPY provides multi-file copies, 'wild-card' mask select, absolute sector mode and other features. SUPERZAP allows examine/change any sector on diskette including track-0, and absolute disk backup/copy with I/O recovery. DCS builds consolidated directories from multiple diskettes into a single display or listing sorted by disk name or file name plus more. Change Disk ID with DISKID. XCREATE preallocates files and sets 'LOF' to end to speed disk accesses. DEBUG!! adds single step, trace, subroutine calling, program looping, dynamic disassembly and more!!

#### BASIC CROSS REFERENCE UTILITY (Mod II 64K) \$50

SEEK and FIND functions for Variables, Line Numbers, Strings, Keywords. 'All' options available for line numbers and variables. Load from BASIC - Call with 'CTRL'R. Output to screen or printer!

#### DEVELOPMENT PACKAGE (Mod II 64K) \$125

Includes RACET machine language SUPERZAP, Apparat Disassembler, and Model II interface to the Microsoft 'Editor Assembler Plus' software package including uploading services and patches for Disk I/O. Purchase price includes complete copy of Editor Assembler + and documentation for Mod I. Assemble directly into memory, MACRO facility, save all or portions of source to disk, dynamic debug facility (ZBUG), extended editor commands.

## "Prepare to communicate with giants like The Source and CompuServe."

#### Table continued

- S-Summarize messages. Allows you to scan over messages starting at the message # you specify.
- T-Time and date. Gives you the current time and date. This is also used automatically during log-in.
- W-Welcome. Prints welcome message at beginning of program.
- X-Expert user. Does away with certain explanatory messages during the program. It also allows certain C/R defaults. Ex: A C/R in response to functions? will print functions supported by the system.
- -Prints functions supported in that current mode of operation.

is self-documented and prompts the user.

#### Forum-80

While there are many bulletin board systems you can use with a TRS-80, the most widely available system designed with the TRS-80 user in mind—and using a TRS-80 as the host computer-is the Forum-80. Bill Abney, the father of Forum-80, spent two years writing the combination Basic and machine language programs. If you have an interest in setting up a builetin board system, the current 3.1 version is available for a one-time license fee of \$150, which includes free technical advice

A minimum Forum-80 bulletin board system requires a TRS-80 with 48K RAM, three 35-track disk drives, an RS-232 board and an auto-answer modern. You can call Abney from 5 p.m. to 10 p.m. EST weekdays, or 10 a.m. to 7 p.m. weekends (816) 921-9439 for further information.

You can use a Forum-80 system by following the screen prompts and using the Help command. However, the system offers sophisticated features and many commands and sub-commands that can save you a lot of time and make your contact more efficient. To encourage proper utilization of Forum-80 systems, Abney distributes free user's guides, in two volumes. Volume I is the basic system and Volume II covers the more advanced features. For copies send a selfaddressed, stamped, legal size envelope for each volume.

Postage is 28 cents for Volume I and 41

#### cents for Volume II. Mail to user's guide, Forum-80 Headquarters, 7600 East 48th Terrace, Kansas City, MO 64129.

#### **Bulletin Board Roster**

There are at least 200 bulletin board systems on line around the United States. Some lists have been published previously (80 Microcomputing, May 1980, page 110, and Kilobaud Microcomputing, October 1980, page 158) but the picture keeps changing. The most extensive list I know of is offered free; send a self-addressed stamped envelope to The Microperipheral Corporation, P.O. Box 529, Mercer Island, WA 98040-(206) 454-3303.

#### What Good Are The BBs?

You might wonder why you should get excited about using a computer bulletin board when a phone call or letter might be more efficient. Consider this: You and your computer are in the forefront of a new technological explosion in the information and communications fields. Bulletin boards are a training ground for developing new communication techniques. Also, some allow programs to be uploaded (from your computer memory to the host computer memory) or down-loaded (from the host computer to your computer memory) in various languages. As this sophistication proceeds, so will your ability to use your equipment and knowledge. Furthermore, bulletin boards prepare you to communicate with glant information systems like The Source and CompuServe.

# OMNITERM

#### What is OMNITERM?

OMNITERM is a professional communications package for the TRS-80 that allows you to easily communicate and transfer files or programs with almost any other computer. We've never found a computer that OMNITERM can't work with. It's a complete package because it includes not only the terminal program itself, but also conversion utilities, a text editor, special configuration files, serious documentation and serious support

#### Why do I need it?

You need OMNITERM it you need to communicate efficiently with many different computers, or if you want to customize your TRS-80 for use with one particular computer. You need OMNITERM to SOLVE your communications problems once and for all

#### What do I get?

The OMNITERM package includes the OMNITERM terminal program, four conversion utilities, a text editor, and setting files for use with popular computers such as CompuServe, the Source, and Dow Jones — just as samples of what you can

# The ULTIMATE TRS-80 Terminal Package

do for the computer you want to work with. The package includes six programs, seven data files, and real documentation: a 76-page manual that has been called "The best in the industry." And OMNITERM comes with real user support. We can be reached via CompuServe, Source, phone, or mail to promptly answer your questions about using OMNITERM

#### What do I need to use OMNITERM?

A Model I or Model III TRS-80, at least 32K of memory, one disk, and the RS-232 interface. OMNITERM works with all ROMs and DOSes, and will work with your special keyboard drivers.

#### What will it do?

DMNITERM allows you to translate any character going to any device: printer, screen, disk, keyboard, or communications line, giving you complete control and allowing you to redefine the character sets of all devices. It will let you transfer data, and run your printer while connected for a record of everything that happens. OMNITERM can reformat your screen so that 80, 32, or 40 column lines are easy to read and look neat on your TRS-80 screen. It even lets you get on remote computers with just one keystroke! The program lets you send special characters, echo characters, count UART errors, configure your UART. send True Breaks and use lower case. It accepts VIDEOTEX codes, giving you full cursor control. It will even let you review text that has scrolled off the screen! Best of all. OMNITERM will save a special file with all your changes so you

41 Fairhill Road, Holden, MA 01520 (617) 852-0233 Source TCA818 CampuServer 70318267 TRS-88 is a " of Tanty Curp

can quickly use OMNITERM for any one of many different computers by loading the proper file. It's easy to use since it's menu driven, and gives you a full status display so you can examine and change everything.

"OMNITERM has my vote as the top TRS-80 terminal program available today Kilobaud Microcomputing, June 1981, pages 16-19.

OMNITERM is \$95 (plus shipping if COD) Call for 24 hour shipment. Manual alone \$15, applied toward complete package. Visa, M/C, and COD accepted. MA residents add 5% tax. Dealer inquiries invited.

Contact Lindbergh Systems for your custom programming needs. We are expert at writing software to work with YOUR hardware, in assembler, high-level language or Forth.

Attend the biggest public computer shows in the country. Each show has 100,000 square feet of display space featuring over 50 Million Dollars worth of software and hardware for business, industry, government, education, home and personal use.

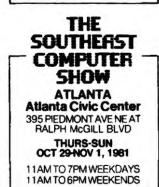

You'll see computers costing \$150 to \$250,000 including mini and micro computers, software, graphics, data and word processing equipment, telecommunications, office machines, electronic typewriters, peripheral equipment, supplies and computer services.

All the major names are there including; IBM, Wang, DEC, Xerox, Burroughs, Data General, Qantel, Nixdorf, NEC, Radio Shack, Heathkit, Apple, RCA, Vector Graphic, and Commodore Pet. Plus, computerized video games, robots, computer art, electronic gadgetry, and computer music to entertain, enthrall and educate kids, spouses and people who don't know a program from a memory disk. Don't miss the Coming Of The New Computers – Show Up For The Show that mixes business with pleasure. Admission is \$5 for adults and \$2 for children under 12 when accompanied by an adult.

## Also, we specialize in complete, powerful software packages for business. Put your TRS-80™ to work for you!

#### **Dealer/Service Center Record Package**

This package, built in several modular packages, can be used separately, or in combination as a complete system. The modular units are self-contained. When combined, they will make the most complete and comprehensive service center bookkeeping/record-keeping package on the market.

A complete history of customer repair files is maintained on-line. Customer files can be accessed by account number or customer name. The information file includes customer name, address and telephone number, make of unit, service dates, name of servicing technician, services performed, and total billed. This information can be called to the screen or printer as a total list, or by the last service date.

The customer records module can post to accounts receivable module, payroll module and our Inventory Control System.

A Model I computer, with four 80-track drives, or a Model III computer, with two 80-track drives will hold approximately 1,800 customers and records. By adding additional drives to the Model III, more than twice this amount of information can be maintained. By switching diskettes in drives, the capacity is unlimited.

Versions of Dealer Service Center Record Package are available for Auto Dealers, Mechanics, TV Repair Centers, **Electronic Technicians and Appliance** Repair Centers. \$199.95

#### **Order Entry (With** Invoicing & Inventory)

Orders are composed of name and address information (with optional company name), method of shipment, method of payment, items on order, quantities, prices, description, and stock number. The system also prints invoices.

At point of shipment, inventory is automatically updated and dollar sales recorded. Shipping charges are logged and shipping date recorded. All entries may be edited and partial shipping is permitted. The inventory module allows checking and updating stock, inventory

reports, sales reports, shipping charges, etc

Order Entry is a complete order entry system, designed for almost any retail and/or wholesale business. Its capacity is upward-expandable from a dual 40track Model I system: 1,750 inventory items, 385 orders per diskette. \$199.95

#### Inventory Control System

This system gives the user complete access to and control over an unlimited number of inventory items. (Note: It has been found that systems containing more than 13,000 items are difficult to handle, from a maintenance time standpoint. Operations, such as Block File reoganization can take more than 3 hours.)

As presently configured, a Model I computer with one 40-track drive will hold 1,925 items, or for a four-drive system a total of 6,625 items. Four 80track drives will hold in excess of 13,000 items. A Model III computer, with two 40track drives, will hold about 13,000 parts. If required, A.M. Electronics can modify both the program and hardware configuration to allow on-line storage of an unlimited number of items. As the file becomes larger, maintenance operations take longer. Average search time is six seconds, with 12 seconds the longest time.

Upon program initialization, the user specifies the item number and description digit length. This allows for item numbers up to 23 alpha-numeric characters. (As item number digits increase, digits for description usage are decreased.)

The program is completely menudriven. Items can be added, edited or deleted from the file. Items can be placed on order, received to stock, or sold from inventory. Complete printout capabilities are available through the printout menu.

Item information includes: item number, description, supplier, re-order point, cost, wholesale and retail selling price, quantity, on-order, and total sold. The re-order point is calculated by the program, based on number of items sold over a period of time. The time period is established at program initialization. \$199.95

Calculating time and place all year.

# Sunrise . . . Sunset

Harold K. Skramstad 8045 S. A1A Hwy. Melbourne Beach, FL 32951

Would you like to know the time of sunrise and sunset without having to look it up in the daily newspaper? The following program finds the declination of the sun, the equation of time (the difference between apparent and mean time), the compass direction of the sun at sunrise and sunset, and the time of sunrise and sunset for any point in the continental United States.

If you are interested in these values for only your own location, the program can be simplified by replacing the statements before line 210 with statements giving the values of LA—your latitude in degrees and tenths, and TD—the time difference between sun time and standard time for your location.

The declination D and the equation of time E are approximated by finite Fourier series in terms of X, the week number and fraction of the week, in lines 280 and 340. The value .04 in lines 530 and 560 is a correction for the refraction of light in the earth's atmosphere at sunrise and sunset.

I have found this program to agree within two minutes with the times of sunrise and sunset given in the local newspaper.

# THE GREAT SIMPLIFIER!

2nd Edition

Encyclopedia of the BASIC Computer Language

APPLE • TRS-80 • ATARI • IBM • DEC • ABC-80 • SHARP EXIDY • NEC • HEWLETT – PACKARD • HEATH SYSTEM 80 • TEXAS INSTRUMENTS • PET • NORTHSTAR SINCLAIR • WANG • VARIAN • OHIO SCIENTIFIC

The only book that simplifies the BASIC language by explaining its many dialects is now even better! We've added 240 BASIC words from the world's latest computers, for a new total of nearly 500 words detailed in a concise easy-to-read manner.

The 480-page **2nd Edition BASIC Handbook** tells you everything you need to know about today's BASIC language. It explains *all* significant Statements, Functions, Operators and Commands, so you can put them to work instantly!

If there's an alternate way to write a program using other BASIC words, the **Handbook** shows you how. If a program needs a Function your computer doesn't have, the **Handbook** generally has a subroutine which does the same thing. And it's all alphabetized and indexed for fast access!

The big *new* **2nd Edition** helps you convert those "strange" programs found in magazines and professional journals to RUN on your computer. Extra sections describe many specialty BASICs, including Atari, Sinclair, Tektronix, TRS/Color, plus Disk BASIC.

For students, businessmen, hobbyists, and pros — anyone who works with BASIC, the updated **Handbook** is indispensable. Order your **Second Edition** today! It's the missing link between you and more computer power!

Where you'll be with this meat inventory program.

# Fat City

#### David D. Busch 515 E. Highland Ave. Ravenna, OH 44266

Letting your computer keep track of the meat in your home freezer can save frostbitten fingers and energy lost to escaped cold air. Better yet, firm control over what you have and don't have can keep you from accidentally dipping into the latest meat stocks while an older cut languishes at the bottom of the stack.

Freezer Inventory was written to take some of the confusion out of stocking and maintaining meat in a home freezer. Some homeowners use log books which are difficult to maintain, never up-to-date, and time-consuming. It's usually necessary to do a physical inventory once each six months or so just to be sure of what's hidden in dark recesses of the freezer.

Others stock and replenish by the seat of their pants, knowing vaguely how much ground beef remains, and frequently allowing choice cuts to succumb to freezer burn or some other malady because they were kept two or three years beyond the recommended freezer life.

#### Features

Freezer Inventory is a diskbased meat inventory system written for the TRS-80 Model I

or III. Type, cut, weight and date frozen for up to 50 pieces of meat can be entered and stored. Depending on memory available, the number of items in the inventory can be increased.

In accessing the data, the user can see a list of all the foods in the freezer or scan the available cuts of only one type of meat. Nervous types can also retrieve inventory items by age. The program presents a list of all meats that were frozen one to six months prior to the current date.

Meats can be entered in one of seven different categories: pork, beef, lamb, fowl, ham, fish and other. Those who normally do not eat a certain type of meat for religious or other reasons can delete that selection(s) from the list. On the other hand, if rattlesnake, game or goat is part of your menu, it can be added.

Thirteen different cuts can be entered to further differentiate the item in the meat inventory. I put together the list to conform to the cuts we most frequently buy in our household: three kinds of roasts, three kinds of steak, chops, and other configurations such as ground. Again, these may be altered by the user.

To initialize the program, the data file must be created. This can most easily be done by typing DIM FOOD\$(50,4) in the command mode, and then typing GOTO 1420. The program will open the file Foods, and save the available data (nothing, at this point) to the disk. Then, a File Not Found error will be avoided when the program is first run.

Data on the different meat types and cuts are Read into two string arrays, Type\$(n) and Cut\$(n), at the beginning of the program. Next, the user is confronted with a menu, which presents six options:

- See list of all foods in the freezer.
- See list of only one type of food in the freezer.
- Add new foods to freezer inventory.
- · See list of foods by age.
- Save information input this session to disk.
- Remove an item from inventory.

#### Entering New Food Data

Depending on the option selected, control branches to a series of subroutines. Foods are added to the new or existing list as a subroutine at lines 730-1030. The meat data are stored within the program in a two-dimensional string array, FOOD\$ (row, column). The first row used, NF, indicates the number of foods in the file, and is incremented by one each time a new food is entered. To simplify printing out options, code numbers instead of the actual names of the types of meat and cuts are stored in the array. The code number points to the element of TYPE\$(n) and CUT\$(n) appropriate to the item.

The first column of FOOD\$ (row, column) stores a number from one to seven, which stands for the name of the meat represented by that element of the string array Type\$(n). For example, TYPE\$(1) = PORK, so if a cut of pork were to be entered, a string containing the numeral "1" would be inserted in FOOD\$(NF,1).

The second column stores a string representation of the number that points to the CUT\$(n) element equivalent to the cut selected. Chops would be the fourth element of CUT\$(n), so to indicate pork chops, FOOD\$(NF,2) would contain a four.

The third column contains the actual weight of the cut, input by the user to the nearest half pound. Because the weight is stored as a string, the user can enter a number only, such as a four, or the words four pounds. The numeral must come first, as the program looks for the VAL of FOOD\$(n,3) when deleting a food from the list.

The date the food was frozen is entered into the fourth column (FOOD\$(NF,4)). The format MM/DD/YY must be used. That is, Aug. 4, 1981, should be entered as 08/04/81. No error trap is built in to catch improper input, and failure to conform to the standard MM/DD/YY will make it difficult to delete an inventory item later.

Entering new foods is fairly fast. Each of the TYPE\$(n) and CUT\$(n) options is presented to the screen in a pair of For... Next loops at lines 830-850 and lines 920-940 respectively. INKEY\$ input will refuse any values other than those offered. Next, the user can input the weight of the meat. Weights to the closest pound are suggested, because of the needless complexity of converting pounds and ounces to decimal values. If two identical cuts of meat are entered on the same day, the user should enter slightly different weights to differentiate them. One could be four pounds, and the other 4.5 pounds. Mark these working weights on the package of frozen meat so the correct weight can be entered when the item is deleted from the inventory.

After the date is input, control reverts back to lines 770-800, where the information entered is transferred to the correct element of FOOD\$(row, column). Then, the program returns to the menu.

You should remember to save current data to disk before exiting the program. By not having Save as an automatic step following the input of each new item of food, some time is saved whenever several items must be entered at one time. This will frequently be the case after a shopping trip, or when freezing a newly purchased side of meat.

In addition, a list of the current foods in inventory, including the new entries, can be requested—prior to the Save. If a mistake is discovered in the new entries, the user can delete the error (using menu option six) before the data is saved. Only one disk I/O operation need be performed at the end of the session.

Saving is performed at lines 1420-1490. The number of foods (NF) is first Printed to the disk file Foods, and then each element of FOOD\$(row,column) is recorded. Because the disk I/O time difference is almost negligible between having the Row loop increment from one to 50 and from one to NF, I elected to use the former. simpler system for program clarity. Those who find It necessary to redimension FOOD\$(row,col) larger than 50 rows may want to switch to the latter technique.

#### Accessing the File

The food file may be ac-

cessed three different ways. In lines 250–270, all the foods in the file are displayed. A loop from one to NF repeats until all foods are listed to the CRT. Pauses are built in every 12 foods by a check in line 290 that sends control to a wait subroutine at lines 400–430. If the loop counter (N4) can be evenly divided by 12(N4/12 = INT(N4/12)), then the user must hit any key to see the rest of the list.

If only one type of meat is to be listed, a subroutine at lines 450-710 checks FOOD\$(N6,1) in line 590 to see if it matches the food type looked for (A\$). If so, then the meat listing is printed to the CRT screen (lines 660-710), and a counter (CU) that keeps track of when 12 items have been found and displayed is incremented. The same wait subroutine is used.

Meats may also be listed by age (lines 1050-1400). The user inputs the current date as a

MM/DD/YY string, which is parsed, and the values of the MM and YY compared with the values of the corresponding segments of each of the dates of the foods in the file. Target years (TYS) and target months (TM\$) are determined for each of six months before the current month (lines 1130-1140). If a target month carries back into the previous year, then the value of TY\$ is decremented by one, and the target month adjusted accordingly (line 1150). The loop prints out lists of meats one to six months old, month by month.

#### **Deleting an item from the File**

As foods are consumed, they must be deleted from the file. This is accomplished by a routine at 1600-1750. The user enters data about the item to be removed (type, cut, weight and date frozen), and each element of FOOD\$(row,column) is examined until a match is found. If the item to be deleted happens to be the last item in the file, (N9 = NF in line 1700), then NF is decremented by one, making that row in FOOD\$ (row.column) available for new entries (which will wipe out the old ones, if still present). Effectively, the old entry does not exist, because loops accessing the data will not go beyond NF in their search.

More frequently, however,

the item deleted will not be the last element of the array. Usually the oldest cuts of meat are consumed first. In this case, the item is deleted by taking the last set of data in the array, and moving it to the spot to be vacated. Then, NF is decremented by one. Effectively, this closes up the array by putting the last entry into the hole left by the last one deleted.

#### Enhancements

Freezer Inventory offers a number of opportunities for enhancement. Additional meat types and cuts can be tacked on by redimensioning the array TYPE\$(n) and CUT\$(n), and by enlarging the loops which display these choices to the user for input or retrieval. Use Step 2 to count off the display loops two numbers at a time, and change print lines, as in line 840 to read: 840 PRINT N2;".)": TYPE\$(N2),N2 + 1;".)"; TYPE\$(N2+1). This will allow displaying a greater number of choices on the screen at one time without scrolling off.

Frozen vegetables could also be added with a little imagination. Vegetable could be given as element 0 of TYPE\$(n), and whenever FOOD\$(row,1) was equal to zero then column 2 (cut) would be ignored, and, instead, a vegetable type would be input or retrieved from a new column in the array.

Coming Next Month

For November, 80 Microcomputing takes a look at micros in business. We will cover topics ranging from real estate to the stock market.

Technical Editor Chris Brown has done an in-depth study of computers and the new white-collar militancy. In many businesses and federal agencies, there is a class of technical elite who have the power to bring these institutions to their knees by tampering with their computers. Some of these people have not hesitated to use this power.

News Editor Bert Latamore will give you the latest on electronic mail and its impact on the business sector. Who knows, maybe someday stamps and mailmen will be obsolete. Electronic mail is but one area that is revolutionizing communications.

Freelancer Theron Wieranga will show you how to use your TRS-80 to keep track of your personnel file. This program has already seen use in a school system and promises to be of interest to any businessman with a large number of employees.

Are you a realtor with a number of rental properties? Freelancer George Kwascha has a program that maintains rental records. Also of interest to realtors will be Leslie Sparks' real estate investment analysis program.

(2) GENERAL LEDGER, ACCOUNTS RECEIVABLE, ACCOUNTS PAYABLE, INVENTORY CONTROL, INVOICING AND PAYROLL (Small Business System Group)...an extensive business system for the serious user can be used one module at a time or as a co-ordinated system, \$225 per module. \$1299 for the complete system.

(3) GENERAL LEDGER, ACCOUNTS RECEIVABLE, ACCOUNTS PAYABLE, INVENTORY CONTROL AND PAYROLL (Compumax) a complete user or-ented business system can be used one module at a time or as a coordinated system \$140 per module \$995 for the complete system

(4) MOD-II UTILITY PACKAGE (Racet Computes) adds important utilities to TRSDOS copy files selectively faster and more accurate file copying repair bad directories displays sorted directory of all files on 1 to 4 disk drives .SUPERZAP change disk ID and more \$150

(5) ADVENTURE #1-99 (Scott Adams - Adventure International) a series of games formally only available on the large computers syour goal is to work, your way through a maze of obstacles in order to recover a secret treasure or complete a mission the package includes all 9 Adventures written by Scott Adams \$99.95

(6) GSF (Racet Computers) Generalized Subroutine Facility a series of super fist machine language utilities that can be called from a BASIC program (no machine language knowledge required) sorts 1000 items in under 5 seconds, allows PEEK and POKE statements move data blocks, compress and un-compress data works under TRSDOS \$50

(7) DSM (Racet Computes) ...Disk Sort Merge ...sorts and merges large multiple diskette files on a 1 to 4 drive system. NOT AN IN MEMORY SORT can actually alphabetize (or any other type of sort) 4 disk drives worth of data, sorts one complete disk of information in 10 minutes information is provided to use DSM with the RS MAILING PROGRAM works under TRSDOS \$150

(a) RSM (Small Systems Software) a machine language monitor and disassembler can be used to see and modify memory or disk sectors contains all the commands found on the Model-I version plus some additional commands for the MOD-II works under TRSDOS. \$39.95

(9) BLINK BASIC LINK FACILITY (Recet Computes) Link from one BASIC program to another saving all versables...chain programs without losing variables \$50

(10) BASIC CROSS REFERENCE UTILITY (Racet (10) BASIC CHOSS REFERENCE UTILITY (Hace) Computes). Isis all variables and strings used in a program (with the line numbers in which they appear) lists all GOTO's and GOSUB's (with the line num-bers in which they appear) searches for any specific variables or strings (with the line number in which they appear) \$50

0 (11) DEVELOPMENT PACKAGE (Racet Computes) SUPERZAP (to see, print or change any byte on a diskette) Disassembler and MOD-11 interface to the S\*

MICROSOFT EDITOR ASSEMBLER PLUS including uploading services and patches for Disk I/0 assemble directly into memory...save all or portions of source to disk dynamic debug facility (ZBUG) entended editor commands \$125.

(12) HARD/SOFT DISK \$YSTEM (Racet Computes) The software essential to interface any of the popular large hard disk drives completely compatible with your existing software and files, allows up to 20 megabytes of storage (and larger), directory expand-able to handle thousands of files \$400

(13) CAMEO HARD DISK DRIVE CONTROLLER coming soon (November 12)

(14) HARD DISK DRIVES coming soon (Nov 17)

(15) H & E COMPUTRONICS, INC. SHARE-A-PROGRAM DISKETTE #1. works under TRSDOS a collection of programs written by MOD-II owners programs include data base management: a word processor mail system mortgage calculations checkbook register and many others \$8 (add \$3 postage outside of the United States, Canada and Mexico). FREE if you send us a diskette containing a program that can be added to the SHARE-A-PRO-GRAM DISKETTE

(16) WABASH CERTIFIED DISKETTES \$39.95 (per box of 10)

(17) FLIP SORT DISKETTE STORAGE TRAY. Stores 50 diskettes comes complete with index-dividers, till plates and adjustable spacing \$44.95

(16) MASTER PAC 100 100 essential programs BUSINESS PERSONAL FINANCE STATISTICS MATH GAMBLING GAMES includes 125 pag-manual and 2 diskettes \$99.95 125 page

(19) BUSINESS PAC 100 100 essential business programs INVENTORY CONTROL PAYROLL BOOKKEEPING SYSTEM STOCK CALCULA-TIONS CHECKBOOK MAINTENANCE AC-COUNTS RECEIVABLE ACCOUNTS PAYABLE includes 125 page manual and two diskettes \$149 95

(20) EDITOR ASSEMBLER (Galactic Software Ltd.) the first user oriented Editor Assembler for the MODEL II and was designed to utilize all the features of the MODEL II Li includes innovative features for ease of coding and debugging and complete docu-mentation (over 120 pages) works under TRSDOS 520 00 \$229 00

(21) BASIC COMPILER (Microsofi) changes your source programs into machine language increases program execution by 3-10 times \$395

(22) MAIL/FILE SYSTEM from Galactic Software Ltd stores 2,500 names per disk. No sorting time is required since the file is automatically sorted by first and last name plus Zip Code on input Retrieve by any combination of 19 user codes Supports an 11 digit alphanumerica Zip Supports amessage line Comes complete with user-oriented documentation (100-page manual) Allows for company name and individ-ual of a company and complete pone number (and extension) works under TRSDOS \$199.00

(23) INCOME TAX PAC Protessional income tax package most forms and schedules output to video or line printer automatic memory storage of all information data can be loaded from diskette changed and edited built in error checking \$199.95

(24) COMPUTER GAMES (SBSG) Mean Checker Machine, Star-Trek III, Concentration, Treasure Hunt, Banco, Dog Star Adventure \$74.95

NEW TOLL-FREE

ORDER LINE

(OUTSIDE OF N.Y. STATE)

(800) 431-2818

**NEW!!!** MOD-II NEWSLETTER \$18/year (or 12 issues)

(3) GENERAL LEDGER, ACCOUNTS RECEIVABLE, ACCOUNTS PAYABLE, INVENTORY CONTROL, AND PAYROLL (Peachtree Software). requires CP/M and MICROSOFT BASIC professional business systems turn key operation. can be used as single modules or as a coordinated system. \$500 per module. \$2500 for the complete system (4) WORD-STAR The ultimate word processor a menu driven word processing system that can be used with any printer All standard word processing commands are included, plus many unique com-mands only found on WORD STAR requires CP/M 5495. \$495

(5) MAIL LIST MERGE An add on package that allows the user to send form letters (created on WORD-STAR) to any completed melling list (using any CP/M based MAIL program such as the PEACHTREE MAIL PROGRAM), requires CP/M, WORD STAR and andy CP/M based mail program \$150

(6) SELECTOR III (Micro-Ap) complete data management system user defined fields and codes... manages any list defined by the user includes additional modules for simplified inventory control, accounts receivable and accounts payable, requires CBASIC-2. \$295

(7) SELECTOR IV (Micro-Ap) the ultimate data management system all features use the SELECTOR III plus data file format conversions. full page report formatter computations, global search and replace hard disk compatible data/text merging \$550

(8) GLECTOR (Micro-Ap) add on package to the SELECTOR general ledger that allows the user to define a customized chart of accounts \$350

deline a customized chart of accounts \$350 (9) CBASIC-2...a non-interactive BASIC used for many programs that run under CPM. allows user to make more efficient use of disk files. eliminates the use of most line number references...require on such programs as the SELECTOR. \$120 (10) MICROSOFT BASIC...an enhanced version of the MICROSOFT BASIC found on TRSDOS adds commands such as chaining (allows the user to LOAD and RUN a new program without losing the variables currently in memory) long variable length file records.WHILE/WEND and others can be used with the BASIC COMPILER to speed up programs (3-10 times faster execution) \$225

times faster execution: 3-20 (11) MASTER TAX (CPAids) professional tax preparation program. prepares schedules, A, B, C, D, E, F, G, R/RP, SE, TC, ES and forms 2106, 2119, 2210, 3468, 3900, 2441, 4625, 4726, 4797, 4972, 5695 and 5521 Printing can be on readily available pre-printed continuous forms, on overlays, or on computer generated IRS approved forms Maintains clinit history files interactive with CP/Aids General Ledger...\$995

(12) GENERAL LEDGER II (CPAids) designed for CPA's stores complete 12 month detailed history of transactions, generates financial statements, depreciation, loan amortizations, journals, trial balances, statements of changes in financial position, and complation letters includes payroll system with automating posting to general ledgers, prints payroll register, W2's and payroll checks. \$450

(13) ELECTAIC PENCIL (Michael Shrayer Software) Complete word processor with extensive editing and printer formating features \$275 (Standard printer version) \$300 (DIABLO, NEC or QUME version

(14) BASIC COMPILER (Microsoft) changes your source programs into machine language increases program execution by 3-10 times \$395 program e

## FACTS ABOUT THE S.B.S.G. BUSINESS PACKAGES

- 1. S.B.S.G. is a sophisticated Business Software System designed for the serious businessman
- 2 Each of the S.B.S.G. Business Modules may be purchased separately. or you may purchase the entire coordinated business system.
- 3. Modules purchased separately do not coordinate with the General Ledger (although for the standard S.B.S.G. fee, the user may upgrade his individual modules for the coordinated system)
- Foolproof, Step-By-Step procedures are supplied, planned and documented for the First-Time Computer User. All programs are selfexplanatory, telling the user what is required at every step
- 5. Programs are written in BASIC and the source code listing is supplied for those users who decide to modify the original system
- 6. A complete users manual is supplied with each module
- 7 Demo Data diskettes are supplied with sample data
- 8. S.B.S.G. has an In-House staff that can answer questions and problems related to the proper use of the S.B.S.G. Business System (on the telephone or through the mail)
- 9 First-Time Computer Owners Note-Instructions are provided for entering state payroll withholding tables. There is an additional charge if you prefer to have S.B.S.G. Programmers insert the correct data
- 10 Minimum system requirement is 2-drives to run any single module.
- 11 Minimum system requirement is 3-drives to run the coordinated business system (AR-AP-GL) or (AR-AP-GL with PAYROLL)
- 12 Minimum system requirement is 4-drives to run the extended coordinated system (AR-AP-GL-PR and INVENTORY/INVOICING)
- 13 The A. OSBORNE & ASSOCIATES business manuals are provided FREE with each order (they may be purchased separately at \$20 per manuali
- 14 The INVENTORY and INVOICING modules are original programs written by S.B.S.G.
- 15 Each module can be purchased as independent modules to run on a 2 or more drive system except INVOICING
- 16 Memory requirement is 48K for the MODEL-I and 64K for the MODEL-II
- 17 All S.B.S.G. BUSINESS SYSTEMS may be upgraded up to 4-disk drives. No data is ever lost during an upgrade. There is a standard S.B.S.G. charge for all upgrades

#### ACCOUNTS PAYABLE

The accounts payable system receives data concerning purchases from suppliers and produces checks in payment of outstanding invoices. In addition, it produces cash management reports. This system aids in tight financial control over all cash disbursements of the business Several reports are available and supply information needed for the analysis of payments, expenses, purchases and cash requirements. All A/P data feeds General Ledger so that data is entered into the system just once. These programs were developed 5 years ago for the Wang micro-computer and have been tested in many environments since then. The package has been converted to the TRS-80" and is now well documented, on-line, interactive micro-computer system with the capabilities of (or exceeding many larger systems).

#### CAPABILITIES:

- menu driven; easy to use. full screen prompting and cursor control \* invoice oriented, everything revolves around the invoice; handles new invoice or credit memo or debit memo.
- invoce information recorded; invoice #, description, buyer, check register #, invoice date, age date, amount of invoice, discount (in %).
- freight, tax (\$), total payable transaction print and file maintenance procedures insure accuracy flexible check calculation procedure; allows checks to be calculated
- for a set of vendors-or-for specific vendors program prints your checks, contiguous computer checks with your .
- company letterhead can be purchased from SBSG
- reports include (samples on back)
  - open item listing/closed item listing both detail and summary debit memo listing/credit memo listing

  - aging check register report (to give an audit trail of checks printed)
- creck register report (to give an addition that of the whole year)
   vendor listing and vendor activity (activity of the whole year)
   fully linked to GENERAL LEDGER, each invoice can be distributed
- to as many as five (5) different GL accounts, system automatically posts to cash and A/P accounts

#### ACCOUNTS RECEIVABLE

The objective of a computerized A/R system is to prepare accurate and timeley monthly statements to credit customers. Management can generate information required to control the amount of credit extended and the collection of money owed in order to maximize profitable credit sales while minimizing losses from bad debts. The programs composing this system were developed 5 years ago, especially for small businesses using the Wang Microcomputer. They have been tested in many environments since then. Each module can be used stand alone. or can feed General Ledger for a fully integrated system.

#### CAPABILITIES:

- menu driven; easy to use; full screen prompting and cursor control
   invoice oriented; invoices can be entered before ready for billing,
- when ready for billing, after billing or after paid allows entry of new invoice, credit memo, debit memo, or change/
- delete invoice
- allows for progress payment transaction information includes. type of A/B transaction
  - · billing date
  - customer P.O. # general ledger account number
  - description of P.O. invoice amount
  - shipping/transportation charges
  - . tax charges

.

- payment
- progress payment information
- transaction print & file maintenance procedures insure accuracy customer statements printed; computer statements with your com-
- pay letterhead can be purchased from SBSG
- reports include: (samples on back)
   listing of invoices not yet billed
- open items (unpaid invoices)
- closed items (paid invoices) .
- aging
- fully linked to General Ledger, will post to applicable accounts. debit A/R, credits account you specify

# **EVERYTHING FOR YOUR TRS-80**

#### PAYROLL

Payroll invoices many complex calculations and the production of reports and documents, many of which are required by government agencies. It is an ideal candidate for the computer. With this Payroll system in-house, you can promptly and accurately pay your employees and generate accruate documents/reports to management, employees. and appropriate government agencies concerning earnings, taxes, and other deductions. The package has been converted to the TRS-80" and is now a well documented, op-line, interactive, micro-computer system with the capabilities of (or exceeding) many larger systems

#### CAPABILITIES:

- performs all necessary payroll tasks including file maintenance, pay data entry and verification
- computation of pay and deduction amounts
   printing of reports and checks
   can handle salaried and hourly employees
- employees can receive.
- hourly or salary wage
  - vacation pay
  - holiday pay .
  - **Diecework** Day
  - overtime pay
- employees can be paid using any combination of pay types (except, hourly cannot receive salary and salary cannot receive hourly) special non-taxable or taxable lump sums can be paid regularly or
- one time (bonus, reimbursements, etc)
- health and welfare deductions can be automatically calculated for each employee
- earnings-to-date are accumulated and added to permanent records: taxes are computed and deducted: US income tax, Social Security
- tax, state income tax, other deductions (regular or one time) paychecks are printed, computer checks with your company letter-head can be purchased from SBSG
- calculations are accumulated for; employee pay history, 941A re-port, W-2 report, insurance report, absentee report fully linked to General Ledger. Each employee's payroll information can be distributed to as many as (12) twelve different GL accounts; system automatically posts to cash account

#### INVENTORY CONTROL/INVOICING

- ISAM (Indexed Sequential Access Method) eliminates the necessity for time consuming sort.
- Pre-Allocated Files for IMMEDIATE update and inquiry capabilities. Fast Disk storage and retrieval.
- Inventory Master Record includes...class...SKU. Division...Retail. Cost. Beginning Balance. Period Sale Units Period Receipts. On Order On Hand Minimum Reorder Point Recommended Re-order Amount. Vendor Number. Period Sale Dollars. YTD Sale Units. YTD Sale Dollars
- Units...YTD Sale Dollars Calculated and Displayed Formulas include. Gross Margin (\$)... Gross Margin (%)...Gross Margin ROI (%)...Average Inventory Retail (\$)...Average Inventory Cost (\$)...Turn-Over (%). Reports Generated include...Master File Listing...Class Description Listing...Transaction Audit Trail...Minimum Reorder Point by Ven-dor ...Retail Price List...Retail & Cost Price List...Period Sales Report ...Year to Date Sales Report...Stock Status (Screen or printer output) ...Commission Report (for salesmen and buyers). Transaction Types include...Sales, Vendor Receipts...Vendor Orders...Customer Returns...Vendor Returns Transfer Stock.

#### GENERAL LEDGER

The General Ledger accounting system consolidates financial data from other accounting subsystems (A/R, A/P, Payroll, direct posting) in from other accounting subsystems (A/R, A/P, Payroli, direct posting) in an accurate and timely manner. Major reports include the Income State-ment and Balance Sheet and a "special" report designed by manage-ment. The beauty of this General Ledger system is that it is completely user formatted. You "customize" the account numbers, descriptions, and report formats to suit particular business requirements. These programs were developed 5 years ago for the Wang micro-computer and have been tested in many environments since then. The package has been converted to the TRS-80" and is now a well documented, online, interactive micro-computer system with the capabilities of (or exceeding) many larger systems.

#### CAPABILITIES:

- more than 200 chart of accounts can be handled
- account number structure is user defined and controlled
- more than 1,750 transactions may be entered via: · direct posting; done by hand; validated against the account file before acceptance
- external posting; generated by A/R, A/P, Payroll or any other . user source
- \* data is maintained and reported by:
  - month
  - quarter
  - year
    previous three guarters
- reports (samples on back) include:
  - trial balances
  - income statement
  - balance sheet
- special accounts reports and more.....
   user formats reports with the following designated as you wish:
  - titles
  - headings
    account numbers
  - descriptions
  - subtotals .
- totals
- skip lines
- skip pages
- up to eight levels of totals fully user designated
- menu driven; easy to use; full screen prompting and cursor control

# COMPUTADNICS

## ••• EVERYTHING For Your TRS-80\* Model I or Model III •••

\* TRS-80" is a trademark of Tandy Corp

# REMSOFT, Inc.

## Let Your TRS-80™ Teach You ASSEMBLY LANGUAGE

#### **REMASSEM-1**

Tired of buying book after book on assembly language programming and still not knowing your **POP** from your **PUSH?** 

**REM**SOFT proudly announces a more efficient way using your own TRS-80<sup>(\*)</sup> to learn the fundamentals of assembly language programming at YOUR pace and at YOUR convenience

Our unique package "INTRODUCTION TO TRS-80" ASSEMBLY PROGRAMMING", will provide you with the following

- \* Ten 45-minute lessons on audio cassettes
- A driver program to make your TRS-80<sup>19</sup> video monitor serve as a blackboard for the instructor
- A display program for each lesson to provide illustration and reinforcement for what you are hearing
- \* A textbook on TRS-80\*\* Assembly Language Programming
- Step-by-step dissection of complete and useful routines to test memory and to gain direct control over the keyboard, video monitor, and printer
- \* How to access and use powerful routines in your Level II ROM

This course was developed and recorded by Joseph E. Willis and is based on the successful series of courses he has faught at Meta Technologies Corporation, the Radio Shack Computer Center, and other locations in Northern Ohio. The minimum system required is a Level II, 16K RAM.

# 30-Day money back guarantee Add \$3 00 for shipping in UPS Areas Add \$4 00 for C O D or NON-UPS Areas Add \$5 00 to C anada or Mexico Add exact postage to all other countries

All orders processed within 24 Hours

## LEARN TRS-80™ ASSEMBLY LANGUAGE DISK I/O

#### **REMDISK-1**

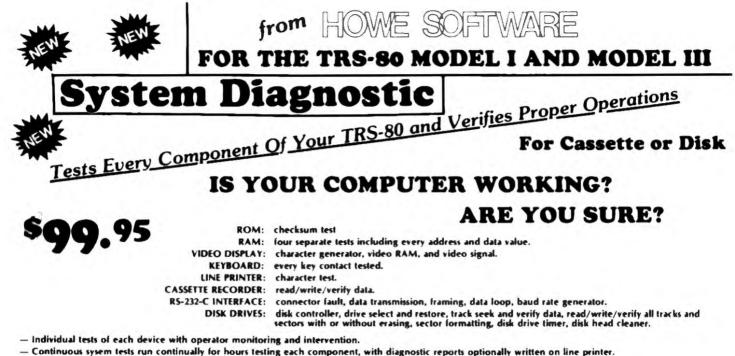

Your disk system and you can really step out with **REM**SOFT's Educational Module. **REMDISK-1**, a "short course" revealing the details of DISK I/O PROGRAMMING using assembly language

Using the same format as our extremely popular introduction to assembly language programming this "ASSEMBLY LANGUAGE DISK I/O PROGRAMMING" course includes

- \* Two 45-minute lessons on audio cassette
- A driver program to make your TRS-80<sup>\*</sup> video monitor serve as a blackboard for the instructor
- A display program for each lesson to provide illustration and reinforcement for what you are hearing
- A booklet of comprehensive fully-commented program listings illustrating sequential file LO random-access file LO and track and sector LO
- A diskette with machine-readable source codes for all programs discussed, in both Radio shack EDTASM and Macro formats
- \* Routines to convert from one assembler format to the other

This course was developed and recorded by Joseph E. Willis, for the student with experience in assembly language programming, it is an intermediate-to advanced-level course. Minimum hardware required is a Model I Level († 16K RAM one disk drive system.

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | . \$74 95<br>. \$74 95<br>. \$79 95<br>. \$29 95<br>. \$34 95<br>. \$34 95 | (914) 425-1535<br>  |

- One program adapts to any system configuration and hardware.
- Complete instructions and documentation.

#### MON-3 and MON-4

The TRS-80 Monitor Programs #3 and #4 are powerful utility programs enabling you to interact directly with the TRS-80 in Machine Language. They are as useful for beginners as for advanced programmers.

- · BEGINNERS can learn to interact directly with the computer in
- Machine Language.
- 40-PAGE MANUAL provided with each program.
- SIMPLE commands, easy to use.

The Features Of The Monitor Programs Enable You To The Following .....

- DISPLAY memory in different ways.
- DISASSEMBLE memory to see Machine Language commands.
- MOVE and COMPARE memory areas.
- SEARCH through memory to find specific values.
- MODIFY memory in various ways.
- RELOCATE object programs.
- PRINT output on video display or line printer.
- READ and WRITE object tapes in SYSTEM Format.
- UNLOAD programs using low RAM on disk.
- SAVE and READ disk files (MON-4 Only).
- INPUT and OUTPUT of disk sectors (MON-4 Only).
- SEND and RECEIVE data over RS-232-C Interface (MON-4 Only). Create SYMBOLIC Tapes (MON-3) or Files (MON-4) of Disassembled output for Editor/Assembler program.

MON-3 (For Cassette Systems) \$39.95 MON-4 (For Disk Systems) \$49.95

#### **SMART TERMINAL**

Enables your TRS-80 to be used as a remote terminal to a time sharing computer system. Supports upper/lower case and full range of control keys, including control key mapping into any ASCII character. Automatic transmission of files between TRS-80 and host computer. Files can be read from or written to cassette tape or disk. Incoming data can be printed on line printer or stored in memory for subsequent save to cassette or disk. Disk and tape files are fully compatible with the ELECTRIC PENCIL pro-gram. Baud rate and RS-232-C sense switches can be reset without open-ing Expansion Interface. Requires RS-232-C interface and modem.

Cassette or Disk Version \$69.95

#### FASTSORT

A series of machine-language subroutines (for 16K, 32K and 48K Sys-tems) to sort data from BASIC programs. Data may be alphabetic (string) or numeric (integer only). Works equally well with Level II or Disk Basic. Complete instructions and examples provided for interfacing with your BASIC programs.

Cassette or Disk Version \$9.95

#### MAILING LIST

Maintains mailing lists of over 1000 names. Commands allow adding, changing, deleting, and finding names. Sorting is done by machine lan-guage according to the information in any field (i.e., name, address, zip code). Labels printed in 1, 2, or 3 columns, in master list on one line, or on video display

Disk Version Only \$49.95

#### HOME BUDGET

Combines the maintenance of your checkbook with analysis of your income, expenses, and monthly bills. Handles data including bills, in-cluding bills, income, deposits, checks and debits to your checking account, and cash expenses. Computes checkbook balance, list of unpaid bills, monthly and year-to-date summaries of income and expenses show-ing income tax deductions. All output printed on video display or line printer at user's option. Complete instructions for customizing to suit your own budget.

Disk Version Only \$49.95

#### SMALL BUSINESS ACCOUNTING

Based on Dome Bookkeeping Record #612, this program keeps track of income, expenditures, and payroll for a small business of up to 16 employees. Income and expenditures can be entered on a daily, weekly, or monthly basis, and the program computes monthly, through last month, and year-to-date summaries. Payroll section keeps record of individual employees and their paychecks with up to six categories of payroll deductions. Employee payroll record and year-to-date payroll totals can be computed. Manual contains complete instructions for customizing to suit your business.

#### Disk Version \$49.95 Cassette Version \$29.95

(Cassette Version does not contain payroll)

## Tweak six additional characters out of Radio Shack's generator chip.

# Soft Characters

Stephen D. Moulton 766 Biltmore Drive Virginia Beach, VA 23454

Being a computer programmer both in profession and hobby, I was intrigued by a letter in 80 input ("Lowercase Access", November, 1980). The letter concerned those who had Radio Shack's lowercase modification Installed, which included a brief program to POKE certain special characters into

> 10 CLS 20 FOR X = 32 to 191 30 PRINT CHR\$(32); CHR\$(X); 40 NEXT Program Listing

video memory. The letter also stated that these characters were otherwise inaccessible to Basic. If you run that program, you will see that a lowercase @ remains @, while lowercase arrows and underline keys produce spaces (see Program Listing 1).

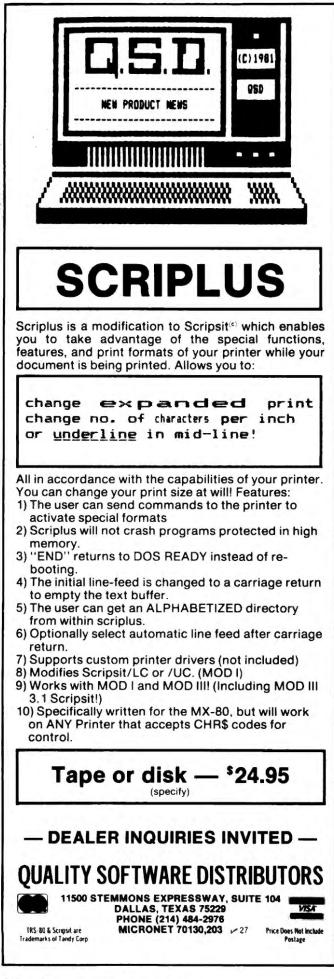

At this point it occurred to me that, if the characters can be displayed with a series of POKE statements, they are obviously included in the Radio Shack hardware upgrade. The lack of accessibility to Basic must be caused by a deficiency in the software driver. I found that this is indeed the case, although I can not fathom why **Radio Shack would deliberately** ignore some of the capabilities of their character generator chip. At any rate, here is a fix for ULCBAS which will allow the display of six additional characters (£,{,},,w,■) under Basic control. In addition, the fix will repair the defective automatic memory protection feature so that the two POKE statements recommended by Radio Shack need not be entered prior to the execution of the driver program.

First, load and execute T-BUG and load ULCBAS using

the L function. Now use the M function to make the changes listed in Table 1. The first two locations changed will repair the automatic memory protection feature so that your Basic program stack will not interfere with the driver software and cause a keyboard lockup. The remaining six changes add the additional characters to the driver program. Next, save the patched driver on tape using P 7000 7270 7000 ULC16K (this is the filename I use for my 16K system, but you can use any filename that you find convenient). At this point, I would turn off the TRS-80 just to make sure that any garbage I may have scattered through memory will be cleared, but a simple J 0000 should suffice.

To run the modified driver, first answer the memory size question with Enter (the program is self-protecting, right?). Next, type System, press Enter, type the filename you chose when you saved the program, and wait for the tape to load. Answer the \*? prompt with

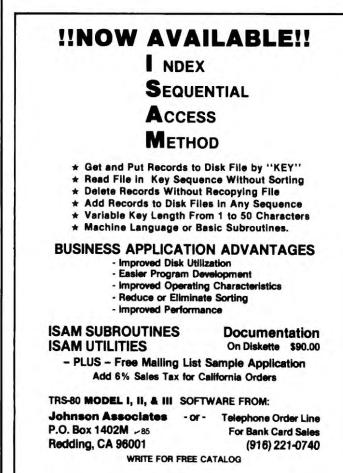

/Enter and the familiar Ready prompt will appear. You now have the lowercase driver in protected memory, and ?MEM will yield 15046. To view your new character set, run the Program Listing 1 again. See the difference?

Now that we can access the additional characters from Basic, let us discuss how to use them in our programming. First, you will note that the @ key will always yield "@" when used alone and "£" when used with the shift key, regardless of the status of the Shift 0 toggie. I did this to make the @ key function like the other dual-symbol keys at the top of the keyboard. I also did not incorporate keyboard reversal for this key because £ will not be used as frequently as @ in normal programming applications. Note that the computer will not accept PRINT£ as PRINT@ (although the Exatron Stringy Floppy will accept £LOAD as @LOAD). Note also that Shift@ still functions to pause program execution. The next four special characters can not be input from the keyboard because the shifted arrow keys serve control functions. These symbols must be displayed using ?CHR\$(123) through (126). The final symbol cannot be input from the keyboard because it is a shifted underline, and the TRS-80 has no underline key to shift! It can be displayed by ?CHR\$(127).

There remains one additional note for owners of the Exatron Stringy Floppy. The lowercase driver software must be loaded and executed prior to the initialization of the ESF operating system (this applies to the original driver supplied by Radio Shack or to the one created in this article). After executing the driver program, the Stringy Floppy must be initialized using /12346 (not /12345) because the Exatron and lowercase driver debounce routines will interfere with one another.

So there you have it; 32 lower case characters for the price of 26!

# I-USER OASIS HAS THE FEATURES PROS DEMAND.

**Computer experts** (the pros) usually have big computer experience. That's why when they shop system software for Z80 micros, they look for the big system features they're used to. And that's why they like Multi-User OASIS. You will too.

#### DATA INTEGRITY: FILE & **AUTOMATIC RECORD LOCKING**

The biggest challenge for any multi-user system is co-ordinating requests from several user to change the rd sa at the but

natio problem tomate or even stroyed da h h

ownems. ample: normally Fo users can view a particular record at the same time. But, if that record is being updated by one user, automatic record locking will deny all other users access to the record until the up-date is completed. So records are always accurate, up-to-date and integrity is assured.

Pros demand file & automatic record locking. OASIS has it.

#### SYSTEM SECURITY: LOGON, PASSWORD & USER ACCOUNTING

Controlling who gets on your system and what they do once they're on it is the essence of system security.

# N COMPARE.

Without this control, unauthorized users could access your programs and data and do what they like. A frightening prospect isn't it?

And multi-users can multiply the problem.

But with the Logon Password and Priv Level feat and files for what pu Securi nced that eer TORV user has been on, when and r how long. Pros insist on these security features.

#### **EFFICIENCY: RE-ENTRANT BASIC**

OASIS has them.

A multi-user system is often not even practical on computers limited to 64K memory. **OASIS Re-entrant** 

BASIC makes it practical. How?

Because all users use a single run-time BASIC module, to execute their compiled programs, less

memory is needed. Even if you have more than 64K, your pay-off is cost saving and more efficient use of all the memor you ha available it se ce

as it ORE .... upports

inals nan is little as an bry. Or, with switching, as much as 784K.

Multi-Tasking lets each user run more than one job at the same time.

And there's our BASICa compiler, interpreter and debugger all in one. An OASIS exclusive.

Still more: Editor; Hard & Floppy Disk Support; Keyed (ISAM), Direct & Sequential Files; Mail-Box; Scheduler; Spooler; all from OASIS.

Our documentation is recognized as some of the best, most extensive, in the industry. And, of course, there's plenty of application software.

Put it all together and it's pros like OASIS. Join them. Twx 910-366-7139 Send your order today.

MAKES MICROS RUN LIKE MINIS

## A TRSDOS to CP/M conversion program.

# Crossdos

Jack Means 1612 East Oakland Bloomington, IL 61701

Digital Research's CPM is neither the most sophisticated nor the most convenient operating system available for the TRS-80. However, the large number of programming languages and quality business packages available for TRS-80 CPM made me more than willing to order it.

Immediately after receiving it, I was faced with two problems. First, the text editor provided with CPM (ED) was too limited and cumbersome to suit my needs. Second, I needed some way to transfer programs and data files from TRSDOS (or NEWDOS) to CPM.

#### **A Solution**

Program Listing 1 solves both problems. I can now create a program under TRSDOS using virtually any text editor (Electric Pencil, Scripsit, Electric Secretary, even the TRS-80 Basic editor), and transfer the file to CPM using the attached program. In addition, the program allows me to transfer any sequential data set from TRSDOS to CPM. The program can handle random files, but they must first be converted to sequential data sets.

To use the program, load the file and type "Run". The system will immediately display: Enter input file name:.

At this point, enter the name of the TRSDOS file to be transferred. If the file is a Basic program created with the TRS-80 Basic editor, it must have been saved with the ASCII option (i.e., SAVE "MAILLST/BAS",A). The next video display will be: Enter name for output CPM file:.

Enter the name which you would like to have assigned to the file after it is transferred to CPM. Remember, if you plan to use the file as input to the CBasic compiler, it must have the suffix of .BAS (i.e., MAILLST.BAS).

Enter CPM Drive (A,B,C,D) for output:

Enter the CPM drive name to which the output data set should be written. Remember that CPM uses A, B, C, D instead of 1, 2, 3, 4.

The system will now display the word Converting: and

display each text line as it is read into the system. When the entire file has been read into

memory, the system will display something similar to the following:

10 20 TRS 89 - CPM TRANSFERPROGRAM COPYRIGHT JACK MEANS ::: 30 40 . 50 .

File MAILLST/BAS has been written In memory. Please copy the following statements exactly.

M8000.875D.4300 SAVE 8 B:MAILLST.BAS

Press Enter when you have copied the statements.

Once the Enter key has been pressed, the screen will clear and the following will be displayed:

Remove all TRSDOS disks. Insert the CPM system disk in drive A. Insert a CPM formatted disk in drive В Press Enter when the CPM disks are

ready

At this point, remove all TRSDOS disks and place the CPM System disk in drive A (TRSDOS 0) and the disk for the output in the drive indicated. If the data set is to be written on the System disk, the second statement can be ignored.

Once the CPM disks have been loaded, press Enter. The CPM operating system will be loaded and the prompt A> will be displayed. At this point you should enter; DDT.

The system will then display the following: "-".

Next, enter the first of the two statements you copied earlier (i.e., M8000,875D,4300). The system will respond with: 54\_90

Now press the Break key. This will cause the CPM to reboot. As soon as the A> prompt appears, enter the second of the two statements copied earlier (i.e., SAVE 8 B:MAILLST.BAS).

A copy of the transferred file is now in the drive specified. It can be edited by ED as if it had been created on the CPM system. However, the last line in the file will usually contain garbage. To eliminate the line simply use the ED kill (K) command.

As written, the system will transfer just over 32,000 bytes at a time. If your file is larger than this, it can be segmented and transmitted as individual files. Once on the CPM system, you can again merge the segments.

## Adventures in Modemland

Fred Blechman 7217 Bernadine Ave. Canoga Park, CA 91307

So you're a new Model III owner—or you're thinking of getting a Model III. One thing you want to know is, "Are there a lot of programs I can use?" The answer is an emphatic yes! The vast majority of Basic programs written for the TRS-80 Model I will run without modification on the Model III—but not all of them.

But first let's get some confusing terminology straight. Radio Shack has chosen to use the TRS-80 name on all their recent computers (Model I, Model II, Model III, Pocket Computer, Color Computer and Videotex Terminal). However, the Basic interpreters for these computers are not the same; some programs require more memory than others; and some programs are written for disk-based systems, others strictly for cassette.

In both the Model I and the Model III the less-sophisticated Basic is called Level I. They seem to be 100 percent compatible, with the added feature Model III Level I includes—printer commands not found in Model | Level |.

Model I Level II Basic is largely compatible with Model III Basic. This Basic is not called Level II with the Model III, possibly to avoid confusion with Model II Basic which is quite different.

I have a cassette-based Model I Level II 16K unit for which I've written and sold various programs (Amway Products Distributor programs and Small Home-Business programs). I also have 22 programs in a new Hayden book (*Programs for Beginners on the TRS-80*). Since all these programs were written for Model I, I wondered if they would run on Model III.

### Real Trouble

I bought the TRS-80 Model III Operation and Basic Language Reference Manual (Radio Shack Catalog Number 26-2112, \$5.95) and read it cover to cover. This convinced me the Model III is more than just a repackaging of the Model I, since it has so many additional features.

Since all my programs are in Level II Basic, I didn't concern myself with Level I, but looked for information on the programming compatibility with Model III Basic. In the 270-page Model III manual, less than one page is devoted to Model I to Model III conversion hints! What particularly grabbed my attention were the differences in available memory (less in Model III) and the slightly different character sets. I could see I was in trouble, but later found the trouble was worse than I thought. Many Level II Model III differences are not mentioned in the manual!

It became obvious that the only certain way to find out how my programs would operate with a Model III would be to run them on one. Armed with my Level II cassettes, my own recorder and a loading meter (to reduce tape loading problems), I went to the local Radio Shack Computer Center and explained my dilemma to the store manager. He could not have been more cooperative.

There were about six Model Is and six Model IIIs set up for their classroom, and he said I could use them as long as I didn't interfere with his classes.

I found a 16K Model III Basic machine and immediately ran into the first thing not mentioned in the Model III manual. It seems Radio Shack recently changed the DIN five-pin plug on the cassette recorder-tocomputer cable from one with a thick plastic sleeve to one with a thin metal one. The old type plastic sleeve DIN plug will not fit the Model III socket! You must have the new Radio Shack cassette recorder cable, now supplied with the CTR-80A recorder also available separately (Catalog Number AW-2577 for \$6.95). The new cable fits both Model I and Model III

The manager loaned me a new cable. We plugged everything in, turned on the Model III and "CASS?" appeared on the screen; this was the computer asking me what cassette speed to use. Model III Basic uses 500 baud for data recording; 1500 or 500 baud for cassette program loading or saving. Since Level II uses 500 baud only and my cassettes were recorded in Level II, I typed and entered L for low cassette speed. The default value (pressing Enter without typing anything) will result in a high cassette speed and Level II tapes will not load!

The first program I tried was my "Amway Order Verification," which loads into about 10,400 bytes of memory: no problemuntil I tried to run it. While dimensioning a large arraysomething I had no problem doing with my Model I 16K-the Model III told me it was out of memory. Model III Basic has less available memory.

### A Definite Lack

How much less? That depends on your Model I. The Model III has 258 bytes less user memory than the older versions of Model | Level II, 256 bytes less than later versions. When you type and enter: ?MEM or PRINT MEM on the Model I, you get 15572 (older Model I) or 15570 (new Model I) for Level II 16K. On Model III 16K Basic you get 15314. This is the best way to determine no extra memory has been reserved for Clear, arrays or upper-memory programs. (Actually, 50 bytes are automatically cleared on power-up for string handling. To prove this, type and enter CLEARO and then ?MEM and you'll find 15364 as the Model III Basic total free memory, but you won't be able to handle any strings at all. Type and enter CLEAR50 and you're back to power-up configuration.)

Fortunately in this program, the entire array was not really required. I reduced the array size and the order verification program ran beautifully. In another version of this program, which needed the maximum array size, I removed some remark lines to free enough memory.

### A Mystery Revealed

Next I loaded my "Amway Monthly Gross Profit" program-plenty of memory to spare, no problem there. However, right at the beginning of the program I PEEKed at memory location 14312 to determine if the printer was ready. A number in this memory location indicates the printer status in the Model I. The printer status is at the same memory location in Model III Basic. Unfortunately, the value of the number at this memory location is not the same in the Model I and Model III.

The solution to this problem

is to PEEK at location 14312 with your printer on and ready and note the number for that particular printer. Be aware that different printers may give a different value at 14312especially if you are using a serial printer with a printerdriver program in memory. The printer-ready number at 14312 can then be used by the program to determine if the printer is ready. If not, the program can branch around LPRINT commands

Also, it's not generally known (and not in the TRS-80 manuals) that with Level II Basic you can punch in POKE16423,4 to make your program transparent to LPRINT statements. This also works with Model III Basic.

However, to restore program recognition of LPRINT, you must insert POKE16423,5 for Model I or POKE16423,3 for Model III. Do not put in POKE16423,5 on the Model III or you will lock the computer in Disk Basic and will be able to recover only by turning the computer off (thus losing your program) and then turning it back on after 10 seconds while also pressing the Break key. I found this out from the store manager when I unintentionally locked the computer center's Model III in Disk Basic and thought I had destroyed it!

### With Renewed Courage

Regaining my courage, 1 loaded and ran five other Amway programs and found no other changes necessary. Then I turned to the Small Home-Business Package designed for Level II 16K with printer. The first program, "Speed-Letter," a simple text generator, bombed out with the message ?OM ER-ROR in 130. Line 130 of that program is CLEAR9400, to preserve lots of string space for text. The fewer bytes of free memory in Model III Basic caused this to happen, so I changed line 130 to CLEAR9000 to reduce the memory requirement. This allowed it to run in Model III Basic, but also reduced the length of text permitted in using the program.

That program also uses an

Dough'flo (do'flo) n. [Collog] a highly interactive business or home finance program. designed to instantly analyze where the hell all that money went.

Doughflo. It's a business program. It's a home finance program. Doughflo is (now hold your breath), "an expenditure oriented data base management system." (Whew.) But best of all, it's easy to use.

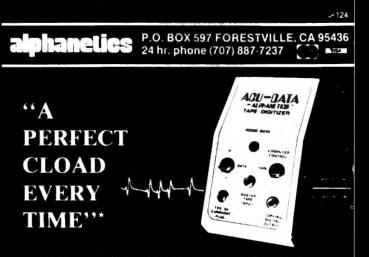

What the heck does Doughflo do? Lots

- Keeps tabs of expenses with up to 26 user defined categories
   Allows separation of home and business expenses for
- Security deductions etc. Ideal for preparing income and state taxes

Be your own business analyst! Virtually obsoletes a bookkeeper, because your com-puter does the work for you. Use Doughtlo to...

- · Instantiv retrieve up to 450 records at a limit without time consuming disk

Exceedingly simple to use (we tested it on simple people!), now there is no excuse not to know where the hell you lost all that money, whether it was last year or last month. Best of all, maybe now you'll be able to save some of that dough for the luture! Requires 32K and one or more disk drives. Specify Model I or III. At only \$39.95 postpaid, it's a steal sure to save you money

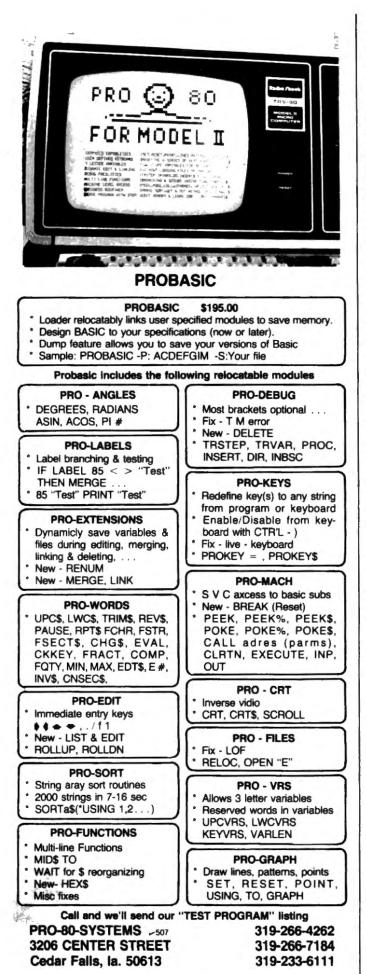

### ALPHANETICS TRS-80 TAPE DIGITIZER

\* From a review in the September October 1980 Elementary Electronics. Reprints available upon request At last there is a cure for TRS-80 tape cloading blues. For over three years, Alphanetics has been seiling the TRS-80 Tape Digitizer, a proven hardware solution for your software problems. No longer need you juggle the recorder's volume control endlessly, trying for a perfect cload of a pre-recorded program. Just pop the tape into the cassette recorder. process the signal through our digitizer, and you're ready to RUN a perfect load!

Just check out the Tape Digitizer's leatures

- Allows copying system and normal tables without using computer.
   Makes a perfect digital copy of any table without using computer.
   removing hum noise and survey more drupouts.
   Cassette switch allows manual control of cassette renorder...independent

Feed your cassette to the Alphanetics Tape Digitizer and feed your computer the exact digital waveform the TRS 80 gave your tape Get ind of your tape bugs today -postpaid or return within 10 days for a full refund<sup>1</sup>

up arrow to indicate the end of text. The Model III video display character set is not identical to the Model I. In particular, there are 96 special additional characters, but no up, down, left or right arrows! It seems incredible these were not included in the new 96 characters. The up arrow on the Model I keyboard produced an up arrow on the screen. This could also be generated using the command CHR\$(91). The Model III keyboard still has an up arrow, but this key (or CHR\$(91)) produces a left bracket instead of an up arrow. I didn't change my program but instead, tolerate a left bracket instead of an up arrow on the screen. This could really be a problem in a program that used arrows to indicate direction, such as some game programs.

### Another Program Bombs

My "12-Column Ledger" and "3-Across Mailing Labels" programs loaded and ran with no changes.

However, I ran into two Model III Basic problems with my "Telephone Dialer/Timer" program. This program automatically dials a telephone, using up to 500 names and phone numbers stored in memory. The dialing is accomplished by using the internal TRS-80 relay to trigger an external buffer relay whose contacts interrupt the phone circuit. The recorder cable subminiature plug (which normally goes to the recorder remote jack) is directly connected to the internal TRS-80 relay contacts. The OUT255.4 command on the Model I closes this relay's contacts, and OUT255,0 is used to open the relay contacts. This does not work on the Model III, so I got help from the manager again. He and the Computer Center lead technician went through some Model III schematics and told me to try OUT236,2 to close the relay and OUT236.0 to open it. It worked!

The timing portion of this program, used to show elapsed time in seconds and minutes for cost calculation, was running too fast. The Model III runs at 2.02752 MHz, while the Model | runs at 1,774 MHz, Consequently, any For...Next loops used for timing need to be modified. Unfortunately, although the Model III internal clock speed is approximately 14.3 percent faster than the Model I, the Basic speed of operation is not directly related by the same percentage. In this program I found a FOR X = 1 TO 266:NEXT loop had to be changed to FOR X=1 TO 285:NEXT (only a seven percent increase in counts) to retain one second for a completed loop count. It becomes a matter of trial and error and will vary with individual machines and room temperature. The circuits are crystal controlled, with no real attempt at extreme accuracy or long-term temperature stability, so don't expect your TRS-80 timing loops to have even the accuracy of your digital wristwatch.

I ran into the same thing in my "Telephone Toll-Charge" program, where a similar For...Next loop count had to be increased from 263 to 325 (an almost 24 percent increase in counts) to maintain a nominal one-second completed loop. Several things affect the running speed of For...Next loops: the location of the loop within the program; whether the variable is an integer, single or double precision; and to some degree, the number of other variables that precede this loop variable in the program.

Next, I decided to see how the 22 programs I wrote for the Hayden book would run in Model III Basic. Most of these programs were originally written in Level I 4K Basic, then changed to Level II. Since the book features line-by-line explanations of each program, I wanted to see if any rewriting would be necessary. I found that except for the numbers in some timing loops, no other program changes were necessary. So, Model III runs many simple Model I programs with little or no change.

The book also contains several appendices, and I checked their validity for Model III Basic. A two-line keyboard debounce program, needed in

Level II to prevent multiple entries when pressing a key only once, is not needed for the Model III, since the keyboard does not have this problem. My Audio/Visual Control Box, for reliably loading cassette programs and controlling recorder operation, worked perfectly with the Model III without any changes. Simple subroutines for printing the screen display on a printer, with and without graphics, worked perfectly. But I ran into trouble using a simple two-line Basic program merging technique.

### **Another Discovery**

The Model III manual memory map (page 12/23 of the operation section) shows 17129 as the beginning of user memory. However, decimal memory locations 16548 and 16549 are the beginning-ofprogram pointer. The numbers in these two locations are the least and most significant bits, in decimal form, of an eightdigit byte giving the decimal location of the beginning of the Basic program area.

For Model I Level II, location 16548 shows a 233 and location 16549 has a 66. Multiply 66 by 256 and add 233 and you get 17129. However, the Model III on power-up shows a 67 in location 16549 and 233 in 16548. Since 67 times 256 plus 233 equals 17385, it seems the beginning of Basic programs is 17385—exactly 256 bytes higher than in the Model I.

Apparently this is where the Model III lost 256 bytes. I confirmed this with some PEEKs at a Basic program in memory and by successfully merging programs using the technique in the book, revised to reflect the new beginning-of-program location.

While you may wonder if this is important, I can tell you this change will raise havoc with any System tapes you have that load into low memory. There are various utility programs that do this. They won't work unless modified and for most of them this means "back to the drawing board," since they are written in machine language, not Basic.

Another item in my book appendix needed revision. I have a one-liner that makes two cassette copies with a twosecond gap between them. I put this at the end of all my programs as the last line:

#### CSAVE"1":OUT255,4:FOR I=1 TO 2000:NEXT:CSAVE"1"

See the problem? OUT255,4 must be changed to OUT236,2 for Model III. With this as the last program line, you merely type run line number and Enter and the computer dumps two copies on tape.

One of my programs uses a

WEB International T-Beep, a device that beeps on command from the computer. This tells you when the computer has finished a task (sort, search, load, save or a program error). It uses a simple command and time-loop for operation from the cassette auxiliary cable. The command OUT255,1 causes the voltage at the computer's gray miniature phone plug to go from its normal .45 volts dc to .9 volts dc. This is enough to make the T-Beep sound. The command OUT 255,0 returns the voltage to .45 volts. I checked this out on the Model III and these commands have not been changed.

There are many other subtle differences between Level II and Model III Basic in various ROM addresses that can crash your programs written for Level II in machine code. Also, Basic POKEs and PEEKs will have to be carefully checked. If your Level II program crashes in Model III—especially with a ?CASS or the memory size query on the screen—you probably POKEd into the wrong location.

| Difference         | Level II Basic 16K      | Model III Basic 16K             |

Model I & II Light Pen. Needs only a 9 Volt Battery. Attaches through the cassette recorder for ease of operation. Easy to use and program. Comes complete with hardware and extensive documentation and sample routines. All this power for only ..... \$19.95

### LYNX MODEMS

Expand your horizons, allow yourself to communicate with other computers, and for others to communicate with your computer! Now this is easy to do with the NEW Model I & III LYNX Modem with Auto Answer/Dial features. Needs no RS232-C Board installed in the TRS-80"". Full 1 year warranty. All this for only ..... \$299.95

### MODEL III MEMORY KIT

Upgrade your Model III to 32 or 48 K with the RIGHT Memory Chips. These are Prime 150ns (Fast!!) chips. Beware of slower chips, as future Mod III upgrades may not work with them!

| 16K set | , | , |  | , |  |   | , |  |   |   |   |   |   |  | • |  |   |   |   |   |   | \$45.00 |

### COPY III by Dick Balcom

Load in the 500 Baud system tapes in 1/3 the time with Copy III. This utility will read in your 500 baud system tapes, and then write them out at 1500 baud. This gives you backup protection as well a speeding up your tapes. A must for all Model III Cassette users!

SPECIAL

The CASOP Utility will allow you to copy systems tapes, Catalogue your Diskettes with this easy to use Catalogue find load locations, check for hidden messages, modify program for Model III Disk systems. Can run on as little as program blocks. relocate program blocks and merge a 32K 1 Disk system. Helps you keep track of ALL of your two tape programs together. CASOP is a must if you write programs. 

### UNI-TERM UNIVERSAL TERMINAL PROGRAM

### by Pete Roberts

Price

The first and only fully intelligent terminal program for BOTH Mod I and Mod III users! Includes all features found in Terminal programs costing MUCH more, plus many not found anywhere else. Includes extensive Documentation and handsome binder.

..... \$79.95

### **RUN YOUR OWN** COMPUTER BULLETIN BOARD

Become a CONNECTION-80 SYSOP (System Operator) with a LYNX Modem, and CONNECTION-80 BBS Program by Tom Vande-Stouwe & Rich Taylor. All for only \$399 (\$100 off regular price).

### DOS PLUS

This is the BEST Operating System currently available for the TRS-80<sup>TH</sup>. It offers you all the features you could ever use, speed, reliability and much more. Available for the Model I and III. Single and double density systems available. Only 99.95 either system.

### UTILITY PACK

by Mike Friedman

FOR THE SERIOUS TRS-80" USER

CONTAINS:

Spooler: Very fast. Allows page parameters & Perf Skip. This spooler allows you to switch Dos's without interupting printing!!

Erase: Super program, purge utility with many modes of operation. You will never use KILL again!!

Map: Places a sector map of your disk on the screen. Shows free, used and locked out arans, All for only

# Multi-Statement

Dan Keen and Dave Dischert Custom Tailored Computer Software RD # 1, Box 432, State Highway 83 Cape May Court House, NJ 08210

One of the best features of Basic programming is that once you become good at it, there are more conquests to make as you discover new methods to use so your programs look neater, execute faster, and use less memory space. We will examine some tricks that will help you round off those rough edges.

It never occurs to most programmers that data statements can exist in harmony on multiple statement lines. The Model I owner's manual gives the impression that data lines should be tucked away by themselves at the bottom of the program. But, both of these lines are valid:

10 DATA 23,25,89,100: FORX-1 to 4: READ A(X): NEXT 10 FORX = 1 to 4: READ A(X): NEXT: DATA 23,25,89,100

Don't hold back on the length of multiple statement lines, pack them full. Multiple statements save bytes and decrease program run time.

```

Program Listing 2.

Program Listing 1 shows a sample menu. An option is to be selected. Check out line 30—it's packed, but very efficient. The book didn't tell you that it's possible to use more than one if ... Then ... Else statement on a line, but you can use as many as you want. Just keep track so each if has a Then, and an Else if needed.

There are two other interesting points to be made about that short program in Listing 1. First, if some options are selected, program execution may branch to another section within the program (by using GOTOs), or it may run an entirely different program. All the command words listed in chapter two in your Level II. owner's manual can be used. The only exception is CONT: It's not that the machine doesn't recognize that word, it just doesn't know what to continue.

Some commands don't return you to your Basic program after they execute, such as CLOAD, List and System.

Experiment deleting lines or even causing New to execute if the operator indicates he's done with this program.

The second point of interest is dynamic flashing of the characters to be selected. As you can see, the program prompts you to respond with A, R, D or S. Between checking the keyboard via INKEY\$, these letters are blinked on and off. Since the Model I doesn't have a flashing cursor, this animated input lets the operator know that the computer is ready and awaiting further instructions.

### Potpourri

You can use a PEEK statement as the value part of a POKE statement. This line takes the character on the upper-most left side of the screen and displays it near the center of the screen:

10 POKE 15850, PEEK (15360)

Variables with a declaration character after them may or may not be the same as the plain variable. For example, if you use the variable SR%, don't expect SR to have the same value. We've run into trouble assuming that the two would always be equal.

### **Auto Date Routine**

If you have a program which uses the current day's date within it, put the auto date check routine at the top of Program Listing 4. The routine determines if the date has been set. If the date has not been set, it will ask you to Enter the date. Should the date already be set, then it will display the date and ask is Date O.K.? Execute these lines before a clear statement in your program so none of the variables here will interfere with those used later on.

The routine simply PEEKs the address where the day is stored. If the value there is zero, the date has not been set.

### The For ... Next Trick

Check out Program Listing 3. See the NEXT A in lines 50, 60, 70, 80, and 100? You could rewrite the program by changing all of those NEXT As to GOTO 20 and delete line 10. But the program as it stands takes up fewer bytes than would the GOTO version even with that extra line deleted!

This method is a convenient way of returning to the same point in a program. Perhaps the returned point could set up something on the screen, or reset some variable. By stepping zero, the loop never runs out of counts.

The For...Next Step 0 technique is not necessarily a great advantage over GOTOs and GOSUBs, but it does use less memory.

### A Disk Basic Trick

Here's a trick for Disk Basic programmers. We had a program where we were cramped for disk space and each byte was important. The program must store many dates, both the month and the day. The trick is to take the dates and manipulate them so they take up less disk space.

Since there is no need to store a slash (/), just create one number from the two. Then you can use MKI\$ and store the number as an integer. Upon retrieving the number, do the reverse. Add a slash and split the number in two. This saves bytes over storing the date in its entered form:

10 INPUT"ENTER MONTH AND DAY (MM/DD) ";DA\$ 20 DA = VAL(LEFT\$,2) = RIGHT\$(DA,2)) 30 LSET(field variable) = MKI\$(DA)

To restore: 10 B\$ = STR\$(CVI(field variable)) 2 0

B\$ = MID\$,(B\$1,2) + "/" + RIGHT\$(B\$,2) 30 PRINT B\$

### Game Tips

When writing a game or a children's program which utilizes an INKEY\$, use a dummy INKEY just prior to the one you want. This picks up any stray keys that may have been pressed before you want a response from the operator. Here's how it could be set up: 30 A\$ = INKEYS: IF A\$ = ""THEN 30 40 ----- PROGRAM TEXT-----

The variable IK\$ will never be used anywhere in the program. It simply prevents previous key entries from getting through to line 30, where the real variable, A\$, is quizzed. Let's go one step better than INKEY\$ for getting input from the operator.

By PEEKing memory location 15350, you can find a value returned by the keyboard. This method has two advantages over INKEY\$. A\$ = INKEY\$ won't hold the value if it is in a loop. The next time that statement is hit, A\$ would change to become whatever is there.

Also, PEEK will detect if more than one key is being depressed. This is great for checking to see if the arrows are being held down. The up arrow returns an eight, down arrow 16, left arrow 32, and the right arrow 64. If you hit the left and up arrows together, the memory location holds a 40, which is the addition of 32 and eight. Furthermore, holding down a key will enable you to design continuous firing into your game.

The negative aspect of this procedure is that we're only looking at one byte of the keyboard return, so other keys will return the same value. Both the left arrow and the letter T, for example, return a value of 32

20 X = X + 1

but it generally serves the purpose for most games.

### **Disk and Level II USR Calls**

Our final tip deals with the use of the USR command. Writing a program with a USR call can get you into trouble if you want It compatible with both Level II and Disk Basic. Since Disk Basic supports more than one USR call, it must be set up a little differently. If the program has only one USR call, an error handling routine can trap it and branch program execution to an appropriate section.

To tell the computer where to go when a USR call is encountered, Disk Basic requires the address to be set up by DEFUSR-address. Level II Basic has the address value POKEd into memory locations 16526 (least significant byte) and 16527 (most significant byte).

A DEFUSR statement would give an L3 error if it were run under Level II. Take a look at Program Listing 2. If this was run in Level II, line 10 would generate an error but because of the On Error statement the program won't go out on error, but rather will branch to line 100 where it can be set up for Level II operation. Similarly, if run in Disk Basic, execution would continue to line 20. ■

Know all the angles before you decide.

# Cadet—The Decision Maker

Victor T. Albino 18501 194 NE Woodinville, WA 98072

Cadet is designed to help you make logical decisions about almost any kind of problem. It provides an orderly process so each factor that goes into your decision making is listed and considered.

Cadet will provide all necessary prompts and protect against illegal entries so that you can easily state your problem and enter any factors you think important. Cadet will then make a recommendation for or against the action you have in mind.

The program is structured on the classic decision grid concept. This management tool facilitates decision making when a problem has many conflicting elements. The real value of Cadet is that it allows you to concentrate on identifying the issues and your feelings about them. The program takes care of the mathematics and even calculates a level of confidence for the suggestion it makes so you have some idea of how sure you can be about its advice.

The program also provides some cheerful graphics to keep

your spirits high while your mind contemplates the issues. When you run the program, for example, you will see an animated spiral that simulates the "thinking" process of a RAM chip.

The action comes from lines 907 to 909. For some interesting variations on this theme, type in the following short program:

```
0 CLS

10 R = 3

20 FOR X = 0 to 375 step 7

30 B = R*7*SIN(X) + 71

40 C = R*3*COS(X) + 20

50 SET(B,C)

60 R = R-.05

70 NEXT X

80 GOTO 80
```

This is the same spiral pattern that appears in the program. Now try changing the 375 in line 20 to 850 and decrease the step size to 5: you get a pretty flower spiral.

Lines 30 and 40 plot the sine and cosine values of X using polar coordinates. The factors of 7 and 3 in these same lines are needed to compensate because the pixel (picture element) on your screen is not square; it is a rectangle with an end to side ratio of 3:7. If you start experimenting with these numbers, you will get an eliptical spiral instead of the circular one. The numbers added at the ends of lines 30 and 40 are there to position the design on the CRT. It is best to keep the center of the design near the middle of your screen since an illegal function error results when the equation attempts to plot points off the video.

There are many modifications you can make in this program. By changing the values, often only slightly, you can create some fascinating graphics. After all, now that Cadet has solved your problems, you should have plenty of time to create fantastic graphics. ■

|                                                   | Program Listing                                                                                                                  |

Not enough? How about turning an 8-track into a mass storage device, making music, controlling a synthesiser, individual reverse characters, and a real-time clock?

If the thought of using a screwdriver gives you the shivers then you can turn to the software section. Learn how to make BASIC programs auto-execute, reset memory size, pack program lines with machine code, and generate sound effects.

The Custom TRS-80 and Other Mysteries is packed with page after page of practical information, and tested software. Get a copy and turn your TRS-80 into a supercomputer. Available for \$29.95 from your local LIG dealer and B. Dalton bookstores.

#### JOE COMPUTER Presents Handicapping Software **IT'S FOOTBALL SEASON!** 193

Pro and College Football from SDL: Now with new manual — old price! That's right, Ken Perry of SOL refuses to raise the price. Joe feels that this program should sell for \$500.00! Why? Because it works — better than 65% against the Las Vegas line for The last 3 years on picking upsets — a whopping 73% last year A proven winner' It takes about 10 minutes a week to record the weekend's results. Then sit back and let your computer predict text weekend's points for 28 pro teams or 78 college teams. Each program comes with a prior season data file. 16K TRS-80 Pro Feetball version new available.

Pre Feetball Cassette (TRS-80 or Apple) \$21.95 Disk \$26.95

College Football Cassette (32K TRS-80 or Apple)

Brand New! Pro Football History This unique program with data files displays the scores and Las Vegas lines for the last five years for all NFL regular and post season games including the Super Bow! All 28 teams included. This data is hard to find — now it can be in your computer Data is displayed via a variety of search keys. A must for senous football fans. TBL Bor et all diff. Dish are: TRS-80 or Apple 48K Disk only \$39 95

 Herse Race Mandicapping! Our biggest seller — Probability Handicapping Device: 1
 This is a comprehensive horse racing system for spotting overlays in thoroughbed
 sprint races. Easy entry of data from the racing form: A complete users manual takes
 you step by step through a sample race and explains overlay betting and money
 management. The user's manual contains a detailed tab run of a 100 consecutive race
 system workout showing an amazing \$1.50 returned for each \$1.00 wagered. (Note this is not the
 same program as "Winning at the Races"). You may purchase the manual separately for \$7.95 and
 redit. PHO-1 is new available for CP/M (Basic-80, M-Basic). PHO-1 User's Manual and casestle for:
 16K Apple II Applesoft, BK Ohio Scientific (specify 1P or 4P), 16K TRS-80 Model I or III
 \$29.95
 Apple or TRS-40 Disk
 \$23.95 CP/M 5" or 8" Single Density Data Disk \$39.95

### OR. QUIRIN'S FAMOUS DISCOVERIES!

Winning at the Races. This is the program using the algorithms from Dr. Quirin's book. Highly praised and endorsed by Dr. Quirin, this program is the best available today. Again, Ken refuses to raise the price! Qur loss is your gain. Screen edit type data entry makes entering data a breeze. Order now before Joe convinces Ke n to raise the price \$34.95

Winning at the Races Cassette (32K TRS-80 or Apple) Disk

MSA

\$21.95

Winning at the Races — the book by William Quirin Ph.D. This is the best computenzed study of thoroughbred racing ever published. This 300 page hardbound book shows detailed studies of high im-pact value factors and includes Dr. Quirin's famous Par Times. A Tom Ainsle Winners Circle Book \$21.95

Basting the Races with a Computer by Steve Brecher A good ``How To`' book on multiple regression techniques applied to Pan-Mutual handicapping. Some heavy math \$14.65

FROM ONE OPERATING SYSTEM TO ANOTHER! A VITAL WAY TO PROTECT YOUR SOFTWARE INVESTMENT FOR THE FUTURE!!

The **EA COMM** language runs on more different Oper-ating Systems and more different-sized computers than any other similar language. For starters, it runs on NCR and Ti minoomputers and, in the micro field, on the CP, M\*, MP/M\*, TRSDOS<sup>5</sup>, OASIS<sup>4</sup>, MOASIS<sup>4</sup>, and UNIX<sup>4</sup> (ONYX version) Operating Systems...to mention only a few

Until now, serious business software of the scope and

Until now, serious business software of the scope and flexibility seen in the minicomputer world has not been available on micros. **EA UDBE**, now allows transfer of such software with a minimum of fuss. We have participated in such a mini-to-micro transfer of a major set of general business software. using **EA CBBEL**, as the transfer mechanism, of course Running on Interally thousands of minicomputers, these refined, submost and prome acoftware methods for a RL A/R enhanced, and proven software packages cover A/R, A/P. ennariced, and proven software packages cover A. K. Y. O(L. F/R, Order Entry (with Invoicing and Inventory Control) as well as Sales Analysis. The packages define a new level of achievement for features and flexibility in micro applications software and offer top quality at a reasonable price. # Micro-Yahtzee

### Mark E. Johnson 2925 W. Lincoln Ave. #11 Anaheim, CA 92801

ere's a computer dice game to help you while away your time. I call it Micro Yahtzee.

The game first displays the instructions. Play begins when your roll is sorted into order and displayed. Use the INKEY\$ function for all the entries so they are quick and easy. During the game the scores for each category appear continuously and the display indicates whether each category has been used or voided yet. After you roll, select your category. The program checks your dice against your selection and then tells you to make another selection (if you have used that category already), or gives you zero for that category if the dice don't apply, or gives you the appropriate points. At the end of the game your point totals and bonuses are displayed. Then the averages for each category and for each player for the games played are figured and displayed.

| Lines 0-105       | a. Initialize variables                                   |
|-------------------|-----------------------------------------------------------|
|                   | b. Display categories and scores                          |

Includes all components to assemble the LNW color computer: high resolution video FAM and 16K user RAM, keyboard, and Level II compatible ROMS. Printed c-rcuit board not included.         LNW EXPANSION INTERFACE KIT \$219.95         (less P.C.B.)         Includes all components to assemble the LNW Expansion Interface plus 32K of RAM. It does not include the printed circuit board, dual cassette relay or cabinet.         A beautiful custom all wood cabinet is available for housing the LNW Expansion Interface. \$99.95                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

You sometimes must use them to get the most out of your disparate program library.

# **Building Bridges**

Wayne L. Mueller 130 Sunset Court Roswell, GA 30075

A t one time or another, almost all of us have bought software that did everything that it claimed, but still didn't do exactly what we had in mind. When this happens, we usually either change our mind about what needs to be done, or change the software to do what we originally had in mind. In this case, I did neither. Rather, I found two pieces of software and built a bridge between them. Taken together, they do exactly what I want.

### **Special Delivery**

On one side of the bridge we have Special Delivery by Software Concepts. This is a very nice mail-list processor that merges a letter text file with a name and address file to produce highly personalized form letters.

If your letter starts with "Dear Mr. <L:", the Mailrite program will substitute a last name for the <L, so that it prints as Dear Mr. Adams, Dear Mr. Baker, or whatever last names may appear in your name and address file. In ail, there are eight fields in the name and address file that may be substituted anywhere in the body of your letter. Other "<" flags allow you to toggle underscores and boldface on and off, change margins dynamically, and provide other slick features too numerous to mention here. (See the July, 1980, 80 Microcomputing for a review.) The problem is that six of the eight fields have to do with the name and address, leaving only two fields to store data about that person or company. For my purposes, two is not enough.

#### AIDS3

Enter AIDS3, by Meta Technologies. AIDS has no text insertion capability, but is a superior data manager. The user may define up to 20 fields of either character or numeric type. In addition, there is a more comprehensive search and select capability. There are no exaggerations in MTC's ads. If anything, the claims are understated. If all you need is a data manager and report generator, AIDS3 and its companion programs are top notch.

### The Bridge

As you might expect, the file structures differ between AIDS and Special Delivery, so that a file written by one cannot be read directly by the other. That's where the bridge comes in. The conversion Program Listing moves any of AIDS' 20 fields to or from any of Special Delivery's eight fields, and does it in a format that is readable by the destination program.

What this means to me is that even after using six of the 20 AIDS fields for name and address information, I still have up to 14 fields to store data for insertion into form letters. Normally I do my data entry, editing and selection with AIDS, and then move the selected data to the Special Delivery format for form letter generation.

The conversion program operates very simply. The program asks for and accepts the names of the files involved, and which way to convert. The respective file formats are then displayed, (Fig. 1) and you select which field is to be moved where. As each selection is made, the arrows to the left of the screen (Fig. 2) depict the source and destination fields. In the example shown, an AIDS file is being converted to Special Delivery. AIDS fields A through F are being moved to the corresponding Special Delivery fields one through six, while AIDS fields M and L are being moved to Special Delivery fields six and eight respectively. Entering the slash (/) character ends the selection, and causes the conversion to take place.

All Special Delivery fields are stored as left-justified characters, and padded on the right with underline characters to fill out the field. AIDS' character fields are padded on the right with blanks, while numeric fields are right justified and padded on the left with blanks. The conversion process accomodates these conventions, so that the converted file appears identical to what would have been produced by the destination program. If the destination field is smaller than

**Program Listing** 

# ...And my dad says GRAFTRAX 80 does better graphics than anybody.

# Epson.

You might say it's the head of its class. GRAFTRAX 80 gives you the highest resolution dot matrix in the world — up to 120 dots per inch horizontally and 216 dots per inch vertically. Which makes our MX-80 and MX-80 F/T work more like a plotter than a printer.

And that's just for starters.

GRAFTRAX 80 more than doubles the features available in an Epson MX-80 or MX-80 F/T. For instance, we've added nice little touches like an italic character set — which doubles the number of font types to 24. And with GRAFTRAX 80, you can change style, size and density anywhere in the line. And backspace the head. And use block graphics with *any* computer. And redefine all escape codes under software control.

Up to now, you couldn't get some of these features at *any* price. With GRAFTRAX 80, you get 'em all. And more. Lots more.

Best of all, we haven't forgotten all those people who already own an MX-80 or MX-80 F/T. You own the printer that set the standards all the others are following. And you can install GRAFTRAX 80 PROMs yourself, for less than \$100. And make the best even better.

You can see why we say GRAFTRAX 80 is the head of its class. There's nothing else *in* its class.

# That Annoying Twitch

Marshall E. Smith 801 West Long Lake Road, Apt. F-1 Bloomfield Hills, MI 48013

an you remedy the twitch Jin my video display?" asked my grandson. He had obtained an estimate for a professional repair job which included replacement of any doubtful ICs and a check of all solder connections. The size of the estimate meant a big hole in his cash reserves which he had planned to use for the purchase of peripherals. He remembered that I had done some do-it-vourself TV repairs and wondered if I could help him. With scant knowledge of computers, I reluctantly consented to tackle the problem.

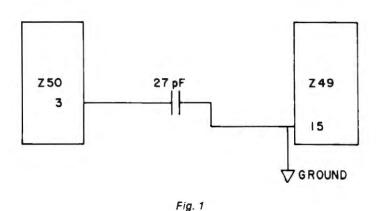

Following the instructions in the TRS-80 Microcomputer Technical Reference Handbook we disassembled the case, trying not to strain the flexible connections and taking pains not to bend the logic board. We positioned the logic board with the devices up and the keyboard in an operable location, then plugged in the power supplies to the logic board and to the video display.

We turned on the power and checked the 12 volt, 5 volt and -5 volt supplies and found them satisfactory. I had learned that the computer had worked well except for the annoying horizontal twitch which appeared periodically at the left side of the screen when an image was being displayed. The problem seemed to be independent of duration of operation or temperature and would come and go without apparent cause. I connected my 3-Inch oscilloscope and went to work.

With a display on the video, I connected the scope ground to the logic board ground, then did some careful probing among the IC pins, working back from the output jack. This was done carefully because I did not want to short-circuit or ground any live pins. All probing was done on the side of the logic board on which the devices are mounted.

With no twitch on the video I found a nice, steady pattern on pin 3 of Z49. Waiting for the Inevitable twitch, which soon occurred, I probed the same pin and found the scope image was vibrating. I then probed other pins in the area and found to my pleasant surprise that the twitching stopped when the probe was on pin 2 or 3 of Z50. It was evident that there was a slight tendency towards instability in that circuit and that a small amount of capacitance to ground might cure it.

Sure enough, a 27pF ceramic type capacitor from pin 3 of Z50 to pin 15 (ground) of Z49 solved the problem (see Fig. 1). Care was exercised not to overheat the pins of the ICs during soldering. After several operational tests indicated success, we reassembled the computer. It has been working faithfully for several weeks now.■

### **COMPETENCY EXAM PREPARATION SERIES**

This comprehensive set of programs consists of simulated exam modules, a thorough diagnostic package, and a complete set of instructional programs. It is designed to teach concepts and operations, provide drill and practice and assess achievement levels through pre and post testing. The Competency Exam Preparation Series provides a structured, sequential, curriculum encompassing mathematical, reading and writing instruction.

The C.E.P.S. program is designed for individual student use or use in a classroom setting. Programs provide optional printer capability, worksheet generation and performance monitoring. C.E.P.S. are available in two software formats.

| National Proficiency Series                        | \$1,299.00 |
|----------------------------------------------------|------------|
| N.Y.S. Regents Competency Test, Preparation Series | \$1,299.00 |

If desired separate Mathematics and Verbal packages are available for \$799.00 ea. A Spanish language version of the Mathematics Instruction Package is available at no extra charge.

### COLLEGE BOARD PREPARATION SERIES 81/82

Each program confronts the user with a virtually limitless series of questions and answers. Each is based on past exams and presents material of the same level of difficulty and in the same form used in the S.A.T. Scoring is provided in accordance with the formula used by College Boards.

S.A.T., P.S.A.T., N.M.S.Q.T., set includes 25 programs covering Vocabulary, Word Relationships, Reading Comprehension, Sentence Completion, and Mathematics. Price \$149.95

EDUCATOR EDITION - includes all of the above programs plus detailed solutions and explanations. Price \$229.95

Independent Tests of S.A.T. series performance show a mean total increase of 70 points in students' scores. Update Pack to 81/82 specs. Available to previous owners. Price \$69.95

### ODYSSEY IN TIME

This spectacular a excitement and com compete with the poexacting quest for vi-To succeed they m rages across 24 time Odyssey In Time in

This spectacular adventure game adds a new dimension of excitement and complexity to **Time Traveler**. Players must now compete with the powerful and treacherous adversary in their exacting quest for victory.

To succeed they must vanquish this adversary in combat that rages across 24 time periods.

**Odyssey In Time** includes all the challenges of Time Traveler plus 10 additional eras, including those of Alexander the Great, Emperor Asoka of India, Attila the Hun, Genghis Khan. Each game is unique, and may be **interupted and saved** for later play.

available for APPLE & TR-80 PET, 32K - \$39.95

### TIME TRAVELER

Confronts players with complex decision situations and the demand for real time action. Using the **Time Machine**, players must face a challenging series of environments that include; The Athens of Pericles, Imperial Rome, Nebuchadnezzar's Babylon, Ikhnaton's Egypt, Jerusalem at the time of the crucifixion, The Crusades, Machiavelli's Italy, The French Revolution, The American Revolution, and The English Civil War. Deal with Hitler's Third Reich, Vikings, etc. At the start of each game players may choose a level of difficulty... the more difficult, the greater the time pressure. To succeed you must build alliances and struggle with the ruling powers. Each game is unique.

\$24.95

Perhaps the most fascinating and valuable educational game ever devised — ISAAC NEWTON challenges the players to assemble evidence and discern the underlying "Laws of Nature" that have produced this evidence. ISAAC NEWTON is an inductive game that allows players to intervene actively by proposing experiments to determine if new data conform to the "Laws of Nature" in question. Players may set the level of difficulty

**ISAAC NEWTON** 

from simple to fiendishly complex. In a classroom setting the instructor may elect to choose "Laws of Nature" in accordance with the complete instruction manual provided.

For insight into some of the basic principles underlying ISAAC NEWTON see GODEL, ESCHER, BACH by Douglas R. Hofstadler, Chapter XIX and Martin Gardner's MATHE-MATICAL GAMES column in Scientific American, October, 1977 and June, 1959. \$24.95.

Send \$2.00 for complete Catalogue.

\$5.00 Discount Coupon included in Catalogue.

An initial program loader for TRSDOS.

# Through-Boot

Alan D. Smith P.O. Box 119 Mortdale, N.S.W. 2223 Australia

ne shortcoming of the TRS-80 disk system (TRSDOS) is the failure to provide an Initial Program Load (IPL) facility to take the user from power-up through to the desired Basic program without the need for numerous keyboard entries. The Auto Function with its one command limitation fails to solve the problem. Unless you happen to own, for example, Apparat's NEWDOS, you're stuck with a somewhat lengthy initialization sequence, particularly if loading I/O drivers. Out of such frustrations was born IPL/BAS.

### IPL/BAS

IPL/BAS is a Basic program suitable for TRSDOS systems of 16K RAM and upwards. It allows the user to create a command file tailored to suit a particular IPL requirement. Each such file consists of a small machine language program plus the specified set of commands. For example, we might build a file called TAXIPL/CMD. Entering TAXIPL after power-up (or setting Auto TAXIPL) might: might:

- set Verify (ON);
- load an I/O driver PRINT/ DVR;
- · load and execute Basic;
- reply <ENTER> to How Many Files?;
- reply 49000 to Memory Size?
- and run program TAX/BAS.
   TAXPASS:1.

All this without any further entries from the keyboard!

### **Program Operation**

To use IPL/BAS, key in the program and save to disk as IPL/BAS; be especially careful copying the data statements, lines 50 through 80. Whenever you want to set up an IPL command file, there are several steps to follow.

Execute Basic and reply 32511 to the Memory Size? query. (The command file is built in RAM starting at 32512 (7F00 hex), so that area needs to be protected. In fact, IPL/ BAS will refuse to run if you haven't set the memory size correctly.)

Run IPL/BAS and when requested, key in the command set you require. Note that Enter should be typed as "+"; for example, to build the TAXIPL file outlined in the previous section, you would type: VERIFY + LOAD PRINT/DVR + BASIC + + 49000 + RUN"TAX/BAS. TAXPASS:1" +

and then press Enter.

The program will return to TRSDOS, and you then write the command file to disk using the DOS Dump command. In the case in question we would enter:

DUMP TAXIPL/CMD (START = X'7F00', END = X'7FBF',TRA = X'7F00')

The command file is now ready for use.

EXPENSIVE - The LNW System Expansion II comes with a full 32K of 200ns RAM, and built-in RS232c 20 MA current loop serial interface. That's for starters. Next, consider our heavy gauge steel case, power indicator lamp, gold-plated connectors, FR-4 glass epoxy circuit board with solder mask and silk screen legends. Then there is the parallel printer port, screen printer port, real time clock, and extra heavy duty onboard power supply with over current protection, over voltage protection and thermal shutdown. If that's not enough then there is the floppy disk controller, guaranteed operation at a 4MHz CPU speed and our 6 month warranty. Every one of these features is STANDARD. This is true system expansion. You get every 'expensive' feature without spending more.

CHEAP - Our price is \$399.95. Any way you compare, features or price, LNW's System Expansion II is the clear winner. The LNW System has been field tested for over two years with thousands of users. It works with any DOS, is 100', TRS-80 Model I compatible and it works 'right out of the box'. If there is any doubt in your mind as to whether you should buy ours or the 'other guys', just ask an LNW owner!

WE ARE #1 - Number one in price, features, reliability, performance and delivery. LNW is committed to 'expensive' features and quality at reasonable prices. LNW is committed to support, thorough documentation, and reliability.

2620 WALNUT Tustin, CA. 92680 (714) 641-8850 (714) 544-5744 This has manufacturer and accessories and accessories for the Model 1 computer. EXPANSION OPTION - 8-inch drive capability is as easy as plugging in the LNDoubler 5/8 option\*. Now you can have any combination of single- or double-density, single- or double-sided, 8<sup>\*\*</sup> and/or 5" disks on-line! 8-inch disk storage increased to 591,360 bytes - 77-track single-sided, double-density or 1,182,720 bytes - 77-track double-density, double-sided.

**2NSIV** 

The LNDoubler's unique 5/8 switch allows you to boot from 5- or 8-inch system disks and it's accessible from outside the interface. The \$219.95 LNDoubler 5/8 comes with a double-density disk operating system (DOS+ 3.3.9), complete with BASIC and utility programs... ready to run your software.

Each of your present 40-track, single-sided 5-inch drives will store up to 184,320 bytes (formatted storage) - that's an 80% increase in storage capacity for only half the cost of just one disk drive. With three 8-inch double-density, double-sided drives your Model I will have 3.75 Megabytes of online storage - that's more storage than a Model II or Model III!

"8" drive operation requires special valle, 6" double density requires J.55MHz CPU speed up modifuation or LNW 80 4MHz componer TRN 961 p. or trank mark of 3 mills 8 organizations

### RAM \$18.99

ONE YEAR GUARANTEE. INCLUDES RAM TEST AND INSTRUCTIONS Premium 16K high speed ram for TRS-80 MODEL 11//I, and COLOR COMPUTER. MODEL 1 owners add 2:00 for 2 dip shunts.

### COLOR COMPUTER SOFTWARE SUPER "COLOR" WRITER

At last!! Fast, full featured, character oriented word processing for the TRS-80TM COLOR COMPUTER and any printer FEATURES • 32K compatible • choice of display color • key beep • help command • words typed & words left • tab key • repeat key • word wrap around • block move • duplicate & delete • global search & replace • quick paging • paragraph scrolling • line scrolling.

SPECIAL FEATURES automatic linking of cassette text files for hands-off continuous printing • unique movable window for viewing any part of the text.

PRINT FEATURES send printer control codes, along with text, to printer \* full use of printer's special features during normal printing \* set margins, line length, line spacing, page length, and page spacing within the text for continuous printing \* automatic centering \* right justification \* page numbers & titles.

| TAPE" \$29.95   | ROMPAK* \$39.95     | DISK \$49.95 |
|-----------------|---------------------|--------------|
| "Tape I/O only. | not disk compatible |              |

SUPER "COLOR" TERMINAL all the features of VIDEOTEXTM and more! Allows COLOR COMPUTER to communicate with computers like TRS-80 MODEL II/I & APPLE II etc. services like COMPUSERVE via MODEM or RS232 DIRECT! Features • upload & download basic programs • print or save data to tape • half & full duplex DOCUMENTATION & TAPE \$24.95 ROM PAK \$34.95

SUPER "COLOR" BUG examine & change memory contents in the color computer • step video display to any location including ROM • look at contents of ROMPACKS! • access high res. graphics & create & debug machine language programs. TAPE AND DOCUMENTATION \$16.95

SUPER "COLOR" SKETCHER turns the color computer into a drawing board. Supports 32K ram + save and load graphics to tape + create basic graphics programs + print graphics to R.S. LPVII, EPSON MX-80 TAPE AND DOCUMENTATION \$19.95

### GAMES

MODEL III / I 16K AND COLOR COMPUTER EXT/BAS. FEATURE QUALITY GRAPHICS AND SOUND!

ADVENTURE 3-PAK TAPE \$24.95 This TRILOGY OF 3-D FANTASY GAMES takes you to the WORLD UNDER THE CIMEEON MOON. Engage in ritual combat with tooamoath, narthokc monsters and skilled warriors. Advance in rank with play experience. Then adventure through DAZMAR'S UNDERWORLD OF DOOM to the forbidden ruins of castle argaan. Search for the eye of dazmar while avoiding the sorceror's intricate traps. Survivors must then negotiate treacherous trails among the perilous peaks of the ugrek moutains to the FORSAKEN GULTCH where the wicked idol awaits restoration.

VEGAS 5-PAK TAPE \$19.95 The THRILLS OF A VEGAS CASINO at home. Five action packed Vegas games for up to four players: CASINO CRAPS -21 • ONE ARMED BANDIT • UP & DOWN THE RIVER • KENO. Bank tracks players' winnings from game to game • realistic cards • regulation tables • boards • authentic sounds • lively graphics • official rules in each game

#### COMBAT 3-PAK

TAPE \$24.95

Three action packed two player games featuring lifelike graphics and sound of LASER FIRE, CANNONS, and PHOTON TORPEDOES.

2.1-0 TANK COMBAT five terrains • the experienced arcade player can design combat scenario. STELLAR BATTLE pilot a flex-wing fighter at incredible speeds in enemy space taking out donan tye fighters defending the imperial star fortress. GALACTIC BLOCKADE maneuver your craft in a course that boxes your opponent but avoid cosmic debris and hostile space probes!

#### MODEL III / I SOFTWARE REQUIRES 16K MODEL III OR LEVEL II BASIC

READ THIS! Add graphics to your programs in minules or draw schematics, graphs, logos, pictures, etc. with graphics and lettering & save them as subroutines or programs? SUPER SKETCHER does more and works just like a text editor with graphics = image frames can be edited and animated on screen = generate, load & save graphics, basic subroutines & programs = includes EPSON MX-80 & R.S. LPVII graphics screen print driver and more TAPE (TAPE VO) \$14.95 DISK (DISK AND TAPE VO) \$19.95

SUPER WRITER word processing that combines the best features of other good word processors and those of the SUPER "COLOR" WRITER including automatic tape of disk file linking and the movable window feature except B/W display. See SUPER "COLOR" WRITER for details! MODEL I/LII needs lower case mod. MODEL II/I TAPE & DOCUMENTATION \$49.95 DISK \$59.95.

AUTOMATIC MENU SYSTEM power up and automenu takes over Execute programs and command files, or LIST, LOAD, enter DEBUG, BASIC, or TRSDOS with single keystroke! Features options menu with library of commands. MODEL III DISK & DOCUMENTATION \$12.95

CODES for THE ELECTRIC PENCIL enter printer control codes within text file to send to smart printers. Includes drivers for EPSON MX-80, CENTRONICS 737, MPI 88 SERIES, and file to customize for other printers. TAPE \$14,95

DISK INVENTORY for the MODEL III manage your disk programs. A menu driven utility featuring sort & print by name, disk, program type, extension, etc. MODEL III DISK \$19.95

Program Listing 2

### **Points to Note**

There are several points to remember about this program.

The maximum length of a command set is 120 characters—usually more than enough, but you can, if necessary, chain command files under DOS, i.e., have one invoke another.

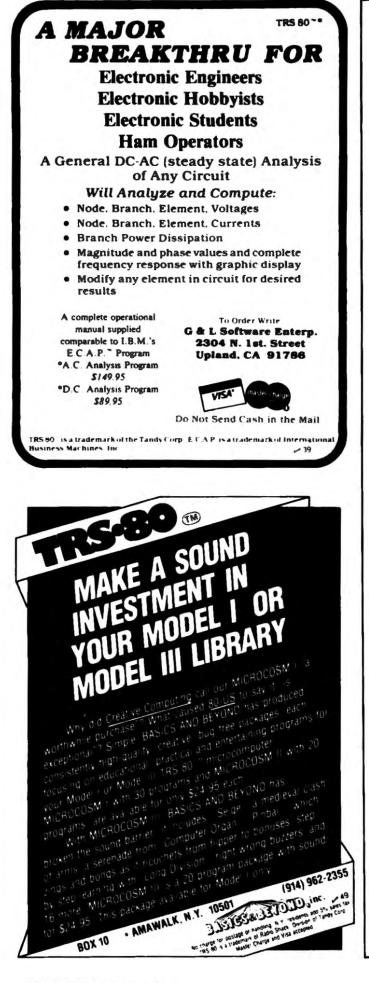

You cannot use a command file to reply to Input, Line input, or INKEY\$ statements contained within a Basic program.

When running IPL/BAS, simply pressing Enter without typing a command set provides a default of Basic+++run" (i.e. load and execute Basic, reply Enter to the How Many Files? and Memory Size? queries, and then type Run. This allows the user to manually key in the name of the program to be run).

### For Assembler/Machine Language Buffs

Command files each contain a 72-byte program in Listing 1, which is POKEd into RAM between X'7F00' and X'7F47'. The specified command set is POKEd into the next 120 bytes (X'7F48' to X'7FBF'). The area above X'7FBF' is not used, because it is overwritten on entry to Basic on a 16K machine.

On initial entry, the keyboard driver address at X'4016'/ X'4017' in the device control block is replaced by an intercept which effectively reroutes all subsequent keyboard requests to X'7F11'. The intercept routine at that address then passes the command set, one byte at a time, to the requestor (DOS or Basic). Before passing the last byte (identified by having bit seven set), the keyboard driver address is restored to its original value, thereby disabling the intercept and restoring the keyboard to normal operation. The delay loop prevents potential problems with functions that scan for Break during execution, as well as providing a little more time for you to observe what is happening!

#### WHATS THE BEST WORD???

How many times have you racked your brain for just the right word when writing an important letter, report, or article? How many times have your ideas been misunderstood because the words you used didn't express your thoughts clearly and accurately? How many times have your turned in a report or mailed an important letter and then hours later kicked yourself for not having thought of the best and most accurate words to use at the time you wrote it

Now, by using the remarkable new REFWARE THESAURUS programs, your computer can speedily find those words that are on the tip of your tongue but that you can't quite remember at the moment. And it tells you how to spell them!

Just slip a REFWARE THESAURUS disk into your disk drive. Then type in your sentences or paragraphs. The computer will quickly offer a variety of alternatives, retyping your sentences or paragraphs with substitute possibilities chosen from its multi-thousand word vocabulary. It displays the revised sentences on your monitor or types them on your printer as you choose, so that you can mult them over and choose the one that most accurately expresses what you REALLY mean to say.

Having helped thousands of writers learn to express themselves with clarity as editor of such publications as the World Book Encyclopedia, the Encyclopedia Americana, and the Reader's Digest Almanac and Yearbook, David C. Whitney has drawn on decades of editorial experience to prepare the revolutionary REFWARE THESAURUS programs, bringing the speed and power of the computer to the aid of anyone who wishes to improve his writing or speaking.

In addition to the specific programs capable of substituting suggested alternate words for nouns and adjectives, **REFWARE THESAURUS Builder** enables engineers, physicians, lawyers, educators, business, physicists, chemists, and other professionals and specialists to develop their own individually tailored computer vocabularies of hard-to-remember technical words

#### REFWARE THESAURUS Builder 1.0 Order No 5001RT \$149.95

Series of eight utility programs enables the user to develop specialized computer thesaurus disk programs of hard-to-remember technical words and their alternates for personal use. Functions independently of Adjectives and Nouns programs.

#### REFWARE THESAURUS Nouns 1.0 Order No. 2001RT \$39.95

Draws on a vocabulary of 6,200 nouns to suggest alternates for the names of persons, places, things, and ideas that you use in your writing and speaking

#### REFWARE THESAURUS Adjectives 1.0 Order No. 1001RT \$39.95

Utilizes 6,200 adjectives to assist you in choosing the most accurate modifiers to describe nouns and pronouns in your letters, reports, and speeches

#### REFWARE THESAURUS User's Manual Order No. 6001RT \$9.95

Complete description of use of each of the above programs. Included at no additional charge with each of program disks listed above. If ordered separately, price of documentation is refundable upon receipt of order and payment for program disk.

Will you have enough water when you need it most?

# Firestream

George L. Gille 220 Clayton Maryville, MO 64468

o operate effectively, fire hose must be supplied with the right amount of water under the correct pressure. The TRS-80 Level II Basic program described here was created to calculate the fire engine pumping pressure needed to effectively supply water to a wide variety of firestreams. (The firestream is the entire water supply system, including the water source, the fire engine pump, the fire hose and the nozzle.) I constructed the program as a training tool for volunteer firemen.

### The Firestream

Firestreams are defined in terms of their volume of water flow in gallons per minute (GPM), and the operational pressure of the nozzle in pounds per square inch (PSI). Operational pressure is the velocity of the water flowing through the fire hose. The volume of water used is a function of the size of the fire hose and the pressure at which it is operating.

The type of fire hose nozzle used dictates the volume of water flow and the pressure which the firestream must supply. Pump operators must be able to adjust the outoing pressure of their pump to meet the requirements of the nozzles they are supplying with water. They are able to determine the correct pressure by knowing the characteristics of the firestream they are operating.

### **Nozzle Characteristics**

Fog nozzles and solid stream nozzles are used in fire fighting. Fog nozzles produce fast moving jets of water that divide into drops with a definite cloud shape. They must be supplied with water pressure between 80 and 100 PSI. The volume of water put out by fog nozzles is determined by the design of the nozzle and the size of the fire hose to which it is attached.

The volume put out by solid stream nozzles may be calculated by the equation:

### Nozzle Output (GPM) = 29.7 · D<sup>2</sup> · VP

D is the nozzle tip diameter in inches and P is the water pressure (PSI) at the nozzle.

Solid stream nozzles usually operate at pressures between 40 and 60 PSI.

### Pressure Losses

Pressure at the nozzle end of the firestream is always less than that measured at the pump, due primarily to these three factors:

•The difference in height between the pump and the nozzle; •The water flow resistance produced by valves and stream splitters (wyes);

•The friction between the water flowing through the hose and the walls of the fire hose. The fire engine pump operator must be able to calculate these pressure losses to correctly set the output pressure of the pump.

Pressure loss due to a difference in height between the pump and the nozzle usually happens when a fire occurs in the upper floors of a building. The pressure loss is one PSI for each 2.3 feet the water is moved above the pump. When pumping the firestream downhill, there will be a one PSI increase in pressure for each 2.3 feet difference in height.

If the firestream is split into two or more smaller streams with the use of a wye connection a pressure loss of 5 PSI is assigned for each wye in the firestream. To determine pressure losses due to friction the fire service uses 2½ inch diameter fire hose which is 100 feet long as the standard for calculation. To calculate the friction pressure losses in hoses with other diameters, determine the volume of water flow (Q) in hundreds of gallons per minute:

> Q = Nozzle Output in GPM 100

The friction pressure loss per 100 feet of hose is then calculated by the equation:

FL = (2Q2 + Q) . HF

HF is the fire hose diameter adjustment factor and FL is the friction pressure loss in PSI. The HF would have a value of 1.0 when the friction loss for 2½ inch diameter fire hose is being calculated. The above equation is used when flow rates are greater than or equal to 100 GPM. If the flow rate in the firestream is less than 100 GPM, the equation for the calculation of the friction loss becomes:

FL = (20<sup>2</sup> + 1/2 0) . HF

This change in the equation is another adjustment for hose sizes less than 2½ inches in diameter.

Once the friction pressure loss for 100 feet of fire hose has been calculated, the total friction pressure loss may be determined by multiplying the calculated friction loss by the total length of fire hose in the firestream and dividing by 100. Note that the friction loss of each different diameter fire hose must be calculated separately.

The total pressure loss in the firestream is the sum of the pressure losses for friction, height differences, and wye connections. After making the above calculations, the pump operator sets the pump output pressure for a value equal to the nozzle operational pressure plus the total pressure loss in the firestream. above the street on the third floor of a building. The fire engine is located at a fire hydrant 500 feet down the street. The firemen have used 600 feet of hose to reach the third floor. At the third floor the hose is split into two 150 foot long,  $1\frac{1}{2}$ -inch diameter hoses, with a  $1\frac{1}{2}$  inch fog nozzle at the end of each of the hoses. The input into the computer program and the solution can be seen in Fig. 2.

This firestream would require a pumping pressure of 190 PSI to supply the two 1½ inch fog nozzles with a pressure of 100 PSI. You can see how this program simplifies the calculation of a proper pumping pressure in various situations. ■

#### Sample Problem

A fire is located about 20 feet

Firestream Program Listing.

BASIC is not nearly as slow as most programmers think.

BASIC Faster and Better shows you how to supercharge your BASIC with 300 pages of fast, functions and subroutines.

You won't find any trivial poorly designed 'check-book balancing' programs in this book – it's packed with *useful* programs.

Tutorial for the beginner, instructive for the advanced, and invaluable for the professional, this book doesn't just talk. . . it shows how! All routines are also available on disk, so that you can save hours of keyboarding and debugging.

The #1 disk *BFBDEM* contains all the demonstration programs, and #2 *BFBLIB* has all the library functions.

BASIC Faster & Better is \$29.95, and the two program disks are \$19.95 each. Get the book and/or disks from your local IJG dealer and B. Dalton bookstores.

### HOW ACCEL2 WORKS

TRS-80 Model 1/III BASIC Compiler

ACCEL2 uses a novel translation technique that keeps code growing budge speedups. Only a highest compatibility with BASIC source programs while grving huge speedups. Only a carefully chosen subset of BASIC instructions is translated. The non-compilable statements are left in the compiled program in their original source form and at run-time are actually given to the BASIC interpreter to execute. Program flow may flip into direct execution of the compiled machine instructions and then flop back to interpretation many times dur-

Why Compilation improves performance.

\*Name Resolution Term given to the process of identifying the value of a variable given its name. As a program runs, the interpreter builds a dictionary consisting of a chain of items each containing a variable name, data type and current value. Every time a variable is to be resolved the interpreter must sequentially search this dictionary. By contrast, ACCE12 builds the variable dictionary once at compile time and thereafter can refer to the variable mames by direct address, with no run-time search.

\*Line Resolution. The interpreter has to take the line number following a GOTO or GOSUB convert it to binary, and then search the program sequentially to trnd the target line. At complie-time ACCEL2 generates single machine instructions for GOTO or GOSUB using the actual address of the target line. For the interpreter, both name resolution and line resolution get slower as the program gets more complex, whereas for compiled code these two operations are independent of program size or number of variables.

The independence of program size or number or variables. "Computational Operations. The interpreter must parse each statement every time. Lind the one byte codes that correspond to the operations, look ahead to the next operator to establish the precedence rules and check for data type mismatch and conversion. Constants must be converted from character strings to internal binary. But under ACCEL2 constants are converted and embedded right in the 280 instructions stream and operations are translated once and for all at compile-time into sequences of calls to ROM or the run time component. INTEGER opera-tions are actually turned into directly executing straight-line Z80 code"

The result is a mixture of BASIC statements and machine language instructions usually not more than 1% -2% times the size of the original but running much faster (can be 50-100 times as fast with some programs)

ACCEL2 32K TRS-80 Model 1/111 Compiles selected subset in all variable types, local and global compilation options, output save to ES/F water, disk under TRSDOS, NEWDOS, NEWDOS/80

### MOD-II HARD DISKS AVAILABLE NOW WHY WAIT FOR RADIO SHACK

Micro Mainframe now supports the Model-II\* Computer system with our high quality add on Winchester disk systems. Each of the disk systems available offers the same high quality Error Correcting controllers used in our Model-II\* and Model-III\* systems.

### Features

- 5 Megabyte to 120 Megabyte systems supported (formatted capacity), with total system capacities from 10 Megabytes to 480 Megabytes.
- Oasis\* operating system available (Model-II\* only)
- TRSDOS\* compatible operating systems available (all models)
- Model-I\* and Model-III\* unit prices include operating system.
- Error Correction on all controllers for years of trouble free operation (up to four bit burst).
- Simple interface to the host computer through one of our host adapters.
- Models available soon for Apple\* and other computer systems.
- Support for more Winchester systems than any other manufacturer.

### System Pricing Removable Cartridge Winchesters

| MMF-100R1 | Model-I or Model-III version\$5350.00 |
|-----------|---------------------------------------|
| MMF-100R2 | Model-II version                      |
| MMF-100A  | Apple Version                         |

### 5 Megabyte Desktop System

### Prices Reduced

MMF-3H, 48K system w/Floppy backup ...... \$5995.00

### **Other Systems**

| 10 Megabyte Fixed Hard-disk systems begin at    | \$5295.00 |
|-------------------------------------------------|-----------|
| 120 Megabyte Fixed Hard-disk systems begin at   | \$7995.00 |
| Model-III* Floppy Controller w/installation kit |           |

Why become locked into a proprietary system from one manufacturer, when Micro Mainframe supports a total of 15 drive manufacturers. When a new drive becomes available, you need only to purchase that drive and controller to upgrade your system. The software and Host Adapter works with the new drive package, thus allowing minimum upgrade cost.

Call for the location of your nearest Micro Mainframe Dealer. Dealer inquiries invited.

Tired of squeaky chalk boards and dusty fingers when playing hangman? Replace those noisy chalk boards with a CRT and far-out computer sounds. Now you and your computer can enjoy each other's company playing Hang-80 on the privacy of your own cathode ray tube.

Hang-80 gets its sound from a utility called Super Sound by David G. Morr (May 1980, 80 Microcomputing). This utility is easy to use and, with a little imagination, makes great sounds.

### Sound

You need a small audio amplifier to hear the sound which comes out of the cassette output plug of your TRS-80 microcomputer.

Before you do any programming, answer your computer's memory size question with 32737 (16K machines). This allows Super Sound to be loaded into the top of RAM undisturbed.

Super Sound is found in lines 60–80. Line 60 sets the USR address. Line 70 reads and POKEs the data in line 80 into the top of RAM. Line 80 is the data for the Super Sound utility. Every time you see a USP(), a sound will be produced.

### The Program

With the exception of a gap here and there, you can Auto all the way through the program, making program typing a little easier. Furthermore, after you type Run and hit Enter, you can forget the Enter key because you won't need it during the game.

Here is how Hang-80 works: In line 100, variables A through Z are defined as integers. Lines 110 and 120 create the opening block letters that are assigned to A\$. Lines 130-200 create letters and sounds.

Lines 3110–3140 are data lines containing the instructions. The loop in line 240 reads the data so lines 260 and 270 can conveniently read and print the instructions with flying sounds.

From 610 we GOSUB 2000. This is where the computer picks the word for you to guess at. Then we return and GOSUB 5000.

### "You can count the words you enter yourself or let the computer count them for you."

Lines 5000-5070 simply set up the playing screen.

Program continued

Lines 630 and 640 put the spaces on the screen. Lines 660 through 780 process the entries and put the letters in the mystery word.

The first 29 data elements are the machine code numbers for Super Sound. The next 514 data elements are the words the computer picks from for the player to guess. Finally, there are the 14 lines of instruction. There is a total of 557 elements of data.

There is an alternative to typing 557 chunks of data. Leave the first 29 data elements alone. However, you can do what you want with the next 514.

You can use a different number of words as long as you make some number changes in lines 240 and 2050.

The number 543 in line 240 must be changed to account for the number of words you enter into the data lines. Simply add your number of words to 29 and enter that number in place of 543.

In line 2050 change the RND (514) to read RND (your number of words) after the change.

### Counting

You can count the words you enter yourself or let the computer count them for you. I found it easier to let the computer do the counting.

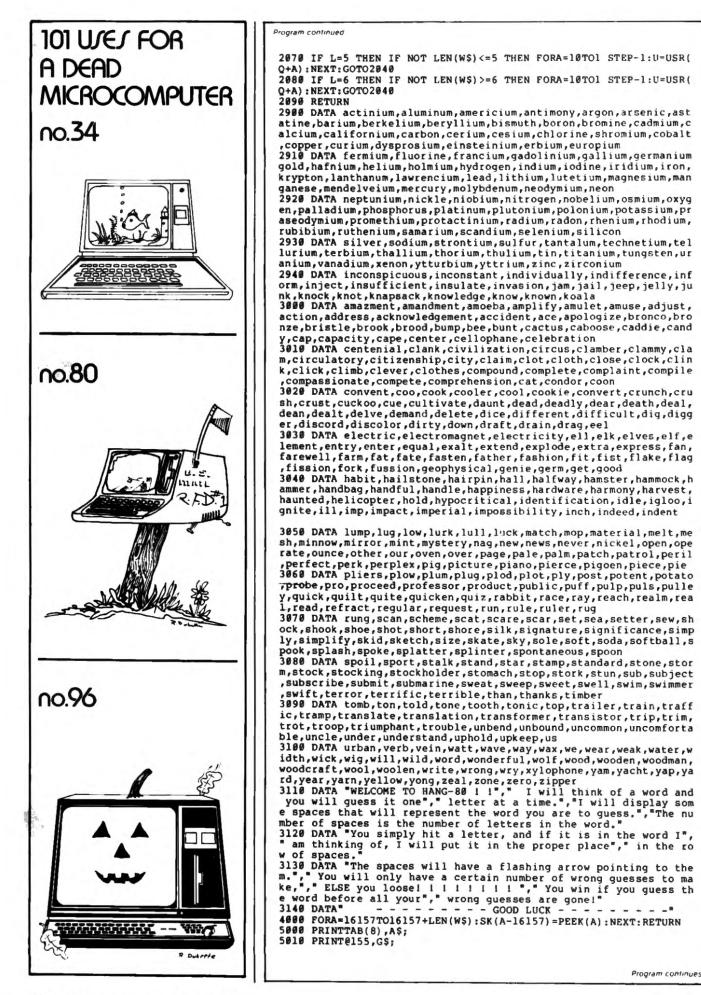

After entering the program, execute the following line: RESTORE:FOR A = 1 TO 29:READ D\$: NEXT A (enter). This gets you past the Super Sound so the next Read statement will read the first vocabulary word. Now execute the following line and remember to use Shift @ to freeze the display when necessary: FOR A = 1 TO 1000:READ D\$:PRINT A;D\$: NEXT A.

Whenever you see "Welcome to Hang-80" pop up, hit the Break key to get out of the loop. Now look at the last word printed; it has a number to its left. That number is the number of words you now have in the computer's vocabulary.

### How to Play

When Hang-80 is run, you must answer a few questions the computer will ask you. The playing screen will appear and you will have all the information you need to play the game. Printed at 797 you will see a row of spaces with a flashing arrow to the left of them. The spaces are actually a row of cursors. The number of the CHR\$(95)s in the row is the number of letters in the word you are to guess at. All you do is hit a letter and the computer will put it in the row of spaces if the letter you hit is contained in the word. Otherwise it is counted as a wrong guess. You lose when you don't have any wrong guesses left.

# APPARAT OFFERS More bytes per buck!

730 K/bytes of storage. Apparat has combined its Newdos/80 operating system and a dual-sided 80 track minifloppy drive to give you up to 733,440 bytes of storage in a single volume. Newdos/80 version 2.0 expands the capability of double density drives, so you'll have greater applications for your TRS-80<sup>®</sup> model I and III.

Drives plug directly into an expansion interface (requires installation of a double density controller) or the model III disk bus with our single volume cable so you can now have over 2 megabytes of storage on-line with standard mini-floppy diskettes. Each drive has up to 573 free grans, for a total of 1,719, on a maximum of three 80 track drives, which can be added to a TRS-80 model 1. Model III's can have up to 4 dual 80's on-line (almost 3 megabytes).

These drives can "read" standard 35 or 40 track diskettes using Newdos/80 version 2.0 which will allow skipping every other track.

Drives come complete with case, power supply and documentation. The drives are priced at only **\$515** (Cat.

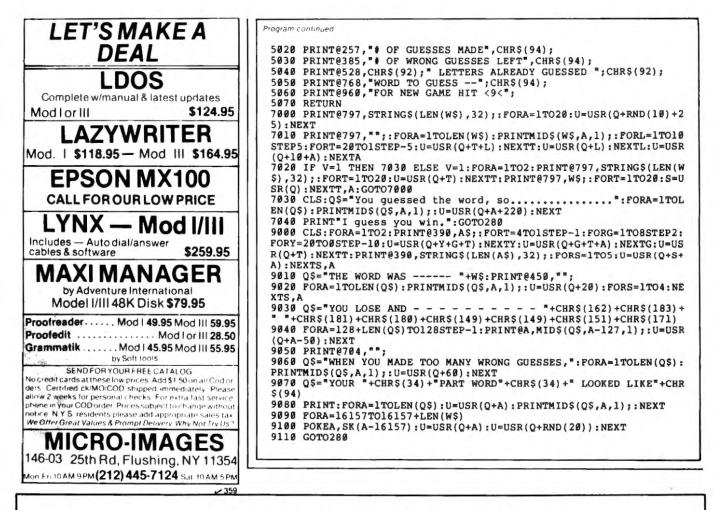

No. 1-705, specify I or III). Now, at 1424 bytes per buck, it just might be the answer to your storage problems. **Special – Two dual 80 track drives only \$999.**

Patches Plus for Level II Basic.

## A Tale of Two Drivers

John T. Blair 122 Dumont Ave. Norfolk, VA 23505

have developed two printer driver patches, one for Level II Basic, operating under either TRSDOS or Basic, the other for NEWDOS's EDTASM. The patches have the following features: They output a line feed after a carriage return (to enable printers requiring this feature), provide for an automatic form feed after a given number of lines and enable the user to output a topof-form from the keyboard. An additional feature, to be used with EDTASM, is a page header printed with the date and page number.

Hardware or software may be used to cause a line feed on a carriage return. Either solution will work equally well, but software is simpler and less expensive.

Program Listing 1 is a predriver (executed before ROM printer driver) for Level II Basic and TRSDOS or NEWDOS. This program is loaded into the upper end of memory and must be protected. To capture the printer driver, which is called from ROM by the various Level II and DOS print commands, change the address of the printer driver by modifying the printer Device Control Block (DCB). The DCB is located at 4025H-402CH, and the printer driver's Least Significant Byte (LSB) is at 4026H, the Most Significant Byte (MSB) is at 4027H. By altering the printer driver address in the DCB, program control is diverted to the predriver, lines 27-61. The address in the DCB is changed by the initialization section of the program. (Note: Readers not using

disk should change line 22 to: LD(40B2)HL. This automatically sets protected memory for disk users. The address of the jump instruction in line 38 must be changed from 402DH to 1A19H, the warm start for Level II Basic.)

ø

Pre-driver operation is quite simple: It checks the character to be printed. If it is not a carriage return, control is given back to Radio Shack's printer driver, located at 058DH. If the character is a carriage return, lines 42-45 output the line feed directly to the printer and increment the line counter. When the line counter indicates 54 lines have been printed, the predriver executes lines 53-58 to generate a form feed.

### Willful Form Feeds

The last feature resets the line-per-page counter, and outputs a form feed at will. The shift @ sign, a printable character with no meaning as a Basic command, is used for this purpose. After a listing has finished, the last page is usually almost filled. Enter LPRINT shift @ to reset the counters and topof-form and to get the page out of the printer. This keeps the printer's counters and the software counters in sync.

If your printer does not accept a form feed, 0CH, use the optional form feed routine shown in Program Listing 3. Those using Level II must protect memory on power up, then load the object program using the System call. After the program has loaded, enter a slash to execute the initialization that links the pre-driver to Basic.

Readers using disk should put this in the automatic boot file on disk. This will cause the line feed on the carriage return patch to be booted every time the DOS is booted. You may now use all DOS and Basic commands that send output to the printer.

#### Page Headers for EDTASM

Program Listing 2 is a modification of Apparat's NEWDOS Plus EDTASM. The program provides: a line feed on carriage return; a way of resetting the counts and giving a form feed; a

method to title and number a page; and inserts the date in the header.

This program will be added to the end of EDTASM. All references to the beginning of the text buffer must be changed to the new beginning of the buffer, the function of lines 350-600.

Generating a line feed after a carriage return is easiest. Since NEWDOS makes use of a ROM call to access the printer driver, we need only change the address of the printer driver by modifying the printer Device Control Block (DCB). This is done in the initialization section. The printer driver's address is altered and program control is diverted to the pre-driver, lines 610-1840. This section of the program checks the character to be printed to determine if it is a carriage return. If not, control is given back to ROM's printer driver located at 058DH. If the character to be printed is a carriage return, the pre-driver outputs the character: lines 850-910 output the carriage return directly to the printer. Lines 930-1040 output the line feed, increment the line counter and check to see if 54 lines have been printed. If not, the character to be printed (carriage return 0DH) is restored, and the predriver returns control to ED-TASM. When 54 lines have been printed, the pre-driver executes lines 1060-1150 to generate a form feed.

There are two methods of generating a form feed. The first has the printer accept the ASCII form feed command, a 0CH. The pre-driver outputs a 0CH directly to the printer, then resets the line counter, increments the page counter and calls the routine to print the page headers. The second method is to call the form feed routine from ROM, which outputs line feeds by replacing lines 1090-1150 with the alternate form feed routine (Program Listing 3).

Printing the page header information is more complex (lines 1380-1840). First, the header message is printed by the OUTSTR subroutine, then the page number is printed. The OUTSTR routine requires that the HL register contain the ad-
