IN A NUT SHELL

OS–9 Level 2 Realeased!

We have been telling you all to withhold judgement on the CoCo 3, and having just seen the OS 9 Level 2 package demonstrated by Blaxland Computer Services at the meet we held at Ringwood in Melbourne, I can say with all certainty that it is going to blow your mind!!

What we have here is an operating system which is fully capable of running EIGHT programs at once with NO speed depreciation!

We sat in awe as Jerome Siappy from Blaxland ran a demo which supplied readouts on 4 windows on the one screen, whilst it also operated 4 other windows off screen!!

It means that you will be able to backup disks whilst writing to a wordprocessor, whilst operating a terminal program on line, whilst playing a game, whilst printing a file... AND MORE!!

If this isn't the biggest news in home computing, I'll go back to Melbourne!

CoCoTex 3.1

To cap a top night, Ron Wright showed version 3.1 of his CoCoTex program which provides access to Videotex services such as Viatel, Telgraf and Prestel.

The new version reflects Ron's work in getting to understand how the GIME chip operates.

He has been able to speed up the operation of the CoCo 3 on Viatel to the point where it is faster than our dedicated Sony Terminal! There are additional features too which make this program, which is available as a free upgrade to CoCoTex 3 owners, a most valuable possession!

Competitions

Don't forget the programming competitions are in full swing. The Tandy prize looks like being something really worth the effort.

For those of you who do not know about this competition, Tandy will purchase from the authors, the best CoCo 3 & the best CoCo 2 programs submitted to us by 31st July, 1987, for resale at Christmas this year.

The prize looks like being in the $1000 region - not bad for doing something you want to do anyhow!

Programs & Articles Needed!

Speaking of programs, we need some urgently! If you have some work that you've been preparing for us, we'd really appreciate getting it real soon! Feeding two mags is a bit different to feeding one!

Conf '87

We're still fiddling with Conf '87, but should have the date set by next month, and hopefully the venue too! It is certain however, that the conference will be in Sydney and that it will be in either the July holidays or in August, as previously stated. If you have any reaction to these dates, good or bad, please phone me!

Alex will be back next month with "In a Nut Shell". We figured this month, as I got to see OS 9 Level 2, that I might as well tell you all about it!

A handy Business Utility

BOOK LABEL PRINTER

16K ECB
BUSINESS

by Wim De Puit

BOOK LABEL PRINTER WAS written to print lots of sticky address labels to be used as names for my children's school books.

Of course it can be also used to print just about anything you want on a standard address label.

I have written it for a Gemini printer running at 4800 baud, but that can be changed quite easily.

The printer codes are in the first few lines; Line 20 sets the baud rate, DW$ is the code for double width, RE$ resets the printer, PI$ is for pica, EL$ is elite and CO$ is the compressed type code.

Put the codes for your printer in, and you're away!!

The first line of the label is always printed as bold as possible, with the remaining lines fitted in without going to double width. Long lines are changed to a smaller font to make them fit.

You can print any line centered, flush left or flush right as you choose.

My kids reckon they're the bees knees with printed lables on their books! I hope you can get some use out of it too!

DOGFIGHT

32K ECB + Joysticks **GAME** **by Craig Stewart**

DOGFIGHT WAS ONE of the first Machine Language programs I created. It is a two player game in control of two bi-planes. The idea is to shoot each other out of the sky.

Being hit five times means your bi-plane goes out of control.

The bi-plane controls are elementary: pulling your joystick back will move your plane in an upward direction while pushing your joystick forward will move your plane downwards.

Note: If you want to save this program as a machine language file, type in DEL40 and type in RUN. When the 'OK' prompt comes back, type in:

```
(C)SAVEM"DOGFIGHT",24576,26837
,24576
```

Here's something to shoot for

STARS

16K ECB
GRAPHICS

by Craig Stewart

STARS IS A SMALL graphics experiment that moves 200 odd stars on four different perspective planes, giving the illusion of moving through space.

About the program: once run it automatically self-executes. If you want to save the machine language program to tape or disk, replace line 40 with:

```
40 INPUT"SAVE TO TAPE OR DISK
  (T/D)";A$
41 IF A$="T"THEN 43
42 SAVEM"STARS",14848
  ,15661,14848:END
43 CSAVEM"STARS",14848
  ,15661,14848:END
```

BUILDING SPEAKER ENCLOSURES

16K/16K MC-10 | UTILITY | by Les Thurbon

I HAVE RE-WRITTEN this program mainly to operate on the Coco but will also run on the MC-10 with some alterations and they are...

For MC-10 owners, delete lines 50, 60, 70, 80, 90, and all of line 40 except 'DIM M(200)'.

Also, delete all POKE'S throughout the program and then replace all 'PRINT#-2,' statments to 'LPRINT' statements. You will also need an 80 column printer for graphs and printouts.

Coco owners who do not have or use a disk drive should change the POKE359,57 in line 60 to POKE359,13.

I found this program in the back of Tandy's book "Building Speaker Enclosures, by David Weems." (Cat. No. 62-2309)

Unless you are an Audio Engineer you WILL need a this book to go with this program.

I think the program was designed for the model one or two, however I'm not really sure and if anyone would like to upgrade the program, with on screen graphics be my guest. I'm sure Tandy will have no objection either.

The program is fully prompted and should operate on most 80 column printers as well as the screen.

The program calculates specifications for Drivers, Closed Box Speakers and Vented Box Speakers for Stereo HIFI, P.A. and general musical applications.

There is little more that I can say here except read the above mentioned book, ALL of it, and GOOD LUCK.

HALLELUJAH CHORUS

CoCo 1/2 + Orchestra–90CC MUSIC

by Harvey Smith

PRESENTING ONE OF THE many music competition entrants. The title of this fine work of art is called the "Halleluyah Chorus" and is just great!

This work of art can be found on the end of the CoCoOz Tape this month.

The Listing:

```

SPEAKER / HEADPHONE SELECTOR

A recent bout of the flu gave me the opportunuity to try out an idea that I had been thinking about for quite some time.

Earlier this year, I had an Audio/Video Amp fitted to my CoCo for use with an BMC monitor and although I don't play a large number of games, I thought that the Audio one was a good choice. I did notice on a few occasions that the little speaker left a lot to be desired when, say an adventure like Dungeons of Daggorath needs the sound as much as the picture. In this game probably more so because it indicates the impending arrival of a nasty that can KILL with one swift blow. I thus found out that the beating heart drowned out all other sounds.

With that in mind I set about to make an adaptor to take the fitting of standard stereo headphones (keeping in mind that I am not an electronics expert).

The adaptations are as follows

First, disconnect both leads going to the speaker taking one to the outside connector of a two position switch. Take the other to a female stereo plug socket.

Now add another wire to the first section disconnected from the speaker and connect it to the centre position of the switch.

Next, connect the remaining speaker terminal up to the second Amp wire previously disconnected and finally connect the remaining switch terminal to the second connector of the headphones socket.

Now you have an adaptor to select between sound from the inbuilt speaker or headphones.

For fear of drilling humungous holes in the CoCo's case, I encased the entire setup in one of those little tin boxes that sits not too untidily nearby.

Like I said, I'm no electronics expert, so if any of this procedure is the long way round, I would like to hear about it.

(The device really adds realism to the shoot em up type arcade games where you can now feel like you're actually in the cockpit).

SCREEN DUMPS with PLOTTERS

by George McLintock

FOR SOME TIME now I have been inclined towards the purchase of a colour printer, but put off by the cost of them for what you get. I recently spent some time experimenting with screen dumps to the CGP-115, and convinced myself that plotters actually produce a superior product. So I went out and purchased an A4 sized plotter, a Pixy 3. This has been available at a 'sell out' price for some time and appears to be excellent value. The only real problem with the CGP is its half size paper width.

I have developed two programs which take different approaches to screen dumps and both include a range of options to obtain maximum flexibility from the capabilities of the plotter.

Colours with a Plotter Single Lines

The BASIC source of colour is the ink in the pen, and which pen you use. The CGP has four colours; black, red, blue and green. The Pixy has these four colours plus brown, orange, rose and purple. In addition to these basic pen colours you can create others with overprinting, eg red over blue to get mauve.

As well as these standard colours, plotters also provide an option of offset overprinting. For example, the following are different ways of producing a mauved coloured line, all of which a different visual effect.

The initial line is (0,0)-(50,0) ie from the point 0,0 to the point 50,0.

The normal mauve is (0,0)-(50,0) in blue followed by (0,0)-(50,0) in red.

- blue over red gives a slightly different colour. A single offset mauve is (0,0)-(50,0) followed by (0,1)-(50,1) in red

Other variations are:
(0,0)-(50,0) in blue,
(0,1)-(50,1) in red,
(0,2)-(50,2) in blue.
... which is different to:
(0,0)-(50,0) in red,
(0,1)-(50,1) in blue,
(0,2)-(50,2) in red.

With its smaller step size the Pixy provides other effects because each line drawn is actually wider than its step size, so that its single offset line is actually a mixture of overprinting and offset printing, eg (0,0)-(0,50) in blue followed by (0,1)-(50,1) in red is different to (0,0)-(0,50) in blue followed by (0,2)-(50,2) in red.

There is no noticable gap between these last two lines, just no overprinting which gives a different visual effect.

Colour Blocks

With a plotter, a single block of colour on the screen can be transformed to any mixture of colours in the dump that you might think of.

For example, the following is an outline of the various ways that a single square of colour on the screen can be dumped to a plotter. The colour block on the screen is produced by LINE (0,0)-(50,50),,PSET,BF.

The simple dump is to draw a series of lines across the page to fill this area using a single pen, eg if the colour is red, then by drawing the following lines (0,0)-(50,0) in red followed by (0,1)-(50,1) in red followed by (0,2)-(50,2) in red, up to line 50.

A lighter red can be produced by skipping alternative lines, ie by only drawing every second line in the sequence above, eg (0,0)-(50,0) in red followed by (0,2)-(50,2) in red up to line 50.

To produce mauve by this procedure you then repeat these same lines by using the blue pen.

Offset overprinting allows for a greater variations in colours. For example a single offset mauve is achieved with the following lines (0,0)-(50,0) in red followed by (0,1)-(50,1) in blue followed by (0,2)-(50,2) in red followed by (0,3)-(50,3) in blue with the sequence repeated up till line 50.

Again skipping alternative lines will give a different effect. To change the references a bit, line 0 is red, line 1 is white (or paper colour), line 2 is blue, line 3 is white, line 4 is red, etc up till line 50.

With this approach, any combination of colours becomes possible, with any number of skips between each line.

Stripes can be produced in various widths, ie line 0 to 3 in red, lines 4 to 7 as white, line 8 to 11 as red (or blue).

With additional program control (as with Colour-Dump), it is possible to treat red on the screen in the top left corner different to red in the top right corner.

Across or Down or Both

The other option with plotters is that you can draw the lines across the page or down the page. For example the discussion above was based on drawing lines across the page. However the simple dump (first example) will work just as well by drawing lines down the page instead of across it, ie to use (0,0)-(0,50) in red followed by (1,0)-(1,50) in red followed by (2,0)-(2,50) in red up till line 50.

All of the variations for across the page have a similar effect if drawn on the page, but the visual effect of each option is different.

The next option of course is to draw the lines in both directions. With solid colours this produces a similar effect to overprinting (but different). But with white (skipped lines) you can produce another range of patterns, eg stripes become checks and tartan effects can be obtained.

Obtaining these Effects

The screen dumps submitted obtain these effects by repeating the same dump several times with different coloured pens and different skip factors (and or offsets).

There are two skip factors to be specified. The number of lines to skip before drawing any lines, and the number of lines to skip between each line drawn.

For example, alternating red and blue lines are obtained by drawing the first dump with the red pen, skip zero at the start and skip one between each line drawn. The second dump is with the blue pen, skip one at the start and skip one between each line drawn.

Stripes are obtained in a similar fashion. The example used above can be obtained with three repeats. The first skips zero at the start and skip 6 between each line drawn. The second skips one at the start and 6 between, while the third is skip 2 at the start and 6 between.

Alternating red and blue stripes require 6 repeats the first three with the red pen, skip zero at start and 12 between, one at start and 12 between and skip 2 at start and 12 between, the next three repeats are with the blue pen, skip 6 at start and 12 between, skip 7 at start and 12 between and 8 at start and 12 between.

For single lines, LINE DUMP also provides an additional option to move the whole dump on the paper between each repeat. This is called an off-set. If the second dump is off-set one or two dots from the previous one, then you obtain the effects described for single lines.

The programs are written to allow you to set it up for any number of repeats before the dump actualy starts. When the setup is complete, the plotter will work away to the end without any further action on your part.

Of the options available; size, rotation, pmode, position etc are set only once for the whole dump. The other options of pen colour, screen colour (PMODE 3), direction of lines, skip factors etc are set seperately for each repeat of the dump. Other options are also available which are specific to each program.

Note that the first repeat is numbered zero, and zero should be entered at the menu for a single pen conventional dump.

With this approach, virtually any style of screen dump can be obtained, and you can experiment with any combination of options that might occur to you.

Aspects Common to both Programs Menu

Both programs contain a number is options which are set up through a menu arrangement. The programs contain instructions on how to use the menu.

For all menus the left arrow key will provide more information about each option (a form of help key). The right arrow key allows you to access other options where these might apply.

The menus are set up for conventional data entry, and when moving down it, the cursor will skip over some cells which are not normally required. To access these options you need to move back to them with the up arrow key.

The basic setup arrangement is designed mainly to experiment with the different options on different screen pictures. It has a number of weakinesses when you come to more regular useage of the program for standard screen dumps.

I have added a couple of features to overcome the more obvious problems, but a better and neater menu setup arrangement could be devised. The major problem (which is common with these sort of exercises), is that with so much of the logic (and code) already in existance, a major change can require a complete re-write of the whole thing.

While I may get round to doing this eventually, I prefer to use it as it is for awhile to develop a better understanding of what I actually want to do. The existing version is the result of two major revisions without a complete re-write (ie re-using existing code where possible), and the code as it now exists certainly reflects this. A complete re-write is required for the next major revision.

The nature of the problem is indicated by the setup of predetermined colour/patterns (discussed later). When you actually set up some examples (as done for Colour Dump), it suggests that you should set up the patterns independantly of the pen colour. But then how far do you go, the same logic would apply to the skip factors within a pattern. Therefore, it may be preferable to re-structure the whole approach to how to specify the repeats. At this stage I prefer to wait and see, and use it as it is.

A possibility of couse is that someone else might like the programs enough the re-write this aspect themselves - send me a copy. I have included a description of the parameters actually required for the dumps. Providing these are set before you enter the dump, any setup procedure will work.

Standard Dumps

The menu arrangement can become tediuos if all you want is a normal standard screen dump. I have therefore included an option with each program to allow this (for the CGP plotter). The parameters required are set up in lines 94 to 96 for Line Dump and lines 83 to 85 for Colour Dump.

You can re-define these if you wish by changing these lines. Or you can add other standard dumps by following the same general logic.

Pre-defined Patterns

After experimenting for a while, you may find that you like certain colour/pattern combinations. If these require a number of repeats to obtain, it can become tedious to have to re-entr them everytime you want that combination in a dump.

I have included a facility with Colour Dump which allows you to pre-define up to 26 colour/patterns which can be

generated automatically by using letters 'A' to 'Z' for the pen colour in the menu. The use of this facility is described in the section specific tro Colour Dump.

A similar procedure could be applied to Line Dump, but I have not attempted it at this stage. Line Dump uses more memory, and its use of memory would have to be tidied up a bit to fit this procedure in.

Save and Restore the Dump Parameters

I feel it would be a desireable option to be able to save and restore the dump parameters for a particular picture, particularly for the more complicated ones. If you try a few different effects, and get one that you like, it would certainly be convenient to be able to reuse those parameters without having to re-enter them.

This option is not included with either program. As a partial solution, I have included an option to print out the parameter values used at the end of the dump.

The values printed could be saved, and re-loaded into another version of the program which by-passed the menu setup completely and re-loaded these values and goes directly to the dump.

Memory Requirements

As set up, both programs require a 32K machine, but most of this space is required for the menu and setup operations. The actual screen dumps themselves are quite small and will fit into a 16K machine if the menu is deleted and the parameters required setup as part of the basic code.

I have included a list of the parameters and program line numbers required for each dump.

Both programs will work without modification with either disk or tape systems.

Machine-Language Routines

Both programs contain machine language (ML) routines. The programs are set up to include the ML routines at the end of the basic program following the procedure described in 'Charlies Machine', Australian Rainbow, Jan 83, and as used for Art Liner.

When you run the program the first time, the ML code will be incorporated within the basic program. You can (C)SAVE this version and use it in this format, or simply RUN the program again to get the dumps.

With Line Dump, the first time you run it after incorporting the ML routine, you may get an ?UL error in line 94. If you do, simply RUN it again and the error should go away.

Before saving it you should change the first line to GOTO the line number in line 650, and delete lines 490 and 650. The program was set up in this way so that it will continue to work OK if you RUN the version with the DATA statements in it a number of times without re-loading the program.

The machine code is relocatable and can be POKE'd into any other area of memory you might prefer. If you do locate it elsewhere, remember to change the value to 'M' in the program to correspond to the start of the routine.

Size of Dumps and Rotation

This depends on your plotter. The Pixy 3 has 2450 x 1800 dot positions (other A4 plotters would be similar). This gives a maximum of 9 times the size of the screen with normal rotation, and six times the size if rotated 90 degrees. This appears sufficient to not require any special treatement for size and rotation.

The only special option for the Pixy is to allow the dump to be positioned anywhere on the pge. The default position is the top left corner, but this can be altered to anywhere on the page.

The CGP provides only 480 dots across the page and 999 down it in any one quadrant. These screen dumps position it in the second quadrant (+x,-y with possible extension to Y+), and some special treatement of size is provided. (If comparingdot widths, the step size of the CGP is twice that of the pixy.)

A single size dump is drawn with normal rotation in the center of the page, although this can be altered in the menu. A double sized dump is drawn with 90 degree rotation, again in the center of the page (which again can be altered).

Options are also provided for 3x and 4x sizes for screens dumps, with either rotation (compared with the Pixy, these are equilivant to 6x and 8x size).

With these sizes, not all the screen will fit on the paper. But there are occasions when the whole screen is not required, anyway, eg Cooch, CoCo Feb/Mar 86 will fit on the paper at 3x size and will fit a 4x size if either Pew or the caption is excluded.

The menu set-up provides for these options and allows for the area of the screen to be dumped to be selected. Use the right arrow at the size option to access this facility.

Plotter Controls and Other Plotters

The programs are organised to be relatively independant of the type of plotter being used. The start and end points for each line drawn is calculated with reference to the CoCo screen and are only translated to plotter reference points at the time that the commands are actually sent to the plotter.

The code for doing this is the same in both programs (line 9 to 13 in Colour Dump, and lines 15 to 18 in line dump). The code invloved is effectively a single line of basic code for each plotter type, so that it should be relatively easy to convert these programs to work with any other plotter.

A possible complication is the fixed value reference point used to reverse the mirror effect that occurs with the Pixy co-ordinate system, and with the 90 degree rotation on the CGP. However these are specific to the particular plotter and have to be allowed for anyway.

The setting up of the fixed reference values is part of the dump size routines and should be relatively easy to find in the code, as should be the selection of the pen colour.

TOAD in the HOLE

16K ECB
GAME

by John Day

TOAD IN THE HOLE is the first program I wrote in ECB, soon after I got the CoCo. It is a typically Queensland game, if the media are anything to go by, which they are probably not. Anyway toads and Queensland seem to go together, so here it is.

TOAD IN THE HOLE is a game for 4 players. All can play at the same time and the aim is to get your frog out of the hole. Actually, the frog hops any which way, all you do is tap the spacebar to say, "Hop, frog!". Maybe you'll be luck if the frog gets out of the hole at all!

Here it is, then, the latest from the warped mind of the mad Sailor from the South. Who? John Day, ninny, who else?

The Listing:

```

COLOUR DUMP

32K ECB + PLOTTER GRAPHICS UTILITY

by George McLintock

COLOUR DUMP WORKS by scanning across (or down) the screen, one line at a time, and drawing lines across (or down) the page on the plotter as required by the size and options selected. Effectively this is the normal approach to screen dumps.

It is designed for a PMODE 3 screen, but includes a ML routine to convert a PMODE 4 screen to a PMODE 3 one, so that it can be used for a PMODE 4 screen as well.

ML routines are used to return one of the screen co-ordinates to the Basic program for the dump. When drawing lines across the page, the Basic program keeps track of the Y co-ordinate (line number), and the ML routine returns the move to and draw to, X co-ordinate values (column number) for all the lines to be drawn across that line.

The role of the X and Y co-ordinates are reversed when drawing lines down the page. This is achieved by the values assigned to P and P1 in line 18. The values from the ML routine are returned to Basic in page 5 of the graphic screen.

When the dump is scaled up, additional lines are drawn as required to fill in the spaces between each line generated from the screen. The skip factors apply to the lines as drawn on the paper, not to the lines generated from the screen.

This program has been designed and coded specifically to allow it to work equally as well using the large graphic screen of ARTLINER. By changing a few parameters in it, the program can be used to dump that large screen directly.

This also means it should be relatively easy to convert it to work with the new CoCo 3 screens.

PARAMETERS REQUIRED FOR THE SCREEN

The Basic lines required for the actual screen dump are 1 to 26 and 75 to 80. The ML routines are also required. If the setup code is excluded, then the following parameter values should be set in Basic code following line 80, and the program should then branch to line 16.

Include a SCREEN statement if you want to see the graphic screen during the dump.

RP is number of repeats (starting from zero)
B(RP,8) must be set with a DIM statement, and the following 9 parameters set for each repeat
F is the counter used in the FOR .. NEXT loop for the dump

B(F,0) = screen colour to be used
B(F,1) = Pen colour
B(F,2) = Direction for lines
  1 for across
  2 for down
B(F,3) = Skip at start
B(F,4) = Skip between lines
B(F,5) = Row start (0-190)
B(F,6) = Row end (1-191)
B(F,7) = Column start (0-254)
B(F,8) = Column end (1-255)

Other parameters required are
PT = Plotter type
  0 CGP
  1 Pixy
K = Size of dump
RT = Rotation
  0 for normal
  1 for rotated 90 degrees

Q and R are the constants required to position the dump in the required position on the page. Values required can be derived from lines 12/13, or from the size part of the set-up routine where these values are set.

To convert a PMODE 4 screen to PMODE 3, EXEC MC

To initialise the routine for disk or tape EXEC M+256.

OTHER OPTIONS

The program has an option to allow you to reproduce the same colour on the screen in a number of different colours on the paper. For example, red in the top left corner can be dumped in red to the plotter, while the same colour, red, in the top right corner of the screen can be made green on the paper. With any number of variations of the same idea.

While this may seem a little complicated, there are occasions when being limited to four colours on the screen can be restrictive, particularly when the plotter can produce a far greater range of colours and patterns in the hard copy dump.

For example, with a scene, you can have one style of blue for the sky, another for water, and possibly a third for mountains, or the colour of a house or car.

Another variation might be for different coloured clothing on people. Two female figures might have the same coloured dress on the screen, but you could dump one with a red and white striped dress, and the other with a tartan skirt and a blouse with stripes the other way.

While this sort of variation requires another level of planning and set-up for the dump, it does provide a significant extension to the graphic capabilities of the CoCo with plotter. Some very elaborate coloured pictures on paper can be produced with this combination.

This option is obtained through parameters 5 to 8. Each repeat of the dump can be restricted to a specific area of the screen. The area to be dumped is specified by the row and column start and stop positions. Only lines within this range are drawn. The default is the full screen.

The setup routine also contains an option which allows you to set these values directly with reference to the actual graphic screen. If you use this option, the values selected are entered directly in to the repeat array for that repeat.

You can of course use this option to find all the reference points you want at the same time, and then key the values in directly.

This option operates completely independently of the

skip factors. The skip factors will always apply in a constant way from the top (or side) of the screen.

To reduce pen changes, the normal setup routine sorts the repeat array into ascending pen number sequence. If you want the lines drawn in a special sequence, then the menu provides an option to suppress this sort.

The sort used is Shell-Metzner, which is very compact (9 lines of code - 28 to 36), and one of the fastest Basic sorts available.

PRE-DEFINED PATTERNS

COLOUR DUMP includes a facility to pre-define a number of colour/patterns which can be used by entering A to Z instead of the normal pen colour. These are defined in lines 325 to 361 and can be modified when desired.

Patterns pre-defined in the listing provide examples of what can be produced. They are:

A to D correspond to pens 0 to 3 and produce a square pattern for each pen colour
: the pattern is draw lines across the page with skip zero at start and skip 4 between lines
: then draw lines down the page with the same skip factors and pen colours

E produces an off set colour mix drawing lines across the page
: is pen 1 skip zero at start and one between
: and pen 2, skip one at start and one between

F as for E but draws lines down page

G as for E, with pens 2 and 4

H as for G, but down page

I as for E, with pens 3 and 4

J as for I, but down page.

K draws a narrow stripe pattern across the page
: stripes are 3 lines deep, skip 3 between
: using pen 1

L as for I, but down page.

M draws a wider stripe pattern
: 9 lines deep, skip 9
: using pen 1

N as for M, but down page.

O draws narrow alternating stripes across page
: stripes are 3 deep with pen 1, skip 3
: then 3 deep with pen 2, skip 3

P as for O, but down page

Q draws alternating wide stripes across page
- uses pens 1 and 2 (as for O) but stripes 9 lines deep.

R as for Q, but down page

S Provides a 3 colour narrow striped pattern
: with pens 1,2 and 3

T as for S, but down page

U combines K & L

V combines M & N

W combines O & P

X combines Q & R

Y combines S & T

Z duplicates A.

These patterns are defined by the strings in A$(26), where A$(0) is the number of patterns defined (must be a string eg "26") A$(1) corresponds to A, and A$(26) to Z etc

Within each string (using A$(1) as an example)

- the first 2 characters specify how many repeats are required for the definition
: eg 02 for 2 repeats required

- For each repeat, you then require 6 characters in the string which are used to define the parameters which may change for each repeat

Within each group

The first character is the pen colour
eg 0 in position 3 and position 9

The second character is the direction of paint
eg 1 in position 4 (for across) and 2 in position 10 (for down)

The third and fourth character is the skip at start value
eg 00 in position (5 & 6) and in (11 & 12)

The fifth and sixth character is the skip between lines value
eg 04 in position (7 & 8) and in (13 & 14)

The intention was to generate these definitions by typing in the list of numbers required to define the patterns. But typing long lists of repetitive numbers is a pain, while string manipulation in basic can be fun.

Hence some definitions have been set up using small bits of Basic code. To see what is in the strings, break the program and print them

The repeat array generated from the menu is set up in A. The repeat array for the dump is in B. The routine to set up the predefined patterns generates B from A.

LINEDUMP

(Screen Dump by following lines)

This program works by following lines on the screen and then drawing the equivalent line on the plotter. It is a destructive dump in that it resets the points as it goes.

To allow the dump to be repeated, the program uses PCLEAR 8, and saves pages 1-4 in pages 5-8 before it starts, and PCOPY's them back for each repeat.

It is designed for a PMODE 4 screen, but includes a ML routine to convert a single colour in a PMODE 3 screen to a PMODE 4 one that can be dumped. This occurs separately for each repeat so that the program can be used to dump a complete PMODE 3 screen if desired. (Requires 4 repeats, one for each colour)

The ML routines used to find the start of the next line to be drawn requires the bits defining these to be on.

So that it will not work directly with an inverse screen, ie pictures drawn using COLOUR 0,1 or 0,5. It does, however, contain another ML routine which will convert these screens to the format required.

If you are not sure of the COLOUR used, a PEEK of the background colour should equal 0. If it is 255 then the screen is inverse. The first graphic byte (Hex E00 for disk, or Hex 600 for tape) is normally the background colour.

If you try to dump an inverse screen, the program will draw one dot at a time, starting from the top left corner of the screen.

The dump itself is coded mainly in Basic, the ML routines are used only to find the start of the next line to be drawn, or the start of the next block to be painted.

This particular operation is painfully slow if coded in Basic, and is the main reason why screen dumps coded entirely in Basic are so slow.

PARAMETERS REQUIRED FOR THE SCREEN DUMP

The Basic lines required for the actual screen dump are 2 to 57, 85 to 91, and 210 to 219. The ML routines are of course required. If the setup code is excluded, then the following parameter values should be set in Basic code following line 91, and the program should branch to line 213. (The picture to be dumped must be copied to pages 5 to 8 before branching to line 213.)

Include a SCREEN statement if you want to see the graphic screen during the dump, and watch the progress of it to estimate how much longer it might take. Remember you must set the value of F to suit.

RP is the number of repeats (starting from zero)

RC(RP,6) must be set with a DIM statement, and the following 7 parameters set for each repeat.

RX is this repeat number and is zero at the start.

RC(RX,0) = offset from previous dump
RC(RX,1) = pen colour
RC(RX,2) = switch to control the operations performed
0 for both paint and draw
1 for paint only (no draw)
2 for draw only (no paint)
Painted areas are still drawn (is equivalent to no paint option)
RC(RX,3) = direction of lines in paint
0 Don't use the paint option
1 draw lines across the page
2 draw lines down the page
RC(RX,4) = skip at start (for paints)
RC(RX,5) = skip between lines (for paints)
RC(RX,6) = if PMODE 3 this is the colour dumped for this repeat, plus one.

0 if PMODE 4 or
1 plus the PMODE 3 colour number (0-3 + 1)

Other parameters required are

F value returned by PPOINT when the dot is on
1 for SCREEN 1,0
5 for SCREEN 1,1
PT plotter type (as before)
K size of dump (as before)
RT rotation (as before)
FP option to draw single dots or not
0 for no - non-zero for yes
PX preferred direction to start searching for the continuation of a line
0 for across or non-zero for down
Q and R are the constants to position the dump on the paper. They operate as
for COLOUR DUMP.

To invert an inverse screen EXEC MI
To convert a PMODE 3 screen, POKE the PMODE 3 colour (0-3) to be dumped into MP and EXEC MC.

PROGRAM OPERATION

The basic operation of this program revolves around its line search procedures. A ML routine is used to find the start of the next line to be drawn, or colour block to be painted, if painting.

The ML search starts at the top left corner of the screen, and scans across each line. It moves down the screen, line by line, until it finds a starting point. The X,Y co-ordinates of the start of the graphic screen byte that contains this starting point are then returned to the Basic program, which performs the rest of the dump.

The Basic program then finds the actual bit co-ordinate to start from, and then enters its line draw or paint cycle.

The line draw routine will continue to draw a line on the paper for as far as it can without lifting the plotter pen. It resets all points as it goes, so that each point is only drawn once

From its initial starting point, the program searches around this point until it finds an adjoining bit that is also on. It will then follow this direction, in a straight line, until the next bit in that direction is not on.

At this stage, it draws that line on the paper and returns to its search routine around this last point. It will continue this cycle until it reaches a point which has no adjoining bit on, when it will return to the ML routine to find the next new starting point.

The sequence in which the program searches around each end point for a new line to follow is determined by lines 5 to 8 of the program. The basic sequence (in degrees) is 90, 180, 270, 0, 135, 225, 315, and 45.

Without the paint option, the sequence in which this search occurs can have a significant impact on the final appearance of some dumps. The paint option overcomes most of the earlier problems I had with this aspect.

The only option still in the program is to start the search with either 90 then 180, or with 180 and then 90. Again with the paint option, this is not as significant as I thought it might be, but I've left it in. The setup routine sets this so that the first search is in the opposite direction to the paint direction.

PAINT OPTION

The program without the paint option, will work quite well with smaller 'sized dumps. But any larger sized dumps which includes an area of solid colour on the screen may require this option for an acceptable result.

The problem can be indicated by seeing what happens if you dump a solid square of colour scaled up by 9. The program will work around this block, from the outside in, and draw corresponding lines on the paper.

But the lines on the page will be 9 dots apart, which does not give the appearance of a solid block of colour.

If the dump is not scaled up then this doesn't matter, because the lines on the paper overlap anyway to give the appearance of a solid block of colour.

When used, the paint opteration is performed before the line draw. The ML search routine is extended to search for a minimum block of 4 bits on, as two adjoining rows and two adjoining columns.

When painting across the page, the program finds the start of the first line in the block, and follows it across to its end, in a straight line. It then draws this line, plus as many additional lines below it as required to fill the gap between this line and the next line from the screen. (Allowing for skip factors as it goes)

It then returns to the starting point of this line and searches for the starting point of the line below it. When it finds that point it then repeats the operation for the next line.

This is repeated until the colour block is painted out. The program then returns to the ML routine to find the start of the next block.

When all colour blocks are painted out, the program resets the ML routine for normal line search, and starts its normal line draw routine.

When painting, the skip factors apply independently to each colour block (They are reset at the start of each block) and determine which lines are actually drawn on the paper.

The same general procedure is applied when painting down the page, and the same code is used for both directions. The different dirctions are obtained by the value of X1 and Y1 being equal to zero or one.

When painting down the page, the program may not perform as expected. The initial ML search routine is designed for across the page. The equivalent search for down the page is rather complicated and has not been incorporated here.

The effects produced may be different for mixed colour paints, but can provide interesting variations.

The paint option will be applied to all areas on the screen where there are 4 adjoining bits on in a square. With some pictures this can occur in places which you might not consider to be solid blocks of colour, and you might think the program is not working properly. It does work, just give it time.

COLOUR OPTIONS

Colour options for this dump are obtained by using similar procedures as for COLOUR DUMP. It includes an option to have the repeat do the paint only, without following lines. With this combination you can use different skip factors to mix colours in the painted areas, while having a single colour for non-painted areas.

With a PMODE 3 screen, you can dump each colour as a separate repeat and get a normal 4 colour dump to correspond with the screen colours. Or mix colours with any particular PMODE 3 colour.

The additional colour option involves the offset. This moves the whole dump a number of dot positions for that repeat. So that you can obtain an offset overprinting for single lines as well as for colour blocks. eg do the first dump in blue and the second in red, offset one, to get an offset mauve for all single lines.

Skip zero at start, and one between each line drawn for both repeats to get the same effect for colour blocks.

Note that the offset also moves the colour blocks, so that an offset of one effectively adds one to the start skip specified for that repeat, relative to the original dump position on the paper.

OTHER OPTIONS

The paint option can leave single dots on the screen. The normal operation of this program is not to draw single dots. However, if you want to draw them, this option will do so.

CHECKSUMS FOR ML ROUTINES

32K ECB
UTILITY

by George McLintock

ONE OF THE major problems with magazine articles containing ML routines as DATA statements within a Basic program is the lack of checksums to assist those who actually type them in from the listing.

I have recently typed in the CGP-115 screen dump from the June CoCo, and feel that it is an extreme example of the problem. The ML routine is 766 bytes long, around 1500 Hex characters to be typed in, and not a single checksum to guard against typing errors. If it doesn't work, what do you do next?

Another problem with this particular program is that you might also notice that the ML entry points set by the DEFUSR's in line 20 of listing 1, are not contained within the addresses in line 2 of listing 2 which POKE the ML code into memory.

Your program is still not working, what do you check next?

I have submitted a number of programs which contain ML routines as DATA statements in Basic, and normally use another Basic program (Listing 1) to produce the DATA statements to be used. This program includes the calculation of a checksum at the end of each DATA line.

Listing 2 provides an outline of how these checksums can be handled in the program which POKE's the ML code back into memory.

These programs are submitted in the hope that other contributors might adopt a similar procedure to assist those of us who still type in programs from magazine listings.

TO CREATE THE DATA LINES

The Basic program, Listing 1, produces an ASCII file of DATA statements which corresponds to a ML program which has been (C)LOADM'ed into memory. The listing provided is the one used to create the DATA statements for REMOVE. This ML routine was ORG'ed at 32000, and the END statement occurred at 32168.

The DATA statements are produced with line numbers starting at 1000, and increments of 10. Each DATA line (except the last), contains 25 bytes of ML code with a checksum on the end.

To alter this for another program, change lines 20 and 40 to suit the start and end addresses of the ML routine. To modify for Extended Basic, also change lines 10 and 110 to File #-1 instead of #1, and delete the "/BAS" in the file name.

The file produced by this program has the same structure as would be produced by a (C)SAVE "MLREMVE",A. The PRINT in line 100 allows you to check that the last byte is correct.

TO PRODUCE LISTING 2

Listing 2 is the Basic program which is used to read the DATA lines produced from listing 1, and POKE the ML code back into memory. For different ML routines, all that needs to be altered is line 20, for the start address, and lines 40, 50 and 120 to correspond to the length of the program.

For Disk Basic you can load this program from some previous use of it, and then MERGE the DATA statements to it. For Extended Basic, if you don't have a tape merge procedure, CLOAD the file produced by listing 1, and then type in listing 2.

In either case, before submitting it to a magazine, RUN the program from the copy to be submitted, to make sure that it works.

Just tell 'em, Joe sent ya!

AL'S HOUSE

GAME

by Charles Bartlett

AL AND HIS BOYS don't like no visitors, especially FEDS wid rods. Dey aint no dummies these boys, so yus better be good or yus ul be dead !!!

Al's boys appear randomly at the windows, but they aint so dumb as to stand in front of a window that any lousy fed, (YOU), already has his sights on.

They will appear at any OTHER window and you must move your gun sight, (using the joystick), to that window. Ya gotta be quick though.

When you have one of Al's boys in your sights, press the fire button and your machine gun will go off with a five round burst, (and machine gun sound). A single tone is heard for a hit and one point is awarded.

Al don't want you to knock off all his boys, so just to keep you on your toes, he appears in person, in the doorway.

Sometimes he's just come to make you jump, but watch out, cos sometimes he pauses a bit longer to take aim and if you don't get him ... he will fill ya full of lead.

The game is over when you are dead, this fun happening can occur either when you run out of ammo, (of which you start with 500 rounds) or when you are not quick enough in shooting Al.

In other words, no matter what your final score, you end up dead ... Al likes this game !!!!

Should you not like the colors as they appear on your screen, the PALETTE colors have been labeled to enable you to know which ones it is you are changing.

```

CoCo 3 Program

Here's a game to test you wits

HOW?

GAME

by Charles Bartlett

THE REASON FOR the name of this game is in HOW it should be played and HOW the devil can you win. At first glance the screen looks like a PACMAN type layout, with one token, (you), and three other tokens, (them).

The screen has lots of dots in a maze pattern and your first inclination will be to charge around the screen collecting all the dots and dodging (THEM), well if you do that you will lose.

This is a game of strategy, (THEM) will try to get at you in an "as the crow flies" fashion. You must collect the dots AND try and get them to trap themselves at the same time.

There are 99 dots per screen, once you get all 99, they will be replaced and you can keep going.

You will ask your self HOW can I get all the dots without getting GOT ... all I can say is it can be done

COME TO

at Bundee

Conf '87 this year is to be held at the Uniting Church's campsite in Bundeena NSW.

This is a particularly pretty area of Sydney, situated on the northern tip of the Royal National Park, in Port Hacking.

The water views are fabulous, and the bushwalks are amoungst the best in Australia.

Not that you'll have anytime during conference for these things, because as usual, the conference will be jam packed with all sorts of things to see and do!

The big news this year will obviously be the growing use of OS-9 Level 2 on the CoCo 3's; and Conf '87 will be the definitive place to see this excellent system.

By that time initial users will have had time to sort the system out and create some really interesting stuff.

But it is not just OS-9 that is of interest this year.

With the release of the new T1000 EX and SX, interest in these machines has never been higher. We'll have a number of these computers at the conference, as well as their big brothers, the T3000 series, which we'll be putting through their paces.

We've had continuing interest in some of the more diverse subjects covered in the magazine at past conferences, so again this year we'll have tutorials on hardware mods and on Forth.

There'll be Basic Basic and Advanced Basic courses, and an Assembly Language tutorial as well.

Other computers will be discussed, principally the 68000 series of computers, and of course, we'll be showing Goldlink 642 on Viatel - and Videotex in general.

Conference is a place to meet old friends, to meet the people behind the names in the magazine, to learn a lot of new information, to see the latest Tandy equipment.

We hope you'll come. We're sure you'll be glad you did. But please hurry your booking, because accommodation (which is not obligatory) and places at the conference, are both limited by the size of the centre.

The cost is increased over previous years due entirely to the fact that we are doing it in Sydney which is a good deal more expensive than the Gold Coast!

On the other hand, many of you will save by not having the additional travelling expenses associated with getting to the Gold Coast.

We aim to make the conference a family affair, and the location is a good one for people with families who are less interested in computers, but who would still like to be with dad or mum for the weekend.

The family can take a ferry trip, go for bush walks, or just laze on the beach, whilst you do your thing at the conference.

CONF '87

na N.S.W.

CONF '87

Rates

Accommodated (1) $87.00
Family of 2, + $68.00 = $155.00
Additional family members $52.00 ea
Includes supper Friday evening, breakfast lunch and dinner on Saturday and breakfast and lunch on Sunday plus all accommodation.

Non Accommodated Rates

	One day	Two Days
One person	$40.00	$58.00
Sat Evening Meal	$12.00	$12.00
	$52.00	$70.00

Additional family $31.50 $45.50 /person
Includes morning / afternoon tea and lunch.

$20.00 deposit required with booking;
final payment to be made by 15th July 1987.

LOCATION:-
Uniting Church's campsite
Bundeena NSW

DATE:- 8th & 9th August, 1987

REGISTER NOW!!
We can only accept a limited number of people this year. DON'T MISS OUT! on a top weekend of FUN, FRIENDSHIP and LEARNING.

COCO RUNNER

32K ECB Tape Only

by Max Bettridge

THE IDEA OF CoCo Runner is to run through cities, forests, seasides, etc and at the same time avoiding all obstacles in your path.

Use the right joystick button to jump over any obstacles that might get in your way.

DISK USERS: load in CoCo Runner and save it to tape. Turn off your computer, unplug your disk controller, turn your computer back on again and type in: PCLEAR5:CLOAD

TAPE USERS: Type in PCLEAR5:CLOAD

ARTIFACT

16K ECB

UTILITY

by Justin lipton

ARTIFACT IS A very short program. All it does is display the artifact colours on the PMODE 4 screen using the '178' POKE. For those who have not seen them before it could be interesting while others may be put to sleep!

The Listing:

```
0 GOTO10
1 '********* ARTIFACT **********
2 '******* JUSTIN LIPTON *******
3 SAVE"86A:3":END
10 PMODE 4,1
20 SCREEN 1,1

ISLANDS

16K ECB
APPLICATION

by Craig Stewart

ISLANDS is a short M/L display program that gives the effect of flying at great speed past a multitude of different shaped islands in low-res. - that's all it does, so don't go grabbing your joysticks. It may have been the basis of a game, but I think it looks just okay as a display program.

PS: For those who are interested, the islands represent the CoCo's memory map. As the program passes over the memory, it will eventually hit lots of blank RAM (represented by open water or flat topped islands), and when this eventually passes, the process will repeat.

The Listing:

```

JOYSTICK SIMULATOR

16–64K ECB
UTILITY

by John Carmichael

JOYSTICK SIMULATOR allows you to simulate a joystick by using the arrow keys to move, and the space bar to fire. It can be used in two ways

1. To speed up games currently using INKEY$ or PEEKs to read the keyboard.
2. To convert joystick dependent games to keyboard driven games.

It should work on either the 16K or 64K CoCo. It is a position independent machine language program, which checks all the arrow keys and the space bar. Three keys can be held down at once. After doing an EXEC JJ the horizontal movement will be placed in variable H.

If left, H=0.
If nothing, H=32.
If right, H=63

The vertical movement will be placed in variable V.

If up, V=0.
If nothing, V=32.
If down, V=63

Fire button (space bar) will be placed in variable FX.

If nothing, FX=32.
If fire, FX=0.

All three variables will change depending on which keys are being held down.

Add these lines to the program to watch it work ...

```
10 GOSUB 10000
20 ?@32,H;V;FX:EXEC JJ
 :GOTO20
```

The utility replaces the following line in a joystick program:

```
10 H=JOYSTK(0):V=JOYSTK(1)
 :FX=PEEK(65280)
```

In the fire routine, replace

```
IF FX=126 OR FX=254 THEN ...
```

... with ...

```
IF FX=0 THEN ...
```

The variable names can be changed (see below) but they must be initialised before doing EXEC JJ, failure to do so results in an ?FC ERROR.

To initialise, make sure your program starts with a GOSUB 10000. Put any DIMs immediately after the CLEAR. If the original program CLEARs space for one of it's own machine programs, then do it's CLEAR before doing the GOSUB10000. Line 10000 causes the machine code to be located under any existing machine code.

Changing the variable names

To change the variable names so that they suit any particular program, change line 10030. Single letter variables must have the CHR$(0) added to them, as all variable names are in fact two bytes long in CoCo's memory.

If the simulator doesn't work it may be that you have a conflict with other DATA statements in the program, especially if a RESTORE command exists.

The Listing:

A. Fraction Fever. Doubles as both a fun game and educational tool. Children hop along on a pogo stick to match correct fractions and zap incorrect ones 26-3169

B. Kindercomp is a compilation of learning tasks. Eg. match shapes, write names, and draw pictures. Kids develop various skills 26-3168

C. Alphabet Zoo encourages children to associate letters of the alphabet with the sounds they represent in 2 exciting maze games 26-3170

D. You must take control of **The Reactoid** in order to contain the atoms and radiation released as a result of a fusion reactor meltdown 26-3092

E. Taxi. A team oriented game in which the responsibility of earning a fare is shared. You drive anywhere from New York to Shanghai 26-2509

F. Children learn to analyse the things they see with **Ernie's Magic Shapes** by matching shapes and recognizing similarities and nuances 26-2524

Star Trap is a dynamic maze game where the challenge is to trap a shooting star by blocking the paths and using special maze gates 19.95 | Reg 34.95 26-2510

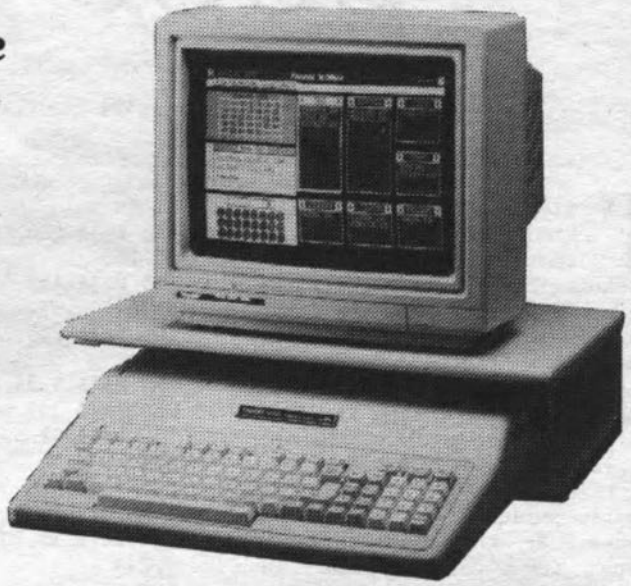
* Some may need recorder and/or joysticks.

Better Again™

The Tandy 1000 EX for Excellence in Home and School Computing

$1499

Monitor and Stand Not Included



The Tandy 1000 EX is our lowest priced MS DOS based Personal Computer. The 1000 EX has a clock speed of 7.16/4.77 Mhz which is 50% faster than the IBM PC ™. Includes a 13.3cm disk drive and 256K RAM that is expandible to 640K. A viable educational aid! 25-1050

CM-5 RGBI Color Monitor. A 33cm screen displays 80 × 25 text and 320 × 200 graphics. Ideal for elementary color graphics. 25-1023 **$599**

TM - Trademark International Business Machines Corporation.

Tandy 1000 SX — the Optimal Way to Business Efficiently

$2299

Monitor Not Included

Tandy 1000 SX. With the 8088 chip at it's core you are assured of compatibility with industry standard MS DOS software and with a selectable 4.77 or 7.16 Megahertz clock speed you'll have your work done faster than ever. Tandy 1000 SX has a 384K RAM that's expandible to 640K and 2 built-in 13.3cm drives. 25-1051

CM-10 RGBI Color Monitor. A 33cm VDU with 640 × 200 high resolution graphics. 25-1022 **$899**

COCO 3 SCAN

for Amateur radio enthusiasts only!

by G. Thurston

THIS PROGRAM will receive black and white pictures from amatuer radio transmissions. It uses the hi-res 640x225x4 screen. There are 24 levels of grey. It will only work on the CoCo 3.

Type in "CC3SCAN" and save it. Type "TVC351/BAS", save it. Then run it,. to produce the ML program. When "CC3SCAN" is RUN, it loads the "TVC351/BIN" program produced.

When RUN, the menu appears. There are four speeds of transmission available from the menu from 7 seconds to 36 seconds per frame. By changing the brightness, you can often get a better picture from an off frequency transmission. The Sync crossing level can be changed as well.

Most slow-scans transmissions can be found on 14.230 MHz upper side-band. Tune in the voice, and the slow-scan should then be tuned properly. Tape the slow-scan audio, and you can look at the pictures at a later date by playing them into the computer again.

The only extra needed is a cable from the speaker output of the receiver to the black cassette plug into the computer.

The Listing:

```
0 GOTO10
1 'RUN THIS PROGRAM FIRST TO GET
   A BINARY FILE CALLED 'TVC351'
   THEN RUN '3SCAN' (THE NEXT
   PROGRAM).

Have fun with...

COCO OSCILLASCOPE

16K ECB + EDTASM+ UTILITY/HARDWARE MOD. by D. Thurston

THIS IS A little program that is sure to make a few people happy. There has been a lot of interest shown in a program to make the computer into an oscillascope. This program does just that. There is a capacitor, a connector, two resistors, and a cable needed to interface to the joystick port.

There is an assembly listing included which should help others to understand a bit more about it. It's fully commented, so I'll just give an outline of the program here.

The first attempt used a real time effort which would erase the last trace, and put the new one up at the same time. However it was too slow to be of use, so this one stores a line of samples, and then displays them. This appears real-time, but isn't quite.

The 5V on the joystick port is divided in half by the two resistors to start in the middle. The program then waits for a negative to positive crossing.

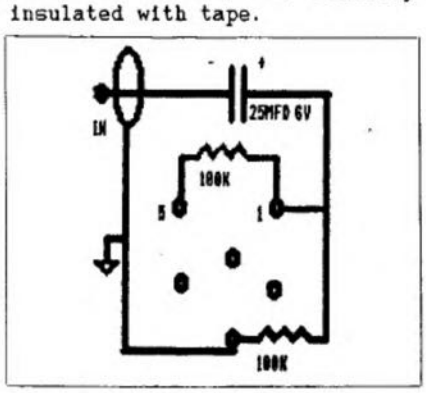
Then the PIA is tested. If it is too high, the digital to analogue converted is increased one step, and the PIA bit is tested again. This process is repeated many times, and the DAC tends to track the voltage on the joystick port.

When the end of the allotted memory is reached, the samples are put to screen. Because the DAC can only be increased or decreased one step at a time, the rise time is limited - therefore, it oversamples, and will show a fast rise better.

The original program used a 256 PMODE4, but it was slow to reach the end of the screen, and to keep the pixels from seperating, it only converted a small amount of the screen with the scan. The cursor PMODE gives a more spectacular display.

The program is written in BASIC, and the ML is poked into memory for convenience. Be sure to save it before running, as it might run rampant over your hard work if there is an error.

The circuit diagram is included, and if small components are used, will fit into the DIN plug neatly. They must, of course, be suitably insulated with tape.



A word of caution!!! The input will not handle voltages over 5 volts, peak to peak.

It is only meant for audio frequencies, and is suitable for the audio out of a radio, amplifier, tape recorder, etc. Just be sure to keep the audio down until you see it on the screen. If there are strange looking lines from the top of the trace, the volume is too high.

The frequency response is limited, but it will give a fair representation of the signals, if care is taken to adjust the oversampling to suit the frequency and rise time. This is not a laboratory-quality instrument, but it can be a lot of fun.

I have a successive approximation routine in mind, and time permitting, will write a program using the same interfacing.

Type in the program, save it, and when it's working, there will be a trace across the screen. There must be an AC input, or the screen will remain blank until the signal is input.

The routine checks the keyboard for an input at the end of each screen. It will ask for the oversampling delay. A higher number will help it follow a faster rise time but will lower the speed. Experiment.

Have fun!

DETACH

32K DECB
UTILITY
D.W Thurbon

THE PROGRAM switches off the disc rom and with a press of the reset button returns you to extended basic interal rom. This means that you no longer need to remove the disc controller to return to normal extended basic.

Therefore, no wear and tear is placed upon the controller.

TAPE CHECKER

16K ECB
UTILITY
by Allan Thompson

TAPECHECKER IS A small utility designed to verify whether or not the programs on your tape have been saved properly or not.

All that is required of you is to enter the number of programs on that particular tape.

After it has checked that number of files, it will return an 'ok' message.

```
0 GOTO10
1 REM   TAPE FILE CHECKER
2 REM   BY ALLAN THOMPSON
3 REM   17 LARKDALE CRES.
4 REM    O'HALLORAN HILL
5 REM   SOUTH AUST.  5158
8 SAVE"100:3":END

HKR/BAS":END
```

How to get large numbers of FIELDS in a Disk Record

32K Disk ECB
UTILITY

by John Carmichael

THIS ARTICLE IS orientated to those programmers using direct access files, who want to create much larger records with lots more FIELDs than they can currently get.

The OPEN "D",#1,"ACCOUNTS/DAT" defaults to a record size of 256. You can gain a larger record size by using the FILES command. It must come before the OPEN.

If unspecified, FILES defaults to two buffers, with a total of 256 bytes. FILES 2,900 however, would give you two buffers with a combined size of 900 bytes. This would allow you to have for example, two records, the first 20 bytes and the second up to 880 bytes long.

E.G.;

```
10 FILES 2,900
20 OPEN"D",#1,"COMPANY/DAT",20
30 OPEN"D",#2,"FIGURES/DAT",880
```

The problems come when you would like to have say, 88 fields of 10 bytes each in the large record. As best as I can make out, this is impossible given the way the FIELD statement works.

All FIELD specifications have to be made in a single line of BASIC. The limit of 250 bytes to a line of BASIC, means you can have a maximum of 22 fields if you also wanted the convenience of arrays.

A statement like the one below doesn't work.

```
40 FOR N=1TO88:FIELD#2,10AS
F$(N) :NEXT
```

It results in a single field of length 10 being allocated to F$(88).

So, for example, in Graham's ACCOUNTS Spreadsheet in Feb, 1986 and May CoCo, he is limited to 15 transaction types.

The following program is designed to overcome this limitation of the FIELD statement by creating a BASIC line as long as is necessary to specify all your field requirements.

Whilst the BASIC input buffer only allows you up to 250 characters per line, execution of the BASIC program is not dependent on any particular line length. (See the articles in JULY 1986 CoCo, p.28 for a fuller explanation.)

This utility should be typed up seperately and SAVEd as an ASC file for future MERGEing. (If you have B-DOS you can eliminate GOSUB10045 by using PPEEK())

When typing the FIELD statement in your program keep going until you can fit no more AS s e.g.

```
40 FIELD#2,10ASF$(1),10ASF$(2)
  ,10ASF$(3), .. etc,  ASF$(22)
```

Then keep typing on the next line as if you were continuing, being sure to start the line with a comma.

```
50 ,10ASF$(23),10ASF$(24),
10ASF$(25), ..etc, 10ASF$(44)
```

Continue doing this on successive lines until you are finished.

Now MERGE the utility, and RUN 10000. Answer the line number question with the number of the FIELD statement that needs extending, in the above example, 40.

The program will reply with LINE 50 ADDED TO LINE 40. Repeat the procedure until all the AS lines are "lumped together" on line 40. When done, DEL10000- to remove the utility. When you LIST 40 you will see only the first 255 characters, the rest of the line will be hidden. Once this has been done you cannot EDIT the line without chopping its length back down to normal.

This method still requires a lot of typing to create a lot of FIELDs, but at least they can now be created!

HOW IT WORKS:

Subroutine 10045 gets the value of the two bytes starting at V, and returns that value in V.

Subroutine 10050 points S to the address of the first byte in the line number specified.

A = the value for the FIELD token as it is stored in BASIC
P = the address of the start of the line which was just searched
B = the address of the start of the next line

Line 10040 gets the address for the line following the one to be concatonated, and stores it in the next-line-pointer of the line with the FIELD statement. It then places 5 spaces where the old BASIC pointers were. That is, it joins the two lines together.

COPY ROM

64K ECB

UTILITY

by D.W. Thurbon

COPY ROM COPIES ROM into high ram (64K only) and allows the use of the ram and is disk compatible. It does this to allow use of the memory locations between 49152 to 65279 for ML programs. Just LOAD and RUN the program then load your ML program into that area and GO FOR IT.

The Listing:

```
0 GOTO10
3 SAVE"24A:3":END
10 ' COPYROM. BY D. W. THURBON.
     CURTESY OF PIXEL SOFTWARE.
     PUBLIC DOMAIN SOFTWARE.

22, 236, 132, 127, 255, 223, 237
, 129, 140, 254, 254, 37, 241, 5
7
```

The vagaries of the variable

VARIABLE LISTER

16K ECB
UTILITY

by Russ Nelson

WHEN DEVELOPING BASIC programs or modifying existing BASIC, it is helpful to know what variables have been used and where they have been used in the program. Some variable listers have been published but none have satisfied me.

This effort is a modification of a program by John Carmichael published in August 1985 Australian Rainbow Magazine. It is saved in ASCII (on the monthly CoCoOz tape) and can be accessed anytime by RUN 50000. Make sure the program to be searched has not got any lines above 50000.

When RUN it will display the first line number of each variable, and store all the next lines that variable appears on. After all lines have been searched, the full list can be displayed on screen or printed in order of line number, or variable name. A list of REM line numbers, bytes used by spaces and total number of program lines is also printed.

Being BASIC, this program is slow so I have used the speedup POKE to save time. If your computer will not accept fast speed, delete line 50040. With fast speed it takes 10 minutes to scan 150 lines, but after saving the variables the display or printing is without delay.

The Listing:

```
0 END
1 '********** VARILISTER ******

They don't write songs like this anymore

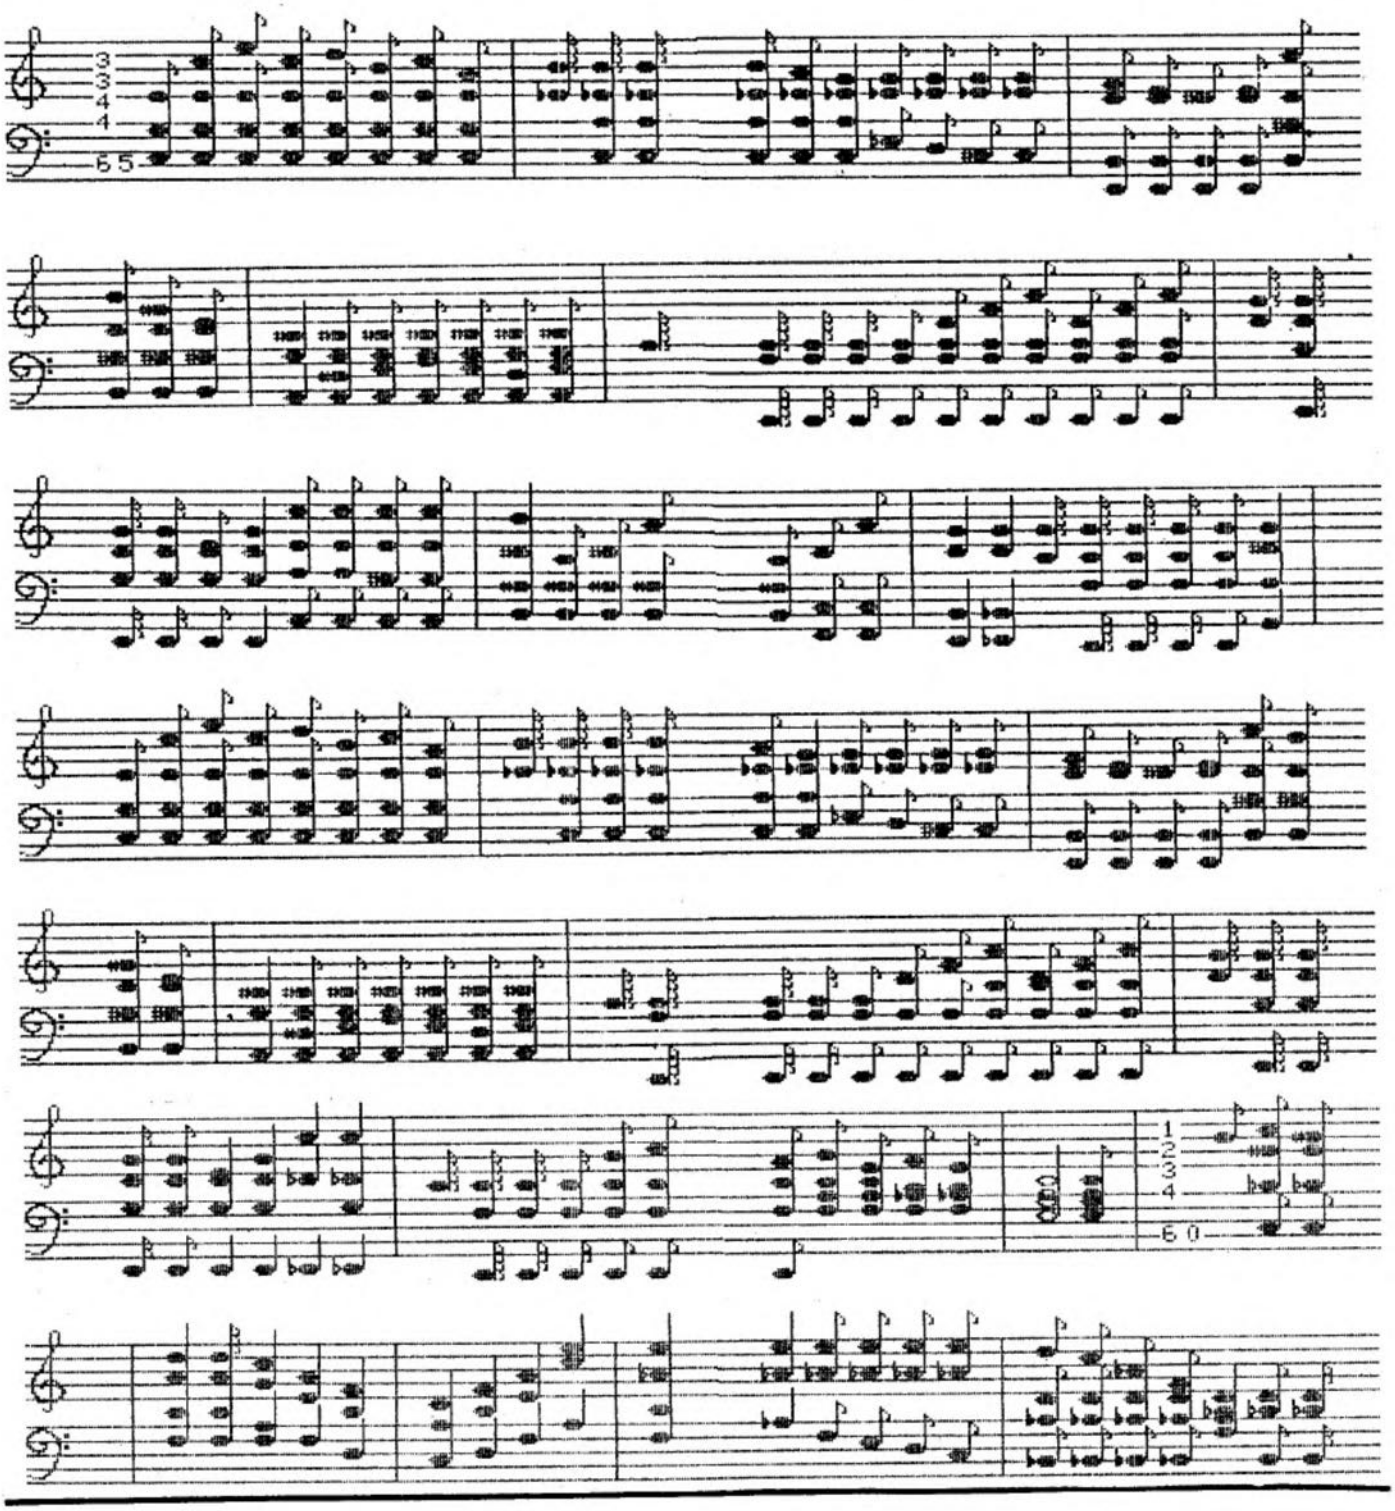
STARDUST

CoCo 1/2 & Musica II
MUSIC

by Harvey Smith

STARDUST IS YET ANOTHER one of the excellent entrants to the music competition. The original artist of the song was Hoagy Carmichael and was cleverly compiled by Harvey Smith using the Musica II program.

Note: It is possible to play this piece using Music (original) for those people who get the CoCoOz on Disk monthly.



For those who need one, here's a ...

DATABASE

32K ECB tape only
BUSINESS

(and Sticky Label Utility)

by Michael J. Hartmann

IT WAS ONLY until recently that the only type of cockatoo seen on our property were the ones that flew over the New England farm every spring in search of feed. August 1984, however, saw the emergence of a new breed of white cockatoo.

My parents had been shopping for computers for quite a while. They were aware that computers were progressing toward becoming an important piece of farm equipment and to stay in the farm game one must move with the times. Finally, a cassette - based 64K ECB CoCo 2 was purchased. It was then up to me to learn and ultimatly design and write programs for use on the family farm.

At that time I was a year 10 student and so had plenty of time to spend learning the new language. Computer programming became my hobby and after about a year I felt that my 'finer' results were worthy of submittion to the crew of 'Aussie Rainbow'.

Prospectivley it was time to think about farm programs. I approached the situation systematically, initially asking myself, "How could CoCo make farm-life easier?"

For an answer I reviewed the farm calender. I decided that the foremost use would be as a source for quick, easy and efficient storage and retrieval of various types of information.

"A DATABASE", thought I. Enthusiastically I charged through the pages of'Rainbow' and 'CoCo' searching for such a program. It was then that I really felt the devestating effects of the rural crisis.

The shortage of money means that no disk-drive will, for the meantime at least, supersede the humble cassette-player.

So the databases I did find just took too long to load and even when they were loaded many didn't satisfactorily fulfill my requirements. So, I was faced with having to write my own database.

When I write a program I like to initially review other authors programs and then modify or adapt them to suit my needs.

The end result should be short, simple and efficient (sounds a lot like a girl I know!!).

'LABKMAKR' (CoCo Nov'86) is an example of the result of this approach. If a program is too fancy I find that the time taken to load it in is often greater than the time taken to perform the job manually. Length must be kept to a minimum.

The database I wrote (LISTING 1) fulfills the above criteria. It is a simple shell-type program and can be modified with little fuss and bother.

Once the ball was rolling there seemed no stopping it. Needs were appearing faster than were the solutions. A new set of stockyards were to be built, 'GRAFPLOT' (CoCo Nov'86) was born. Although a bit clumsy, it was a far better system of designing the yards than we'd ever had before.

All was going well, and I was really progressing with this application programming. But this was all to change. The ball that had been rolling so well fell into a hole. Year 12 and the HSC stopped it in its tracks. My programming was sacrificed for study. The Coco, however, was not left to gather dust. The printer (DMP110) and word processor (TELE64) purchased earlier in 1986 meant that I could write essays and assignments quicker than ever before. The teachers couldn't even complain about my handwriting, although some typo's led to some remarks!

With the welcome demise of my school-life, I have been active with my computing. There are indeed many needs to be covered.

For example, the CoCo has now entered the fire-fighting business. The system is now utilised to print reminders to all members of the local Bushfire Brigade, TELE64 records the minutes of general meetings, my database stores the names and numbers of members and my short, simple and efficient program 'STIKLABL' (Listing 2) addresses stickers for mailing envelopes.

So, effective business computing CAN be carried out more than adequatly by the CoCo, even with a simple cassette system. The possibilities are almost endless, from data storage to word processing and beyond. Technology on the farm is ever-changing, and in modern agriculture where speed is a vital factor, the CoCo is proving itself a worthy addition to the farming enterprise.

For the mathematician

ANOTHER PIE

32K ECB
APPLICATIONS

by Jim Jacobs

BILL BARDEN'S article "Pi to 10 000 Digits" in the May RAINBOW intrigued me. The ability of a home computer to do things which were once so difficult is fascinating.

As Bill mentions in his article it is possible to improve and speed up the program. This prompted me to try and the one I ended up with is nearly 800 times faster.

While the calculation of Pi to many decimal places may not have much direct application, my work on the program has helped me understand better how computers do arithmetic and to utilise the capabilities of the 6809 (the CPU chip) of the CoCo more effectively.

As well the Basic program to calculate Pi ("NUMBERPI") I have included the machine language part of the program with notes which should be useful to those who wish to delve deeper.

LIMITATIONS

Checking a few numbers gives this timing formula for the program ..

Time = 1.05 D*D seconds

... where D is the number of decimal places divided by one hundred - just under three hours for 10 000 places. I cannot see any more ways to increase the speed (except the high speed poke), but no doubt some ingenious reader will.

About 416 bytes are required for each 1000 decimal places held in multibyte variables and as two are needed a 16K machine could handle almost 20 000 places!

There is no allowance for overflow in the odd number division routine which limits the number of decimal places to about 20 000. Otherwise two byte arithmetic could handle up to 40000 places in about 50 hours on a 32K COCO!

IMPROVEMENTS

I imagine the multibyte variables as strings of bytes stretching from left to right the first two bytes are the integer part and the rest are the fractional part.

I used Bill Barden's program as a guide or check list and made the following changes to speed up the calculation:

1. By multiplying by the argument the series becomes ...

$$\text{arctan1/x} = x \cdot \sum_{i=1}^{\infty} (-1)^{(i-1)} / (2i-1) \cdot x^{2i}$$

... avoiding the initial division by x.

2. There is no need to prescale the variables. The sum of the series ...

Pi/4 = 4.arctan1/5 - arctan1/239

... is a fraction less than one and after the initial multiplication by 4 to get Pi; repeated multiplication by 10 will produce the digits to the left of the decimal point one by one.

3. Only two multibyte variables are required. One for the sum of the series (the sum variable) and the other for the powers of (1/5**2) or (1/239**2) (the power variable).

4. Shifting all the bits of the power variable during division is not neccessary. Each byte of the quotient ends up in the same position and so can be simply produced from left to right.

5. During division it is only neccessary to shift one byte at a time from the dividend into the remainder even for word (two byte) division. This gives a 30% speed up.

6. Only one byte division is required for 5**2 giving a further 25% speed up.

7. The two divisions and the summation can be done at the same time. As the words of the power variable are produced they are divided by the odd numbers and incorporated in the series. The operations can be imagined proceeding from left to right.

8. As the process goes on the numbers get smaller. Leading zeros appear in the power variable allowing the length to be reduced. Also this allows the summation to be terminated when the values are small enough there is no need to count the bytes.

9. Division can be speeded up by adding the negative of the divisor instead of subtracting a carry is generated when the quotient bit is one and can be shifted into the quotient; at the same time a one is shifted through the quotient to count the bits.

LISTINGS

The Basic program "NUMBERPI" is given in Listing 2. It contains a machine language routine for the actual calculations this is given in assembly language in Listing 1.

When "NUMBERPI" is RUN the machine language program which is held in the data lines is poked into memory just above the Basic area. This takes a few seconds.

Then Pi can be calculated to a chosen number of decimal places and the results displayed one line at a time. The display can be repeated or a new number of places chosen.

The assembly language used in Listing 1 is to explain the machine language and would need to be adapted to suit the assembler being used.

The addresses given are notional only the program is automatically located just above the Basic program.

Note that the code is self-modifing ...

- The two series use different power division routines the branch offset at 0E56 changes.
- The series summation is addition and subtraction for alternate terms. The operations

are changed at addresses 0E5B & 0E65 .

- The odd number divisor at addresses 0E3E & 0E43 is changed for each term of the series.

These zero page addresses are used:

```
0040-1  ST  Sum pointer  (start of sum variable)
  42-3  PT  Power pointer  (..... power ...)
  44-5  END  End of multibyte storage
  46-7  Q   Odd division remainder
    48  FLG  Hi/lo byte flag
    49  N   Power division quotient
  4A-B  R   Power   ..    remainder
  4C-D  M   Odd     ..    quotient.
```

SNAKES and LADDERS

CoCo 3 Program

GAME

by Charles Bartlett

THIS IS PLAYED by the traditional rules with the following changes in the interest of more INTEREST. The player that starts first is selected by the highest throw, not the first to throw a six.

Two tokens are NOT allowed to occupy the same square, if a move would land you on the opponents square you will be placed on square back.

This applies in ALL cases, including going up ladders and down snakes, (you don't get put back down the ladder, just moved back one space at the top of the ladder).

An EXACT throw is required to reach 100. An extra turn is awarded for each SIX that is thrown. The computers messages, token and dice are all one colour, your's are all another colour.

Press any key to start your dice rolling, press any key to stop it rolling ... the number showing when you press a key is NOT the number that the dice will stop at, it stops at the next number ... just in case anybody thought of cheating, not that you would ... would you?

The next installment

CASHBOOK

OS-9
BUSINESS

by Ian Lobley

(The following program is in Basic09 source code and is quite long. Several Procedures will be published each month and will then be followed by Ian's articles explaining the operation of the program. As Ian uses the HIRES screen, those who wish to use Wordpak will have to alter the Modules accordingly.

This is the second part of Ian Lobley's CASH BOOK program written in Basic09. If you haven't already done so, may I suggest that you start with last months magazine as it will give you an introduction to these articles. The following is just a brief guide to the operation of Cash Book. Next month we will explain how the whole system works and what to do if you get into trouble.

Having typed in all the procedures and SAVED them under the correct NAMES we are ready to PACK them into the CMDS directory (don't forget to keep the Basic09 source code on another disk). As per all PACKED procedures, RUNB must be in the cmds direcory for them to work. The next step is to use the MAKDIR command and create a directory called CASH. This directory will hold the following data files for the program; Items_list
Company_name
Bank
Start_bal
Chq_record

When running the procedure RUN_CASH, a memory size of 9000 is required to Run, and store data files during operation. The 'CASH' directory will always be the working directory (chd /d0/cash)

If problems are encountered, go back and check your source code. Some adjustments may have to made in the layout of the screen. Ian uses OPAK in the sixtyfour character by nineteen line mode.

```
RUN CASH includes the
following procedures :-
menu  Read_Bank  Title
title2  items  Change_chq
get_chq search_chq
create_chq  print_t
print_chq  set_date
input_chq  plus

CREATE_CASH includes the
following procedures :-
create_menu  create_chq
create_bank  create_name
input_items create_items

*REM create_bank creates
bank and start_bal

PRINT_CASH
search_month_p  print_chq_p
title_p  macau_title  items

OTHERS
Search_month
delete_chq_record  del_all
see_bank  recon
recalc  change_start_bal
```

HELPFUL PEEKS and POKES

APPLICATIONS

16K ECB

by Greg Dennis

HELPFUL PEEKS AND POKES is a program I devised so that I could keep a record of Peeks and Pokes in one program.

It covers areas such as getting more memory, speed pokes, screen management, input / output problems, disability controls and character controls.

The Listing:

```
0 GOTO10
3 SAVE"201:3":END
10 '***************
20 '*  HELPFULL   *

MACHINE LANGUAGE PROGRAMMING

LESSON TWO
32K CoCo with EDTASM+

by Malcolm Patrick

IN THIS LESSON you will learn how to write the source listing, check for any errors while in the edit command, and check for any errors while in the zbug command.

Instruction Mnemonics is how the computer gets its information. There are two parts to the Mnemonic, the Opcode and the Operand.

Comment Lines start with an asterisk or are placed in column five. Remember to always put in the comment lines because you might pick up the program next year and you will not remember what it is all about.

Labels are found in column two of the text (listing).

Look at figure 1-1 on page 2 and particularly at line 220; you will find the instruction

* BNE BUB020 *.

This means Branch if Not Equal to BUB020 in line 140 and continue on.

The Assembly–Language process

The 64K Colour Computer has 65,536 Bytes of memory available to the system. Each byte is made up of 8 Binary Ones or Zeros.

I.E. 00101011 = 1 BYTE or 8 BITS. If a BIT = (1) then it is on, if it = (0) then it is off.

The 6809 Microcomputer (computer) will read each Byte and convert it to an instruction (Binary code).

The EDTASM+ has a built-in assembler that will translate the text of the "assembly language" into "machine language", the binary ones and zeros.

A/IM

After the Assembly language (listing) has been typed in it is then (ASSEMBLED) by the edtasm+ command A/IM , Assemble / In Memory.

If you type in figure 1-2 on page 4 of Barden's book, and then do A/IM ,you will note the extra columns added to the source listing. This is referred to as the object code.

On the top of the first column of the object code is 0A6A. This will more than likely be different to your listing. It is the address in memory where the machine language is to be stored.

The second column of the object code begins with 7F. This will always be the same as your listing. It is the machine code for CLR found in the third column of the source code (opcode). So this is the OPCODE for the OBJECT CODE..

The third column of the object code begins with 0A95. This is sometimes different to your listing. This is the OPERAND for the OBJECT CODE.

COMMENT lines are ignored and do not generate any Object Code.

Below the listing is TOTAL ERRORS, this must always be Zero, otherwise the program will not run properly. If it is not zero then there is a mistake in the source listing so go through and correct any mistakes.

Last of all to scroll onto the screen will be the LABEL ADDRESSES. You will note that BUB010 from line number 120 in the source code, is assigned to the address of 0A6D in the Object Code.

Whatever address your Edtasm+ assembles BUB010 in line 120 to, it will always give you that address at the end of the program.

If there is any letter beside the OBJECT CODE LABEL ADDRESS, then there is a mistake with one of the labels either in the label column or the operand column.

A/LP A/IM/LP

To get a complete listing of the Object & Source code to the PRINTER, type in A/IM/LP. = Assemble In Memory to the Line Printer. If you are running EDTASM+ on disk and wish only to get the source listing, then you only need the letter (T).

A/IM/WE

When typing in large programs it is easy to make mistakes. One easy way to find them is to Assemble / In Memory / and WAIT on all ERRORS. I.E. A/IM/WE.

Load figure 1-2 from page 4 and change the (P) in line 110 to (D).

Now do an A/IM/WE. You will note that the assembling program will stop at line 110 and print the words UNDEFINED SYMBOL. It is telling you that there is an error in your program. You could stop the assembler there and correct the line, but at this stage we will continue by pressing enter.

The assembler will continue until the end and added to your Label Addresses is the word DASSNO followed by the letter (U).

This is also a way of finding if there is an error.

ZBUG

Zbug is another part of the EDTASM+ assembler package. It is another means of scrutinizing the source listing in the most intimate way. You will learn much more on this with each lesson.

EXECUTING THE PROGRAM IN ZBUG

To EXECUTE the the listing of figure 1-2, first make sure that the assembler runs through without any errors. Next go into ZBUG then make sure that the program will break out by typing (XLOOP), meaning EXIT at the word (command) LOOP.

Next start the execution (or run) by typing (GBUBSRT), meaning GO at the word (command) BUBSRT.

So what we have done is this.

```
*A/IM  rem assembled in memory
*Z     rem gone into zbug
           (note the change
           from asterisk to
           the pound sign)
#XLOOP rem exit at loop
#GBUBSRT  rem go bubsrt
```

You will see the letters being sorted at the top of the screen and the numbers at the bottom. To execute this program again

you will have to go back to the editing mode with the letter (E), assemble the source code again and continue the whole procedure again.

Now let's change the listing so that it will display better on the screen. Change the 400 in line 120 to 432, this is the beginning of the screen location. Now change the 511 in line 210 to 454, this will place the sorted numbers up a few lines.

To finish with run the assembled program in Zbug and note the difference.

EDTASM+ EDIT Commands

Q = Quit the program and return to basic
N = renumber, N200,20 = renumber from 200 and increase by 20
I = Insert, I200,2 = insert at line 200 and increase by 2

QUESTION FOR LESSON TWO

Q1 Why is a LABEL used ?

A1: .....

Q2 What is Mnemonics and what does it do ?

A2: .....

Q3 What is a BYTE and what does it represent ?

A3: .....

Q4 Why is each BYTE converted to either a one or a zero ?

A4: .....

Q5 What command is used to Assemble the source code ?

A5: .....

Q6 After you have assembled the source code what code is generated to the left of the line numbers and what are the three columns called ?

A6: .....

Q7 What is the easiest way to find an error in the source code?

A7: .....

Q8 If you changed the opcode in line 190 to CTA and then assembled the source code with A/IM/WE, what error code will appear?

A8: .....

Q9 What is the ZBUG and what does it do ?

A9: .....

Q10 What are the 4 commands to test by running a source code in zbug ?

A10: 1.....2.....

A10: 3.....4.....

Answers for Lesson Two (to be looked at AFTER you have completed the questionnaire!!)

Q1 Why is a LABEL used?
A1 It is easier to say goto label BUB020 than to find the address of the line and say go to address 0A74 and continue.

Q2 What is Mnemonics and what does it do?
A2 The mnemonics is how the computer gets its information by adding, subtracting, and comparing information found in the opcode and the operand.

Q3 What is a BYTE and what does it represent?
A4 A byte is 8 BITS of memory that is made up of ones or zeroes.

Q4 Why is each BYTE converted to either a one or a zero?
A4 The 6809 microcomputer can only read (understand) Binary code.

Q5 What command is used to Assemble the source code?
A5 A/IM

Q6 After you have assembled the source code what code is generated to the left of the line numbers and what are the three columns called?
A6 The OBJECT code is generated, and the three columns are 1 the address in memory 2 the opcode 3 the operand.

Q7 What is the easiest way to find an error in the source code?
A7 With the command A/IM/WE, Assemble in Memory Wait on Errors.

Q8 If you changed the opcode in line 190 to CTA and then assembled the source code with A/IM/WE, what error code will appear?
A8 Bad opcode

Q9 What is the ZBUG and what does it do?
A9 The zbug is part of the EDTASM+ program, and it allows you to examine the source code to see if there are any bugs in it.

Q10 What are the 4 commands to test by running a source code in zbug?
A10 1 A/IM/WE 2 Z
3 XLOOP 4 GBUBSRT

DATA STRUCTURES in FORTH

Languages

by John Redmond

IT HAS BECOME common for computing languages to require data to be declared at the beginning of a program, such as in Pascal or C. In truth, it's to give the compiler a chance to make sense of what the programmer has written, but it has become an important, and useful, part of the discipline of programming.

The absence of anything like this requirement in Basic programming certainly does make things simpler, but I'm convinced that it's an important contributor to the disorganized state of most Basic code. It IS possible to write clear, elegant Basic code, but it happens all too rarely.

One of the most conventional characteristics of Forth is the requirement to predefine constants and variables, e.g.,

```
4 CONSTANT LEGS
VARIABLE FROGS
```

Now, when you use LEGS in a program, or enter it from the keyboard, the constant value of 4 is placed on the stack. LEGS is a VALUE. When you use FROGS, however, things are very different.

FROGS places on the stack the ADDRESS of a reserved part of memory. You can then get the VALUE currently in that memory with the @ word (pronounced 'fetch').

When you do this, the address on the stack is replaced by the 16-bit value at the address.

This is a very natural way to do things, and we don't need to get involved with pointers and with talk of left and right values, as in C.

Such complications are red herrings and just get in the way of understanding what programming is about. Just remember that invoking a variable returns an address, while invoking a constant returns a value.

Beginners start to get confused, however, when a constant is used for an address. If you are familiar with assembly language, you will recognize that this is just the same as an equate - and done for the same reason, to make the code more readable and easier to maintain.

Programming would be very limited in Forth if the only data types were constants and variables. What about arrays, strings and the records of Pascal? Forth can go a lot further than more conventional languages in designing and defining specialist data types and the point of this article is to explore some simple examples. But first we must recap the structure of a Forth word, to see how memory is used.

A word in memory consists of a header and a body. To make the discussion clearer, I will discuss only the simplest type of header. In this, the first four bytes of the header contain the length of the name (first byte value), then the first three letters of the name. (If the name is shorter than three characters, the extra bytes contain garbage.) There are variations in header structure, but both the great polyForth and A*Forth version 3.69 do it in this way. The next two bytes are the link field and point to the header of the next word in the dictionary (this need not concern us any more in this article). The last two bytes contain the pointer to the code being used in the word (again, let's not worry too much here, but it's all in Brodie's 'Starting Forth').

All very complicated, but it's all constructed automatically by the very smart word CREATE. So, then, if we type in:

```
CREATE POND
```

... we get a complete header corresponding to POND. POND can now be found in the dictionary and, if we now type in POND, what happens? An address is placed on the stack. This address is that of the NEXT byte after the code pointer (see above). The jargon for this address is the pfa (parameter field address) and that of the code pointer is the cfa (code field address).

Getting complicated? A little, but the previous two paragraphs are worth re-reading. Then let's introduce another standard Forth word: ALLOT. ALLOT allots a designated number of bytes after the header. So, now are in a position (believe it or not!) to define the defining word VARIABLE. It is simply:

```
: VARIABLE CREATE 2 ALLOT;
```

In other words, VARIABLE uses CREATE to make a header with a cfa which points to the 2 bytes which have been allotted.

CONSTANT is very similar, except that the cfa points to different code, so that the CONTENTS of the two bytes, rather than their address, are returned on the stack.

Two more words, related to ALLOT, are , ('comma') and C, ('c-comma'). These introduce a 16-bit (comma) or 8-bit (c-comma) at the position after the header. In fact A*Forth always initializes variables to 0 when they are defined, and its definition is equivalent to:

```
: VARIABLE CREATE 0 , ;
```

Using CREATE and ALLOT, it's very simple to define an array. Suppose we need an array which holds 24 byte values - and we want to refer to it by name, e.g. ECOSYSTEM:

```
CREATE ECOSYSTEM 24 ALLOT
```

Now then, what happens when we type in ECOSYSTEM? We get the address of the first byte after the header, of course. It is the address of the first of the 24 ALLOTed bytes. It is the BASE ADDRESS of the array, i.e., the address of the 0th element. Want the address of the 9th element (i.e., with an offset of 8)? Just add 8 to the base address! You can fetch the byte value with C@ (c-fetch) and you

are there - or you can change its value with a C! (c-store). Not hard, is it?

In fact, defining an array in this way is trivially simple. Trivially simple, yes, but the data structure we have constructed is primitive. No checking for index range (what happens if we fall off the end?) or for element type (what happens if we forget that it contains bytes and try to poke it 16-bit values?).

This is part of the strength of Forth and part of the advantage in designing your own data structures: YOU can decide whether you need to have protective code.

If you do the range checking and data type generation somewhere else in a program, it is superfluous and time-wasting to repeat the check when you access the array.

If you really do need a smarter data structure, such as general ARRAY word to keep in your Forth library, it is still easy - once you have the hang of how Forth accesses data.

But let's not move too quickly but rather stick to the simpler examples for the moment - this time strings (the great strength of Basic). The simplest string type is the dimensioned string (just like the first four bytes of the header discussed above).

The length of the string is in the first byte, and the string itself follows. If we want a string variable, we need a string arranged in just this way directly after the header. We need, of course, to ALLOT some memory for it. But how much?

Well, the length of the string is in the first byte; so we need to ALLOT one more byte than the content of the first byte. Think about it!

But we still have to get the string into position, after the header. Forth has a special word to do exactly this - a word called WORD.

This is a brilliantly versatile word which is used over and over in all sorts of contexts. It expects on the stack a delimiter, which might be 32 (for a space) or 34 (for a "), and accepts a string of characters from the keyboard or disk screen up to, but not including, that delimiter.

WORD returns on the stack the address of the length byte of the string. Let's try to get these words working together with STRING:

```
: STRING CREATE 34 WORD C@ 1+
   ALLOT ;
```

Isn't the definition short?

Quite normal for Forth. Remember that STRING is a DEFINING word which is used to define other words, e.g.,

```
STRING PREACHER John Redmond"
```

Note that STRING extracted TWO strings from the command line. CREATE extracted PREACHER by using WORD with 32 as delimiter, then the act was repeated with 34 as delimiter. A matter of having the right tools for the job. Then the job's simple. Now, again, we have a header constructed with CREATE; so what happens when we type in PREACHER?

Yes, we get an address on the stack, as before. This is the address of the length byte of the string (the string proper starts at the next address). But what can we do with the address? Why COUNT it, of course!

The word COUNT takes the address and returns on the stack the byte value in the address and, underneath on the stack, the next address (i.e., that of the first character of the string). Again, the right tool for the job. We'll finish with another right tool: TYPE.

This word expects on the stack just the two entries put there by COUNT. Therefore, if we type in:

```
PREACHER COUNT TYPE
```

Forth responds with 'John Redmond' (who else?). But preachers don't usually count and type (do they?). The command line doesn't feel right, does it? Forth has unique power to make commands feel right (yes, I DO mean unique!). Let's define a very small word:

```
: IS COUNT TYPE ;
```

NOW we can type in PREACHER IS and get a perfectly reasonable answer. That's all for now.

What we've looked at this time is a selection of the simplest (and dumb) data types. There is just so much more that we can do with data in Forth and next time we will start to look at some of the more sophisticated structures and start to nibble at concepts of smart data types which know their own functions and know their place in the world (those interested in OOPLs will know what I'm talking about). Until then.

PROGRAM FIX

32K ECB
UTILITY

by D.W Thurbon

PROGFIX RELOCATES ML programs that normally reside in graphics screen memory pages 1-4 to a higher position in memory so that they may be used with disc systems. The program has user prompts.

The Listing:

```
0 GOTO10

The continuing saga of.....

FRICKERS FOLLIES

by Jack Fricker

This month I am going to continue with the subject of Public Domain Software. At the end of this article is a listing of the help files for the software I have been talking about. As you can see there is quite a number of them. The help files alone take up 1 disk

I am assured by INTERTAN (Tandy) That Level II will be released at the end of March which means that you should be able to purchase it by the time you read this. Hopefully I will have mine soon and will be able to report to you on it.

A Pascal version of...

GAME of LIFE

The Game of life is a facinating game invented by the Mathematician, John Conway, which attempts to simulate a collection of living organisms. The game was originally designed to be played on a grid board of specified size on which counters are to be placed. These counters are born, survive or die during a generation according to the following rules:-

(a) Counters with 2 or 3 neighbouring counters survive to the next generation.

(b) Counters with 4 or more neighbours die from overcrowding and are removed from the next generation.

(c) Counters with 1 or less neighbours die from isolation and are also removed.

(d) Empty locations which have 3 counters in the neighbouring locations is a birth location. A counter is placed in the location for the next location.

The program is implemented in OS-9 Pascal. However, it can be translated into Basic09 easily if you understand both Pascal and Basic09 (well the two languages are compatable to a degree in that no further alteration of the alogrithm is required - unless you have a better one).

The program presented here used a grid board of 20 X 20, you can make it larger by changing the constant size. But remember the larger the board the slower the program. I do not recommend it.

If you have an IBM compatible machine and a Standard Pascal compiler then delete all the lines with the Shell commands. The program should run (even better) as the program is implemented in standard Pascal.

After you have typed in the program, compiled it using 'PASCAL < program name'. When you have succesfully compiled it without errors, you should PCODEF in your current data directory.

You mav execute the program at this stage, However I reccomend that you continue to compile this into native code (6809 Machine Language) for higher execution speed.

When you run the program, it will ask 'how many counters you wish to start with'. This is the number of stars in your initial pattern. Then it will ask you to enter the co-ordinate of each counter. Remember to draw up initial at the centre of the grid board to allow for expansion.

Note that you must NOT enter a comma between the X and Y co-ordinate. For example to enter a co-ordinate od x=10 and y=6 (10 accross, 6 down), type 10 6<enter>.

Please note that you must have the file 'SUPPORT' (one of the files included in the CMDS directorv of the Pascal Compiler) in the CMDS directory when running the program in either PCODE or in native code.

For the program to run properly you must have the following utilities in your execution directory:
TMODE , LOAD , DISPLAY

(For further details on this game see Scientific American, 1970 ,P 120) If you have any question please contact me on viatel 677282790.

Some initial patterns for you to try out :-

A straight line with either 3, 4, 5, or 6 counters. Or

```
***
* *
* *
```

for about 30 generations.

Please note: PCODE file must be executed by PASCALS, Native code can be executed by simpy typing its name.

```

CORRECTIONS

"National Anthems" (Page 54, Australian CoCo, February 1987)

There is a printing error in line 50. Apparently some magazines have got this error while others don't.

But for those of you who do, here is the solution:

```
50 DATA169,191,182,207,201,228,2
17,239,233,255,249,207,207,207,2
07,207,207,207,207,207,207,249,2
55,233,239,217,228,201,207,182,1
91,169
```

***

"23" (Page 55, Australian CoCo, December 1986)

It seems that line 14 in the listing was accidentally typed into line 13. This is what it should look like:

```
13 LO$="BRNR4HU6ER4FD6GBR5":AP$=
"BU8NH2BR4BD8":N2$="NR5UE5UHL3GB
F6GBR4":N3$="BUFR4EU2HNL3EU2HL4B
F8":BB$="BR5":LY$="BR3U5NH3E3BR4
BD8"
14 LL$="NU8R5BR4":SL$="NG2E10BD1
0BR4"
```

***

"Disassembler" (Page 8, Australian CoCo, March 1987)

I forgot to acknowledge the authorship of the subroutines I used in 'the "Disassembler" program and consequently some of them weren't listed in the hardcopy.

Line 255 should read:

```
255  'HEX  -  DEC  ZH=HEX(ZN)
THESE SUBROUTINES ARE COURTESY
OF H. SCHNEIDER FROM FEBRUARY
1984 OF HOT COCO
```

The same applies for lines 271 to 282 inclusive.

Also, line 171 has got the last three characters missing. At present it reads ... 'GOT'. It should read ... 'GOTO 12'.

W. Tritscher

Hint...

LLIST @ 32 CPL on a DMP105

The below program will print out your program listings on a DMP 105 printer at 32 characters per line. Simply load and RUN the program before loading the program to be listed.

```

Draw your own conclusions
with CoCo 3 graphics.....

COCO 3 DRAWING MACHINE

CoCo 3 + Joystick
GRAPHICS UTILITY

REPRINT!!!

by Andrew McLintock

<Ed's note: This program appeared in last month's edition of Australian CoCo Magazine. It appears that the listing was subject to a change in the CoCo 3's DOS. We listed the program with a Rainbow Bits 1.4 DOS residing in the CoCo 3's memory. Sorry folks!>

A WHILE AGO dad got himself one of these flashy new colour computer three's. At first I didn't want too much to do with it probably because I didn't understand half the new commands.

After trying a few different ideas I soon found out that the graphics are very impressive.

That's what Drawing Machine is all about - a way of using the graphics in the easiest way possable. Nearly all the commands can be controlled by the joystick and this was the best way I found to make Drawing Machine easy to use.

There are a complete set of instructions with the program but if they look to be a bit long to put in and you don't want them then DEL 1150 - 1360.

You also need to change these lines:-

1140 RETURN

Get rid of the last command in the last HPRINT command in Line 1130. It is important that line 1370 stays the same line number.

Line 10 is needed if you have BDOS.

You can save your drawings on tape or disk but you will need a CoCo 3 and a joystick.

The Listing:

```
0 GOTO 10
1 '**DRAWING MACHINE**
2 '**BY ANDREW MCLINTOCK**
3 SAVE"148:3":END
10 POKE &H13E,0:POKE&H143,0 'FOR
