IN A NUT SHELL

What a month! Just when I thought there was nothing new, here were all these changes! A few of these were:

* Deon & Meredith

Deon is our new Tandy 1000 person. So if you have a submission to make to the Tandy 1000 section of Softgold magazine, send it to Deon.

If you submit an article or program or whatever, the same conditions apply when you send in submissions to the CoCo section of either CoCo or Softgold - Read the article on "Submitting your Work".

Also, if you have a question regarding earlier Tandy machines such as the Model 1, 3 or 4 or anything to do with MS-DOS equipment, ask Deon. He has a solution to (almost) everything.

Meredith is our new paste-up person. So, if you see any nasty boo-boos in the magazine (which is unlikely, for she's VERY good at what she does), you know that Meredith's been at it - naturally, she's still learning.

This magazine is her first effort - not bad, either.

* Goldlink *642#

"Who?" - that's the reaction we got when we finally got back on-line.

We were off-line for two weeks or so during September due to a dispute with Viatel and our billing. The problem is still unresolved, but hopefully we can finalize it without going off-line again.

Now that we're back, let's party!

* New "Best of" Tapes

In about a month or two, we will be releasing an all new "Best of" series of tape and disks. The subjects on each one will be:

- #12: 16K Games III
- #13: 32K Games III
- #14: CoCo 3 games
- #15: 16K Utilities
- #16: 32K & 64K Utilities
- #17: CoCo 3 Utilities
- #18: CoCo 2 & 3 Graphics
- #19: Education IV
- #20: Adventures II

Most of them are in the development stage and they reflect excellent quality of the magazine - so go to 'em (when we officially announce their release!).

Apart from all the changes, here are some other subjects worth mentioning.

* January Reference Issue

As you may know, the January edition of CoCo, is set aside as the reference issue. In that month, we print information such as error messages, computer vocabulary, computer terms, "peeks, pokes 'n execs" and so on.

We are looking NOW for anything that might be useful for such an edition.

It might be the printer codes for your DMP-200 printer (- we hope to print all the printer codes for each printer so you can easily convert that !#$@@! printer program that won't work on your DMP-130 to something that will work on your printer), or an article on OS-9 terms, or general hints and tips, or ... or ... anything you like!

But we have to have your information early by the the 7th of November, 1987 so we can put it in January's issue.

Please note that we make January's edition late November.

In the last two weeks of December, we have an official holiday (yes, we have holidays, believe it or not!).

* 64K Upgrade Kits

Those who wanted the 64K upgrade kits - terribly sorry for all the delay. We can't seem to deliver what we promised, because of the 'little' trade war between America and Japan!

We hope that we deliver within the next month.

* Surveys

Remember that infernal question and answer sheet we published in September's magazine - the survey form? Well, because we've had such a wonderful response, we are going to extend the deadline to the 21st of October.

We're receiving we'd really like to collate the surveys and publish a report in the following months magazine.

The competition to win 100 disks has been extended to the 21st as well!

See ya!

Alex

LETTERS

Dear Graham & Alex,

I read letters and articles printed in your magazines and feel a lot of the information is worth its weight in gold.

I would like to contribute a little, hopefully useful information.

In your last two magazines you have had people wanting information regarding screen dumps onto a Brother printer.

I have a friend who has a CoCo 3 with a Brother printer. He, too, was pulling out his hair because he couldn't get screen dumps. At his age, he could not afford to pull out any hair - he's seventy years young. Age is no barrier when learning on computers.

Firstly with the Brother printer, you must set the dip switches for either graphics or text.

The settings for text are as follows:

Dip Switch 1: 1-off, 2 & 3 & 4 & 5-on, 6-off, 7 & 8-on, 9-off, 10-on.

Dip switch 2: 1 & 2-on, 3 & 4 & 5 & 6-on, 7 & 8 & 9-off, 10-off.

The settings for graphics are the same for dip switch 1, but for dip switch 2, they are: 1-on, 2-off, 3-on, 4-off, 5-on, 6-off, 7 & 8-on, 9 & 10-off

Now for the screen dump program, parts of which come from many late nights.

```

Please note that this program does a print out of your screen from left to right going down the page. The next bit of information is for a password on the CoCo 3 when using the WIDTH 32 column screen.

Just insert the following program somewhere at the start of your program.

```
1 WIDTH40:PALETTE13,63:PALETTE13,64:PRINT
2 INPUT"PASSWORD PLEASE";A$'PUT ANY PASSWORD PROGRAM HERE
3 'IF PASSWORD IS INCORRECT
4 WIDTH32
5 'IF PASSWORD IS CORRECT
6 'START PROGRAM
```

Going back to graphics to get a copy of a PMODE 4 screen onto disk, or just the picture on the screen, press <reset> or <break> and type in ...

```
SAVEM"filename",3584,9727,3584
```
(for disk)

```
CSAVEM"filename",1536,7679,1536
```
(for tape)

To load either type in ...

```
PMODE4:PCLS:SCREEN1,1
(C)LOADM"filename" <enter>
```

To view the screen, type ...

```
SCREEN1,1:EXEC44539
```

Last but not least, we were all beginners at one stage. I notice in your "Help" section a lot of people write in about programs that have errors such as ?FC or ?TM.

To fix this, people must sit down and study the program - they will find the line causing the error is not in that line, but in some other line.

Eg, 150 A$=K$:B$=S$(5)

There is no error in line 150, so you get complaints. All they have to do is to find the value of A$ or whatever is causing the error by asking the computer to PRINT A$ or whatever.

I hope these hints will come in handy to users.

If anyone wants to contact me regards more Brother printer information or just for a natter about my dear old grey case (computer).

Phone 086-362-546 anytime, just ask for Paul.

Paul Savage,
Crystal Brook, SA

Paul,

Thank you for including your telephone number.

One of the things that is coming out in the surveys is that many people would like to write to authors - or at least be able to phone them. But as it is
a Goldsoft policy to protect authors' privacy, we are only prepared to reveal addresses and telephone numbers where the author specifically includes this information in line 1 of this program, or where it is included in the article which describes this program.

Graham

Hints and Tips

RENUM blues

Ever lost your BAsic program due to a RENUM command, ie you find that your Basic program has been lost when you've RENUMbered it?

Yes? Then type this in - this'll restore that program for you.

```
EXEC &HACEF:CLEAR
```

*

ECB system - CoCo 3 only

The next group of commands create an ECB system. Particularly useful when loading programs off tape that require an ECB environment, without having to unplug the controller.

```
POKE 49152,0:POKE&H134,0:POKE&H139,0:EXEC&H8002
```

NOTE: POKE49152,68:EXEC&H8002 will restore everything to normal.

Black and White Screens (CoCo 3)

Wanted a screen with a (colour) difference? Below are the PALETTES to use if you want a white on black screen.

Width 32:

```
PALETTE12,63:PALETTE13,0:CLS
```

Width 40/80 mode:

```
PALETTE0,0:PALETTE8,63:CLS1
```

REVIEW

by Arthur Slade

Software: Deskmate 3

DESKMATE 3 IS specifically designed for the CoCo 3. It comes with 2 Disks. The first disk contains the operating systems and the Ledger program, where as the second disk has the remainder of the programs, e.g. Calendar, Text, Filer as well as Paint and Telecom.

The disks, on a 2 drive system, switch between each other depending on the application you are using.

However, you are prompted when to change disks, should you only have one drive.

A very comprehensive 205pg manual and a reference card as well come with the package, making it MOST easy to understand.

It requires DECB 2.1 and all you do is type 'DOS' and <enter>.

When Deskmate is booted you are requested (if you want) to put in the date and time.

As the program is written under OS-9 Level 2, you can therefore boot your OS-9 level 2 disk, and at the OS9 prompt type ...

```
OS9:RENAME /D0/CMDS/AUTOEX
 DESKMATE <enter>
```

This changes the AUTOEX file to DESKMATE. At this point there are 2 ways you can access Deskmate programs; from the command line type ...

```
OS9:DESKMATE      <enter>,   or
OS9:DESKMATE DMxxxx  <enter>
```

... where 'DMxxxx' are any of the deskmate program filenames.

For example, say you only wanted TEXT EDITOR and the sample you typed in. At the prompt, type ..

```
OS9:DESK DMTEXT1:SAMPLE  <enter>
```

However all of these features are discussed fully in the manual. There are 8 utilities you can use, acessing each of them by pressing 'ALT*'.

These eight utilities are ...

* FOLDER,
* PRINTER,
* CALCULATOR,
* TIME,
* DISPLAY,
* CURSOR CONTROL,
* HELP and
* ICON.

I will give a brief description of 'Display'.

This utility is designed to let you change the resolution on screen (in TELECOM-TEXT-LEDGER) to a 40 or 80 column format and change the 16 available colours on the colour palette.

The calendar and paint files can only use 40 columns.

The colour palette consists of 3 scales: red, green and blue with which you can alter any of the available colours.

The top 4 colours are specifically designed for the screens; background (BG), foreground (FG), window borders (WB) and the command bar (CB).

Paint is autoset for 16 colour format.

ALWAYS REMEMBER TO BACKUP YOUR DISKS. This can be done firstly by write-protecting your originals, booting Deskmate, and using Deskmate's own FORMAT and BACKUP facilities that are provided.

REMEMBER: You don't have to have two drives to use Deskmate.

You have the option of either Mouse/Joystick or Keyboard.

Much can be written in a review about this particular program, however I can only give you my opinion, and after having spent the best part of a week playing around with it on my 512K CoCo 3, I could find no fault whatsoever.

In fact with the added HELP menus, it is a very user friendly program, and after a couple of days I found I only needed to refer to the reference card, which is double sided.

If you find you need to set up a budget, create a mailing list, set up a calendar schedule or even DRAW a picture, write a letter, then THIS program is for YOU!

I fully recommend it to those of you who own a CoCo 3 - you have everything at your finger-tips.

For a price of $129.95 it IS value, and I rate it a 10/10.

Review product gratefully supplied by Tandy (INTERTAN).

Tandy Products, 91 Kurrajong Avenue, Mt.Druitt. N.S.W. 2770.

Cat No.26-3262.

Look for it at your local Tandy store.

Hints and Tips

*

COPY with fewer swaps

The following will copy fairly large programs on disk with fewer swaps.

```
CLEAR200,32766:POKE25,14:POKE358
4,0:NEW
```

*

*

INKEY redefined

Waiting for a keystroke? Then do it this way! Instead of:

```
10 A$=INKEY$:IFA$=""THEN10
```

... try:

```
10 EXEC44539:A$=INKEY$
```

*

FOLK MUSIC

By Mal McLauchlan
MUSIC
32K ECB + MUSIC II

I'M RAPIDY BECOMING fascinated with MUSICA 11 now that I've come to grips with some of its complexities (complex to me anyway as I know little music theory).

It's a program where you see a representation of the actual sheet music on the screen, and have a great degree of control over the tone (trumpet, violin etc.). Different voices in the harmony can be emphasised to provide more flexibility.

Here I have compiled two "folksy" songs, "Last Night I Had The Strangest Dream" and "You Have To Walk That Lonesome Valley".

Incidentally, along with Telewriter 64 and CoCoMax, I have Musica II working well on CoCo 3.

MACDANCE

By Mal McLauchlan
MUSIC
16K ECB

THE SIMPLE ONE-PART music capability of CoCo, without special software, provides a good vehicle for playing certain types of music.

One type that I have targeted on is the flute-like notes of folk music, such as played for Scottish traditional dances (when flutes became bagpipes).

These dances in their original setting were often performed in a Highland glen with a sole piper providing the rhythmic sounds - music?

My greatest musical pleasure comes from attempting to simulate the complex waveforms of various instruments using programs like MUSIC+ and MUSICA II.

But the simple 1-part music isn't far behind when it comes to personal enjoyment.

Anyway play these 5 Scottish dances and see what you think!

By the way, what I'd like to see in Softgold from some "expert" CoCo 3 graphics programmer, is a super-duper tartan screen. I reckon it would look superb.

WEATHER REPORT

By Harry Hoffmann

UTILITY

32K COCO

TODAYS PROGRAM IS the start of a series of ten programs dealing with the weather. The first five programs take care of the temperature and the second five are about the rainfall.

To give as many people as possible the chance to use these programs, I have written the majority of them to suit the CoCo 2.

The second program prints a chart to the DMP-105, the third one displays the chart in the CoCo 3 HSCREEN, the fourth program displays the chart in the PMODE 4 screen, and the last one prints a chart to the TP-10 printer.

This first program is a data input program. It creates a datafile, which will be used in the following four programs.

You can input any amount of data, (daily temperatures) you like.

After loading an existing file into the computer, the options offered are renewing or extending the file - don't worry about putting in too much data (eg, 32 days per month).

The other programs will choose the right amount of data. If you don't have enough memory, you can omit all comments and possibly the second page of instructions.

Please save this program as ["3tem-dat/bas"] - thank you very much. I hope these programs are of much use to you.

GRAPHIC TO DATA

By Tom Lehane

UTILITY
32K ECB

A GREAT MANY graphic screen pictures are composed using special drawing programs written in either Basic or machine language. The art work from these drawing programs are saved in binary format and can only be viewed by loading back into the computer using the load function from the drawing program or by loading and writing a small program to view them.

The small Basic program consists of two lines as follows:

```
10 PMODE4:SCREEN1,1
20 GOTO 20
```

This will display a M/L screen loaded back into the computer. You can use this small program to view a graphic screen of your favourite game.

Load your M/L game and type EXEC. When a graphic screen is displayed, press the RESET button and write the two line program above and type RUN.

Your game screen should now be seen and held for viewing by the GOTO in line 20.

You can save this game screen using the "SCR SAVE" program accompanying this article.

Please note that the above instruction will only work if the machine language program or game does not auto-start.

The idea behind auto-start software was to make the program easy to load and use.

Software programmers soon found it also stopped piracy of their product and was included in a lot of software made available for the CoCo.

Some copy programs could get around this protection, but in general it was a deterrent.

To have the art work printed in a magazine or sent to a bulletin board over the modem is not possible unless it is in ASCII format.

The program, "GRAFDATA", converts a PMODE graphic screen to a Basic program in the form of HEX$ data statements.

The compiler creates a ready-to-run basic program that is saved to either Disk or Tape.

The GRAFDATA program provides compatibility with tape or disk users, so there is no need to modify any part of the compiling program.

The program PEEKs the start of the current HI-RES screen so it does not matter if you are using a tape or disk system.

This PEEK is also in the compiled Basic program so it can be loaded and RUN even if used by a tape based user and the program was compiled from a disk system.

To get GRAFDATA to compile a graphic screen, you can either load a Basic program that has your chosen graphic picture and RUN the program so it will draw the picture to one of the PMODE screens. Then press the reset button and load GRAFDATA.

This will over-write the previous Basic program but will leave the graphic screen untouched.

Follow the on-screen prompts to view, change PMODE or compile the graphic screen.

The program provides for loading a M/L graphic screen from both tape or disk.

The only thing to note is that a M/L screen saved from disk will not load in to the correct PMODE location from a tape based set up as disk basic uses the normal PMODE area for it's own operations and both graphic PMODE areas start are at different addresses. Tape based user's HI-RES screens starts from 1536 and disk starts from 3584 so to load a M/L saved screen from disk in to a tape based system the program would be loaded 2048 bytes above the normal start address.

For the same token if a tape saved screen was loaded in to a disk system the M/L screen would be loaded onto disk Basic's operations area.

Once GARFDATA has compiled your graphic screen into a Basic data program, it can then be loaded into both tape and disk systems and RUN without any further changes.

Due to the large amount of memory to be compiled from a PMODE 4 graphic screen, the program can be a little slow. If detail is not of great importance the graphic screen could be compiled from PMODE 0 to save time when sending data over the modem.

NOTE: The screen would have to be drawn in PMODE 0 not compressed from PMODE 4.

SCR SAVE program ....

TAPE READER

By Malcolm Patrick

UTILITY
32K ECB COCO

I AM A HORDER of programs. Like most CoCo nuts, I save everything on tape because that is the safest place to store programs for any length of time.

Over the months I have accumilated many tapes and consequentially keep forgetting what was on the tapes.

Well that problem is now solved. I have written a program that will read the names and types of the the program and then save these titles to disk.

These titles are saved in an ASCII format and are then read in with an ASCII-read program. I use Telewriter-64 for my ASCII-read program.

MAKE SURE the LAST title on your tape is named "END/BAS", as this will allow you to go into the save mode.

The program is self-prompting and simple to use. I welcome any suggestions that you might like to make, through the magazine.

The Listing:

```

HINT:

A "SKIPF" for disk

Want to verify the existance of a program on disk without having to type 'DIR', 'LOAD' or whatever from a Basic program? Then try this below, typing it in EXACTLY as shown below.

NOTE: This will work only on a DECB 1.0/2.0 DOS. IF you have a DECB 1.1/2.1 DOS, then change '51338' to '51512'.

Also change '&HC65F' to '&HC68C'.

```
A$="filename/ext":EXEC 51338 A$:
EXEC &HC65F:A=PEEK(&H973)
```

DISKLOCK

By Harry Smith

UTILITY
COCO 3 + DISK

DISKLOCK IS A utility I wrote to prevent unauthorized access at any information stored on a disk.

This program has many benefits and can be used in many ways. For example,

* It could prevent unauthorized access to programs being developed.

* A parent could lock up all the games until the children have completed their homework.

* It could be used to protect home financial and budget files, and ...

* Teachers could use the program to secure test files and test results.

Just about everyone has something they would like to secure!

When the program is first run you are presented with the title page - just follow the prompts.

Instructions and a program description are included within the program. Two passwords are required to operate the progam and are requested before the main menu can be used.

As a Basic program this causes a problem as anybody can list your program to obtain the passwords and unlock protected files. The best method I have found to make the program secure is to place your passwords in line 380 and use a program called "Loadmask" by Glen Dahlgren which is contained on page 24 of the February 1987 edition of American Rainbow Magazine.

This program is a machine-language loader that fools the computer into thinking that the Basic program in memory is machine language. The program also encrypts the Basic program which stops the Basic programs being listed or LLISTed to a printer after it is loaded.

The program contains POKEs to disable the LIST command and POKE113,0 which will perform a cold start if the reset button is pressed. The combination of these POKEs, the ON BRK GOTO command and the encryption by "Loadmask" make this a very secure program (althogh it could probably be broken into by a very good programmer).

I hope that you can find some way in which to use this program - I have used it myself on many disks without any program loss or disk crashes.

I would, however suggest that you should only use the program on backup disks, not your originals.

No liability will be accepted for any program loss as a result of use of this program.

I also welcome improvements and enhancements to the program. If you do make any changes, please don't keep them for yourself, send them in to Softgold magazine so that we all may take advantage of your ideas.

NOISEWORKS

By Steve Youngberry

ARTICLE

IF YOU ARE A beginner when it comes to programming then this idea will probably be a nightmare.

If, on the other hand, you just want an end result, then you might find this of some interest.

Those of you who know anything about M/L after reading this might make a noise that goes like this: YECH!!!.

The idea is to have M/L sounds instead of Basic <POPS> and <SQUEAKS> in your Basic program.

If you don't know how to program in M/L then you (like me) are up the creek.

Well not any more! While this may be a long winded process, it does have the desired end result - a Basic program with M/L sounds and music.

First you need a couple of programs. The first program is "Music+" from July '86 and the second is "Data Generator" like the one from CoCo June '85.

The first thing to do is to RUN "Music+" and discover your new sound, be it effect or music.

After you are satisfied, you then save it onto disk or tape.

Exit "Music+" and RUN "Data Generator" and convert your M/L file from MUSIC+ into Basic DATA statments.

Easy so far.

In theory you could have up to 10 different sounds by using the DEFUSR function. I ran into some trouble with a lot and you also end up with a page of data statements VERY quickly.

Next comes the merging - disk users will have no problem. Tape users will have to use a merge program or print out the listing and retype it in after you have CLOADed your program (or look up January's 1986 edition of CoCo in the Hints and Tips sections of the magazine. There's a hint there relating to merging two basic programs if you only have a tape. -ed.)

Don't forget to RENUMber your program accordingly. You can use more than one sound, but you must not overlap the M/L subroutines.

Work this out by subtracting the address of the first byte from the address of the end byte of the first M/L subroutine and then add the result +1 to the start, end, and exec address of the second subroutine.

Now somewhere along the way you may notice the nice little tune becomes an unbearable noise (I don't know why ...).

Someone somewhere will be able to tell us why (I hope they do).

Also, the manual tells us to save Basic's stack pointer before using the USR fuction and restore it before going back to Basic if the M/L subroutine is more than 30 bytes long.

I couldn't find the stack if it bit me nor could I save or restore it.

Maybe this is where I'm going wrong. Anyway, it is workable and the sound effects are much better than Basic's.

Below is a little help.

```
10 CLEAR19712,951:CLEAR20285,573
```

This clears enough memory for two subroutines. This line generaly caused am OM error so I deleted it (what ever works).

```
20 FOR A=19712 TO 20663:READ Q$:
POKE  I,VAL("&H"+Q$):NEXT  A
30 FOR A=20664 TO 21237:READ Q$:
POKE I,VAL("&H"+Q$):NEXT A
```

With "Music+" the start and exec addresses are always the same, so in line 30 the data is POKEd into addresses 951+1 higher than the first routine. (951=len of the first routine +1)

```
40 DEFUSR0=20100:DEFUSR1=21051
```

WORKING DATA STRUCTURES *Pt 3*

By John Redmond ARTICLE

FOR THE LAST TWO months, we have been discussing some aspects of writing a full screen editor in Forth, and how the correct data structures can make the program more elegant and efficient. This time, we look at an ASCII file as a data structure.

The simplest text file is simply an unstructured stream of characters, with an End Of File mark, which might be 0 (ASCII null) as in Unix, or 26 (control-Z) as in CP/M. Within such a file, there will probably be control characters, such as 13 (for carriage return), 10 (line feed) and 9 (tab). These will affect the way in which the text will be displayed on a screen or a piece of paper.

The EDTASM+ line editor saves a text, to tape or disk, in just this way. But, when it loads such a file, it holds it in memory as a linked series of dimensioned strings (see 'Data Structures in Forth' a few months ago).

I mention this, only to make the point that there are several ways of handling text, but we will not pursue this sort of structure further at this stage.

In some ways, Forth seems to show its age. The text file which it uses is the very simplest, and it relates directly to the way all data are saved on disk. Regardless of data type, this is done in 1k blocks and, for text, the 1k is organized into 16 lines of 64 characters.

There are NO control characters, like carriage return. When the text is displayed on screen, during an edit, the lines are normally placed in the middle of the screen, with work and prompt space above and/or below. If a line is altered, it is immediately updated, in its proper place, on the screen.

If a line is to be printed, it has first to be found in the text buffer. I would prefer to avoid the intricacies of Forth virtual memory management at this stage, but suffice it to say that a disk screen (say number 27) can be got into memory by 27 BLOCK. BLOCK does all the work of finding a buffer for the screen and reading it from the disk into the buffer.

When it finishes the job, it returns on the stack the address of the memory buffer that has been allocated. For our present purposes, this value can be saved in a variable:

```
VARIABLE BUFFSTART

27 BLOCK BUFFSTART !
```

Now, logically, this buffer is considered as a 16 x 64 array of characters (bytes). The first 64-character line (line 0) will start at the address given by BUFFSTART @.

The addresses of other lines are best given by a special word:

```
: LINESTART ( #line--add)

  64 * ( get array offset)

  BUFFSTART @ ( base add)

  + ; ( line add)
```

LINESTART expects a line number on the stack and returns the address of that line. Very easy, but note that LINESTART does no range checking (what if the line number is negative, or greater than 15?). The checking should be done somewhere else in the program, where the line number is thought up in the first place.

Once we have the address of the first character, we can do things with the line. Because we are going to use the value many times in the program, it is best to define ...

```
64 CONSTANT /LINE
```

This name is pronounced 'perline'. What perline? Characters, of course! If we want to type line 4 (say), we code ...

```
4 LINESTART /LINE TYPE
```

But maybe there are not 64 characters on the time - perhaps only 41? Then we will code ...

```
4 LINESTART -TRAILING TYPE
```

Remember that -TRAILING (pronounced 'not-trailing') trims trailing spaces from ASCII strings. It is very useful for speeding up writing to the high-resolution screen (why waste time writing spaces?).

Remember, though, that a full-screen editor must put the lines in their proper places on the screen. If we have no spaces wasted at the top, line 4 of the text will appear in the position for logical line 4 on the screen, and this is where the cursor must be placed before starting the print.

This is done with TAB.

```
  0 4 TAB
```

... will do the job, but it is better to define a special word

```
: .LINE  ( #line)

 0 OVER ( get line no)

 TAB ( locate cursor)

 LINESTART ( obvious)

 -TRAILING ( trim line)

 TYPE ; ( display it)
```

As the editor is implemented, there is space taken at the top of the screen, for messages etc., so that this definition will not put the line in the correct position. Assume that four lines are used at the top and we have another short

definition ...

```
: +TOP  4 + ;
```

Now, all we have to do is insert +TOP before TAB in the above definition and we have the desired display.

But there are other things the editor needs to do with the text strings. We need to move lines, and to insert and remove them. Want to move line 4 to line 11?

```
4 LINESTART 11 LINESTART /LINE

CMOVE
```

Feel the power? Want to remove a line? Before we do that, we must recognize that the buffer has a fixed length - and has an end.

```
1024 CONSTANT /BUFFER

: BUFFEND  ( #buff--add)

  BUFFSTART @ /BUFFER + ;
```

Note that we have defined BUFFEND in terms of the value contained in BUFFSTART at the time BUFFEND is invoked. It is NOT a constant but, as far as the calling program is concerned, it is indistinguishable from a constant, like /BUFFER. Each is only a single word, but how they do their jobs is no business of the rest of the program. Such information hiding makes software maintenance very easy and orderly.

The job of removing a line comes down to 1. moving a block of text from the start of the next line down to the start of the current line; and 2. filling the last line with blanks. The main problem in part 1. is determining the size of the text block to be moved.

This is given by the difference between BUFFEND and the start of that next line (think about it!). Part 2 is easier: the address of the last line is given by BUFFEND /LINE - and the standard Forth word, BLANK, is used to fill it with the correct number of ASCII spaces. Therefore

```
: XLINE  ( #line)

  DUP 1+ ( #next line)

  LINESTART ( its add)

  DUP ( extra copy)

  ROT ( # this line)

  LINESTART ( its add)

  BUFFEND

  ROT ( add next line)

  - ( block length)

  CMOVE ( do the move)

  BUFFEND  /LINE - ( last)

  /LINE BLANK ;
```

It's worth saying here that the definition of XLINE is about as long as any word definition should get. There are two Forth dirty words (DUP and ROT) in the definition. These are part of the tremendous power that a Forth programmer has over her/his data stack.

The values are there, but they are so abstract that they don't even have names. No other language has such mystical powers, but things can get out of hand. By using the dirty words OVER, DUP, SWAP and ROT excessively, it is possible to write code that is just as obscure as C.

This is a lesson that every budding Forth programmer has to learn personally. If there are lots of dirty words, the definitions are too long and/or the code is badly factored. (Ironically, the textbooks say that C definitions should be short and well-named, but noone seems to have heeded that advice.)

While I'm on my high horse, I point out the lack of punctuation in Forth. It doesn't need those awful commas, colons, semicolons and brackets. It gets by with the humble space, assisted by good factoring and the much-maligned postfix notation.

Is it just possible that those other languages are wrong after all?

Well, that's all for a while. I feel that gentle reader is due for a spell without me, but I also feel that s/he needs a spell WITH Forth. As always, I'm available at 23 Mirool St., West Ryde, NSW 2114 or (better) (02)-85-3751 after 7pm.

Come Forth!

From p16

```
640 IF DS=9 THEN MID$(B$,120,LEN

800 GOTO 470
810 WIDTH32:RGB:POKE65496,0:END
```

From p16

This tell the computer where to find the routine when you call it.

```
50-???? program
100 P=USR0(0)
```

EXEC the first routine by typing ...

```
150 O=USR1(0)
```

EXEC the second routine ...

```
200 DATA,,,,,,,,,
```

To explain the DEFUSR and USR functions refer to the manual - I can fumble though them, but I'm not really sure what goes on.

If anyone can simplify this method or gets lost trying to follow it, drop me a line or a phone call will eventually get to me.

My address is PO Box 244, Tara, 4421

AUTO EXEC AND PASSWORD

By John Baker 32K ECB + EDTASM+ OR SOME SORT OF ASSEM

IN JUNE'87 COCO, there was a program written by BILL SNOW on how to Auto-execute Basic programs and password protect them.

I found a way to combine the AUTOLOAD program into my assembly program to enable Basic and Machine language programs to auto-execute.

In listing 1, you will see in line 10 that the program begins with ORG 386 - this is a RAM HOOK. There are a few of these in the Basic operating system.

They are changeable so that you can direct Basic to the beginning of your program with a JMP START.

There are other ways but they are more complicated.

In line 40 my logo is placed on the screen while loading - this can be changed for your own needs.

Line 80 is the beginning of the password routine. The password may be changed for yourself by changing the word in line 370 to your own and by changing the LDX #n value in line 230 to the length of your password.

Line 680 is the start of the auto load and run program from Bill Snow.

Listing 2 must begin with lines 5 + 6. All of your programs must have lines 5 + 6 and begin at line 10.

This is so nobody may escape the password subroutine.

You may not even want password protection in your programs.

If so, simply delete lines 70 to 600 and delete lines 5+6 of your Basic programs.

You may not want the front logo either - if so, simply delete lines 30 to 60.

First, save your assembled program straight after your Basic program. Leave the record and play keys depressed during it.

Oh! And one other point - when saving the assembly language part make sure it has the same name as the Basic program.

Any trouble? Write to
John Baker
63 Tucker Rd.
Moorabbin, 3189

CONVERSATION

by Martin Eade

GAME
CoCo 3/CoCo2 Modifiable

CONVERSATION IS mainly for fun but is a good demonstration of several Basic techniques.

It has set responses to around 75 words and is based on a program found in "Better Basic" by B. Reffin Smith & L. Watts.

Any sentence can be entered and it will either randomly generate a sentence or print a response to your last one.

It incorporates the triple speed poke, so it may not work on some systems without modifications.

So if your CoCo can't stand the triple speed POKE, then get rid of it.

ILLUSION

By Nicholas Fuller

EDUCATION GRAPHICS
COCO 3

WRITTEN FOR THE CoCo 3, "Illusions"'s aim is to demonstrate common optical illusions. Most programs for the CoCo in education seem to be aimed at primary school students - well, what about high school and uni students?

I hope this program goes a long way in achieving it's aim for uni and high school students.

This program has all the instructions for the different illusions. I intend to write more programs for high school students in the near future.

This is a really interesting subject which deals with our "perception" and just some of the illusions include, The Necker Cube, Ponze Illusion, Size and Perspective.

Have fun!

YAHTZEE

by Frank Woodward

32K ECB
GAME

by Frank Woodward

THE OBJECT OF YAHTZEE is to obtain the higest score. Each player may roll the dice up to 3 times before having to enter their score in one of the 13 sections.

On each roll you may keep any of the five dice to produce the desired combination.

Press <enter> for yes, or "N" and <enter> for no. If you make a mistake press "R" and <enter>.

Each player must complete the full 13 sections and is invited to enter their player number 1-4 to enter their score on their score card.

Sections 1-6 score the total of all dice. A bonus of 35 is awarded if the total of these sections is greater than 62.

A "yahtzee" is 5 dice all the same and a bonus of 100 is awarded for every yahtzee after the first in any one game.

The other sections are self explanitory.

Have fun, and may the best one win!

SCREEN DRIVER

By Russel Lucas
UTILITY
COCO 3

I'VE FINALLY DECIDED to send you one of the many programs that I have written over the last few months for the CoCo 3.

This program is a simple screen driver utility that allows you to display up to twelve programs on the screen at once.

An inverse video function is used to show the present cursor position and pressing <enter> will load the selected program.

The <esc> key can also be used at any point to return to Basic.

There are two data lines that must be entered by the user before running the program.

These are lines 430 and 440. Line 430 will contain the data that the user wishes to have displayed on the screen and line 440 is the actual file name of the program.

This is so you can have the actual name of a program displayed on the screen, even though the name may be abbreviated on the disk.

If you have less than twelve files that you wish to load then you must fill the remaining files with the minus sign (-) to show that space is not a program, eg:

```
430 DATA 1,2,3,4,5,6,7,8,-,-,-,-
```

The last four minus signs show that there is no program present for that space and if one is chosen then nothing will happen.

I originally wrote this program to support machine language programs only but it can easily be changed for Basic programs by changing the 'LOADM B$(T)' in line 210 to read 'RUN B$(T)'.

This utility is good to place on all your disks with the relevant programs displayed on the menu.

It is especially good for those who are unfamiliar with the computer and can easily type RUN "STARTUP" and have an easy to use screen driver.

The Listing:

```

■

COLOUR SCREEN DUMPS

By George McLintock UTILITY 32K ECB COCO + CGP-220

WHEN TANDY CLOSED the Computer Centre here in Canberra, they sold off a number of items which have been discontinued for some time. One such item was a number of ink jet printers, sold at a price that I found irresistible when I brought one.

The CGP-220 Ink Jet printer was never a big seller for Tandy. It was expensive (Over $1000 some years ago), and its print quality as a printer was not very good. However, as a colour printer for screen dumps it is superb.

The printer provides four basic ink colours, black, red, green and blue. A further three colours can be obtained by a single overprinting of the red, green and blue inks to get yellow (red & green), magenta (red & blue) and violet (green & blue). The eighth colour available is no colour (white or paper colour). The printer does not allow overprinting with the black ink.

While this is adequate for the 4 colours of Pmode 3, it is only half the number of colours available with Hscreen 2 of the CoCo 3.

The CoCo screen dump provided by Tandy for the printer was also quite limited. You could select one of three colours for the background, and this fixed the other three colours for the dump.

Eg, if you selected green for the background, then the other three colours were yellow, blue and red. This setup could not be altered.

After I got the printer, I set out to develop a more flexible screen dump that would provide more colours and allow any pixil colour to be set to any printer colour. Along the way I've also provided for different scaling factors for size of dump, and for a different coloured border and margins to be added to each screen dump. The dump will operate on any of the Pmode's or Hscreen's in the CoCo.

Although the programs themselves may be of limited interest (I don't think there are many CGP-220's around - and although six were sold in Canberra recently, at least two of these are not on CoCo's),

The procedures for generating more colours from the basic set may be of more general interest.

Also, while I have not checked the specific details of how other colour printers generate their colours as they move across the page, it should be fairly easy to convert these programs to suit any other printer that follows the same general procedure for printing colours.

Producing Colours with the CGP-220.

The CGP-220 has two basic modes of operation. In its normal mode, it operates as a standard Tandy printer with a colour option. Any of the 8 basic colours can be selected for normal printing and normal graphics, ie graphics as seven bits per row of print, with the high order bit always one.

In this mode, a normal Tandy printer screen dump will work without modification except for changing the control codes to start graphic printing.

If the colour is selected before the dump starts, you can get a single coloured dump by using any of these existing programs.

The single colour replaces the normal black for these dumps.

There are some other interesting options for printing in normal mode which are not standard for Tandy printers but these are not covered here.

The other mode of operation is colour scan mode, which effectively prints a single row of dots across the page, with the colour of each dot specified independently.

The colour of each dot is specified by a combination of three bits. If all three bits are off, the printer prints a black dot. If all three bits are on, then it prints no colour at all.

The first bit controls the red colour, the second bit the green colour, and the third bit the blue colour. If these bits are on then it prints that colour in the dot position.

Hence if the first bit only is on, then it prints a red dot, and if both the first and second bits are on then it prints both red and green to give a yellow in that dot position. As noted, if all bits are on then it prints no colour.

This setup provides for the 8 basic colours that can be produced by the printer.

The number of dots to be printed in colour scan mode can be varied. The printer allows for a maximum of 640 dots across the page, (which produces the 91 characters per line of normal text that can be printed).

For these screen dumps, I've set it up to print all 640 dots in each line, and set dots to white which are not required for the dump.

In this situation, each line of dots to be printed requires 240 bytes to be sent to the printer (plus 3 bytes for control codes). The first 80 bytes contain the bits that control the red colour for each of the 640 dot positions across the page. Each bit in these 80 bytes corresponds to the dot positions for the printer starting from the left. The next 80 bytes control the green colour, and the last 80 bytes are for the blue colour.

The dump operates by starting with a string of 240 bytes with all bits zero. A machine language routine then sets the bits on as required to dump that

line of dots, and the string is then printed with a PRINT#-2 command in Basic.

Getting more Colours

The 8 basic colours are produced by printing each dot in the colour desired, so that it fills an area of the paper in that colour to correspond with an area of colour on the screen.

Whilst this is obvious, it forms the basis of describing how other colours are produced.

For example, if the area of the screen for (1,1)-(10,10) is red, and you want this area to be red on the paper, then you print all corresponding dots on the paper in red. ie

```
R R R R R R R R R R
R R R R R R R R R R
R R R R R R R R R R
```

... etc for 10 rows

I have developed four variations to this normal pattern which are outlined below. The detailed logic is covered later.

Two Coloured Patterns

The first variation to this is simply alternating colours, which I have called two colour patterns. For example a lighter red can be produced by alternating red and white dots as follows:

```
R W R W R W R W R W
W R W R W R W R W R
R W R W R W R W R W
```

... etc for ten rows

The general form of this pattern allows you to mix any two colors, and the 8 basic colors allow 28 different patterns (7+6+5+4+3+2+1)

eg red and black gives a darker red, while red and green give a sort of variation of yellow to a brown.

Multiple Colour Patterns

The next variation is a simple moving colour pattern which I have called multiple colours. eg a 4 color pattern of red, green, blue and yellow would be ...

```
R G B Y R G B Y R G
G B Y R G B Y R G B
B Y R G B Y R G B Y
Y R G B Y R G B Y R
```

For this one I have provided two options for how it repeats at the end of the basic pattern (ie after 4 rows). The first option continues to repeat the same lines from the start, while the second option counts back one colour at a time

eg for option 1 the next 4 lines would be ...

```
R G B Y R G B Y R G
G B Y R G B Y R G B
B Y R G B Y R G B Y
Y R G B Y R G B Y R
```

While for option 2 they would be ...

```
B Y R G B Y R G B Y
G B Y R G B Y R G B
R G B Y R G B Y R G
G B Y R G B Y R G B
```

The general form of this pattern allows for a very large number of different colour patterns to be produced. The colour sequence can be of any length, and it can be set to repeat after any (different) number of rows. The fixed bit of logic for this one is that each line starts with a different dot colour to the one before it.

"This program will print pictures in eight colours"

Colour Blocks

The third variation removes the restriction that the colour changes for each line printed. I call it colour blocks.

There are effectively two variations of this pattern depending on the value of the parameters set.

The first variation is effectively an extension of the two colour pattern to blocks of colours that can extend to multiple colours.

For example, a two colour block of three colours, red, green and blue could take the following form ...

```
R R G G B B R R G G
R R G G B B R R G G
G G B B R R G G B B
G G B B R R G G B B
B B R R G G B B R R
B B R R G G B B R R
```

Within this variation there is another option to have the rows repeat in the same fashion, or to count back by colour blocks. Follow this along similar lines as this option obtains multiple colours.

Again there are a very large number of patterns that can be built up using this procedure. It has the same flexibility for varying the different parameters as provided for multiple colours.

The second variation allows for stripes down the page. In effect the colours don't move at all. (The increment is zero). Using the example above for stripes would be ...

```
R R G G B B R R G G
R R G G B B R R G G
R R G G B B R R G G
```

... without any change

Row Colours

The final variation included is one which allows rows of colours across the page. eg 3 red, 3 green, 3 blue etc. Again in any combination to provide a large number of choices.

Parameters for Colour Paterns

Each colour pattern is set up as a series of parameters which are accessed by a ML routine to determine the color of the next dot to be printed.

The parameters for each of the variations are specified below, together with a brief outline of the logic used for the print operation.

This should help clarify the various options that can be obtained.

Parameters common to all options are ...

.This screen pixil

The printer colour patterns are set up independently of the screen dump to be performed. This parameter links the printer colour pattern to a screen pixil colour for the dump, eg if the parameter is 2, then this colour pattern will be used for the screen pixil colour that equals 2 when it is extracted from screen memory.

As borders and margins for the dump don't have a corresponding screen pixil number, I use numbers greater then 64 to

represent these areas of the dump, where the same colour is not used as a screen pixil.

This also allows the same printer colour to be used with different screen pixils, eg if pixil 1 and pixil 2 are both set to the same printer colour (Multiple copies of the same printer colour are allowed), then they will both appear as the same colour in the dump.

A similar procedure can be used to eliminate colours from the screen. By setting them to the same printer colour as the background, they will not show in the dump.

.This colour

Represents the position number of the next colour in the pattern to be printed. It is a signed number from zero to the number of colours in the pattern, and is updated after each dot is printed.

.Start colour

Represents the position number of the colour to be used for the first dot in the next line printed. The 'this colour' parameter is set to the start colour value at the beginning of each line printed, and the start colour value is then updated for the next line.

The number of parameters for each colour pattern within a pattern type, has to be the same so that they form a table which can be searched by the program. The two colour pattern has only two colours and these are stored as part of the parameter list.

However, the other patterns allow for a variable number of colours in each pattern, and the actual colours to be used are stored in a different part of the memory. This also allows the same series of colours to be used by more than one colour pattern.

Other parameters common to these three options are:

.Start address of colours

Contains the memory address where the colours for this pattern start.

The parameters for start colour, this colour etc are used as displacements from this address to find the actual printer colour to be used for the dot to be printed.

As coded, the displacement is a signed value, so that if the number of colours exceed 127, you have to arrange the colours in memory to suit.

.Number of colors in the pattern

This is used in association with the start colour to determine when to reset the start colour to the begining of the colour sequence.

Each time the start colour is altered, it is compared with the number of colours in the pattern, and is reset to zero when it reaches this value. Specific parameters are ...

Two Colour Patterns

0=this screen pixil
1=start colour
2=this colour
3=first colour in pattern
4=second colour in pattern

The this colour value alternates between zero and one after each dot is printed across the line.

The start colour alternates between zero and one after each line is printed.

Multi-Coloured Patterns

0=this screen pixil
1=start colour
2=roll start
3=switch for up/down
4=this colour
5=number of colours
6&7=start address of colours

Each time a dot is printed across the page, this colour is incremented by one and compared with the number of colours in the pattern. When they are equal, this colour is reset to zero.

For each line printed

- If the switch for up/down is zero, then the start colour is increased by one and compared with the roll start value. When they are equal, the start colour is reset to zero
- If the switch is positive, then the start colour is increased by one and compared with the roll start value. When they are equal, the switch is set to a negative value
- If the switch is negative, then the start colour is reduced by one and compared with zero. When it becomes zero, the switch is set to positive again.

Colour Blocks

0=this screen pixil
1=start colour
2=roll row
3=switch for up/down
4=this colour
5=number of colours
6&7=start address of colours
8=this increment
9=roll increment
10=colour increment for each roll

Each time a dot is printed across the page, this colour is incremented by one and compared with the number of colours in the pattern. When they are equal, this colour is reset to zero.

For each line printed

- if the up/down switch is zero
- this increment is increased by one and compared with the roll increment value
  : if less than, no other action occurs
  - when it equals the roll increment value
  : this increment is reset to zero
  : the start colour is increased by the colour increment for each roll
  : and the start colour is compared with the roll row value and if it is less than, then no further action occurs
  : when the start colour reaches the roll row value, the start colour is reset to zero
  : If the up/down switch is non-zero then positive and negative values are used in a similar way as for multiple colours
  : ie the start colour is increased or decreased by the colour increment for each roll
  : and compared with the roll row value or zero depending on the switch setting
  : when it reaches its limit, the switch is altered to count in the opposite direction for the next change.

Row Colours

0=this screen pixil
1=start colour

2=roll row
3=row count
4=this colour
5=number of colours
6&7=start address of colours

These parameters are not altered after each dot is printed. The same value of the colour is used across the page.

For each line printed, the row count is increased by one. When it reaches the roll row value, the start colour is increased by one, and the row count reset to zero.

As with all patterns, when the start colour reaches the number of colours in the pattern, it is reset to zero.

A switch to count up and down the colours is not included with this pattern because it is easy to include this feature in the colour patterns without requiring extra code.

Normal Printer Colours

There is another table in the system for normal printer colours.
It consists of ...

0=this screen pixil colour
1=printer colour

Features Common to all Patterns

Printer colours are represented by the values 1 to 8, where ...

1=red
2=green
3=blue
4=yellow(1&2)
5=magenta(1&3)
6=violet (2&3)
7=black
8=white

The values in the colour patterns themselves must be standard printer colours (1 to 8). If a value is outside this range, it will be printed as white (colour 8 - no colours)

I did consider allowing colour patterns to be set up in terms of other patterns, but that becomes a bit complicated and seems a little excessive at this stage.

Program Operations

The screen dump itself is a Basic program which makes extensive use of machine language routines for most of the work. The high level control logic and setup of parameters is coded in Basic, with the ML routines used for the low level detailed data manipulation.

The dump is performed by a sequence of two quite separate operations.

The first operation extracts the pixils from the graphic screen memory and puts them in the pixil buffer, where each pixil occupies a separate byte of memory.

The second operation then sets up the print buffer as a completely separate exercise. The print buffer is 240 bytes long, and forms part of the string (A$) which is printed by Basic. This string (A$) is 243 bytes long, where the first three bytes are control codes for the printer, and the rest forms the print buffer.

The setting up of the print buffer, and printing of coloured pictures can in fact be performed without the first part being used at all. So long as the parameters for the ML routine are set correctly, and suitable data put in the pixil buffer, coloured pictures can be drawn without accessing the graphic screen memory.

The program that prints out all colours defined uses this approach, and other possible uses are outlined later.

Setting up the pixil buffer

This folows a conventional procedure to extract the bits for each pixil in the graphic screen and putting them into separate bytes in the pixil buffer. The number of bits per pixil and bytes across the screen for the different graphic screens are set up as parameters in the direct page before the ML routines are entered.

Separate entry points are provided to extract the pixils from either across the screen or down the screen, depending on the parameter vaues set.

Setting up the print buffer

The print buffer is set for 640 dots across the page for all dumps. The ML routines move across the line, setting each dot colour as it goes. The left margin and border are set first, then the dots are set for each pixill in the pixil buffer, and finally the right border and margin.

By changing the size of the left and right margin, it is possible to locate the dump anywhere across the page

For each line set in the print buffer, the program updates the parameters for all colour definitions as described above. Similarly, as each dot is set the parameters are also updated as described for each dot. This is necessary to ensure that the colour patterns print consistantly across and down the page.

Each dot to be printed has a value associated with it, which is either the value of the pixil as extracted from the graphic screen, or a value to represent one of the borders or margins. Once this value is selected, the routine then searches the table of colour definitions to find the matching printer colour that corresponds with that value, (this value is the first parameter for each colour definition).

When the matching printer colour is found, the routine then picks up the value of the corresponding basic printer colour to be printed, (also included in the list of parameters for each colour definition), and sets the bits in the print buffer to print that colour in the dot position.

In all cases the updating of the parameter list for each colour definition includes the value of the next basic printer colour to be used, (it is called 'this colour' in the parameter list, and is parameter 4 in all colour colour definitions except the two colour one).

This approach provides a convenient way of breaking down the logic for the whole operation into reasonably sized components for coding and testing.

It also means that a large part of the overall program logic is completely independent of the specific colour printer being used and how it actually controls its printing of colours. The only change required to suit any other printer that also prints a single row of dots across the page, is to the small routine which actually sets up the bit pattern in the print buffer to generate the colour required in each dot position.

If no printer colour definition is found to match the

value being searched for, the printer colour for that dot is set to white (or no colour).

Memory Usage

While the ML code itself is relocatable, the way in which the colour patterns are defined is not. Although the colour patterns could be made relocatable, it hasn't seemed to be worth the effort at this stage. Hence the ML routines must occupy a fixed area of memory and cannot be incorporated at the end of a basic program

As now set up, the ML routines and colour definitions occupy protected memory above address 26000. The ML routines themselves occupy less than 1000 bytes and the remainder is used for colour definitions. While this is reasonable for a 32K machine, it could be compressed to fit in a 16K machine if nesessary. The CoCo3 routines would not be required, and memory usage could be reduced considerably by reducing the space for colour definitions.

The two main dump routines are stored from 26000 upwards, with the colour definitions following. Space is available for 28 two coloured patterns, 25 row colours and 100 each for multi colours and colour blocks. There is still approx 1K above this for other uses.

In actual fact this is not a very good way of organising things, but it works, and at this stage I don't feel any real need to change it.

The ML routines use a large number of parameters and tempory storage for variables. To make the code relocatable, I've used the direct page register to point to this area, and located the direct page for this purpose with respect to the Pmode graphic screen pages.

Reference addresses are stored by Basic at Hex BA for the start of graphic screen, and Hex B7 for end of graphic screen.

For the Pmode 3 dump, the program sets Pclear 5, and uses the fifth graphic page as the direct page for data storage.

The method used to access the CoCo 3 graphic screen requires all program code and data used to be located below address Hex 2000. This is achieved by setting PMODE 0,1, which then locates the direct page for data storage in the second graphic page. (The start of the direct page is taken from location Hex B7).

The program code used to extract the pixils from the CoCo 3 screen is then moved to the first graphic page (Obtained from Hex BA) and executed from there.

As both the pixil and print buffers are set to follow the direct page area of memory, this effectively puts both these buffers below Hex 2000 for the CoCo 3 dumps.

Improved Memory Storage

Most of the problems associated with memory usage are associated with the way I've defined the different colour patterns, with these programs being developed in a sequential fashion.

With the knowledge gained from doing it this way, I feel it would be better to use the same number of parameters to define all colour patterns. It could be done with 12 parameters and the same 11 as for colour blocks plus one to show the type of pattern to be used

While this would waste some memory for the definition of all patterns, it would allow the definitions to be grouped into a single table, with a single area of memory devoted to it, and another single area of memory to be set aside for colour specifications.

The way it is now set up is that sufficient memory is provided in a single block for a maximum number of each colour patterns, repeated four times.

Also with a single table, it would be more reasonable to code the definition of patterns to be relocatable.

But at this stage I don't intend to recode it that way, perhaps later on.

Size and Rotaion of Dump

The 640 dots across the page allow for the doubling of the size of the dump for the Hscreens 1 & 2, and for two and a half size for the Pmode 3 screen (with normal rotation). If the dump is rotated 90 degrees then all screens can be dumped at three times normal size. These dumps allow for the three times size.

The scaling up of the dump is applied at the time that the pixils are extracted from the graphic screen. For example to double the size of Hscreen 2, the pixil buffer is set to 640 bytes, and each pixil extracted from the graphic screen is stored in the pixil buffer twice.

The actual printing of the dump is done with a FOR .. NEXT loop in Basic. At double size, for each of the 192 lines down the screen,

- a line of pixils is extracted from the graphic screen and put in the pixil buffer, with each pixil duplicated in the pixil buffer,
- to get a doubling of size down the page, the routine to set up the print buffer is then executed twice, using the same set of pixils each time.

In this situation you can't simply print the same print buffer twice, because the colour patterns will not be updated if you do. The execution of the routine to set up the print buffer is required to update the parameters for each definition.

For the Pmode 3 screen, each screen pixil is in fact two dots wide for a normal size dump, and only one dot deep. It is this aspect which allows the screen to be dumped at two and a half size. For this size, each pixil is extracted five times into the pixil buffer to get 640 dots wide.

To get the two and a half size down the page, the dump alternates between 2 and 3 repeats for each line of pixils extracted from the screen.

OTHER SIZE OPTIONS

Larger sized dumps can be obtained if parts of the graphic screen are excluded, eg a quarter of the Hscreen 2 screen could be dumped at four times size with normal rotation.

For this dump I've provided for these options by allowing margins (left, right, top, bottom) to be set for the graphic screen. The dump skips the margins and only operates on the area of the screen inside the margins. This is achieved by only taking the pixils from inside the margins to the pixil buffer.

Likewise an option is included to do any sized dump rotated 90 degrees, or with normal rotation.

Borders and Margins

All borders and margins for the dump consist of four parts, left, right, top and bottom. Normally the margins would be white with a singe coloured border around the whole picture.

However to allow some experimenting with unusual dumps, I've allowed each separate part of both borders and margins to be specified as different colours and to be of different sizes.

As coded, it is quite easy to allow for these options, so I did.

Mirror Image Effects

A mirror image effect is fairly common with screen dumps. It occurs when you transfer the x,y co-ordinates of a point for one device (computer screen) to the same x,y values for another device (printer or plotter) which measures these values from a different origin, eg the origin for the CoCo screen (point 0,0) is the top left corner of the screen.

If you draw a picture on the CoCo screen and then draw the same picture using the same x,y values on a plotter which has its origin (point 0,0) in the top right corner of the page, then the picture on the plotter will be a mirror image of the picture on the screen.

If you take the picture from the plotter and hold it up in front of a mirror, you will see the picture in the mirror the same as you see it on the screen.

While a printer doesn't have a specific origin for a picture in the same way as a plotter does, the sequence in which the dots are printed effectively operates in the same way.

For these dumps, rotating the screen 90 degrees will produce a mirror image effect, if the co-ordinates for the points extracted from the screen are not modified.

There are various options available for correcting mirror image effects produced during screen dumps. The one used here is to adjust the pixils in the pixil buffer after they have been extracted from the screen, ie exchange the first and last, second and second last etc.

An incidental effect of doing it this way is to allow the deliberate creation of a mirror image effect for those dumps where it would not normally occur, ie to allow any dump to be a mirror image of whats on the screen. Hence, because it is easy to do, I've included it as an option for all dumps.

Set-up of Parameters

The routines used for this dump have been coded to handle all CoCo screens, but for them to work correctly, a number of parameters have to be set to appropriate values first. Most of the parameters apply to the ML routines and these are poked into the parameter table before these routines are executed

"The routines used for this dump have been coded to handle all CoCo screens."

I have also developed a small Basic program to calculate these parameters from a menu arrangement to enter the basic information. eg size, graphic screen, setting pixil to printer colours, etc.

However, to keep this part simple, I've restricted the automatic set up of parameters to Pmode 3, and Hscreens 1 and 2. The other screens, including the two colour ones can be dumped, but I have not included them in the set up program. To dump these, parameter values have to be poked into the ML routines separately.

Selection of Colours to be Used

A problem with this approach to colour dumps is to achieve some trade off between the number of different colours which can be obtained, and the size of the definition tables to be searched and updated during the dump. The greater the number of colour patterns to be updated during the dump, the longer it will take to complete the dump.

The approach adopted here is to use a separate block of memory to define the colours, and then to select the colours required for the dump and move the parameter list for those colours from the colour definition area into a separate 'execute time' table which is then updated during the dump.

To take the colour block patterns as an example. There is an area of memory set aside to allow up to 100 different colour block patterns to be defined, but it would take an excessive amount of time to update all of these for each dot printed during the dump.

To avoid this, there is a separate 'execute time' table set up to hold the colour patterns which are actually required for the dump. And it is this execute time table which is actually used and updated during the dump

This procedure also allows the same printer colour pattern to be associated with more than one pixil colour, eg both pixil 1 and pixil 2 can have the same printer colour. In this case, two copies of the printer colour parameters are brought across to the execute time table.

Part of the set up routine includes the selection of colour patterns in the colour definition area and moving those required to the execute time tables. The parameter list for each pattern can, in fact, be operated on at any memory location, which allows this move to be done.

The only part of the system which prevents the dump being fully relocatable at this stage is the parameter for the start address of the colours. To make the whole thing relocatable would only require the ML initialisation routine to loop through all the colour definitions tables and adjust these parameters to the actual memory locations used at the time.

An alternative setup arrangement could be to restrict the number of colours to a limited set in the execute time tables only, and leave them there all the time. This would also substantially reduce the memory required for colour definitions, but would make it more difficult to achieve the same printer colour being used for more then one pixil colour.

Another alternative, of course, would be to define all colours required at the start of each dump.

The setup actually used can

also be altered quite easily to vary the number of each pattern type that can be defined, ie to increase the number of colour blocks that can be defined.

part three (318b on disk9)

PARAMETERS REQUIRED FOR DUMP

A number of parameters are required to be set for the ML routines before they are executed. These parameters are contained in either the direct page, or as part of the ML code itself.

In the list that follows parameters in the ML code are shown as actual Hex addresses, while those in the direct page are shown as Q + 'value', where Q = PEEK(&HB7)*256 (Start of direct page)

Q+47=colour of left margin
Q+48=low order byte of number of dots in left margin
Q+49=high order byte of number of dots in left margin
Q+50=colour of right margin
Q+51=low order byte of number of dots in right margin
Q+52=high order byte of number of dots in right margin
Q+53=colour of left border
Q+54=number of dots in left border
Q+55=colour of right border
Q+56=number of dots in right border
Q+57=colour of top/bottom border/margin

The value poked in here is used to replace the values of pixils in the pixil buffer when doing the top and bottom borders and margins.

Q+63=number of times to repeat each pixil in the pixil buffer
Q+64=pixils per byte
Q+65=bits per pixil
Q+70=number of bytes across the graphic screen
Q+71=number of bytes in left margin of screen
Q+72=number of bytes to use for extracting pixils from the graphic screen and moving to pixil buffer
Q+73=number of bytes in right margin of screen

When extracting pixils down the screen, the values in Q+71 to Q+73 represents pixils down the screen, rather than bytes across the screen.

The address of the start of the next line of pixils to be extracted from the graphic screen is stored at Q+59 and Q+60. This is normally set up and maintained by the ML routines, but can be altered if you want to perform the same operation from another area of memory.

Hex 68F6 and 68F7 contain the number of pixils in the pixil buffer. This value must be set before the initialise routine is executed. It is used to calculate the end of the pixil buffer address, and is set to 256 in the ML code.

Entry Addresses

Hex 67C0 = reverses pixils in the pixil buffer to correct or generate a mirror image effect
Hex 67ED = extracts the next line of pixils from Pmode graphic screen
Hex 6829 = skips a line across the screen
Hex 6833 = skips a line down the screen
(Used for top and bottom screen margins)
Hex 6849 = extracts pixils down screen (Pmode)
Hex 68AE = initialises the routine for the Pmode screen
Hex 689B = initialises the routine for Hscreens

The initialise routine is called by A$=USR(A$) with DEFUSR0 equal to one of the values above.

The initialise routine also sets the VARPTR of A$ to point to the print buffer Hex 6590 = fills pixil buffer with border colour Hex 665E = execute address
to set up the print buffer

When extracting pixils from the Hscreen, the ML routines which access the graphic screen are moved to the Pmode graphic screen and executed from there. (This move is done by the ML initialisation routine). The entry points there are at an offset from Q1 where Q1 = PEEK(&HBA) * 256

Q1+0 = extracts pixils from across screen
Q1+180 = extracts pixils from down the screen

The routines to skip screen margins works the same for all screens. All it does is to change pointers.

The number of colour patterns for each execute time table is normally set in high memory before the routine is initialised. As part of the initialisation routine, the table of pointers to the execute time tables of colour definitions
is moved to the direct page and accessed there.

Hence these values exist in two places in memory.

Q+76 & Hex 68FE = number of two coloured patterns
Q+81 & Hex 6903 = number of multi coloured patterns
Q+86 & Hex 6908 = number of block patterns
Q+91 & Hex 690D = number of row patterns
Hex 66AD (only) = number of normal printer colours

Setting up Colour Patterns

A separate program, called SETUP, is used to actually set up the colour definitions in memory, and to print all colours that are defined.

It contains four components which are accessed through a main menu.

1. A routine to allow new colours to be defined in memory. Using data entered through the keyboard. This allows individual colours to be set up following a simple menu.
2. A series of routines to define a number of patterns using Basic programming code.

Defining colours through the menu becomes tedious after a while and it is quite easy to set them up with a few lines of Basic code.

This part of the program can be modified as required to set up any colours required. It also establishes the area of memory to be used for the definition of each pattern type, and hence the maximum number of each pattern that can be defined. If this is changed then the corresponding addresses in INKDUMP must also be changed to the same values.

3. Prints all colours defined in memory to a printer using character format. It prints out the reference code, parameter values, and colour definition values as they exist in memory.

4. Prints all colours defined to the GCP-220 in the way that they would appear in a screen dump.

The colours are printed in a box, 80 dots wide by 20 dots deep, with 8 boxes per line. The reference to the colours is printed below each box.

For this one, the program sets up its own pixil buffer of 640 pixils wide, and sets up pixil values of from 0 to 7 in this buffer. It then cycles through all the colours defined, bringing eight colours at a time into the execute tables.

Each colour in the execute table is then set to a pixil value of 0 to 7, and twenty lines are dumped to the printer, using the second part of the dump routine only.

Combining Pictures for a Single Dump

Normally screen dumps are done from a single screen picture to a single picture on the paper. However, there are times when you might want to combine a series of related screen pictures into a single large dump.

For example, I quite liked the series of Footy Badges by Joy Wallace in Softgold, March 87, and have used these to produce a single large dump of the 14 badges together, as three across the page for four rows, and the last two as two across the page below them.

This required a certain amount of additional programming using direct access files on disk, but the general set up and operating logic for these dump routines allows for this type of activity to be undertaken without too much effort.

The program for Footy Fever is set up to draw the 14 badges in sequence on the Hscreen 2 of the CoCo 3.

After each badge is drawn, the program waits for the break key before drawing the next one.

Some additional code was added to the program so that, instead of waiting for the break key, it executed a GOSUB 2000, where each screen was then extracted into a separate direct access file on disk.

The file for each screen has a record length of 160 bytes (number of bytes per row of pixils) and contains 192 records (number of rows down the screen).

"This program can handle dumps of multiple pictures."

The extraction of bytes from the graphic screen follows the same general procedure as used to extract the pixils into the pixil buffer. Only instead of extracting the pixils at this stage, the routine simply moves 160 bytes at a time from the graphic screen to the direct access buffer for the disk. (Starting from Hex 989).

After each record is extracted, it is PUT to the disk file.

I have also included a copy of the code used to do this. It it could also be useful for other purposes.

As well as extracting graphic screen memory into a direct access disk file, it also produces a table to show the colours used for each palette slot, and the number of pixils set to each palette.

This saves working your way through the program listing to find out which colours are actually used and not used.

This second part of the routine can also be used on any Hscreen 2 picture without actually saving the screen to disk.

The Pmode 3 (& 4) screen can be extracted and put into a direct access file without any ML routines at all. By changing the VARPTR of strings, I've also included a small Basic program to show how this can be done.

The next stage was to combine a record from each of these files into a single record for the dump.

When drawn, each badge occupies the centre of the screen with a reasonable margin. It is possible to fit three badges across 640 dots by taking 212 pixils (106 bytes) from the middle of each screen and combining them into a single row of pixils across the page, (with either a 2 dot margin on both sides, or making the middle one 216 pixils wide).

This can be done reasonably simply with a disk system by using the FIELD and LSET commands with four files open.

File #1 is opened first and is the result file, fielded as

```
FIELD #1, 106 AS AP$, 108 AS BP$, 106 AS CP$
```

File #2 is the first badge extracted and is fielded as

```
FIELD #2, 27 AS A1$, 106 AS A2$, 27 AS A3$
```

File #3 is the second badge extracted and is fielded as

```
FIELD #3, 26 AS B1$, 108 AS B2$, 26 AS B3$
```

File #4 is the third badge extracted and is fielded as

```
FIELD #4, 27 AS C1$, 106 AS C2$, 27 AS C3$
```

The first row of the result file is then produced by

```
GET #2,1: GET #3,1: GET #4,1
LSET AP$=A2$: LSET BP$=B2$:
LSET CP$=C2$
```

This produces a single row of 320 bytes, starting from Hex 989 and containing 640 pixils in the same format as if they were stored in a single row of graphic memory for Hscreen 2. (It also requires a FILES 4,820 to work.)

The extract routine is then set up to extract from a graphic screen with 320 bytes across each line, 2 pixils per byte and 4 bits per pixil.

These are all separate parameters poked into the direct page table, and the routine will operate quite normally with these parameter values. The

pixil buffer is set to 640 pixils wide to suit.

The extract routine has a parameter (at Q+59) in the direct page to show the start of the next line of pixils to be extracted. After each row is set up in buffer #1, Hex 989 is poked into this pointer and the extract routine executed as if for the pmode screen. This puts the pixil values into the pixil buffer , and the second stage of the dump is executed normally.

This same general procedure can also be used to scale up each badge to a larger size, by using the data from a single disk file as the result file.

For example, you can get a badge three times normal size by setting the extract routine to extract from a screen 160 bytes wide, 2 pixils per byte, 4 bits per pixil, a left screen margin of 27 bytes, extract 106 bytes, and scale up by three. For this one a 4 pixil margin must be provided, and the right screen margin set to 27 bytes.

There are other ways of achieving the same general effect by operating through the pixil buffer. It takes a bit more space on disk, but may be easier to use.

The direct page has two parameters for the address of the start of the pixil buffer (at Q+33), and the end of the pixil buffer (at Q+35), and these can be set to point to anywhere in memory. If changed the alteration must be made after the routine is initialised.

For example, if you open a direct access file with a length of 320 bytes, and poke Hex 989 into Q+33 and poke Hex 989 + 320 (decimal) into Q+35, then the pixil buffer will occupy the same memory as the disk file buffer.

You can then extract each line of pixils from the graphic screen and put it directly to disk as pixils.

At a later stage you can then set the pixil buffer pointers to the same address, and read the pixils back from disk and execute the second part of the dump directly from there.

You can use the same approach as outlined above for combining pictures across the page, except that the result file becomes the actual pixil buffer, rather than a line of pixils across the screen. Hence you can execute the second part of the dump directly after each row of the result file is built up.

If you think you might want to repeat the dump a number of times you can also save the actual print line to be printed into another disk file, and simply print off this file for subsequent dumps.

Each line to be printed for the dump is set up in the string A$ by the ML routine, and this is then printed by Basic. If you open a fifth file, fielded as ...

```
FIELD #5, 243 AS AX$
```

... you can replace the PRINT#-2 command with LSET AX$=A$: PUT #5,P: P=P+1 to produce a direct access file containing all the actual strings required to produce the dump.

You can then repeat the dump at any time, with the following small Basic program

```
OPEN "D",#1,"name",243
FIELD #1, 243 AS A$
FOR X = 1 TO 192
GET #1,X: PRINT #-2,A$;
NEXT X: CLOSE: STOP
```

There are some minor logistical problems with doing 14 badges in this way. Associated with the capacity of each floppy disk. A single floppy will hold 3 badge files plus the file of the print strings for these three badges combined. To do 14 badges therefore requires 5 separate floppy disks to hold the lot.

Setting up the Program

A couple of other programs have to be run before you are able to do any dumps.

"SETINKML/BAS" is a Basic program which sets up the ML code for the dump. It consists mainly of DATA statements which are POKE'd into protected memory.

After running the program, the ML code can be saved, although it is required in memory for the next program.

"SETUP/BAS" is the Basic program used to define the color patterns to be available for dumps.

Run this program, and when you have enough colour patterns defined, save the ML code with the pattern definitions with

```
(C)SAVEM,"INKML",26000,&H7FFF,0
```

The ML routine, INKML, must be loaded into protected memory and be available every time INKDUMP is run.

"INKDUMP/BAS" is then available to be used. Requires a CLEAR 200, 26000 before the (C)LOADM

To define more, or different patterns, run SETUP again and save a new version of INKML.

The other programs, "SAVCOCO3/BAS" and "SAVPMODE/BAS" can be used to save a graphic screen to a direct access disk file.

Hints and Tips

Where's that error again?

Okay, so there's this error in my Basic program. And fair enough I did a bit of variable experimentation to find this error. And now I can't remember that line number, because I've used more than a screenload of typing ... aaarghh!

(Luckily this programmer can now flip through CoCo Magazine and find this little program. It will return the last program line executed.)

```
PRINTPEEK(43)*256+PEEK(44)
```

HSCREEN bugs (CoCo 3)

Whenever you execute a HSCREEN command, a HCLS command is executed automatically without you knowing/ wanting it.

Here is a way to defeat that.

```
POKE &HE6C6,18:POKE &HE6C7,18
```

Booting OS9 on a DECB 1.0/2.0 DOS

Just type the below program and you'll be able to boot any bootable OS9 disk from your DECB 1.0/2.0 DOS.

(For people who can't use the DOS command available in DECB 1.1/2.1:

```
10 FOR I=0 TO 70:READ A$:POKE &H
5000+I,VAL("&H"+A$) 40 NEXT I:CL
S:PRINT"INSERT  OS9  DISKETTE"
15  PRINT"INTO DRIVE 0 AND PRESS
A KEY"

CONTENTS

By Nicholas Fuller

UTILITY
COCO 3

ONE OF THE disadvantages of a tape based system is unlike a disk drive you can't get a directory of what is stored on the cassette. This is inconvenient as one often forgets what is on the tape.

"Contents" for CoCo 3 is a directory which allows you to enter the names of the programs you have on your tape for quick reference, which can be edited.

When RUN, you will be asked to enter your security code (input statement, line 140). You can change it if you wish.

Apart from that, it's pretty simple - I have placed garbage in the data lines just to fill the pages. You can replace this with your own programs.

OS9 LEVEL 2 Screen Patches

By Rob Unsworth

THOSE OF YOU WHO have monochrome monitors will no doubt be aware of the problem of using the 80 column display with the various windows that are on your OS9 Level 2 system disk. In most cases, due to the colour combinations, it is almost impossible to read.

Then there is the problem that after having configured a disk using TERM.WIN your screen boots up 40 column with black lettering on a green background.

Having an amber monitor I found that the only foreground-background colour combinations which are acceptible is white and black.

Why not have an 80 column display that is not directly accessible? ... it is!

Using modpatch you can rebuild any screen to your own specifications.

Firstly you'll need to decide what size window you wish to create. On startup it is $28 (40 columns) and $18 (24 lines).

The offset for these bytes are at $2C and $2D. To create an 80 column screen, the offset for the screen type will also need to be changed.

This is at offset $30, the startup byte is $01 (40 column) and needs to be changed to $02 (80 column).

The offset for the no of lines will not have to be changed as it is already set for 24 lines.

If for example 12 lines were wanted then you would change $2d from $28 to $1c.

The offsets for the screen colours are $33 (text), $34 (background) and $35 (border).

On startup these are $02, $03 and $03 respectively.

Now to get that clear readable 80 column screen with white text on a black background, type the following :-

```
modpatch 1 term  c 2c 28 50 c 30 01 02 c 33 02 00 c 34 03 02 c 35 03 02 v
```

Then all you need to do is a "cobbler /d0" to generate a bootable system disk, with /term as a 80 column white on black screen.

If you want to have the pause command built in then change the byte at offset $19 from $00 to $01.

To change windows w1 to w7, to either full screen or multiple windows on the same screen, then the bytes at offsets $31 and $32 will need to be changed, as they determine the x-y position of the screen.

To get these and the other bytes that need patching.

Copy the dump command from level 1, then dump the device descriptors from the modules directory on the config disk.

LOST IN THE WILDS?

by Ozzie OS9

(from the depths of PNG)

SOME OF YOU HAVE probably been wondering whats happened to Fred? Haven't heard him carrying on about OS9 lately! (One or two were probably pleased)

Well I have bad news ... I'm BACK! Well, not in person anyway. In May I packed my bags and headed for Papua New Guinea.

It was rather short notice, so all you people who have been trying to phone me, or expected replies to letters or Viatel MB's:- all I can say is SORRY.

Unfortunately Australia Post don't upgrade local mail to overseas air mail without getting paid hard cash up front. I have now replied to all letters and you should have had them for some time (by the time you read this in the mag).

For those of you who wish to phone (expensive) my number is:
(ISD) 0011 (country) 675 (number) 255565 OR 255011.

Address is:-
P.O. Box 5447,
BORDKO,
Papua New Guinea.

Boroko is a suburb of Port Moresby, and aerograms are a lot cheaper than phoning. I will 'ATTEMPT' to get onto Viatel from time to time. It is rather difficult due to the amount of line noise and echo which causes all sorts of problems for the transfer of data, so please be patient for a reply - better still just write to the above address.

Recieved copies of August and September's mags yesterday afternoon and having devoured the contents of them twice, I would like to congratulate the winners of prizes and awards at CoCoConf, as well as people like Johanna Vagg (Hi Johanna), Mike Turk and many others who freely give their time to make CoCoConf a success.

I was dissapointed to hear that Sydney siders did not support the Conf. What a shame - they don't know what they have missed. I'm only sorry that I was not able to be there to meet up with the many friends I had met at previous Conf's, as well as the opportunity to meet many more.

As I haven't seen a CoCo or Softgold since May, going through the newly arrived August/Sept. mags, I am suddenly reminded of the continually high standard of articles and programs submitted.

These are equal to, and in many cases better than anything produced for the the home computer anywhere in the world. Personal opinion you say!

Okay, that may be true, but ask people like the Canadians who have a multitude of magazines to choose from (local, USA & others) - you may be surprised at their answer.

So all the novices to the CoCo, do not be discouraged, the articles and programs in the magazine in many cases are submitted by people who not so long ago were new to the CoCo too.

If you do not belong to a user group, join now, or even start your own. User groups are a very good way of giving and recieving help and information.

Since my arrival in PNG my access to information has been resticted by the number of known CoCo owners in Port Moresby (one - me) and by my job.

So in order to be able to collect enough information for regular articles I'm going to have to rely heavily on your letters and questions. That way we help each other, as well as others new to the magazine and CoCo. Although my major interest lies in OS9, queries on any matter are always welcome.

So thats it from the WILD'S of PAPUA NEW GUINEA.

November's CoCoOz

Next month's Australian CoCo Magazine will feature a number of OS9 programs and CoCoOz ON DISK will have these programs on it!

The disk will be a "flippy" – RS DOS programs from the magazine on one side, and OS9 programs on the other.

Dependent upon your response to this new system, we will look at making CoCoOz this way more often.

Tape users please note that you will only get the programs found on the RS DOS side of the CoCoOz disk.

SUBMITTING YOUR WORK

Ah! So you've finally finished that program? And you say to yourself, "What a great program that would make for CoCo Magazine/Softgold Magazine!"

And so you wonder to yourself, "How am I going to send this program in to the magazine?". Some time goes by and you suddenly realise, "Hey, there's an article in this month's magazine about submitting your work. I'll read through that and maybe that'll help me."

So you rip the magazine out of your stack of other CoCo/Softgold magazines and read the article on how to submit your program.

It reads ...

" ... we accept programs stored on both tape and disk ONLY along with a hard copy of the program(s) (optional only; we use it here as a reference to see what the program is/does) and suitable instructions.

Saving to Tape

Each program would be best saved three times with the last save being in ASCII. The tapes we recommend you use are either a C30 or less (the reason for that is that tapes longer than C30 have a tendancy to tear).

It'd be even better if you could include some instructions along with the program, either as a seperate program or in the wordprocessors listed below.

Saving to Disk

With disk, you'd be best to save it three times with the last save being in ASCII. Also, the extension name for the second and third copy should be different, so to distinguish the three copies. A simulation is given below.

' ... I have just saved 3 copies of a program called "HORSE". The directory listing would be:

```
HORSE  BAS  0 B 3
HORSE   1   0 B 3
HORSE   2   0 A 3'
```

Any instructions could be saved in the same system using either a program or in the wordprocessors listed below.

Wordprocessors we use.

Here is a list from our most preferable worprocessors to the drastic measure one could take to tell us how your program works.

1. Telewriter/Telepatch
2. Scripsit
3. PenPal
4. VIP Writer
5. Any form of data file.
6. Instructions written in a seperate program."

"Oh wow!", you think to yourself as you read it with awe and astonishment. So you go about your busy little way saving your program and instructions to tape or disk. Then you say to yourself, "Where do I send it?"

You read the article on ...

" ... any articles and programs should be sent to this address:

Submissions Editor,
Freepost 5
PO Box 1742,
Southport, Qld, 4215

All mail to this address need not be paid for.

All tapes and disks received will be returned after three months in case we need to refer to something or re-print something."

So place your tape/disk along with your hardcopy of the listing in a postpack (or suitable wrapping) and pop it in the mail.

All done!!

Telecom VIATEL

AUSTRALIA'S NATIONAL VIDEOTEX SERVICE

REGISTRATION AND SUBSCRIPTIONS

Customers must register as a Business Service if the telephone number nominated for the use of the VIATEL Service is a Business Service and/or VIATEL is to be used wholly or mainly for Business, Commercial, Industrial, Professional or Government purposes. (Charges incurred on Business Services are usually tax deductible.)

Where a Business Telephone Service is nominated for the use of VIATEL, but the use of VIATEL is wholly or mainly for Non-Business purposes, the Customer may be registered as a Non-Business VIATEL subscriber, providing the registration is taken out in the Customer's personal name and address and not a Business name.

Telecom Australia will register the Business or Individual named under Section 1 as a Customer of its VIATEL Service and will provide the Customer with a confidential Customer Identity Number and Personal Password by mail.

Where billing address is indicated, bills and bill related correspondence ONLY will be forwarded to that address. All other correspondence will be forwarded to address under Section 1.

Customers should advise VIATEL of any change of address as soon as possible.

If you lose your Customer Identity Number and/or Personal Password, you must advise VIATEL in writing before new numbers are issued. Our postal address is: Freepost 20, Box 188C, GPO Melbourne, Vic. 3001. FOR SECURITY REASONS REPLACEMENT NUMBERS AND PASSWORDS CANNOT BE PROVIDED OVER THE TELEPHONE.

Customers of VIATEL acknowledge that their name and registered VIATEL Number will appear on the VIATEL Mailbox Directory and that Service Providers and/or other registered VIATEL users may send messages to their VIATEL number.

Telecom Australia undertakes no responsibility in relation to the accuracy of the information or service provided by Service Providers on VIATEL. Telecom Australia will not be responsible for any loss or damage arising out of or in any way connected with the use of this information or service.

Attention is also drawn to the terms and conditions governing the provision of information and services by some Service Providers. These terms and conditions may, in some cases, include a disclaimer absolving the Service Provider from liability regarding information and services supplied on VIATEL. The means of accessing these terms and conditions is set out on the Service Provider's Index Page on VIATEL.

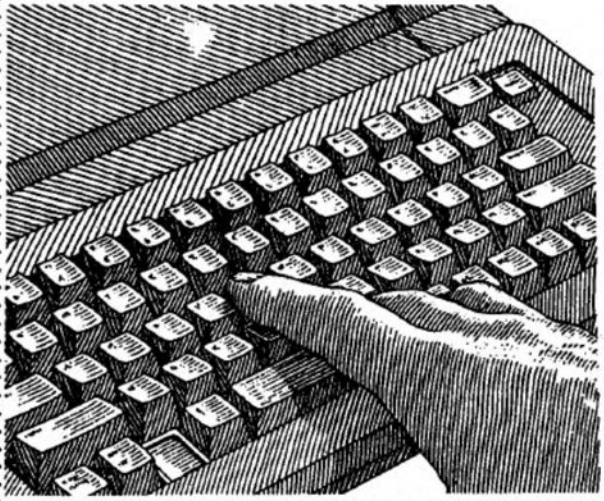
Should you require any changes to your existing telephone equipment (e.g. new exchange line, additional socket), please contact your local District Telecom Office.

In a small number of cases VIATEL reception may be unsatisfactory. Correction may incur an additional charge.

COMPETITIONS

As a result of the success of the Tandy programming contest this year, Tandy have agreed to rerun it in 1987–88!

So – get your thinking caps on! Perhaps YOU will be the one receiving that cheque from Tandy next year!



And speaking of cheques, the best ML Game for the CoCo 3 with a BiCentennial theme submitted by 7th November 1987, will win a $300 prize WITH royalties for every program sold from Goldsoft.

The next minor competition – the annual Graphics Competition begins now and ends on 7th November, 1987.

All computer created pictures are elligible, and the competition is divided into a section for Basic pictures, one for CoCoMax & ColourMax pictures, and one for pictures created in some other way.

As with the last Graphics Competition, the judges are looking for animated pictures.

First prize in each category will be 5 boxes of disks or tapes.

GOLDSOFT
