# IN A NUT SHELL

Ahh ... back to 'normality'. For the uninitiated, last month's edition of 'Nutshell' was written one-and-a-half months earlier than normal, because we were to go on holidays a few weeks later.

For the initiated, welcome back to the new year! I hope everyone had a great Chrissy!

## The power of the CoCo

Yes, CoCo is the best thing since sliced cheese! Do you really realise what power your CoCo has, and what it is capable of?

Just to mention a few things:

\* It runs high-level languages like OS-9, Forth, Pascal, Flex, Cobol (soon), C, Logo, and a few more I can't think of.

\* It also runs 4GL (Fourth Generation Language) programs; one currently very popular is Sculptor.

\* It can run very good database programs (contrary to other peoples' beliefs) compared to other machines running database programs.

\* At the other extreme, you can play a challenging game of chess, or play a great game of Moon Patrol, or play a great game of whatever game you like.

\* You can talk to it, and it will respond, by either speaking to you, or execute a process (imagine: instead of typing in your program, you can speak the commands).

\* It supports true multi-tasking and multi-user, unlike other machines which claim they can multi-task (mind you, they don't even mention a multi-user environment),

\* You can play your organ (with a MIDI interface) and your CoCo will record the notes you play.

It then plays these notes back to you, in stereo, and with up to 12 chords playing simultaneously!

\* You can design almost anything graphically using nothing more than a mouse (or a joystick).

\* You can connect a house alarm or anything electrical for that matter, to your CoCo, via a CoCoConnection.

\* You can use the joystick ports of your CoCo for a light pen - all you need is the software.

\* ... and you can even learn,

with the greatest of ease, the Basic language.

Mind you, you can do a lot more things than I have listed above.

For example, WE run our subscription database off a CoCo 3, and I run the submissions database off a CoCo 3. Both databases can be very easily expanded, and no great effort has to be made in writing the extra code. (A program which has been structured and well-written in the first place demonstrates that almost any program can be expanded and/or modified.)

We're happy with the CoCo and what it can do for us - and we're sticking to it! We believe it is the best machine for the beginner and for the expert.

## Paris Radio

Paris Radio Electronics have a large range of software and hardware for the amateur/expert user of the CoCo. They specialize in that "advanced" language like Sculptor, OS-9 Level 2, and more recently, the OS-9 developers package.

See them for any hardware you might want as well.

Paris Radio Electronics' person to talk to is Jackie Cockinos.

## Pursuit and Craig Stewart

At last year's Conference, Craig Stewart won the Games competition - and the offer to sell the winning game via Tandy stores throughout Australia.

Since Christmas (which was the date it was going to be released through the Tandy stores) Tandy has sold thousands of Pursuit games.

That says a lot - thousands have gone out the door, and it's only been a month! Must say something for the game.

Pursuit is for the CoCo 3 and can be found at any Tandy store for \$19.95.

# COCO

WITH GRAHAM MORPHETT

# NEWS

Its good to have a column in Australian CoCo Magazine again!

Over the last year or so, I've concentrated on getting Softgold together, as a magazine entity. Its been a lot of hard work, but a lot of fun too.

Now that Softgold's future is assured and it has such a capable Editor in Deon, I'm going to spend more time once more with my CoCo and this magazine.

The CoCo really is a computer that just keeps turning up the surprises in performance and reliability.

For example just this week we learned that the program "Where in the World is Carmen Sandiego" - probably THE definitive educational game, has become available for the CoCo 3 from Blaxland Computer Services.

And there are other things too - the CoCo's ability to multi task, its ability to do efficiently and quickly things that "faster" computers really spend time doing. These make the CoCo a real gem.

## The Year of the Hard Drive

1988 may well become the year of the hard drive - we've heard so many of you mention that you are planning to purchase them this year!

We've just purchased one from Blaxland and we'll be reporting on it, and the uses we put it to next month.

I can hardly wait to start playing with it - imagine being able to log all our CoCo's into it to get files - no need for the rest of them to save to tape or disk any more!

## Paris Radio

Both this month's magazines are full of Blaxland Computer Services news - and so they should - Blaxland have released a heap of product onto the market this month! But don't forget that Paris Radio have a heap of gear in their store at Kingsford, NSW, for all of you with a technical interest in CoCo's and 68000 computers.

Jacky Cockinos is the owner and he has been involved with CoCo right from the early days, so he can certainly get you the right help!

## Melbourne

Alex and I will be in Melbourne on the week of the 7th March.

We will be attending a meeting of the Ringwood Users Group on Wednesday night (9th March) and will be going to a dinner with anyone interested on the Friday night.

On the Saturday night, we'll be at the Viatel Bash.

More details of each of these events can be obtained by phoning or by accessing page 642901 on Viatel.

Alex and I are anxious to meet with other CoCo users whilst we are in Melbourne, so if you can make it to one of these events, that would be great!

## Blaxland Computers:

Blaxland Computer Services are moving into the T1000 / compatibles area, and if they do the job they've been doing for CoCo owners for the last five years for the compatibles owners, then other stores had better watch out!

The first program to be released by them is DOS Help - a memory resident program which provides instant on screen help for anyone who has less than a working knowledge of MS DOS (which is just about all of us! G.)

The program is written by Peter Feldtman who wrote a similar program "Wordstar Help" for Wordstar users and which is now sold all around the world. Peter started his programming career writing programs for this magazine - so it is with special pride that we announce this new release.

DOS Help gives other commands which can be used, correlates other commands with the one you are attempting to use and provides hints, tips and cross references to books.

DOS Help is thorough, quick, and the 200 K disk file compacts to 70 K in memory to ensure that your computer is not overloaded by its presence.

Whilst on Blaxland, they have both the LT 1400 and the T1000TX on demo in the shop, along with a lot of software for the machines that you can't get anywhere else as of yet.

One of these packages is Microsoft Works - an integrated package which works like a more advanced Deskmate. At \$370 it comes with a 3 disk tutorial for the very new user - a real feature for very new users.

Blaxland also sell ASI Clones, which have 12 months warranty and 24 hour service in Sydney. The PC/XT, 640K RAM with 2 drives, and RS232 clock calendar card is \$1450, whilst the XT with a 20meg hard drive costs an additional \$920 (Mini Scribe Drive).

Blaxland will be specialising in CAD packages for the Education Dept. They recommend the ProDesign package which has appeared in these pages before.

CoCo 3's sold very strongly for Blaxland over the Christmas rush - hardly surprising really, Blaxland are the pre-eminent CoCo 3 experts!

Now that you have your CoCo 3, Blaxland have 20 Mq hard drives for \$1599, which run OS9 L2 very fast and store heaps!

Blaxland still supply CoCo 2 packages. They will buy old CoCo's as trade ins for people upgrading to CoCo 3's. The CoCo 2's are serviced and then resold to people requiring a CoCo 2.

Don't forget that the 2 is a very powerful machine. It can multitask, run electrical gadgets and do most of what the CoCo 3 can do.

Bye!

That's it for my news this month.

If you live in Melbourne I do hope you'll come and say "hi" on at least the Wednesday night. If not, have fun - see you on Viatel!

Graham

# DR COCO

Dear Dr CoCo,

I saw a program in the February 1987 CoCo, page 51, called "Address Book", by Wayne Kely.

The parts I needed were to stop anyone using the tape unless the correct password was put in. At the beginning of my program I changed lines 130 to 210. At the end of the program I added an extra line:

POKE113,0:EXEC40999

This works very well, but if someone finds the password, OK appears on the screen and all they have to do is type in LIST and they get the listing of the program as well as the password.

Is there some suitable program I can invent to stop 'undesireables' from getting into the program - something so that when the correct password is put in, the game starts automatically, like the Tandy tapes, and even if you press <break> it does not stop the game to enable you to get the listing.

Malcolm Reid  
Ingleburn, NSW

Malcolm,

The question I would raise concerning 'password protection schemes' is, "is it really worth it?"

In other words, what do you want this password protection scheme (PPS) to protect? If it is to stop people from using your games, then the best thing is to hide the games somewhere.

On the other hand, the PPS that Tandy use (for an example) is an auto-start program ie, as soon as it loads, it runs.

To find out where Tandy get theirs from, it would be a good idea to ring up Tandy and ask them.

The only problem is that if you put a game (or any other program) under a PPS, you couldn't enhance that particular program (if you wanted to), because it's under a PPS.

\*

Dear Dr CoCo,

While looking through the

November 1985 back issue of Aussie Rainbow, I noticed a program by the name of "Moonbase Amphibia". After reading the write-up and becoming excited, I began typing this program into my CoCo. This excitement did not last long because when I came to line 1000 I noticed the end of it was missing. I looked through the rest of the program and began pulling my hair out at the sight of several other lines missing their ends.

I hope you can help me before I go bald.

Neil Etheridge  
Pomona QLD

Neil,

It sounds like to me that the author of the program packed his program. How do you do that? Simple - write your line of code until you reach the end. When that happens, press enter and then edit the same line. You can get an extra 3-5 characters.

Now, we don't encourage doing this, mainly for the reasons mentioned above in your letter.

As for helping you, I can only recommend filling in those spaces with what you think would logically go there.

We haven't seen any corrections for it, either.

\*

Dear Dr CoCo,

Does anyone out there have ...

1) A printer utility like "Calligrapher", only with normal bold block letters, and

2) the draw statements or a screen utility that draws large block letters on the screen.

All the utilities I have either draw in fancy writing or stick writing. Can you assist me in this area?

Tony Taraborelli  
Wilston, QLD

Tony,

I personally don't know anybody out there who does, but I don't see any problem in making one - it would probably be faster and cheaper, too!

Can anyone out there help?

\*

Dear Dr CoCo,

I am having trouble with a program called "Bigtext" from the June edition of CoCo. There seems to be a problem in the ML section of the program, but I can't find any typing errors. I wonder if you have a fix.

The Basic program run okay, but when the ML routine is entered some random graphics appear at the top of the graphics screen then control is returned to the Basic program.

I hope you can help. Bye for now,

Geoff Mackie  
Niagra Park, NSW

Geoff,

After just running the program, I have found that it works. The "Random graphics" that you mention, appear in my version (or the magazines version) as well, so it must be part of the program.

As for the control being returned to Basic, I would suspect that there may be something wrong with the Basic program or the Basic Machine Language program that you have.

May I suggest that you check the ML program?

\*

Dear Dr CoCo,

I had received two disk that I ordered - Best of #3 - Utilities and Best of #4 - Business a little while ago.

Now before I go on any further, can you please let me know if all the programs on disk #3 can be used straight from the disk without having to disconnect the controller?

I was really disappointed to find that, even when ordering the disk, most games and business programs have to be used from tape and have to have the controller disconnected.

C.W. Escabacke  
Seaview Downs, SA

Mr(s) C.W. Escabacke,

Sorry to inform you, but not all programs on the Best of #3 disk can be used directly from the disk. Why?

On the games tape there are a few programs that will not work with the disk controller in on

# DR COCO

the side of the computer.

One of these programs, called "Chomper", a few commands inside the Basic program that stop the program from working properly.

All in all, some programs will either crash or not work properly if you have the controller attached.

\*

Dear Dr CoCo,

When I read "What's on CoCoOz 1-33" in the January editon of CoCo, I find some programs which I would not mind getting my hands on. The problem is, that they're on different tapes.

What I would like to know is can you copy the ones that I am after?

Also, can you tell me if there are any word-processing programs on tape or disk and what features they have. Also, will they work on a DMP-105 printer?

Michael Dobesch  
Childers, QLD

Michael,

We can't custom-make tapes for you - if we did, we'd be here all month just making tapes. (Another good reason to look at the Best of Series - they are a compilation of the best programs. For example, Best of # 2.1 - 16K games - are a compilation of games that will suit a 16K CoCo.)

There are a number of word-processing programs for your CoCo. They are:

1. Telewriter/ Telepatch/ Ultra-Telepatch: These are all the same style of wor-processor, except that each one is a little more advanced than the one previous.
2. VIP-Writer
3. Scripsit
4. Deskmate 2/3
5. Pen-Pal

They all have numerous features, depending on what you want out of them. To find out all the features, the best thing to do is to call a software agent and ask for a brochure.

Any printer will work on any word-processor; therefore your printer (the DMP-105) will work with any of the above word-processors.

\*

Dear Dr CoCo,

In the April Softgold magazine, there is a program called "Fraction Action" by Bob Horne. This particular program has an FC error in line 170.

I have tried to fix it myself, but to no avail. Can you please give me some advice on how to make the program run?

Apropos programs; there is a program called "CoCo Runner" by Max Bettridge. When we CSAVE the game it sounds like it has been CSAVEM-ed and when it is listed it only says 'ok'. Can you fix it up as to make the data sound like it has been CSAVE-ed and not CSAVEM-ed, and to not make it say 'OK' when it is being listed.

Graham Freak,  
West Croydon, SA

Graham,

Looking at line 170, it appears that the only problem in the program could be that the variable 'F1' is at fault. To find this out, try the following:

1. RUN the program.
2. When you get the error, type PRINTF1

If F1 is a number less than 0, then F1 is the problem.

Your next thing to do is to find where F1 originates from. Looking at the program, F1 is created in line 160, via an ASCII of a string.

3. Type PRINT Z

By doing this, Z will tell you the position of the string.

4. Type PRINT C\$

This will tell you what the computer is trying to print on the graphics screen.

Your option is now this:

Check what the computer is trying to draw on the graphics screen by typing (immediately after the error) DRAW CH\$(F1) - if you get an error here, then the 'F1'st draw-string is wrong and you'll have to check lines 2360-2390.

The above procedure is my standard policy on checking errors such as the one you have encountered. Try it - it will work and in most cases, it's a typing mistake in the draw strings.

I'm afraid I have insufficient information to be able to help you on your last problem - if you could tell me more, (or send me the tape, c/o Goldsoft, PO Box 1742, Southport, 4215) I could help you out further.

\*

Dear Dr CoCo,

I have a problem with the Scripsit program that I have on tape. It operates on 600 baud and my printer after being returned from service will not operate at this baud rate. It will work well on 240 baud which is an advantage.

What I would like it to do is to alter the Scripsit program to run on 2400 baud (or 4800), but I don't seem to have much success.

Could you help?  
Les Hillel

Les,

There are two ways that you could try:

1. Load the main loader program (by typeing CLOAD). In the front of the program, enter this line: F0KE150,41 and re-save the modified version.
2. Take the printer back to the service department and s v to them, "It doesn't work/ The baud rate is faulty/ Fix it, or else". Printers are supposed to work at 600 baud; if they don't after coming back from the service department, then (in my opinion) they haven't been fixed.

Please address all  
correspondence to:

Dr CoCo,  
PO Box 1742,  
Southport, Qld., 4215.

# Letters

Dear Graham,

I'm writing to you for some information regarding the interfacing of a Tandy Color Computer to an electric train set.

I've had a Color Computer now for five years that started out as a 16K model and has been upgraded to a 64K model.

At present it is not getting a great deal of use and I thought there must be a way of using it to run an electric train set.

I've never practised any electronics before and know absolutely nothing about how to go about interfacing - I think that's the word.

I believe I can use the games port of the Color Computer to achieve what I have in mind. I would appreciate it if you could offer me some assistance in where to look for the necessary information, what equipment I need and anything else you may think I need to know.

The more I think about it, the more involved I think it will be, particularly how to supply the power to a section of track gradually, as it cannot be just an off/on type of operation.

G. O'Brien  
Balcatta, WA

Mr O'Brien

Thank you for the enquiry regarding connecting a model Railway to the CoCo.

I'm in the throes of completing an article on the subject for our magazine "Australian CoCo Magazine", so I was surprised to receive your letter!

I'm assuming you have at least read "HO Primer" (or "N Primer"), and a good selection of other model railway magazines/books.

If not, I suggest that before you go too far, you bone up on some theory of operation. Before a model railway gets this sort of sophisticated control, you really do need to understand what you are doing and why.

By the way, "sophistication" need not equal "hard"!

The job is a complex one but once the principles are understood, it need not be seen to be difficult - and the results are stunning!

You need a CoCo 1 or 2, a CoCoConnection (CoCoConnection

is available from us for \$216.00), relays, wire and time!

The CoCoConnection was designed by us specifically to operate model railways, but it has found a number of other uses including the control of the lights at Sydney Cricket Ground.

The CoCo can be disk or tape - we suggest you eventually purchase a second hand CoCo to run just the railway - leaving your own free. The program can be left in the computer most days so you won't need to load it all that often. The tape deck you have for your other computer will then be sufficient.

The CoCoConnection has sufficient instructions to indicate how to get a relay to switch under its control.

Basically, with the CoCoConnection in place, you POKE a memory location to effect a change and POKE it again to change it back.

You purchase 5 volt relays - either double pole double throw, or single pole single throw, from Tandy. These are controlled by the CoCoConnection and these in turn control points, on/off buttons and train controllers.

The best train controller to use is the Locomotion Controller, which has the push brake control on the panel - ie, it does not have a slider brake - you hold the button to stop the train.

All train movement under the CoCoConnection is controlled by a relay which can override this button. Again a DPDT relay attached in series to this controller effects forward/reverse.

The CoCoConnection can also sense its environment by reading inputs to it.

It can read a change from an open to a closed circuit and vice versa.

You PEEK set memory locations to see if changes have occurred.

Simple switches such as pressure switches, press buttons and so on can then control various actions.

More sophisticated use of this feature can be made by employing the Twin T train detector (described in the American Model Railroading magazine) or the one available from Taintasia.

Other train detectors have been made utilising Infra Red

detectors and light sensing diodes. Simple detectors can be made which feed AC thru one of the DC rails, but this system is not all that reliable and plays havoc with other things.

It is therefore easy to see a model which will report the position of a moving train, and where the computer will control, as a result of the train movement a series of signals, points and other trains to protect the progress of your train.

We have had a test line running here for a while to find components to operate under this system.

As a result of these tests, I am about to embark on a project I would not attempt if computer control were not available - at least not on a 12 volt system in HO!

I have designed a garden railway, which is being built in stages in my back yard.

In the first stage, it is a simple out to a loop and back line with the main sidings in my garage, and some 100 yards of track to the loop.

The computer in this phase must control 2 reversing switches, a minimum of one point motor, and the speed of the train.

The trick to it all is that from the first day of operation, the computer will be sending out at regular intervals, a track cleaning car/train.

As we live on the coast, the salt spray here is a real problem for any track - even though it will be nickel silver.

With a regular track cleaning car/train operating, I'm hopeful that many of the problems I might otherwise experience will not occur.

There is a learning curve involved for you initially - but they never hurt anyone - and we've already been rewarded by seeing our test bed do some pretty tricky things.

The boys at the Perth Users Group will know little about this aspect of operating a CoCo, but they will be able to help with many general principles. Talk to Ian MacLeod - he's a good guy.

You are welcome to phone me too, should you decide to take the matter further. Graham

# The Right Chemistry

Teaching the basics for early high school students

CoCo3  
EDUCATION

by Nicholas Fuller

**C**HEMISTRY IS A PROGRAM that I wrote some time ago to help teach the basics of chemistry to early high school students.

When RUN, you are presented with a title page. The title page was created using HDRAW's and each letter was placed in a string. The title is drawn in an offset of 5 by 5 to obtain the shadow effect and in a different colour. The helium atoms rotating around electrons and nucleus are a result of simply changing palettes between the 2 colours they were drawn in.

After the title page, there will be a menu. The four options on this menu are:

1. Start again
2. Quit
3. Glossary
4. Save program

Choosing 'start again' will lead you to part one: "Atoms and Molecules", which explains the nucleus and so on.

Pressing a key brings a picture of the different parts of an atom. Following that, there is the "Periodic Table of the Elements".

A description about the table follows, with a very brief tutorial on balancing equations. You will also find the option of returning to the title page or the menu.

Choosing the quit option, option 2, shows a brief bibliography. Here the program ends.

Choosing the third option will lead you to a glossary. This shows the meanings of each scientific word used in the program, and the electronic configuration for the first twenty elements of the periodic table, with their symbols.

Option four, or 'save program', will do exactly that - save the program onto tape or disk under the name of "Chemistry".

Please note that this program should only be used as a guide to explain chemistry. Don't hesitate to replace my information with yours.

If you are not a chemistry fan, then you should enjoy the title page. The line numbers involved in the title page are from 10 to 490.

## Anatomy of Program

Line:	Description:
0- 490	Title page
500 -	Menu
520- 590	Quit/Bibliography
600- 630	Save option
650- 750	Atom molecules
760- 800	Atom Picture
824-1000	Periodic table
1030-1236	Bonds, equations, info on table.
1250-1280	Glossary
1290-1340	List of elements
1380-1510	Tables data statements

Enjoy the program. See you in the lab!

**W**E WOULD LIKE to enter this program in the graphics competition you are running.

Our program shows the Bicentennial logo and a ship representing one of those from the first fleet, which sails across the bottom.

All to the tune of "Advance Australia Fair".

It took us many hours to design this program on a CoCo 2.

# The Colour Computer Pokies

Try and get the better of  
CoCo's very own one-arm bandit.

32K ECB  
GAME

by Nick Kostarelas

**T**HIS IS A simulation of the good old pokies. You play the same way, only you bet in chips rather than money. One chip is a dollar.

You start off with 200 chips, and the maximum bet is 1,000,000 chips. If you ever get over a million chips and you want to bet more, then you can take a gamble and type ALL when it asks you for 'CHIPS TO BET'.

When you do make a bet, it displays your bet, the least and most you can win. If you hit ENTER when you make a bet, it will take your last bet as the current bet (if you have enough money).

After your first play, it will display how many times you played, how many you've won, and a percentage of wins.

The game is easy to play, once you know how many chips to bet each time. You can get to a million chips within 15 minutes. The most I have ever had was 110 million, after sore eyes and a sore bum. I gambled it all and lost it as well.

Line 100 disables the break key and speeds up the program by 30%.

**DON'T FORGET DON'T FORGET DON'T FORGET DON'T FORGET DON'T FORGET DON'T FORGET DON'T FORGET DON'T FORGET DON'T FORGET DON'T FORGET DON'T FORGET DON'T FORGET DON'T FORGET DON'T FORGET DON'T FORGET**

In Edit mode, K = Kill. It is  
 the opposite of hack. It "kills"  
 everything up to the character  
 you specify.  
 Eg:  
 50 DATA EGGS, BACON  
 K,  
 50 BACON  
 \*  
 RENUM's format is:  
 RENUM newline, startline, increment  
 \*  
 VAL (string) gives the numeric  
 value of the string.  
 EG  
 10 A\$=10  
 20 INPUT B\$  
 30 PRINT VAL(A\$) + VAL(B\$)  
 \*  
 Your variables can be stored  
 in more than one dimension.  
 This is handy when you wish to  
 assign a number of attributes to  
 one entity.

# Extra Mem with M/L

Here's a way of accessing CoCo's upper 32K.

by George McIntock

**A** 64K COCO (1 OR 2) has 64K of RAM, but only 32K of it is available for normal Basic programs. Likewise, the 128K CoCo 3 does in fact have 128K of RAM, but again only 32K of it is available for normal Basic programs.

I have developed a series of ML routines to allow a normal Basic program to use this extra memory for data storage (they will be submitted shortly).

The basis for these routines were developed for a 64K CoCo 1, but I have also developed a simple variation which allows the same functions to be performed on a CoCo 3.

The normal memory map for a 64K CoCo is 32K of RAM for the addresses from Hex 0 to 7FFF, with 32K of ROM from Hex 8000 to FFFF.

If you store any value to address Hex FFDF, this changes the memory map to all RAM from Hex 0 to FFFF.

The CoCo memory from FF00 to FFFF is used by hardware as well as for special functions and does not change.

To restore the machine to the normal memory map, you store any value in address Hex FFDE.

Before you change the memory map, you MUST mask all

interrupts (with an ORCC #550 instruction), otherwise the machine will hang up.

This is because all interrupts cause a branch to a ROM routine which handles them. If you are in memory map 1 when they occur, then the ROM code is not available to handle them.

When you reset the memory map to normal, you can allow interrupts again with an ANDCC #SAF instruction.

The memory map arrangement with the CoCo 3 is quite different, and I don't know much about how to use it.

However, I have worked out a method which allows you to access the 32K RAM provided for the hi-res graphic screen in much the same way as the extra 32K for the old CoCo.

Memory locations from Hex FFA0 to FFA7 are used to hold the high order bits of the complete CoCo 3 memory space (from Hex 0 to 7FFFF).

For the 'normal' CoCo 3 map these contain the values from Hex 38 to 3F respectively, when everything else required is set to address actual memory from Hex 70000 to 7FFFF.

For normal use, it appears to be sufficient to simply change the value in these locations to access any part of the extra memory available, eg with Hex 38 in location Hex FFA0, the CPU will access actual memory from

Hex 70000 to 71FFF when using the normal addresses of from Hex 0 to 1FFF.

However, if you store Hex 30 in location Hex FFA0, then the normal addresses of Hex 0 to 1FFF will then access actual memory from Hex 60000 to 61FFF.

Each register in the range FFA0 to FFA7 controls a block of 8K in normal address space.

The high order values required to access actual memory from Hex 60000 to 67FFF (the high res graphic screen) are from Hex 30 to 33.

To have this memory mapped into the address space normally occupied by the ROM (ie, to achieve the same effective memory layout as provided by map 1 of the old CoCo) requires Hex 30 to 33 to be stored into Hex FFA4 to FFA7, eg Hex FFA4 contains Hex 30, Hex FFA5 contains Hex 31, Hex FFA6 contains Hex 32 and Hex FFA7 contains Hex 33.

Again, you MUST mask all interrupts before changing these locations in this way, because once you change them, the ROM code is no longer available to handle any interrupts.

Also, before leaving your ML routine, you must restore the values in Hex FFA4 to FFA7 to the original values of from hex 3C to 3F, and do this before unmasking interrupts.

There are other registers in the CoCo 3 (at Hex FF90 and FF91) which appear to allow you to use the locations from FFA8 to FFAF to set up an alternative memory map arrangement and switch between them, but I haven't been able to work out how to use them in this way.

The method described above is sufficient to provide what I require at this stage, so I haven't pursued it any further.

For the routines I am currently working on, I have

## HINT:

When you are renaming a program on disk, don't forget to add the extension and drive number inside the quotes. i.e.

```
RENAME "COCO/BIN:1" TO  
"DEMO/BIN:1"
```

(if you only have a single drive, then you don't have to worry about including the drive number)

Continued on p24

# CoCo3 Keycodes

Here's more info for our OS9 users.

by Ken Wagnitz

OS9 Level 2

I RECENTLY WANTED to use my CoCo as a terminal off a Unix computer, and screen edit on it. That meant the Unix machine had to know both what my CoCo would send for various commands, and what codes my CoCo needs to move the screen cursor around, clear the screen etc.

The OS9 screen control codes are listed in the LEVEL 2 book. But what codes the various keys

produce is not so obvious. To find out, I used the following command line:

```
dump < /term
```

The 'dump' command is not supplied with Level 2, but the Level 1 version works fine.

What it does is list the contents of a file, in both hex and ASCII. In this case I used I/O redirection to feed it from the terminal, ie keyboard, instead of a file.

The output goes to the screen (Standard Out). The characters produced by various key combinations are given below in hex. Where the control key is used with other keys to produce characters which are not on the keyboard, I have given the character, eg Ctrl / = ' '.

Note that some combinations produce two characters!

CoCo 3 Key Codes under OS9 Level II

I feel, after checking that list, somewhat disappointed.

The alt key simply sets the 8th bit (in most cases); while that gives lots of extra characters to a program running on the CoCo, they are of limited value over a serial link.

Some computers either use the 8th bit for parity, or strip it off anyway. Remember that the ASCII code is only defined for the lower 7 bits. That also writes off the two function keys.

Every permutation of them has the 8th bit set.

The other problem is that the arrow keys all generate codes which are universally defined as screen controls unrelated to cursor movement!

Left Arrow gives \$08 - a destructive Backspace; Right Arrow gives \$09 - a Tab; Down Arrow gives \$0A - a Line Feed; Up Arrow gives \$0C - a Form Feed (clears the screen).

The receiving computer in this case will not allow me to tell it that I want to send these codes, but as cursor move commands!

Conclusion: To do what I intended, is out. Now I have to write a program which will translate the key presses on the CoCo into different characters, to send to the host.

In other words, I need a VT100 emulator. Does anyone out there have one?

COME HELL OR HIGH WATER...

Continued from p22

adopted a procedure which allows me to use the same programs in either a CoCo 3 or the old CoCo by changing two bytes of the ML code by POKE's from within the Basic program itself. This avoids the requirement to have separate versions of the same program for the different machines.

The routines are set up so that they all call a single routine to change the memory map as required, eg SETRAM to change to all RAM, and RBASIC to return things to normal.

An outline of the code used is as follows:

```

SETRAM ORCC #50
SI BRN COCO3
CLR $FFDE
RTS
COCO3 LDD #32031
STD $FFA4
LDD #3233
STD $FFA6
RTS

RBASIC BRN COCO3X
CLR $FFDF
RX ANDCC #5AF
RTS
COCO3X LDD #3C3D
STD $FFA4
LDD #3E3F
STD $FFA6
BRA RX
    
```

These routines are coded to suit a 64K CoCo. For it to operate on a CoCo 3, the Basic program tests for a CoCo 3, and if it is, then it POKE's Hex 20 into location SI and RBASIC.

This converts the BRN (branch never) instruction into a BRA (branch always) instruction.

Other Points for ML routines in the upper 32K.

In general, ML routines which access data in the upper 32K of RAM require no special coding procedures.

However, you do have to ensure that for any comparisons of addresses you use the BLO, BHI series of branch instructions, rather than the BGT, BLT series.

For addresses in the lower 32K of memory, both series have the same effect because the addresses are positive values in two's complement form.

However, for addresses greater than Hex 7FFF, the BGT, BLT series will treat them as negative numbers and this produces an incorrect result.

# Colour Computer Castle

Once a Knight is enough.

CoCo3  
ADVENTURE

by Nicholas Fuller

**T**HE YEAR IS 1600AD and you as the fearless Welsh Knight, Sir Nicholas, roam the countryside, in desperate need for money and a suit of armour after being thrown out of your own castle.

You decide to travel to the Welsh mountains in search of the famous Norman Sword that went missing over 500 years ago, and find yourself admiring Colour Computer Castle from a distance.

This totally silly outline is the basic plot of this program. After a rather attractive title page, you move closer to the castle. To gain entrance to the castle, you must enter a security code for the drawbridge to come down.

If you enter the wrong security code you get a second chance, but failing that, you're banished to the countryside.

Once you have passed the security code just sign the visitors book and your adventure will begin.

In the game the Amiga Knights hand is to the left while yours is to the right. The Amiga Knights' hand is displayed first. Simply place a bet (up to \$100) that you will beat its hand with yours.

Press any key to begin a new hand. Everything is controlled by the computer. Once \$1000 is reached, you begin the trek down the castles dungeons to look for the sword, but watch out for the dragons, spiders, and trapdoors.

## The Dangerous Doors

Here you must choose one door. If you choose the wrong one, you might not come back.

Orange door: "He who chooseth me shall get what they deserve"

White door: "He who chooseth me shall get many surprises"

Blue door: "A treasure of pleasure lies behind this door."

If you happen to die during the "game", the computer will arrange your funeral for you! If you succeed, you are given your life story and then go back to the title page for another person to try.

NB, to see the title page only, type in lines 0 to 500.

If you like, you can alter the adventure to your liking. I hope you like it!

# Carn 'Berries

Keeping up with your favourite footy code.

CoCo3/CoCo2 (with mods)  
OSO + Pascal

by Damien Clarke

**W**ITH THE FOOTBALL season over, wouldn't it be nice to be able to keep a personal record of the last season, or find out who is in the top 5 next year?

Well, if you have a CoCo 3 (or CoCo 2 with program modifications) and OS-9 PASCAL you can see an up-to-date football ladder by just typing in the exact results for each week, every week.

This program is setup for the Sydney Rugby League competition, but can be changed by adding, deleting, and the changing of the constants at the start of the program, eg to change this program for next year's competition of the Sydney competition, you would have to make the constant noofteams 16, and noofgames 8.

Also you would have to add 3 more team string constants, eg...

```
team14='Brisbane
```

... and finally add 3 other such statements to the enterdata procedure. To change this program for OS-9 level 1, delete all references to the procedures invert and uninvert, and also shorten some of the WRITELN statements, and break up long messages.

If you are adventurous enough, you could add a feature that calculates the amount of money you won on footy tab or even calculate who will win the next premiership.

This program uses two records. The first record 'infoecs' stores the actual football ladder, and 'weekdata' stores the actual draw.

These 2 records are passed in and out various procedures, making the whole program work.

If you did not understand that, you don't really have to worry, all you have to worry about is bribing someone to type this program in, or you could even type it in.

But the safest bet is to support your favourite magazine and lash out and buy the disk from Goldsoft. This program is bit long, but I am sure you will

find a use for it one day.

(Ed's note: The source for this program will on the next OS9 disk, which appears quarterly. See 'In a Nutshell' for details.)

Now, because I wrote this program, I have finally found out how to use OS-9 PASCAL, a position, I am sure many people are still in. OS-9 rules OK!

## The Listing:

# Tax Rebate

by Duncan Bourne

CoCo3  
BUSINESS

**T**AX REBATE WILL show the user the amount of tax return he/she may expect, in accordance with the 1986/1987 formulae. Follow the prompts and press enter at each entry. It is rather late for this financial year, depending on changes, if any, for the 1987/1988 year, although it may be useful with minor adjustments.

# Border Graphics

Create any size borders with this handy CoCo3 program!

CoCo3  
UTILITY

by Frank Buttigieg

**E**VER SINCE I got Telewriter-64 some 2 and a half years ago, I've always looked for a utility that'll help me create some fancy border lines, but I've had no luck.

So finally I decided to write one myself. I did and this is it!!!

I'll try to explain how it works. The border is a GRID to help you calculate where you want the BLOCKs to be placed on the sheet, and to create any sized borders.

Let me explain.

First of all, it is done on a DMP-110, which uses a total of 960 dots to draw a line across the paper. It will not allow you to draw more than 256 Dots. It's all explained in the manual, so study it.

Here's how I worked it out:

BLOCK = 16 dots (DMP-110's elongated mode) or 8 (for 480 dots).

SECTORS [0 to 2] = 16 BLOCKS = 256 dots/sector [3] = 12 BLOCKS = 192 dots 1st BLOCK in 'any' SECTOR. It's Starts on the [0] position. Last BLOCK in SECTORS [0 to 2], starts on [240] position. Last BLOCK in SECTOR [3], starts on [176] position.

OK, here's how I formed a border to use as a kind of GRID.

1)- CLOAD & RUN program. You are greeted by a MENU of 5 choices.

2)- Select Number 4 and press <enter> to create a new design.

3)- Now, for those who are not too familiar with printer graphics, I suggest they pick up Australian CoCo, 12/87, on page 29.

There is an excellent article by Mal McLaughlan on this subject.

For those who can't be bothered, or don't have a copy of the mag, just type in a 3 digit number between (128 & 255) when prompted, or use these numbers:

255 - 193 - 201 - 221  
201 - 193 - 255 - 128

4)- You're back on the main menu. Select No.5

5)- Here comes the nitty gritty! You're prompted by:

"Start @ SECTOR...?" <type 0>  
"Start @ POS...?" <type 0>  
"End @ SECTOR...?" <type 3>  
"End @ POS...?" <press> 176

By now it should be clear what the last 4 prompts are about. The next prompt is ...

"How many <BLOCKs> across...? <type 60>

This number is calculated as such:

SECTOR 0, POSITION 0 to  
SECTOR 2, POSITION 255  
= 3(SECTORs) X 256 = 768.  
SECTOR 3 = 192.  
Add 192 + 768 = 960.  
Divide 960 / 16 = 60 BLOCKS

"BLOCKs per columns ...? 87

... pure guessing! Hence why it's important to create this GRID first. It is a good ruler to use.

So now the printer takes over...

6)- When the printing is done, you're back to the main menu.

7)- Before you type 3, make sure that the text printing is going to sit snugly under the bottom line, but not on the perforated line.

If it does, don't worry,

adjust the paper to sit on top of the next sheet, making sure the GRID sits in position on paper, and type <1>.

This time you don't have to punch in all those numbers again. This you can do as many times as you want to.

Now, presuming all is done right, press <3> and you'll get a printout of the 3 digit numbers you punched in earlier, for later reference.

Also, because the text format is 80 columns (BLOCKs) across, and my format is 60 columns (BLOCKs) across, you can use the text below the GRID as a guide, to work cohesively with "BORDER GRAPHICS".

I hope you find this program interesting and helpful for you as it is for me.

Cheers to you all!

# Labels

Printouts for  
standard labels

by Barry Sidebottom

CoCo3  
UTILITY

**L**ABEL IS for the CoCo 3, prints out labels on standard 3.5 X 9 cm labels.

By using colour codes you can see which lines are formatted and how, ie emphasised, enlarged, condensed, italicised, normal and all underlined or not.

The program is straight forward with a couple of notes: the "e", "n" & "c" on the screen during input show the length available for enlarged, normal and condensed print.

You may have to change your printer codes - I use an ANUST 80DT and the codes are listed below:

line	code	function
112	27;45;1	underlining on
112	27;45;0	underlining off
116	27;14	enlarged on for 1
118	27;15	condensed on
118	27;18	condensed off
120	27;52	italics on
120	27;53	italics off
122	27;"E"	emphasised on
122	27;"F"	emphasised off

Hope you can use it. If you have any problems, call me (03) 744-6281.

# Tandy ELECTRONICS

## Handy Pocket Computer

### Pocket Computer and Accessories

- Programs in BASIC and Assembly Language

**A. PC-4/6 Portable Printer.** Prints 20 characters per line. This compact printer is a great addition to your pocket computer. 26-3652 **149.95**

**Cassette Interface and Printer Cable.** For connecting the PC-4/6 portable printer and PC-4/6 cassette interface, to your portable computer for greater results. 26-3671 **29.95**

**8K RAM Module for PC-6.** Is expandable to 16K. 26-3674 **39.95**

- 65 Built-In Scientific Functions

- Programs in BASIC and ASSEMBLY LANGUAGE

**B. Pocket Scientific Computer PC-6.** An ideal tool for engineers and students, the PC-6 combines the best features of a powerful scientific calculator and a pocket computer. Performs up to 65 scientific calculations or write your own programs in BASIC or Assembly language. Retains data and programs even when power is turned off. With 8K memory. Includes battery. 26-3672 **229.95**

### Sale Priced — Software For Your Color Computer/1000

**C. Flight Simulator.** Learn how to fly a plane! Works on CoCo 2/3. 26-3108 Reg 69.95 **Sale! 49.95**

**D. DeskMate.** Package of seven commonly used personal applications on one disk: Text, Leader, Index Cards, Paint, Telecom, Calendar and Calculator. Works on CoCo 2/3. 26-3259 Reg 119.95 **Sale! 99.95**

**Color Computer Learning Lab.** Self teaching course in standard color BASIC programming. 26-3153 Reg 99.95 **Sale! 79.95**

**Color Editor/Assembler.** Develop 6809 software programs or subroutines. 26-3250 Reg 99.95 **Sale! 79.95**

**Color Cubes.** 26-3075 Reg 39.95 **Clearance! 19.95**

**Color Disk Scripsit.** An easy to use word processing program. 26-3255 Reg 79.95 **Clearance! 59.95**

**MS-Word.** A high performance word processing program. For the Tandy 1000. 25-1153 Reg 749.95 **Clearance! 299.95**

**Scripsit®.** Prepare memos, letters, reports or manuscripts. For the Tandy 1000/2000. 25-1155 Reg 699.95 **Clearance! 369.95**

**Microsoft MultiPlan.** Ideal for profit and loss projections, budgeting and sales forecasts. For the Tandy 1000. 25-1152 Reg 399.95 **Clearance! 179.95**

**E. Friday.** Supports file management and report writing. Req. 128K, 2 disk drives. 25-1149 Reg 749.95 **Clearance! 149.95**

**F. New! Typing Tutor III™.** The fastest, most effective way to learn how to type on your computer. 25-1126 **99.95**

**Basic 09.** An enhanced version of standard BASIC OS-9. 26-3036 Reg 99.95 **Clearance! 79.95**

**Corplan.** A management decision simulation game designed to teach people about the basic rules of running a business. 26-2619 Reg 99.95 **Clearance! 79.95**

**Flipside.** Exploration game. 26-2529 Reg 34.95 **Sale! 29.95**

**Micro Painter.** 26-3077 Reg 59.95 **19.95**

**Pooyan.** Take aim with bows and arrows to protect the piglets from the wolves. Requires 32K. 26-3048 Reg 59.95 **Sale! 49.95**

**Dynacalc.** A powerful electronic spreadsheet. Built-in functions and 16-digit precision. 26-3275 Reg 179.95 **Sale! 149.95**

**pfs:graph.** Helps you produce charts for reports. For the Tandy 1000/2000. 25-1143 Reg 229.95 **Clearance! 69.95**

**Omniterm 2.** Provides the ability to communicate with other computers. 25-1160 Reg 249.95 **Clearance! 149.95**

**Flight Simulator.** With 35 important aircraft characteristics. For the Tandy 1000/2000. 26-5379 **129.95**

Prices Apply at All Tandy and Participating Dealers

# Just Released! Tandy 1000 TX

**A Professional-Class  
MS-DOS® Computer  
For Any Office, Home**

**New!**

- High-Speed '286' Technology
- 640,000 Characters of Memory
- Disk Drive Stores 720,000 Characters
- Includes MS-DOS 3.2 and GW-BASIC Software
- Compatible With The IBM® PC
- Includes Personal DeskMate® \* 2

Is it time to invest in a new computer? Go no further! '80286' processing power has never been this affordable. The **Tandy 1000 TX** packs a full 640K memory and 8.89cm disk drive. There's also room to add a second internal 8.89cm or 13.3cm disk drive so you can use 13.3cm software as well as the new release on 8.89cm diskettes. There's more good news - graphics, parallel printer and joystick adapters are all built-in and also has RS-232C serial port! Tandy includes these adapters that you'd pay extra for with ordinary PC compatibles. The Tandy 1000 TX comes complete with Personal DeskMate 2 software. This is an easy-to-use integrated program that lets you put your computer to work straight away. Invest in the best with the Tandy 1000 TX Computer.

25-1600

**\$2299**

For clear quality viewing attach a 33cm **CM-5 Color Monitor**. This will add the final touch to your computer system to ensure that you receive the best in performance and convenience. 25-1023 **\$599**

**WE SERVICE WHAT WE SELL!**

# OS9 Level 2: Customising your System Disk

by Ken Wagnitz

OS9

**H**ERE ARE THE things you may like to do with your System disk to customise it for your particular hardware setup.

But first, write protect both supplied OS9 disks then make copies of them and put them away in a safe place. You can BACKUP the disks as if they were normal RSDOS 35 track disks, ie using DSKINI to format disks, then BACKUP.

## The Clock

The clock module is responsible for maintaining the current time, being incremented by the an interrupt from the vertical sync pulse, which in Oz is 50Hz, but 60Hz in the USA.

Consequently when you boot the bought OS9 or DESKMATE, the screen may roll, and the clock will lose time. (It also loses time with disk accesses, but that's another story).

If you have a Philips colour TV you will not be able to correct the rolling if it occurs. Other people can reach for the Vertical Hold. It is important to have the time roughly correct because it "date/time" stamps files so that a DIR E shows the date/time of last modification of a file.

Fortunately a 50Hz clock module is supplied, along with other modules, on the Boot/Config disk.

To use it, run the CONFIG command, as follows:

1. Assuming two disk drives-Boot with the COPY of the system disk in d0.
2. Format a disk in d1, leave it there.
3. Place your COPY of the CONFIG disk in d0.
4. Type 'chx /d0/cmds ; chd /d0'. (The ';' is a command separator.)
5. Type 'config' and follow the

prompts as per the 2-drive description in the manual (OS9 Commands, page 6-18).

5a. Include all of the window descriptors (w.dw - w7.dw), and d0-35s.dd, d1-35s.dd, ddd0-35s.dd drive descriptors, and every other option, and TERM-WIN type terminal.

5b. If you have three disk drives, include d2-40d.dd.

6. Config will write a bootfile on the blank disk in d1 then ask what commands you want on that disk. Type 'i' to add a couple of command files. Select 'grfdrv' and 'shell' only. Now replace the disk in d0 with the one from d1, and press the RESET button to boot from the new disk.

7. You should have a 50Hz clock.

8. Then put the system disk back into d0 and type 'chx /d0/cmds ; chd /d0'.

9. Type 'setime' and enter the time and date.

## Printer Characteristics

Type 'xmode /p' to see the current printer settings. Change any of these as per the xmode command description (OS9 Commands, page 6-100). In particular, the baud rate will probably need changing.

## Disk Drive Characteristics

When a drive is used, its descriptor is read to see what the drive's characteristics are. So somewhere in the module 'd0' (which is in memory), is a byte which determines what stepping rate should be used for drive 0.

We can modify the descriptors to reflect what the drives look like. (Use the command MDIR to see what modules are in memory.)

Type 'help modpatch' to see the usage of a command which was for some reason not documented in the Commands descriptions. It

is used to patch modules in memory.

Now turn to page 5-9 of the Technical Reference section. There you will find a description of the relevant parts of a disk drive descriptor module, referenced by their offset from the start of the module (ie byte address, relative to the 1st byte of the module at address 0).

Note that the offsets (Relative Address) and all numbers that follow, are in hexadecimal.

Type 'modpatch'. No prompt is issued. Then type the following, not including the \* or past it (these are comments).

```
l d0
```

```
* the 'current address' is now the 1st byte of d0.
```

```
c 14 0 3
```

```
* this changes the step rate from 0 (30ms) to 3 (6ms).
```

```
* use 1 for 20ms, 2 for 12ms, or leave this line out for 35ms.
```

```
c 18 23 28
```

```
* changes the number of tracks from 35 to 40 - use 50 if an 80 track drive, or leave out for 35.
```

```
c 19 1 2
```

```
* changes the number of sides from 1 to 2 - leave out if drive is single sided.
```

```
v
```

```
* fixes the module crc which is incorrect after changing bytes.
```

```
l d1
```

```
* repeat the above 4 lines (after 'l d0') for the 2nd drive (d1), putting in the new bytes applicable. Then repeat for dd.
```

making it the same as d0. Patch d2 also if you have 3 drives.

### The Terminal Screen

When you booted, you got a 32 column by 16 line screen. Disappointed? That can be changed, but at the expense of memory. It will cost an extra 16K of RAM to have a 40 or 80 by 24 screen.

The device descriptor for the terminal has to be patched ('Term').

Turn to the Technical Reference section, pages 6-7,6-8. That is the detail of a device descriptor such as 'Term' which determines the features of the Terminal screen. Now let's customise it! You should still have 'modpatch' active.

l term

\* this points to the descriptor we want to change now.

c 2c 28 50

\* change number of columns to 80 (use 28 for 40 columns).

c 30 1 2

\* change window type to 80 column text (see wcreate command).

\* if you wish, the colours can be changed also - here I choose white on black.

c 33 2 0

\* choose white foreground

c 34 3 2

\* choose black background

c 35 3 2

\* choose black border

v

\* fix up the crc.

Now press CTRL BREAK (Escape) to end the modpatch session.

Place the new boot disk you created, in /d1. Type 'cobbler /d1'. The current modules in memory are used to create a new bootfile on that disk. Put that disk into d0 and press RESET.

It should boot giving you a nice 80 or 40 column screen. You will have heard disk accesses speed up (if you put in faster stepping rates) after the bootfile loaded, as the shell file and GrfDrv load.

If it didn't work as you expected, start all over again! If it did work OK, place your system disk copy in d0, and type...

'chx /d0/cmds ; chd /d0'

... then type 'cobbler /d0'. You now have a customised system disk! You can re-use the boot disk created, since it is no longer needed.

Of course the system disk is not a 40 track double sided. To get that, format a disk (which will be 40TDS), then DSAVE all of the system disk onto it.

### Memory

Booting on a 128K CoCo leaves 56K of RAM free. The above changes to the initial Terminal display reduce that to 40K.

Opening more windows will reduce that more. The answer is to purchase a 512K RAM board.

Read the magazines to find out where to get one, or contact me.

Contrary to what the last CoCo magazine suggested, changing the makeup of the file 'shell', which actually contains a lot of utilities, will not increase available memory. As long as a SHELL (memory module) needs to be loaded, it may - as well be merged with just less than 8K of utilities, since any file loaded on its own will occupy 8K of RAM space!

```

**T**HE INSTRUCTIONS to this game are in the program, but I will define the words RUN and SPACE which appear at the bottom of the screen.

A "RUN" is a person's turn which means a screen. If you get an extra "RUN", you have to complete that "RUN".

There is a high scoring routine which is cleared every time you run the program. The scores can be stored permanently on disk if you insert the following lines:

```

2475 OPEN"1",#1,"SNAKEHI":FORI=
1TO10: INPUT#1,HS$(I),HS(I):NEXT
:CLOSE
2665 OPEN"0",#1,"SNAKEHI":FORI=
1TO10:WRITE#1,HS$(I),HS(I):NEXT
:CLOSE

```

If you are running SNAKE for the first time, save it first, then run the following little program to initialize the high scoring file:

```

10 OPEN"0",#1,"SNAKEHI":FORI=1
TO10:WRITE#1,".....",0:NEXT
:CLOSE

```

This is one of the first programs that I wrote for the CoCo, so the program may look sloppy and primitive in some places.

When I upgraded to 64K, I rewrote some parts to make it run a bit faster.

Submit your program to be eligible for one of the prizes at Conf '88.

Categories include The Tandy Programming Contest for Machine Language games; CoCo 3 Games; CoCo 2 Games; Utilities; OS 9; MS DOS programs; Applications; and many more.

Prizes range from a contract with Tandy to produce your software to printers, computers, disk drives, modems and software.

Entries close 31st August 1988, so plan now to get your work to us by then. The address to send your program to is:

Goldsoft Pty Ltd  
Freeport 5  
Southport. Qld. 4215.

# The Headless Knight

by Pat Place 32K ECB GRAPHICS

I WOULD LIKE to submit a graphics program which I have called "KNIGHT" (short for "Headless Knight" as you will see when you run the program), in this year's graphics competition.

As far as I am aware, the program will work on any CoCo with 32K or more. As can be seen in the listing I have acknowledged a utility program called "LINEMASTER", by Tom Lehane which appeared in June, 1987 Australian CoCo Magazine.

An easy way to utilize this program (and explaining the way I drew this picture) is to trace the required picture onto clear plastic with a felt-tip pen and then place the picture on the screen of your TV or monitor and then re-trace the picture with the cursor, using the "LINEMASTER" program.

The program then reads the x-y coordinates on the screen and records them in the form of DATA statements.

It then is imbedded in the program, which can then be SAVED or CSAVED to disk or tape.

## The Listing:

```

1 GOTO 70
3 SAVE"55:3":END"5

# 4096 Colours

by Chris Dent  
CoCo3 UTILITY

**4**096 COLOURS IS A BASIC program to demonstrate one form of colour mixing techniques on the CoCo 3.

The technique used is the most simple available. It simply draws alternating lines of two different colours.

Because the CoCo 3 can only display 16 of its 64 colours at one time, we are restricted to 256 colours (16x16) when colour mixing out of a palette of 4096 (64x64).

When you run the program you will notice that a lot of the 4096 colours look stripey. Despite that, there are still lots which look very good.

To use the program you simply press the arrow keys.

Pressing the left/right arrow keys decrements/increments the vertical palette by 8.

Pressing the up/down arrow keys decrements/increments the horizontal palette by 8.

# ASort & Asearch — Corrections

by George McLintock

**I** MUST APOLOGIZE FOR a couple of errors which are contained in the ML routines which I submitted recently for sorting and searching arrays (titled ASORT & ASEARCH).

They demonstrate that my testing and checking procedures are not as exhaustive as they might be.

In this context, I would note that if anyone has any problems with using or understanding any of the routines which I submit to these magazines, they are welcome to contact me about them and I will respond as best I can.

My phone number is 062-95-6590 (a/h), or write to ...

7 LOGAN ST,  
NARRABUNDAH, ACT, 2604

## ASORT

The problem with ASORT is that if certain addresses occur for the VARPTR of the pointer array used for the indirect sort, then the sort will not work correctly.

This results from using the switch to show that an indirect sort is required, plus 1, as the switch to show that a swap has occurred in the sort for a list.

While this particular aspect is associated with a number of different parts of the logic, the fix itself is quite simple and demonstrates an interesting bit of trivia about binary numbers.

The switch to show if an indirect sort is required or not is produced by OR'ing the first byte of the 2 byte integer produced by the conversion of P(2), with the second byte. This gives a valid switch for the purpose.

The problem arises when this switch is then used to produce the switch to show that a swap has occurred. Because this second operation is performed in a part of the code which is always executed, and the initial value can be zero, I used the INCA instruction to make it non-zero.

However, if the first operation produces a switch value of HEX FF, then the INCA instruction will bring it back to zero again, and the second switch will not be correct.

The fix for this problem is to change the INCA instruction to a DECA, and this will always produce a correct value for the second switch.

The single exception, of course, is if the original address is Hex 0101, which will not occur because of its position in the Basic communication area.

To apply this correction to the ML routine after it has been incorporated at the end of a Basic program ...

```
POKE M+&H1D2,&H4A.
```

```
... where ...
```

```
M=PEEK(27)*256+PEEK(28)-583
```

To make the change to the Basic program as submitted, alter the 4C in line 56180 to 4A and change the checksum for the line from E4A to B48.

## ASEARCH

ASEARCH was designed to use the same working storage as ASORT, which is why its use of working storage starts at an offset of 50 from the direct page register.

However, I didn't count correctly and a numeric sort with ASORT actually uses 52 bytes of working storage, not the 46 as stated in the description.

Hence if you use them both together, and mix the EXEC calls for both of them, then a numeric

sort will wipe out the first two parameters set by the initialisation routine for ASEARCH. These are the values set from P(4) and P(5) of the parameter array.

While this is only a problem if you do a numeric sort after initialising ASEARCH and before doing a search with the EXEC call, it can happen.

The easy way to fix this is to re-assemble the routine with all working storage positions moved up two places. But this will change all the ML instructions which use the DP register. The minimum number of changes is obtained by moving these two parameters from DP+50 to DP+76 and from DP+51 to DP+77.

To do this after the ML routine has been added to the end of a Basic program requires 7 POKE's at an offset from M1, where the value of M1 is the starting address for the utility, as described in the original submission.

```
POKE 76 into M1+&HC, M1+&H129,  
M1+&H142, M1+&H146 and M1+&H158  
POKE 77 into M1+&H12 and  
M1+&H14D.
```

To change the data statements in the Basic program as submitted, make the following changes:

Line 58000: change the 32 to 4C and the 33 to 4D, and also change the checksum from 7A9 to 7DD.

Line 58110: change the 32 to 4C and the checksum from 924 to 93E.

Line 58120: change the 32 to 4C and change the checksum from 9C7 to 9E1.

Line 58130: change the 2 x 32's to 4C's and the 33 to 4D, and change the checksum from 864 to 898.

This also changes the poke addresses, if you want to alter these switches in this way.

◆

# Alphabet Filer

...and you can get a CoCo2 version.

by Lindsay Bradford

CoCo3  
BUSINESS

## The Listing:

**T**HIS IS THE FIRST program I have sent into CoCo magazine. It was just sitting at home growing old and decrepid, so I thought that I'd send it in to CoCo Magazine.

It was originally designed for the CoCo 2, but after my recent purchase of a CoCo 3, I just could not go past using the CoCo 3's new features.

Now I hear some of you saying, "Great, now I'm going to have to push everything over a bit just to see it!" Fear not, I myself use a TV, so I've used the 64 column screen.

Everything can be seen and I think that it'll be a real help to people like myself without monitors.

The program is pretty well self-explanatory but I'll just run over some of its other features now.

After the sorting has been finished, hit the 'G' key to get the 'extras'. They allow you to add titles to the names or to delete any of the names that are wrong.

Another feature that I've found quite useful is the feature to save the names so they can be used in other applications, such as the ability to make multiple copies of the same letter, so that it can be sent to many people.

"FILER's" sorting technique is quite slow, so I've set it up for fast speed operation. If you have any problems with "FILER", then contact me by writing to my address:

14 LOBELIA CRT,  
MOOROOBOOL,  
CAIRNS, QLD, 4870

If anyone wants a version that is CoCo 2 compatible then send a tape to this address and I'll put it on the tape for you.

# 64 Colours

All 64 colours at once AND in the right position!

CoCo3  
UTILITY

by Lindsay Bradford

**H**OW MANY PEOPLE out there who, like me, have typed in a program that was to give the full 64 colours of the CoCo 3 at once?

Though I have seen a correction to it, all the correction does is reposition the boxes. Until now, no-one that I know of was able to find out what was really wrong.

So I set about finding out what was wrong with the program in the machine-language code.

After searching through the assembly supplied by American Rainbow magazine, I found a section dealing with the beginning of the vertical scan lines.

After altering the values of the beginning, I found a value that really did give all 64 of the colours at once, in the right position, without re-positioning the boxes.

For those of you who still

have the original, all you have to do is find the value '70' and change this to a '96'.

For any of you who don't have this very useful program, I have supplied an edited version that needed only the change of one value to get it working.

## The Listing:

HOW CAN I BEGIN TO  
TO DESCRIBE IT?

HAVE YOU EVER SEEN  
EVIL DEAD ?????

# CoCo3 Revealed

## Part 2

Another look at the CoCo3,  
plus a few corrections.

by Darren Reed

**O**k, these magazines give out awards for the BEST Tandy store each month, but have you ever seen a Victorian store get one of these awards?

Yes, down here the Tandy Salespeople are quite hopeless (except for a few) in selling the CoCo's. It is quite possible to walk into a store and find the CoCo 3 with a CM-8 monitor both OFF! How do they expect to sell them without showing prospective buyers what they can do!?

Their first Demo program with the rainbow and the rest was excellent, and could quite easily entice somebody into buying one.

Also, when they have specials, the display card shows nothing but catalogue numbers - how is a person looking at this supposed to know what he is getting if all he is told are catalogue numbers?

I think Tandy have got the products, but not the push to sell them. Is there any way to get this message to the Tandy sales reps.? Enough of complaints.

Since "CoCo 3 REVEALED" I have found some mistakes in the programs (sorry about the delay for the corrections) and some new information.

On the CoCo 3's new ROM.

The corrections first:

In the "POKESYNC" program, there should be a line 13:

```
13 DEFUSRO=&HEOA
```

To then 'fix' the POKE command use A=USRO(0). In the "Font Changer" program (FNCHANG) then following:

\* In line 120 forget the "HLINE-(22" in the listing the end. Instead make a line 121 as follows:

```
121 HLINE-(225,152),PSET
```

Change the following lines to read as they do here also.

```
710 FORI=32TO58:HPRINT(I-18,2),C
HR$(I):NEXT
720 FORI=59TO99:HPRINT(I-59,3),C
HR$(I):NEXT
730 FORI=100TO128:HPRINT(I-100,4
),CHR$(I):NEXT
740 IFAC<128 THENGOSUB950
750 FORI=OTO39STEP2:HPRINT(I,10)
,CHR$(AC)+" ":NEXT:HPRINT(0,14)
```

```
,STRING$(40,AC):GOSUB950:HPRINT(
5,20),"Press any key to continue
":HPRINT(0,16),"the quick brown
fox jumps over the lazy":HPRINT(
0,17),"dog.":EXEC44539:WIDTH40:G
OTO230
```

Also two POKES for switching between two HSCREENs need to be changed. The first should be POKE&HFF9D,200 (for the second screen) and the other should be POKE&HFF9D,192 (for the first screen).

This is needed for 512K machines but work as they are for 128K machines.

Now for the new stuff. After the first two byte of the new ROM, presumably for identification, the next 14 bytes contain the addresses for some new, vital, ROM routines. A summary of what they are is as follows:

\* \$E002-\$E003: contain \$E019.

Sets up text screen according to what is in location \$E7.

Values for location \$E7:

```
0 - Width 32
1 - Width 40
2 - Width 80
```

By storing one of these values in \$E7 and then doing a JSR \$E019 or a JSR (\$E002), any of the three text screen modes can be achieved.

\* \$E003-\$E004: contain \$E04D.

Sets up a HSCREEN according to what is in location \$E6.

Values for location \$E6:

```
0 - No HSCREEN set up.
1 - HSCREEN 1
2 - " 2
3 - " 3
4 - " 4
```

Use the same method as above to activate or deactivate a HSCREEN.

\* \$E006-\$E007: contains \$E097.

Reads MMU data in from locations \$E0E1-\$E0F0 into \$FFA0-\$FFAF.

\* \$E008-\$E009: contains \$E0B5.

Changes MMU data for WIDTH40+80 screens. Restores data in \$E0E1-\$E0F0 after it has been moved to \$FFA0 - \$FFAF.

\* \$E00A-\$E00B: contain \$E0A1.

Change value in \$FFA0 by reading data from \$E0E1-\$E0F0 into MMU. New value is put in the B accumulator. B is preserved. Data at \$E0E1 is restored also.

\* \$E00C-\$E00D: contain \$EOFF.

Sets the TR bit of \$FF91 to 0. Returns stack to normal.

\* \$E00E-\$E00F: contain \$E119.

Sets the TR bit in \$FF91 to one. Moves stack \*.  
\* - The return address and the stack pointer are both preserved by being saved at locations \$42 - \$45. They are saved before the TR bit is altered and restored after. It is therefore advisable to be very careful how you manipulate the block pointing to \$0000- \$1FFF. The TR is bit 0 of \$FF91.

For any of these routines it is recommended that you use the indirect JSR (JSR (\$xxxx)) so that if any further revisions of the ROM in which the direct addresses may change, your ROM calls should still work.

For the first 2 routines, A,X,Y are all preserved. For the next three A,B,X,Y are all preserved. For the last two only A,B are preserved by storing them in location \$40. Only those registers preserved are used.

Some other routines from 2.0 that are called by these are:

\* \$E0F1: the major one. This reads data in from a 16 byte data area pointed to by X into the MMU at \$FFA0-\$FFAF. A,B,X,Y are all used and are not preserved. To use this a direct JSR is required with X pointing to the data. It is advisable to preserve A,B and Y before calling it.

\* \$E0CB: this routine is identical to the one at \$E0B5 except that it sets the MMU up for the HBUFF area instead of for the text screens.

Data for the ROM calls here is literally stored all over the place. The MMU data is between \$E0E1 and \$E0F1. Data set one is \$E0E1-\$E0E8 and data set two is \$E0E9-\$E0F0. Data for the text screens:

32: \$E032-\$E03A  
40: \$E03B-\$E043  
80: \$E044-\$E04C

Data for the HSCREENS:

1+2: \$E070-\$E078  
3+4: \$E079-\$E081

For all these data areas, the first byte goes into \$FF90 and the next 8 into \$FF98-\$FF9F.

For the HSCREENS, the data that goes into location \$FF99 is stored in locations \$E06C-\$E06F. HSCREEN 1 uses \$E06C, 2 uses \$E06D, etc.

This byte is loaded into the other area and then transferred into \$FF90, etc.

Now to apply some of that information. Well the ROM routines can only be used by ML so lets see what we can do through BASIC.

For those with only 128K

Most of the following cannot be done on your machines due to lack of memory ( I have a 512K machine) but read it still and maybe this will give you extra incentive to get the extra memory, you will need it, especially if you want to use OS9 Level II.

512K for the CoCo 3 is like 64K for the CoCo 1&2.

For 512Kers, to obtain extra HSCREENs poke the new block numbers into locations \$E0EA- \$E0ED. Any number between 0 and \$33 is acceptable in any

of these locations.

This changes the vertical offset register. A POKE to \$FF9D is not sufficient. This is like the old SCREEN command, ie you can be drawing to one screen but looking at another.

After you have stored your new block allocation numbers in the relevant locations, do an EXEC&HE097 to transfer your block to the MMU. Your MMU data image needs to be both in the MMU and between \$E0EA- \$E0ED. To see the blocks you are drawing in, the following POKE is needed.

POKE x,y

x - \$E076 for HSCREENs 1&2,  
- \$E07F for HSCREENs 3&4.

y - 4 \* the block number in location \$E0EA. Then do a HSCREEN command and away you go.

N.B. It is possible to draw to any 4 blocks, not necessarily in order, but it is only possible to display 4 consecutive blocks.

Other extras are possible to, extra HBUFF areas thankfully. By POKE-ing the block number for the HBUFF into \$E0D4, more HBUFF area is obtained.

To clear the HBUFF area, make it part of the HSCREEN area and HCLS0.

The following program demonstrates the above block switching for the HSCREENs. Do not try this with 128k, it simply will not work!!

```
4 'High speed POKE
5 POKE 65497,0
8 '*****
9 'Disable HCLS when HSCREEN is
  executed
10 POKE &HE6C6,18:POKE&HE6C7,18
20 A=0
30 FOR J=0 TO 11 '12 HSCREENS
38 '*****
39 'Set vertical offset
40 POKE &HE076,A*4
48 '*****
49 'Put block No.s into $E0EA-$
  E0ED
50 FOR I=A TO A+3:POKE &HE0EA+
  (I-A),I:NEXT
58 '*****
59 'Transfer into MMU
60 EXEC &HE097
70 HSCREEN 2
80 HCLS J: HCOLOR J+1
90 FORT=1TO99:HLINE(RND(320)-
  1,RND(192)-1)-(RND(320)-1,RND(1
  92)-1),PSET:NEXT
100 A=A+4
110 NEXT J
120 GOTO 120
```

There is no need for the REM lines except to explain what the next line is doing.

After running this program once insert line 75 below and change line 120 as below.

```
75 GOTO 100
120 RUN
```

Copy that PMODers!

## Some utilities for 512k owners

### The "Backup" procedure

The BACKUP procedure is now much easier thanks to the extra RAM. Many 128K backups have been done but here's one for 512K only (or 128K if you must). This one (Listing 1) is quite simple - you input the last track of the disk to be read, the source and destination drives and away you go.

It will even read those mammoth 80TK disks one side at a time. This one allows to go from side one on one side of a DS disk to the other side of another DS diskette. (DS refers to disks that can be read on both sides without extra punctures in the jacket.)

This program doesn't respond to disk errors (they shouldn't be there in the first place) and will keep trying to read it until an I/O error appears (if it gets round to it).

### The "Ramtest" program

I wrote this for someone who makes 512k cards to check them. This program checks the RAM's ability to store data and results in an error if the RAM is found not refreshing properly or similar. This sort of RAM is termed *short-term RAM*, ie the data is only retained a short while then lost, drastic for some long power-on performances. The program does a rather long loop after the initial check to allow the RAM to deteriorate (if it is faulty).

## Non-Tandy DOSes and the CoCo 3

The combination of non-Tandy DOS and the CoCo 3 is most interesting. It seems that the CoCo 3 interprets the syntax of the extra DOS provided commands as the new CoCo 3 commands and confuses the user with this combination. To get around this problem there are two alternatives:

1. Get a Tandy DOS 1.1 and get it put in your controller case with a switch to switch between the two or ...
2. Find out which commands replace what and learn this 'code'.

I had only a non-Tandy DOS when I first got my COCO3 but now have 1.1 as well. For those who still have an 'uncompatible' system, Listing 3 may be what you need. I created a program that contains all the new commands with 1.1 and next to them behind REMs put the command once more. Loading this in with the other ROM, the commands behind the REMs stayed the same but those in the program were changed.

Those unchanged cannot be used as such and required other means. The listing I have included are for POWERDOS/COCO3 (POWERDOS comes from Geelong).

Some of the replacements are also included.

This incompatibility only disallows commands from being entered from processing, those loaded in from programs written under 1.1 will work fine.

### Power DOS Vs. CoCo 3

```
10 ON HIDE GOTO 310 'ON ERR GOTO
20 ON UNHIDE GOTO 340 'ON BRK GOTO
30 SLIST 40 'WIDTH

330 END
340 CLEAR
350 ! 0,0 'ATTR
```

Some alternatives for other Dos users:

ATTR - Poke \$FE08 with a value to set the attributes (see JULY '87 Ausi. CoCo for more details).

PALETTE RGB - EXEC &HE676

HSET - EXEC &HE671 (x,y,c) put in brackets following the EXEC, no colon inbetween the x and y co-ordinates and the color.

HRESET - EXEC &HE765 (x,y) as for HSET but no colour code.

HDRAW - EXEC &HF39D "... " put in quotes directly after the EXEC the string of commands you wish to execute.

Some gossip: I have heard that IBM are changing thier DOS format again, from MS-DOS to OS-9.

Yes, this system is compatible with ours, the disk format is the same so we should be able to read their disks.

I am not sure whether this is for a new line of multi - user computers or just another disk format change. Does any one else have any further details on this change?

Finally to the eds., are programs written for the CoCo 3 under the new BASIC09 going to be judged in the same section as normal BASIC?

BASIC09 has a lot of advantages over BASIC including being compiled. Classy BASIC09 programs are going to outclass those BASIC programs for sure.

*Because of the different structures used (a type of Pseudo-code vs an unstructured basic), we are going to judge the Basic09 programs separately from the other Basic programs - Ed.*

To contact me about anything here, I can be found at the Nth. Eastern CC in Melbourne when it meets. See end of magazine for a phone number.

## NEW RELEASES

At last! A new series of "Best of's" (12 to 20) is about to be released. As we are still finishing several disks/tapes in this series, we thought we'd whet your appetite by pre-releasing a couple of the complete ones this month

And as a further bonus, we're offering these ones at the old price of \$16.00 ea (disk or tape) for February only. In March, all Best Of's go up to \$19.50 ea.

The Best of CoCoOz #13. 32K CoCo 2 Games. (CoCo 3 Compatible.)  
The best CoCo 2 games of 1987 from Australian CoCo Magazine and Softgold Magazine!

And for the first time we're including three machine language games - Tank Part 2, Dogfight and Gunfight!

The Best of CoCoOz #15. CoCo 2 and 3 16K Utilities.

All the utilities you wanted, but were afraid to ask for!  
Included is a screen dump for the DMP130 and DMP 105, a joystick simulator, tape checker, variables lister, program recovery system and many more utilities to make your use of the computer that little less frustrating!

The Best of CoCoOz #18. CoCo2 & 3 Graphics.

Features heaps of graphics programs from Australian CoCo and Softgold Magazines. Programs like "Tartan", "Snoopy", "Monster", "Pink" and a host of others!

Just the thing if you are looking for designs for printouts, or for addition to a program of your own!

The Best of CoCoOz #20. The Drenkald Adventure.

by Scott Harvey. (Flippy Disk only.)

An all Basic all graphics adventure!

You are one of the mighty warriors of Yurndor, warriors feared by all the forces of evil because of their great strength and courage. But can you defeat the forces of evil?  
For both CoCo 2 and CoCo 3.

# M/L Utilities

For special requirement, or may be of some general interest

by George McLintock

32K ECB  
UTILITY

I HAVE SUBMITTED a couple of small ML routines which were developed for a specific requirement, but may be of some more general interest.

They are ...

- \* PCLEAR0 - Performs a PCLEAR 0 from within a Basic program, and
- \* DELETE - Deletes specified line numbers from within a Basic program without interfering with the program operations, and with all variable definitions retained.

## "PCLEAR 0"

CoCo Basic does not support a PCLEAR 0 command. If the graphic screen is not being used, you can do a PCLEAR 1, which means that 1.5K is still reserved for the graphics screen.

It is possible to do the equivalent of a PCLEAR 0 by POKE's from the keyboard which will eliminate all the graphic screens, ie ...

```
POKE 25,PEEK(&HBA)
POKE PEEK(&HBA)*256,0
NEW
```

However, the requirement for a NEW with this procedure means that it cannot be performed as part of a Basic program, and it has to be done before loading the program itself.

I find this aspect rather annoying because I tend to forget to do the POKES required before loading a program which requires it, which means that you have to find out why the program doesn't work correctly, and then restart it using the correct procedure.

To avoid this problem, I have developed a small ML routine

which will perform the equivalent of a PCLEAR 0, as part of the normal program execution.

This avoids any requirement for a special set up procedure to be performed before loading the program.

## Program Operation

The program operates by changing the Basic pointers required to achieve a PCLEAR 0. It then moves the Basic program itself up in memory to occupy the new correct memory locations, and then resets other Basic pointers to the new correct values.

The other operation performed is to adjust the value of the Basic pointer at Hex A6 so that control can be returned to the Basic program in the normal way.

Hex A6 contains the address of the next byte in the Basic program to be processed by the interpreter (or the last byte processed, depending on the function performed).

When a ML routine is entered by an EXEC command in Basic, Hex A6 points to the delimiter following the EXEC 'address' command, ie normally to either the zero byte marking the end of line or the ':' marking the end of a statement.

If using this pointer to pass parameters to the ML routine, it will point to the comma used as a delimiter. In this context, a blank is not a delimiter.

When the ML routine returns to Basic with a RTS command, the value in Hex A6 must point to either a zero or ':', ie it must point to a valid end of Basic command token. If not, Basic will generate a syntax error.

Because this ML routine moves the Basic program code in memory, the value in Hex A6 is altered to point to the same relative position in the Basic program at the new memory

location, as it was pointing to when the ML routine was entered.

As a general point of interest, the pointer at Hex A6 can also normally be used by a ML routine to change other aspects of how a Basic program will operate.

Each Basic command tends to operate as a completely independent procedure (with some exceptions), so that control can be returned to any part of a Basic program and it will continue to operate normally.

The only problem, of course is that if you change anything at all which effects the way that the interpreter operates, you have to adjust all other pointers, etc to the correct values for Basic.

And the main problem here, is to identify all the other things which must also be altered.

## Using the program

The ML routine must be included as part of the Basic program which calls it, for it to be of any use.

The idea being that you can load the original program, and RUN it, and it performs its own PCLEAR 0.

I've included a brief description of two alternative ways of including it with a Basic program.

The routine itself is executed by an EXEC 'start address' command, which is at the beginning of the ML code.

The execute command can be located in any part of the program, but would normally be at the logical start of the program.

Any variables defined before the EXEC command will be lost.

After executing the PCLEAR0 utility, a CLEAR statement is required to reset other Basic pointers.

The utility checks if a previous PCLEAR0 has been

```

performed and if so, then it exits without doing anything.

For some reason, which I haven't been able to work out, is that if you do a PCLEAR command in the program before calling this utility, you will get a syntax error in the EXEC command line.

However, there is no point in doing a PCLEAR before calling the routine, so it is no real problem.

memory is tight, and you need the space used by that code.

However, the main problem with using it is this way is that you cannot delete these lines from within the Basic program itself, and then have the program continue to operate normally.

The program operation will stop after executing the DEL command, and you have to RUN it again to restart it. This, in turn, limits what code you can delete in this way, and any variables defined before the DEL are lost.

The utility submitted overcomes these limitations by deleting the lines required and then adjusting the other aspects required for the program to continue to operate normally.

The adjustments performed also retains the values of all variables & arrays which have been defined by Basic at that stage, ie you can read a series

of DATA statements into an array, and then delete that code, and the DATA statements, from the program, while still retaining the values as set up in the arrays.

### Using the Program

This ML routine is best included as part of the Basic program which calls it. While it can be located in any part of memory, there seems little point in having to load it as a separate operation.

I've included a brief description of two alternative ways of including it as part of a Basic program. There are other ways of achieving the same effect, and it is really a matter of personal preference as to which way you do it.

As set up, the line numbers to be deleted must be POKE'd into the cassette file name buffer before executing the routine, ie starting line number to delete at Hex 1D1 and ending line number to delete at Hex 1D3.

For example, if you want to delete lines 1000 to 2000, then you could use code like this:

```

SD=1000
ED=2000
Y=&H1D1
POKE Y,INT(SD/256)
POKE Y+1,SD-INT(SD/256)*256
POKE Y+2,INT(ED/256)
POKE Y+3,ED-INT(ED/256)*256

```

If you want to delete selected groups of lines, eg 1000 to 2000 and 5000 to 6000, then you could set up the POKE's in a subroutine, and GOSUB it.

(If doing this, note the restriction!)

If set up as a sub-routine, then the last group of lines to be deleted could be that subroutine itself.

This command treats line numbers in a different way to the DEL command.

If it cannot find the line numbers specified, then it will operate from the next highest line number, eg if all line numbers are increment of 10, and you delete from 55 to 85, it will in fact delete line numbers

60 to 90 inclusive.

To delete from line number 1000 to end of program use SD=1000 and ED=&HFFFF or some value greater than the highest number used.

The routine operates by finding the addresses in memory of the line numbers to be deleted, and then moves the program code and variable definitions areas up in memory to go over the top of the lines to be deleted.

The procedure used for moving the variables definition areas, retains the definition of all variables, and resets the pointers required by Basic.

The move routines are specifically coded to retain any ML routines or data which is stored at the end of the Basic program, ie routines incorporated in the program like this one can be.

### Restrictions for use

The only real restriction with using this routine is that the EXEC command to execute it MUST be contained in a part of the program which is not moved, eg if deleting line numbers 1000 to 2000, then the line number of the EXEC command itself must be less than 1000.

If it is not less than 1000, then you will get a syntax error because the pointer at Hex A6 is not adjusted (see explanation with PCLEAR0).

The other restriction relates to retaining string data, eg if you have a statement like ...

```
1000 A$="FRED"
```

... and you delete line 1000, then the definition of A\$ will be lost.

To retain definitions of this nature, use code like ...

```
1000 A$="FRED"+""
```

... which will set up the string data in normal string space.

### ADDING THE UTILITIES TO A BASIC PROGRAM

Both routines are submitted as Basic programmes, with two variations for including them with another Basic program.

⊕

The ML source is also included.

Poked at the end of a  
Basic program.

For normal use, I consider this to be the most appropriate way of including ML routines within a Basic program.

The versions, PCLEAR0 and DELETE, are set up as Basic programs containing DATA statements which are POKE'd into memory at the end of the program to set up the ML code.

The code used for this purpose is MERGE'd into the original program and RUN.

Executing the code installs the utility and deletes the Basic code used, using the normal Basic DEL command.

This same procedure can be used for installing any number of ML utilities within the same Basic program.

If both these utilities are installed together at the end of the same Basic program, and DELETE is installed first and PCLEAR0 installed last, then the entry point for PCLEAR0 is ...

M=PEEK(27)\*256+PEEK(28)-55

... while the entry point for DELETE will be M1=M-120.

To avoid possible complications, if a number of utilities are installed in this way, then PCLEAR0 should be the last one installed.

This utility moves the program up in memory, and if there is a large ML utility (or data area) installed below it, then it may overwrite itself as part of the move.

If any move does occur, then it will be by at least 1.5K, so other data up to this length can in fact follow it without problems.

The DELETE utility can move data in much smaller increments, to as little as 6 bytes, and to avoid the possibility of the code being overwritten, this version moves the code to be executed to the cassette buffer (from Hex 1DA) where it is actually executed.

As a String to be POKE'd  
into Memory

Another way of incorporating a ML routine into a Basic program is to set it up as a string of Hex characters which are then POKE'd into memory and executed.

Continued on p60

# Clocks Revisited

Keeping your eye on the clock.

by Ken Wagnitz

Ed's note: This article/hardware modification appeared in the pages of December's CoCo Magazine.

As there were a few things missing (like the circuit diagram and a proper listing of the assembly listing), we have decided to re-publish it. As for the programs and the instructions, see Decembers magazine.

## OS9 Level 2 HARDWARE MOD

**A**N ARTICLE titled 'Clock Chips n Things' appeared in the December 87, CoCo magazine. It detailed a clock and I/O add-on for the CoCo.

Unfortunately the associated circuit diagram didn't appear with it, and the text was a taken little out of context (from the Adelaide Micro User Group newsletter), making it all very confusing. To redress the error, I present the circuit diagram and some additional

information now. Refer back to the December issue as well.

### The Hardware

The circuit diagram is in three parts. The first is a dual monostable (one IC) setup which provides the signals needed for the family of ICs I used. That connects to the CoCo (1, 2 or 3) cassette port or indeed the cassette port of any computer.

The other parts of the circuit are a Real Time Clock, and an 8

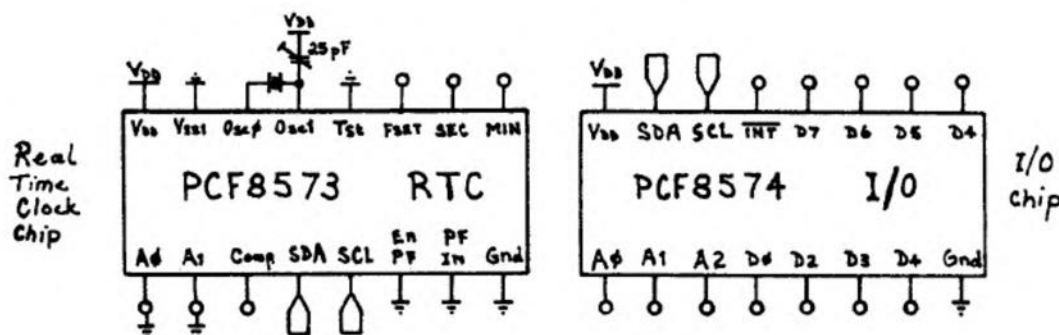

port Input/Output IC. Either or both could be connected, and extra I/O chips can be added, by changing their address strapping, (A0, A1, A2).

As you can see, all of the complexity is in the generation of the SCL (Serial Clock) signal. The only connections between the three circuit parts are ground, Vdd (+3 volts), SDA and SCL. The whole clock circuit can be built for around \$20.

The batteries in my version (which are housed in a Strepis tin) are two AA cells, and the

REAL TIME  
CLOCK and  
INPUT/OUTPUT  
CIRCUIT

### I<sup>2</sup>C BUS SIGNALS

circuit is mounted on 'Veroboard'.

The Machine Code Subroutine (see Dec 87 issue).

For those interested in writing machine code routines to use with Basic09, this subroutine deserves a little explanation.

There is an OS9 module type, 'subroutine'. The example I looked at (to work out how to write it) was 'inkey' which is written for use by Basic09, and is listed in the back of the Basic09 manual. If a subroutine is not in memory when it is called, it is loaded from the current execution directory.

Hence when you run a Basic09 program which needs 'inkey', 'gfx', 'gfx2' or 'syscall', you get a disk access while the module is loaded from disk.

I had two reasons for using a machine code subroutine instead of just sticking to Basic09. Firstly Basic09 was too slow. The fastest times in which hardware can be pulsed from Basic09 are measured in milliseconds. Secondly the multitasking aspect of OS9 means

that every running program gets interrupted at regular intervals while the DOS checks for other tasks that need time.

Because my circuit is very time critical, I couldn't afford random changes in timing caused by interrupts. The way to stop this (for short periods) is to mask interrupts. Basic09 doesn't have any way to do this.

A subroutine gets no static data space given to it, so local storage space is created by decrementing the stack pointer and using the RAM then free above the stack pointer.

The other thing about a subroutine (normally) is that it has parameters passed to it, and passes parameters back to the calling program. In this case the calling program is in Basic09, but it could be any language, including machine code. (No, Basic09 does not get compiled down to machine code.)

The Basic09 calling line for my subroutine is 'run i2c (string,number)'. So two parameters are passed, a string and an integer. Note that these are passed "by reference", so

what actually gets passed are the address of the string and the address of the integer.

Thus the subroutine can both use the string and integer, and in the case of reading the clock or I/O chip, put the bytes read into the string space.

Note how these parameters are in the stack, on entry to the subroutine. I equate names at the beginning of the subroutine code, to offsets from the stack pointer, which give me the passed parameters.

If you make up the circuit and want the assembly source code, let me know, and I can send a disk or put it on a Bulletin Board of your choice. The code as listed in the December CoCo should be correct, because it was photocopied straight from the AMUG newsletter (the AMUG editor wrapped the comment lines unfortunately).

The text of the article however, was retyped by CoCo/Softgold HQ, who added their own flavour to the spelling.

Continued from p57

This procedure is used in the programs described above, to incorporate the ML routine which move the Basic pointers required to actually install the ML code there.

I don't normally use this procedure, except for very short routines, because it is more tedious to set up, and it uses more memory in the Basic program.

Its main advantage is that it does not require any DATA statements, and hence avoids any conflict with the placement of DATA statements in the program.

With particular reference to the DELETE utility, it has

another advantage in that once it has been used, the Basic code required can then be deleted from the program anyway.

It is mainly for this reason that I've submitted a second version of the utilities which are set up this way.

These versions are called SPCLEAR and SDELETE (for string version).

These are also set up so that they can be merged into another program and called with a GOSUB.

The ML code is poked into the cassette buffer (at Hex 1DA), and executed from there.

This reduces the size of the utility DELETE, because it removes the requirement for the code which moves it to the cassette buffer for execution.

# Directory Printer

Here's a program to sort out those directory blues

CoCo3  
UTILITY

by Barry Sidebottom

**W**HEN I BOUGHT MY CoCo 3, one of my used programs that was no longer compatible was one which manipulated the directory including sorting. This program does that and then prints out a listing of the contents on a small index which when cut out will fit nicely into the disk jacket.

You can sort alphabetically and/or manually. At the start you are asked for the date, enter it as DD/MM/YY.

At the start of each read, you are asked for the drive enter 0 to 3 or 4 to quit the program.

You may have to change the printer codes to suit your printer. I use an AMUST 80DT which is pretty much an Epson.

Anyway the codes are:

line	code	function
72	27;14	double width for 1
76	27;15	compressed on
79	27;18	compressed off

I haven't had any problems so far, however I suggest you thoroughly test it with a couple of back-ups as it does manipulate your directory and I accept no responsibility for any mis-haps.

Nevertheless it has been very useful.

If any problems phone me on (03) 744-6281 and ask for Barry.

# Music, Music, Music

If you're into music, this hits the right note

32K ECB  
MUSIC

by Nick Kostarelas

**A** LONG TIME back, when my brother brought home an IBM-PC from his work, I was interested in the machine, and played around with the few programs that came with it.

I liked a BASIC program called Music and wondered if it could run on my CoCo.

Since my brother had the computer only for the weekend, I printed out several BASIC programs, including the music program.

After about a year, I cleaned the dust off the listings and try to do what I intended to do a year back.

After I typed the program in my CoCo and a lot of playing around, I finally got the music as accurate as possible.

There are two programs - the first one, "MUSIC 1", is a

selection type music program, where the music is played on a piano with a musical note.

The second program, "MUSIC 2", draws a chicken with the appropriate song, and plays all songs.

This program has better music quality, since it does not have to redraw every note, like in the first program.

Both programs are originals from IBM, as well as the music composure.

I only converted the programs to run on a CoCo, so the copyright still remains with IBM.

# Sculptor

4GL + DATABASE

RAPID SOFTWARE DEVELOPMENT

This professional-quality fourth generation language with integral database management used by system developers worldwide is now available to you both at home and at work at an affordable price. Sculptor features:—

- \* VERSIONS FOR 100 COMPUTERS AND A DOZEN OPERATING SYSTEMS
    - Supporting from 1 user up to 1000 users
    - Available for all current Tandy models, all MS-DOS PCs.
    - All 6800 machines under OS-9/68K (Atari ST, Amiga, etc)
    - OS9 MS DOS (+LAN) UNIX XENIX ONX VMS ULTRA UNIFLEX etc
  - \* TOTALLY PORTABLE APPLICATION AND DATABASES
    - All versions compatible at program and data level
    - Develop at home on your Coco and run the system on your PC, mini, supemini at work AND vice versa!
  - \* LOW RESOURCE CONSUMPTION, FAST COMPILE + EXECUTION
    - You can begin with as little as 128KB RAM + 1 diskette (hard disk highly recommended for full performance)
    - Compiles and runs lightning-fast, even on small systems
    - Fast storage/retrieval in database of millions of records
- |                     |               |                           |
|---------------------|---------------|---------------------------|
| 6809 OS-9 level II  | (Multi User)  | r.r.p. inc. tax \$495.00  |
| All MS-DOS systems  | (Single User) | r.r.p. inc. tax \$1134.95 |
| All MS-DOS L.A.N.S. | (Multi User)  | r.r.p. inc. tax \$2046.95 |
| SCO XENIX           | (Multi User)  | r.r.p. inc. tax \$2046.95 |

\* New\* Sculptor Starter Pack for the above machines. \*New\* Limited-size versions of each of the above — only \$69.95

Available at your local Tandy Store

MPD Australia Pty Ltd  
119 Willoughby Road,  
Crows Nest 2065

Australasian importer and distributor

## COLOUR 5 1/4 DISKETTES

Available in Lavender, Dark Blue  
Light Blue, Grey, Beige, Pink, Yellow  
White, Orange, Red, Burgundy, Black  
Brown and Green.

TOP QUALITY CENTECH BRAND  
with LIFETIME WARRANTY

SOLVE the problem of trying to  
locate your programs....

COLOUR CODING MAKES IT EASIER!

SSDD \$23.50 for 10  
DSDD \$25.00 for 10

(postage free)

Please state colours required

JANDA (AUS)  
P.O. BOX 239  
MARYBOROUGH Q 4650

106 NEPTUNE STREET (071) 23 1369

\* PORT 4. CoCo2 and 3 — four port Serial  
Serial I/O. Finally push your CoCo3,  
with Level 2, to the max! Run multiple  
printers, terminals, modems, includes  
all driver patches. **\$179<sup>95</sup>**

\* CoCo3 Multi-pak extender kit. Three  
piece kit. Finally all your desk  
space recovered. **\$49<sup>95</sup>**

\* Hard disk Interface kit — incl.  
Interface and drivers for 5, 10, 20,  
ZXHEC, WD, DTC, SHUGART controllers. **\$129<sup>95</sup>**

\* Total OS9 support. Software programm-  
ing and hardware design. Custom  
Sculpture base. Software development  
systems available.
