REMEMBER:

MORE THAN JUST ANOTHER PRETTY FACE.

Says who? Says ANSI.

Specifically, subcommittee X3B8 of the American National Standards Institute (ANSI) says so. The fact is all Elephant™ floppies meet or exceed the specs required to meet or exceed all their standards.

But just who is "subcommittee X3B8" to issue such pronouncements?

They're a group of people representing a large, well-balanced cross section of disciplines—from academia, government agencies, and the computer industry. People from places like IBM, Hewlett-Packard, 3M, Lawrence Livermore Labs, The U.S. Department of Defense, Honeywell and The Association of Computer Programmers and Analysts. In short, it's a bunch of high-caliber nitpickers whose mission, it seems, in order to make better disks for consumers, is also to

make life miserable for everyone in the disk-making business.

How? By gathering together periodically (often, one suspects, under the full moon) to concoct more and more rules to increase the quality of flexible disks. Their most recent rule book runs over 20 single-spaced pages—listing, and insisting upon—hundreds upon hundreds of standards a disk must meet in order to be blessed by ANSI. (And thereby be taken seriously by people who take disks seriously.)

In fact, if you'd like a copy of this formidable document, for free, just let us know and we'll send you one. Because once you know what it takes to make an Elephant for ANSI . . .

We think you'll want us to make some Elephants for you.

ELEPHANT.™ HEAVY DUTY DISKS.

For a free poster-size portrait of our powerful pachyderm, please write us.

IF YOU'RE WAITING FOR THE PRICE OF WORD PROCESSORS TO FALL WITHIN REASON,

IT JUST DID.

Everyone expected it would happen sooner or later... with **WordPro PLUS™** it already has! Now all the marvelous benefits of expensive and advanced word processing systems are available on Commodore computers, America's largest selling computer line. WordPro PLUS, when combined with the new 80 column CBM 8032, creates a word processing system comparable to virtually any other top quality word processor available—but at savings of thousands of dollars!

TM WordPro is a Registered Trademark of Professional Software, Inc. WordPro was written by Steve Punter. All specifications subject to change without notice.

New, low cost computer technology is now available at a fraction of what you would expect to pay. This technology allowed Commodore to introduce the new and revolutionary CBM 8032 Computer.

WordPro PLUS turns this new CBM 8032 Computer into a sophisticated, time saving word processing tool. With WordPro PLUS, documents are displayed on the computer's screen. Editing and last minute revisions are simple and easy. No more lengthy re-typing sessions. Letters and documents are easily re-called from memory storage for editing or printing with final drafts printed perfectly at over five hundred words per minute!

Our nationwide team of professional dealers will show you how your office will benefit by using WordPro PLUS. At a price far less than you realize.

Introducing Spinnaker. We make learning fun.

At Spinnaker Software, we make educational games that are actually fun.

Because they're fun, your children will use them. Instead of letting them collect dust in the basement.

And because your children use them, they'll be learning. And after all, isn't that what educational games are all about?

Our games are educational, because you can't kid parents.

As a parent, you're probably very concerned with how much time your kids spend playing mindless video games.

Sure, they're fun. But they don't do much more than develop reflexes and hand-eye coordination. Spinnaker games are different.

All our games have true educational value. They help develop a child's learning skills. And that's something your kids can take with them wherever they go.

Our games are fun, because you can't kid kids.

Kids like Spinnaker games for the same reasons they like roller coasters, going to the beach and ice cream sundaes.

They're fun. Lots of fun. So much fun your kids will probably forget they're learning.

Our games make the computer screen come to life. With colorful graphics, animation and sound.

And they're easy to use. In fact, a lot of our games are easy enough for kids who've never even used a computer before.

How do we make our games both educational and fun?

We're glad you asked.

Educators and game programmers write our software.

Educators, because they've been in the classroom and know how children

learn. And what it takes to keep their interest.

Game programmers, because they know how to have fun with computers. These programmers give our games the high resolution graphics, animation and sound that make them so entertaining.

And right now, we're introducing four new games that can be played on the most popular computers, Apple,[®] Atari,[®] and IBM.[®]

First, there's FACEMAKER. It's for young computer users, kids ages 4-8. FACEMAKER helps children improve memory and concentration and provides familiarity with the computer.

Another game for young users is STORY MACHINE. This game lets children ages 5-9 write their own stories and see them acted out on the screen. STORY MACHINE helps children learn to write correctly and acquaints them with the keyboard.

Our SNOOPER TROOPS™

detective series gives your child mysteries to solve. As a Snooper Trooper, your child will have to do some daring detective work, including crawling through dark houses and talking to mysterious agents.

Designed for kids ages 10 and older, SNOOPER TROOPS helps children learn to take notes, draw maps, classify information, and develops vocabulary and reasoning skills.

All four games are available in stores today.

With Spinnaker products, you can rest easy knowing your children are spending their time wisely.

So ask your retailer about the growing line of Spinnaker games.

Because one of the smartest things parents can do is help their children learn.

SPINNAKER[™]
We make learning fun.

METEOR RUN

UMI games...for the fun of VIC®

You're in command with Meteor Run . . . guiding your craft through treacherous meteor fields . . . fighting alien ships . . . dodging exploding photon torpedos . . . fighting your way to the red star, Alderbaran. The closer you get, the more hazards you encounter. You're surrounded with challenging adventure! This action-packed game will hold you spellbound for hours. Just imagine the fun you'll have!

UMI provides thrilling entertainment with a variety of top-notch, arcade quality games. They're designed to play better, have more action and last longer than most.

All games come on low-cost cassettes or on UMI's own durable cartridges. So live it up, take your pick of games from United Microware today. Send for a catalog or contact the UMI distributor nearest you and start the good times rolling. After all, it's just for the fun of VIC®!

The Editor's notes...

Robert Lock, Publisher/Editor-in-Chief

Will The Price Wars Continue?

Texas Instruments announced a \$100 rebate program on the TI-99/4A, thereby bringing its price to \$199. We must confess that we were never aware that TI had moved to \$299, but this was apparently the case. The stock market welcomed all of this news enthusiastically, promptly lowering the price of stock in TI, Commodore, Warner Communications (Atari), and Tandy.

The recent market rally seems to have helped though, and the group is climbing back. Atari has announced a software coupon savings offer on the 400, and Commodore has moved to lower prices on the VIC-20. Predictably, Commodore has slowed down its introduction of the \$179 Max machine, moving instead to dramatically increased VIC production. Their 40,000 units per month will be increased to 70,000 by late fall.

As an aside, we'd like to point out a few things. A personal computer is not, for example, a toaster. It's a sophisticated piece of computing power that, properly used, can teach, entice, amuse, and entertain. This is a rapidly maturing market. It will continue to grow on its strengths. We suspect that those who try to sell it on price alone will suffer in the long run.

West Coast Subscribers, Take Heart

Finally, with this issue, your copies will start arriving earlier. You are now officially in the "pool," meaning your copies are trucked by our printer to three west coast mailing centers, where your copies are mailed. The key is mailing you on the west coast rather than the mid-west. We're expecting this will cause all of your

magazines to arrive by no later than the first week of the month. Imagine – your subscriber copy arriving before retail store copies!

A Record Setting Issue

Not only did our press run break 100,000 with this issue, but we set other new **COMPUTE!** records as well: largest issue, most advertising, most four-color. Equally important, this special games issue is full of excellent articles, and, as always, programs ready to type right in and use. Enjoy it.

A New Atari President

Roger Badertscher, who resigned as president of the Atari, Inc. Home Computer Division in June, has been replaced. Ray Kassar, chairman and CEO of Atari, has announced the appointment of John Cavalier. Mr. Cavalier was previously vice-president and general manager of the Dixie-Dixie /Marathon unit of American Can Company.

MORE THAN EVER, ATARI HOME COMPUTERS ARE SPEAKING YOUR LANGUAGE.

With more program languages than ever to choose from, you now have more opportunities than ever to utilize the amazing capabilities of the ATARI 800™ Home Computer.

Whether you're a beginning programmer, or at the forefront of the art, you'll find an ATARI programming language that can make your task quicker and simpler than ever before. Just look at what ATARI has to offer:

ATARI Microsoft BASIC—Now we offer the industry standard, the most powerful Microsoft BASIC yet. With simple commands, it allows you to take advantage of unique ATARI hardware features such as our well-known player/missile graphics. For ease of programming, it includes n-dimensional arrays for numerics and string handling. And importantly, conversion procedures are simple.

ATARI Macro Assembler—Faster and more powerful than any ATARI language before, the ATARI Macro Assembler also allows you to access more memory space. And it's excellent for I/O interface and manipulation of such features as: player/missile graphics, sound registers and peripherals. In addition, the macro processor and "include" file library features speed-up program development considerably.

Fig-FORTH*—For specialized programming needs, such as educational or game applications, ATARI Fig-FORTH is uniquely effective. Fig-FORTH combines power and simplicity in an efficient 10K size, with characteristics of an interpreter and the speed of machine language code.

ATARI BASIC—An affordable and easy to use BASIC that requires only 8K of memory. It allows you to take advantage of the spectacular ATARI graphics and sound capabilities.

And its immediate mode error messages greatly simplify debugging.

ATARI Assembler Editor—An excellent tool to assist the assembler-programmer in creating, editing and debugging assembly programs.

PILOT—ATARI PILOT is an exceptional learning language, with built-in "turtle" graphics to let you create spectacular designs and pictures with very short programs. Simple one or two-letter commands allow you to create a dialogue with the computer. And a single "match" command can perform complex text evaluation and pattern-matching instantly.

ATARI Pascal*—An excellent high-level language for teaching structured programming, and for developing and maintaining programs. In addition to offering all the features of the ISO Pascal standard, ATARI Pascal offers unique extensions that allow you to take advantage of ATARI graphics and sound capabilities.

ATARI is constantly developing new ways to help you get more out of your ATARI 800 Home Computer. So watch for more innovative and exciting programming languages from ATARI in the future.

POWER

Professional Software Introduces

POWER

by Brad Templeton

ADD **POWER**™ TO YOUR COMMODORE COMPUTER

\$89.95

POWER produces a dramatic improvement in the ease of editing BASIC on Commodore's computers. POWER is a programmer's utility package (in a 4K ROM) that contains a series of new commands and utilities which are added to the Screen Editor and the BASIC Interpreter. Designed for the CBM BASIC user, POWER contains special editing, programming, and software debugging tools not found in any other microcomputer BASIC. POWER is easy to use and is sold complete with a full operator's manual written by Jim Butterfield.

POWER's special keyboard 'instant action' features and additional commands make up for, and go beyond the limitations of CBM BASIC. The added features include auto line numbering, tracing, single stepping through programs, line renumbering, and definition of keys as BASIC keywords. POWER even includes

new "stick-on" keycap labels. The cursor movement keys are enhanced by the addition of auto-repeat and text searching functions are added to help ease program modification. Cursor UP and cursor DOWN produce previous and next lines of source code. COMPLETE BASIC program listings in memory can be displayed on the screen and scrolled in either direction. POWER is a must for every serious CBM user.

Ask The Readers

The Editors And Readers of COMPUTE!

AND And WAIT

I've noticed many programs using "AND," such as: IF (Z AND 127) < 32 THEN.... What's being compared when it says "Z AND 127"? Could you also explain to me how the WAIT statement works?

David Zacharuk

The two numbers are being compared in their binary form: if the variable Z is, say, 15 then it would look like this in binary: 00001111. ANDing it with 127 (01111111) gives 00001111 (15) so the IF THEN in the example would be less than 32. For further explanation of AND, consult any book on machine language or see "The Beginner's Page" last month, COMPUTE!, September 1982, p. 24.

WAIT is infrequently used in BASIC programming (and is not available in some versions of BASIC). If you wrote WAIT 5000,5,1 you would cause the computer to stop operations until it PEEKed address 5000, Exclusive-ORs the number it found there with the 1, ANDs with the 5, and the result is anything other than zero. If it gets a zero after these operations, it continues to wait until the result becomes something other than zero. WAIT's primary value would be for communicating with peripherals when you've added your own interface. It's hard to explain, hard to understand, and, luckily, hardly ever needed.

Reader Requests Assistance

In November 1981 I corresponded with a company named PROTRONICS for the purchase of a memory board for a PET computer. My check has been cashed. To date I have not received a product, nor have I been successful in getting my monies refunded. I have initiated action with the postal authorities and the Washington State Attorney General.

I am requesting that anyone who has had a similar experience with PROTRONICS to please correspond with me. Mail a short letter giving a few particulars of your case. I will then package the information and forward it to the proper authorities along with each person's name. Mail information to:

Arthur G. Walden
7505-78th Avenue SE
Mercer Island, WA 98040

Arcade Vs. Adventure

Could you define the difference between an arcade game and an adventure game?

A. Rabin

It's getting less and less easy to define the difference between these two computer game styles. Adventure games are including "arcade" features, and some arcade games now have several different "scenes" of action. Traditionally, an arcade game (named after the rooms in shopping malls where the machines offering these games are located) has one scene or "playfield" like the maze on Pac-Man. There's fast action, color, sound, and you succeed in these games because you have good coordination. It's a physical experience — some say a sport — and things happen in realtime (the time between your moves and the opponent's moves is the same as it would be if you were really running through a maze being pursued by ghosts).

An adventure game, on the other hand, is more like reading an adventure story in a book. There is generally no time limit to your "moves," and there are often many characters and many settings. An adventure game can take hours to play while you wander through a mansion with many rooms or search through forests and caves for a hidden treasure. Frequently your victory will depend on your skill at solving a riddle, or effectively using your available resources. In short, an adventure game is generally a mental rather than an athletic effort.

The trend, though, is toward a merging of adventure and arcade game qualities into what will likely be the supergames of tomorrow. To find out what the experts are forecasting, see "Future Games" on page 20.

Butterfield On RS-232 Interfacing

I have a RS-232 interface made by Quantum Data, Inc., connecting my Data Products DP-50 Daisy Wheel printer to my VIC-20. I am having a problem printing anything in my program. I keep getting out of memory. I am able to use my un-word processor I got from Microdata. It prints fine. However, it's in machine language and my programs are in BASIC. I can also list my programs by using:

```
10 open 128,2,0,chr$(4+2):cmd 128:list
```

Here is the buffer Control Protocol for my printer (handshaking).

Data Terminal Ready, goes false (-V) when the interface buffer has less than 16 locations remaining and goes true (+V) when the buffer has more than 96 locations available. Remote/Software Provision: The terminal inspects the incoming data stream for the ASCII ETX control character (67 Coded Decimal Value) and automatically transmits an ACK control character (70 Coded Decimal Value) when the ETX is pulled from the interface buffer. By transmitting the data in blocks separated by ETX characters, the host system can synchronize the rate of block transmissions to the actual average

More Apple II owners choose Hayes Micromodem II than any other modem in the world. Compare these features before you buy. You should. It's your money. Thousands of other Apple II owners have already compared, considered, and are now communicating — all over the U.S.A. — with Micromodem II. The best modem for the Apple II. The most modem for your money.

A complete data communication system. Micromodem II is not "base priced" plus necessary "options." It's a complete, high-performance data communication system. The printed circuit board fits — quickly and easily — into your Apple II, eliminating the need for a serial interface card. And the Microcoupler™ (included) connects the Apple II directly to a standard modular telephone jack. Auto-dial and -answer features are built-in. Operation can be full or half duplex, with a trans-

mission rate of 300 bps. And it's Bell 103 compatible and FCC approved.

Now there's Hayes Terminal Program, too! Developed by Hayes specifically for Micromodem II, this new

Terminal Program allows you to access all the great features of your modem in a matter of seconds.

With it, you can use your CP/M,® DOS 3.3 or Pascal formatted diskettes to create, send, receive, list and delete files. Hayes Terminal Program is a complete, stand-alone disk.

And because it's menu driven, you can

choose from a wide variety of options to set your communication parameters — as well as change hardware configuration — directly from the keyboard. It even allows you to generate ASCII characters that are normally not available from Apple

keyboards, further extending your capabilities. Incoming data can be printed (on serial or parallel printers) as it's displayed on your screen.

Software sold with Micromodem II or separately. A Terminal Program disk and user manual now come with Micromodem II; or, if you already have one, you can buy the Terminal Program separately.

If you're ready to communicate with other computers, to access information utilities, timesharing systems, or use bulletin boards, then you're ready for Micromodem II. Come on. Compare. Consider.

Micromodem II is already the best-selling modem for the Apple II. Now, with Hayes' new Terminal Program, it's better than ever.

Don't settle for anything less. Available at computer stores all across America.

"THE COMMODORE 64 COULD BE THE MICROCOMPUTER INDUSTRY'S OUTSTANDING NEW PRODUCT INTRODUCTION SINCE THE BIRTH OF THIS INDUSTRY."

—SHEARSON/AMERICAN EXPRESS

They're speaking to a group as interested as anyone else in the future of computers: the people who buy stock in the companies that make computers.

If, on the other hand, you're a person whose livelihood depends on a personal computer—or whose leisure time revolves around one—what follows should impress you even more than it impresses investors.

MIGHT MAKES RIGHT.

The value of a computer is determined by what it can do. What it can do is largely determined by its memory.

The Commodore 64's basic RAM is 64K. This amount of power is unusual enough in a micro at any price.

At \$595, it is astonishing.

Compared with the Apple II+, for instance, the Commodore 64 offers 33% more power at considerably less than 50% of the cost.

Compared with anything else, it's even more impressive.

PILE ON THE PERIPHERALS.

Because the basic cost of the 64 is so low, you can afford to buy more peripherals for it. Like disk drives, printers, and a telephone modem that's priced at around \$100.

This means you can own the 64, disk drive, printer and modem for a little more than an Apple II+ computer alone.

HARD FACTS ABOUT SOFTWARE.

The Commodore 64 will have a broad range of custom software packages including an electronic spreadsheet; business graphics (including printout); a user-definable diary/calendar; word processing; mailing lists, and more.

With BASIC as its primary language, it is also PET BASIC compatible.

The Commodore 64 will also be programmable in UCSD PASCAL, PILOT and LOGO.

And, with the added CP/M* option, you

will have access to hundreds of exciting software packages.

THE FUN SIDE OF POWER.

The Commodore 64 can become very playful at a moment's notice.

You can use Commodore's plug-in game cartridges or invent your own diversions. All will be enhanced by brilliant video quality (320 x 200 pixels, 16 available colors, 3D Sprite graphics), plus outstanding sound.

The 64's built-in music synthesizer has a programmable ADSR (attack, decay, sustain, release) envelope, 3 voices (each with a 9-octave range) and 4 waveforms. All of which you can hear through your audio system and see in full color as you compose or play back.

NOW'S YOUR CHANCE.

If you've been waiting for the "computer revolution," consider it as having arrived.

Through its 25 years of existence, Commodore has been committed to delivering better products and lower prices.

Today, the company's vertical integration has resulted in the Commodore 64's price performance breakthrough heralded by Shearson/American Express.

Visit a Commodore Computer dealer and discover the 64 soon.

It will expand your mind without deflating your wallet.

printing speed.

So it looks like I have to set up a buffer for handshaking. I am lost; can you help me? I have one other problem in setting up this buffer. If I want to print lower case letters I will need some conversion in setting up my buffer. This is because my printer uses true ASCII characters, not Commodore. Are you still with me or have I lost you as I am lost?

Daryl E. Williams

The August issue of **COMPUTE!** should have been some help on how VIC uses RS-232 (page 99, "VIC Communications: The RS-232 Interface").

First, a little exercise in terminology. Usually, VIC is the "terminal" and is working a communications line through a modem. However, if we want VIC to talk to a printer, VIC can't be the terminal — we already have one of these — so VIC must become the "line," acting the part of the modem. No problem here except that connections change names as they pass between the two units. One device's Send is the other's Receive, of course. The DTR sent by the printer becomes the DSR (Data Set Ready) connection on the VIC, and vice versa. Similarly, the RTS (Ready to Send) output and CTS (Clear to Send) input must be flipped over between the two devices.

RS-232 is hard to pin down; it can be used in many ways. If we wish, we can simply send on the send line and receive on the receive line and not worry about the other wires. This is the basic "three-wire" operation (the third wire is ground); it has no handshake. Alternatively, we can use DSR to see if the other guy is willing to receive from us, and DTR to signal whether we are ready to take from him. This is one of the options on your printer.

Now, VIC reads the handshake lines from the printer (VIC sees them as DSR and CTS) and is capable of restraining traffic. Unfortunately, there's a bug in the present VIC software, and the handshake won't work. Your program can still check this information directly: DSR, the printer's DCD, can be seen with PEEK(37136) AND 128; and CTS, the printer's RTS, can be seen with PEEK(37136) AND 64. But you must do this in your BASIC program.

The alternative you mention is a remotelsoftware handshake. Not hard to do for a printer that is so equipped. Just PRINT#n,CHR\$(67); that sends the ETX. Now wait in a GET#n loop until you get a character back from the printer. The character will be CHR\$(70), but that doesn't matter. When it arrives, you'll know that the printer is "caught up."

No need to set up a buffer: opening the RS-232 does that for you automatically.

Final problem: PETASCII is not the same as ASCII. The conversion rules — assuming your PET is in text mode (upper/lowercase) — are as follows: ASC values less than 65: no change. ASC values from 65 to 96: add 32. ASC values from 193 to 224: subtract 128. Any other

characters are not really ASCII compatible (for example, graphics), and you can make arbitrary decisions on their translation.

This is all very nice as a set of rules, but starts to look clumsy when you want to translate "The quick brown fox..." for the printer. Each character will need to be extracted with MIDS, changed to its ASC number, translated to the new ASCII numeric, and then sent on its way with PRINT#n,CHR\$(.); Slow and unsatisfying, but workable. The translation part can be speeded up somewhat by setting up an array of pre-translated values, so that a PETASCII value of 70 would translate immediately to T(70), in this case 102. We can now start boiling down translation of string S\$ to something like:

```
FOR J = 1 TO LEN(S$):PRINT#n,CHR$(T(ASC(MIDS
(S$J)))):NEXT J
```

(Whew!)

The whole thing becomes faster and easier with either of two other solutions: hardware or machine language. It turns out the manipulations above are really simple bit rearrangements. A few hardware gates on the interface will do the job easily. Similarly, a few machine language instructions can test for certain bits and then AND them away or OR extra bits into place. But we must deal with new questions here: how do we get into the information stream to make these changes? It can be done, but there's no space for a brief answer here. Perhaps your word processor can be easily modified for your printer; you might query the supplier.

The following machine language conversion code takes a PETASCII value in the A register and converts it to ASCII before output. The hardware conversion is very similar to this simple machine language process.

```
CMP #$40
BCC NOTALF
CMP #$60
BCS NOTALF
ORA #$20
NOTALF AND #$7F
```

The jargon of RS-232 can intimidate the beginner. It can be puzzling to find that most of the 25 connections are left unused in the average system; they are there for features that we don't need. And the VIC's non-working handshake doesn't help clarify things.

But the pieces are all there, and they can be made to work. The VIC gives you a lot of help on RS-232: a bit more effort might pay real dividends.

COMPUTE! welcomes questions, comments, or solutions to issues raised in this column. Write to: Ask The Readers, **COMPUTE!** Magazine, P.O. Box 5406, Greensboro, NC 27403. **COMPUTE!** reserves the right to edit or abridge published letters.

Introducing the **PERCOM** Alternative to **ATARI** Disk Storage

Your Atari 800 is the finest home computer on the market. Now you can own a floppy disk system that measures up — an RFD mini-disk storage system from Percom.

At Percom we've been making disk storage systems since 1977.

Our designs are proven, our quality is well known. And we back our dealers with service know-how. Expect more from Percom. You won't be disappointed.

- Operate in either single- or double-density storage mode using Atari DOS 2.0S. In double-density you can store almost 184 Kbytes (formatted) on one side of a 40-track diskette.

For the best thing next to your computer, see your Atari dealer about a Percom RFD floppy disk storage system. For the name of your nearest dealer, call Percom toll-free 1-800-527-1222.

PERCOM

PERCOM DATA COMPANY, INC.

11220 PAGEMILL RD. • DALLAS, TX 75243 • (214) 343-7081

- Connect your Percom RFD first-drive system directly to your computer or connect into your system through your Atari 810 Disk Drive.
- Add an RFD first-drive system with its versatile four-drive controller, then connect as many as three more low-cost RFD add-on drives.
- Write application programs that can query and set up your system to operate a different type drive at each cable position — that can even change configuration as the program executes.

PRICES AND SPECIFICATIONS
SUBJECT TO CHANGE
WITHOUT NOTICE.

- Get quality and state-of-the-art capability at competitive prices. Percom first-drive RFD systems are priced from only \$799, first add-on drive is only \$459. Cables included.

Watch for announcement of a new, powerful, easy-to-use disk-operating system for your Percom-equipped Atari 800 computer.

Minimum system requirements — are an Atari 800 computer with 24-Kbytes of RAM and compatible video display system; Atari's disk-operating system (ver 2.0S) and owner's manual; and, for add-on drives (if used) an optional disk drives interconnecting cable available from Percom.

Yes ... I'd like to know more about Percom RFD disk drives for my Atari 800 Computer. Rush me free literature.

The Game's The Thing

Those who draw a distinction between Education and Entertainment don't know the first thing about either.

(Marshall McLuhan)

I can think of no application of microprocessor technology that has aroused as much controversy as the electronic game. It matters not if the game is in the home or in an arcade; some people feel that such electronically enhanced entertainment is a greater threat to society than, for example, microprocessor controlled smart bombs.

Almost anyone with a sufficiently negative opinion of game arcades seems assured of television exposure on the evening news or front page treatment in the local paper. As an example of the level to which the hysteria has risen, I have only to thank those readers who sent me copies of the front page article from the June 1 issue of the tabloid *Weekly World News*. For those of you who haven't read it, the front page headline blared (in 1 3/8" type) TEEN KILLED BY VIDEO GAME. The article went on to say:

Shocked players at the Calumet, Ill. video center were stunned as they watched the 18-year-old youth suddenly slump at the controls of 'Berserk' and slowly crumple to the ground. His lifeless body was a tragic symbol of the video game's conquest over its human foe.

Of course, the article went on to point out that the coroner found the boy had an undetected heart condition, and that it was the stress that killed him. Had this young man died as a result of overstress on the tennis court, I'm sure the story would not have been nearly as newsworthy.

It was thus with great relief that I received a package of articles in the mail from Peter Favaro — a Long Island psychologist who has spent years carefully studying the effect of video games on children.

You say that you haven't heard of Peter? Well, from what I can tell, he isn't the sort who is going

to be gobbled up by *60 Minutes* or *The Today Show*. He is a scientist who believes in reporting without hysteria what he observes. His writing does *not* contain sentences like:

He could see the beads of sweat reflected in the TV screen as his clammy hand reached for another quarter. Finally, after spending \$85, he was within striking distance of his goal — a free game.

What Peter has done is quite interesting. He explored the skills acquisition potential of video games for his Master's thesis a few years ago. He explored the use of video games as a reinforcement tool for teaching learning disabled and emotionally disturbed children, and he studied the so-called "addictive" aspects of video games.

Coordination Test Findings

What did he find? First, some game proponents (myself among them) have speculated that, if nothing else, prolonged video game play would result in improved eye-hand coordination. Along with three colleagues, Peter devised a test involving 45 nursery school boys aged three to five years. The children were randomly divided into three groups. The experimental group received six, five-minute training sessions on a popular video game; another group received the same amount of personal attention, but did not play any games; and the third group was a control group that received no special treatment.

Prior to the experiment, each group was tested on two video games and one pencil and paper maze-solving task. The results showed that the experimental group did improve their skills in playing other video games, but that these skills did not transfer to the maze-following task. As Peter says,

One might criticize these results by saying that they suggest that children who play video games only get better at playing video games. On the surface, this is certainly true; however, my colleagues and I feel that, if given longer training sessions, the children might have achieved transfer to the maze tasks since there was a trend in this direction and since transfer was shown on a task with different stimulus characteristics.

Note that he did *not* say:

In the diffuse light of the damp basement laboratory, one could see that the children's eyes, once large with excitement and wonder, had hardened to steel as they fought for the right to get just one more quarter.

Peter's more recent work included the use of video games as a reinforcer for good behavior in a

of The Hundreds of Reasons You Ought To Be A **COMPUTE!** Magazine Subscriber:

From "The Editor's Feedback" Card, a monthly part of our continuing dialogue with readers of **COMPUTE!** These are responses to the question,

"What do you like best about **COMPUTE!**?"

1. "It is written so a beginner can read and understand it... it's layman oriented..."
2. "Clear, clean layout, good presentation..."
3. "The Atari game programs..."
4. "Best and most information on PET..."
5. "Cover to cover, and all in between..."
6. "Reviews of software and hardware..."
7. "Good balance of application and technical articles..."
8. "It is the best source of info about various levels of VIC/PET/CBM machines and applications..."
9. "The BASIC and machine language programs..."
10. "I like programs that can be typed into a computer, run, and then used right away (a program without bugs!)"
11. "That it is organized well, and covers a broad range of information concerning Atari. Keep it up! please, I'm learning..."
12. "Table of contents listings and computer guide to articles is a great idea. Best magazine for personal home computer users..."
13. "Best I have found for VIC info..."
14. "Informative articles: 'Secrets of Atari', Game programs, especially programs that teach the reader about the Atari..."
15. "I like all the articles and programs for my computer, the PET. I've learned and found out things about it that I never even thought existed. Other magazines don't have too much material for the PET and, for that reason, I find **COMPUTE!** invaluable..."
16. "The up-to-date hardware reviews..."
17. "Machine language utilities for Atari..."
18. "Articles are terse but understandable and accurate. Utility and applications program listings very helpful..."
19. "The April, '82 issue is my first. I am impressed that you not only acknowledge the VIC-20, you even have applications for it..."
20. "I really enjoy (since I am one) the Beginner's Page..."
21. "The attention it gives to Atari and the easy-to-understand language it's written in..."
22. "It is concerned with explaining programs, not just listing them. It is the best VIC magazine I could buy..."
23. "The new table of contents 'Guide to Articles and Programs' is excellent, particularly the indication of 'multiple computer' items..."
24. "Broad range (sophistication) of programs..."
25. "You don't speak over the average user's head..."

Whether you're just getting started with personal computers, or very advanced, you'll find useful, helpful information in every issue of **COMPUTE!** Magazine. We specialize in supporting the Atari, PET/CBM, VIC-20, and Apple computers. Editorial coverage is expanding to include the TI-99/4A, the Sinclair ZX-81, and the Radio Shack Color Computer.

Every issue of **COMPUTE!** brings you user-friendly articles, applications programs, and utilities you can type right into your computer and use. To subscribe to **COMPUTE!**, or to order a sample issue, use the attached reply card or call our toll-free number. **COMPUTE!**... special education class of six boys who had previously "acted out." (Acting out, for those of you unfamiliar with the term, means doing things like breaking chairs over each other's heads.) Using this class as an opportunity for more research, he discovered that children responded much better when video games were used as the reinforcement tool than when the traditional "snack" reinforcers were used. An incidental benefit (beyond the low sugar content of video games) was that some of the more withdrawn and defensive children gained confidence and peer acceptance through the games.

Of all the criticisms leveled against these games, the idea that children become addicted to them raises considerable concern with the greatest number of people. Accordingly, Peter devised a study to measure social responsibility, impulse control, and compliance among groups of children who played video games. Since these three areas are ones in which addicts display behavior quite different from that displayed by non-addicts (whether the addiction is alcohol, drugs, etc.), it seemed appropriate to measure these things for a group of "heavy game users" and to compare the results with those for a group of "light game users."

In one test, he gave every child 12 quarters and told them that they could use six quarters on a game, but must give the remaining six quarters to a person nearby who was collecting money for charity. While the heavy game users did play more games (7.6 quarters vs. 5.6 for light users), the heavy users showed more social responsibility in giving the balance to charity (5.5 quarters vs. 4.5). My, my – so much for differences in social responsibility.

While Favaro's study is by no means conclusive, it did encourage him to make an interesting observation:

Obviously, anything that is done in an obsessive way can seriously disrupt anyone's life, but the point is: Why focus on video games? A child would be in serious trouble if he practices dribbling a basketball nine hours a day to the exclusion of everything else. Children as well as adults who have "addictive personalities" will always find a target for their addictions. It is unscientific to claim that a causal link exists between video games and maladaptive behavior, simply because a small population of children do both.

Well said, Peter, well said.

COMPUTE! The Resource.

ANNOUNCING AN INNOVATION IN TYPING INSTRUCTION.

FUN.

Improve your keyboard skills with MasterType.

A typing program for the Apple II that dares to be fun. But it's not just child's play. No matter who you are, your computer will become a more efficient tool, as you become a more proficient typist. And MasterType can help. Dramatically.

But don't just take our word for it.

Infoworld magazine had this to say about Lightning Software's Hi-Res MasterType: "MasterType is an excellent instructional typing game. We had fun reviewing it, and we highly recommend it to those who want to learn typing in an unconventional but motivating way."

Infoworld also went on to rate MasterType as Excellent in all categories.

Good news for Atari owners!

MasterType will introduce an Atari version on July 1st. Watch for it!

Attention all Dealers.

Don't miss out on one of the hottest selling software products on the market. Call today for a free demo disk.

The Computer Games Of Tomorrow

Tom R. Halfhill
Features Editor

Harry Butttdown left the office promptly at 5:05 p.m., walked two blocks to the subway stop, dutifully deposited his token in the turnstile, and stepped onto the train.

It was already pretty crowded. Harry decided to squeeze himself next to a seat-hog who was inconsiderately sprawled across two spots, staring obliviously out the window with his back turned. Harry leaned toward the stranger. "Excuse me, sir," said Harry, with the assuming poise of a supervisory executive. "Please move aside."

Slowly the man turned his head. Harry froze in terror as he stared into the stranger's glowing red eyes – all five of them. Foam drooled from laser-sharp fangs and dribbled down a fur-covered chest. Growling like a timber wolf with acid indigestion, the thing reached toward Harry with a pair of six-inch claws.

Harry screamed. All poise forgotten, he hurled his Gucci briefcase at the horrible monster and stumbled over an obstacle course of ankles and feet in his mad scramble down the aisle for the exit.

Suddenly, Harry became aware that people were laughing at him. Were they insane? He turned around, panting, and saw that the creature had mysteriously disappeared. Then Harry noticed a huddle of snickering teen-agers in the back of the train. They were holding one of those newfangled portable holographic computer game machines. (Snickers, snickers.)

Harry sheepishly recovered his briefcase and found another seat. How he yearned for the good old days when kids used to board the subways with nothing more than boom boxes.

Forces Shaping The Future

Sounds pretty fantastic, doesn't it? But when you think about it, Harry Butttdown's encounter with the subway creature is a logical extension of two trends in game and entertainment technology: the

trend toward games which more and more closely simulate reality (or unreality), and the trend of miniaturizing entertainment devices until they are portable enough to be carried around almost anywhere. Both of these trends are highly visible today.

On the one hand, technology is making possible increasingly vivid video games, and on the other, it is shrinking stereos and televisions – and computers and electronic games – down to personal size. Appliances that used to occupy immovable living room cabinets can now be carried while jogging. Would anybody have imagined 25 years ago that radio-tape stereos, the "boom boxes," would be toted by kids on subways? Or, even ten years ago, that video games could be worn on your wrist?

Still, it's too easy to get carried away with the possibilities of future technology. Sure, almost anything is possible in 20 or 30 years. The moon landings and other technological feats of the past two decades have pretty much silenced the doubters and nay-sayers. You can get away with predicting practically anything these days, and almost nobody is now willing to go on record saying, "Impossible!"

So what are the possibilities? What can we realistically expect in the near, and not-so-near, future? Three-dimensional, high-resolution computer graphics on home video game machines? NASA flight simulators in the arcades? Videodisc adventures? Wraparound screens and "smellavision"? Will the teen-agers of tomorrow really carry portable holographic computer game machines onto subways?

Even the experts – the programmers and software producers who will make the future happen – don't agree. What's more, some warn against a narrow vision of the future that considers only technological advances as a vehicle of change. Don't forget, they point out, that psychological factors, fads, styles, marketing considerations, and economics are equally important.

"Five years ago I could never have predicted where things are today," says Scott Adams of Adventure International. "I've been totally amazed. So there's no way I could anticipate what's going to happen five years from now."

Predicting the future – as many a crystal ball-gazer busted by the fraud squad has discovered – is a

risky business.

Are Video Games A Fad?

One thing virtually everyone agrees on is that computer games are here to stay. Individual games will pass on after short lifespans, and certain general types of games may fade in and out of style, but we've only begun to exploit the possibilities of computerized gaming.

"If people today are becoming bored with electronic games, it's because they're becoming too sophisticated for the games," says Michael Tomczyk, product marketing manager for Commodore International. "The whole question is whether the game players will outstrip the technology, or whether the technology will outstrip the players. If the players grow more sophisticated than the games, then the games will fall off for awhile until the technology catches up. On the other hand, if the technology outstrips the game players, we'll see games that only a very few highly skilled people can play."

Tomczyk foresees a general trend of increasing technological sophistication filtering down from the coin arcades to the home. Right now, he says, there's a crying need at the home level for more powerful game machines and better game controllers. Within a year, he predicts, home games will start incorporating simulated three-dimensional graphics, remote-control joysticks, voice-actuated joysticks, and wider use of voice synthesis. "The next big step will be graphics that look just like cartoon animation on TV – I mean very much like it."

Others believe the popularity of computer games does not depend on new technology, that computers are flexible enough already to sustain long-term interest. "I think people always will be fascinated by [computer] games. They'll never tire of those fantasy worlds," says Ernie Brock, product manager for Sirius Software, a top game producer for the Apple. "People still watch TV, don't they? People have hi-fis and stereos and continue to buy new records and don't tire of them. I think the same thing is true of computers and game software.... If you tire of one world on the computer, you can stick in a new disk and create another one."

This principle of escapism has not been lost on software designers, any more than it has on today's Hollywood filmmakers. That's why space and fantasy themes are so prevalent in both entertainment fields. What better way to escape the day's troubles than to leave the planet altogether, or even the universe? But although escapism will endure, certain methods of achieving it may not. Some already think the "shoot-'em-up" space games

have peaked.

"The key is that the computer can temporarily make you into something you are not," notes Ken Williams of On-Line Systems, a major game software producer. "But even being a spaceship commander gets boring if that's all you do. The games where he just shoots up screens of aliens, and which only give him more aliens when he's done, are going to die. They're OK for now, but they won't be soon."

Several top game designers predict more different types of simulations in the very near future. Chris Crawford, a programmer with Atari, Inc.'s Research and Development Group who has written such games as *Eastern Front*, refers to the "movement of computer games into larger realms of reality," and "broadening our base of fantasies instead of expanding our hardware." He says the current glut of space/fantasy games will be supplanted in part by computer simulations of soap operas, Westerns, detective mysteries, cops and robbers stories, and even gothic romances. In other words, all the escapist paths of pop culture in modern America.

Harlequin romances on disk? Heaven help us.

The Psychology Of Computer Games

But the fear of fading fads is certainly not the only reason why game producers are moving toward wider varieties of simulations. Another reason might be even more important: they want computer games to attract wider audiences.

Think about it. The audience (read: market) for computer games today is really quite narrow – mainly, children and young adults with excellent reflexes and an almost insatiable appetite for space/fantasy themes. Too many people (read: consumers) are left out. For example, millions are addicted to soap operas. What if they could be hooked on a computer-adventure simulation that transports them into *All My Children*? Or if the thousands of *True Detective* readers could be transformed into cops by an interactive adventure game, so they themselves could heroically rescue the innocent victim from the cult-killers? It takes no marketing genius to realize that software sales would skyrocket.

This possibility – the concept of redesigning the *psychology* of computer games to attract a wider audience – is now under close scrutiny by many game designers. If they weren't already thinking about it, something stupendous happened last year which opened their eyes:

Pac-Man.

You see, *Pac-Man* was more than just a hugely successful video game that managed to gobble more money in 1981 than the entire Hollywood

DODGING TREES, ROCKS, CHICKENS, AND COPS AT OVER 80 MPH MAY NOT BE LEGAL. BUT IT SURE IS FUN!

Grab the wheel in *Hazard Run*, our high-speed cross-country chase . . . and watch the feathers fly! It's just one example of the high-involvement exciting game software created by Artworx. At Artworx, we're directly involved with the software we sell. We know our game software is fun to play because our own people can't keep their hands off it. We created *Beta Fighter* to simulate a moonscape battle that will literally take you out of this world! Our

Drawpic software lets people of all ages get hooked with the limitless possibilities of graphic creation. *Golden Gloves* gives you all the thrills and slam-bang action of a super slugfest, right down to the noise of the crowd!

At Artworx, we have a full range of software . . . for people who like to play and people who want to turn work into play. We have text editing, mail list, and analytical programs, to name but a few. How good are they? We

use them in our own business . . . and we welcome your comments and suggestions. We pride ourselves on a line that's complete, unique, diverse, and offers you a great value for a very reasonable price.

At Artworx, we're as accessible as your local computer store or your telephone. Write or call us toll-free at 800-828-6573. We'll send you our free catalog . . . it's good reading and a great introduction to a whole new world of fun.

ArtworxTM
So you can play.

film industry combined. *Pac-Man* also turned out to be an equal opportunity employer.

Before *Pac-Man*, you saw very few young women playing video games. When you did, they usually were with their boyfriends. But *Pac-Man* was different. Women liked *Pac-Man*. So much, in fact, that although no one has done a formal study, women are believed to have been a major factor in the immense *Pac-Man* phenomenon.

That's exactly why a new version of *Pac-Man* hit the arcades and cafes this summer: *Ms. Pac-Man*, complete with different graphics and colors. The lesson was not lost on other game designers, either. Computer games are no different than any other form of popular entertainment – specific audiences can be psychologically targeted.

"*Pac-Man* is classified as a 'cartoon' game," says Gary Carlston, marketing director and co-founder of Brøderbund Software, a leading game house. "If you're planning a game to appeal to women, you've got to be consistent in your concepts. For example, you couldn't put together *Pac-Man* and *Space Invaders* and expect a game about space warfare and killing aliens to attract women."

Commodore's Tomczyk says his company has gone so far as to informally study the matter. "Men tend to like games that have you destroying aliens and running away from robots and landing landers without crashing them. Women tend to like games which are, well, let's not say nonviolent, but not as grotesque, not involving destruction of animate objects or human life. Like, the ghosts in *Pac-Man* never really die, they just get recycled."

Jim Wylde, vice president-sales for United Microware, Inc., has also noticed these characteristics. "There doesn't seem to be much 'femaleness' in computer games today. They seem to be left out of computer games. I've talked to many, many young women in my own organization and elsewhere, and I always ask them, 'What would you like to see in a computer game?' And I always get a blank stare."

Joanne Lee, a consultant for Tensor Technology Ltd. and a freelance game programmer for United Microware, explains why: "I don't like violence and I am not into science fiction, so I don't like space games. I don't like the little aliens running around on the screen. The only game I

really liked was *Pac-Man*...."

The bottom line is that game designers no longer will ignore the female market, and will scramble to tap other new markets as well. Does this mean we'll see a sharp decline in space/fantasy shoot-'em-ups? No way. The young males still dominate the market. As Lee explains, "Sure, I would prefer to write a more nonviolent type of game, but I have to think about what is marketable."

The forecast: more diversified computer games, each catering to its own audience.

Re-creating Reality

So. Now that we have some idea where computer gaming is headed, what technological form will it take? This is the sort of pie-in-the-sky dreaming that everyone likes to indulge in, but there's a difference between imagination and extrapolation. We can imagine anything – well, quite a lot – but what seems likely to happen, based on current trends?

Practically all the experts agree that computer games will continue to grow increasingly sophisticated, and that sophistication will come in the form of better simulations of environments. That is, the games of tomorrow will seem incredibly real.

Videodiscs are most commonly mentioned. As consumer items, today they're pretty much limited to playing back movies, like videotapes. But videotapes, like computer tape drives, are only *sequential access* devices. Videodiscs, like minifloppy computer disks, allow *random access*. Under computer control, an image (or sequence of images) stored anywhere on a videodisc can be searched out and displayed within seconds. Consider the possibilities of a videodisc interactive adventure game. Instead of watching crude computer drawings of dungeons and caverns on the screen – or text descriptions – the player can see actual film footage of the scene unfold. In fact, filmed motion can be stored on the videodisc and recalled in response to joystick commands. Move the stick forward, and you walk deeper into the cavern. Move it left, and your "eyes" pan left.

Not only is all this possible: it's being done right now in highly advanced flight simulators and trainers. There are even projects underway in which film crews are filming all the streets of entire cities, making every possible turn at every intersection. When the images are stored on high-density videodiscs, they will be linked to computerized driving simulators to train truckers and cabbies.

The chief limitations are speed and cost. "We've fooled with that here," says Williams of On-Line Systems, "but the access time just isn't fast enough yet. No one wants to wait four or five seconds for a

Jim Wylde,
United Microware, Inc.

GHOST ENCOUNTERS™

A 16K Assembly Language Real-Time
Adventure Game For ATARI® 400/800™ Computer

GHOST ENCOUNTERS™ is the second in a series of real-time, joystick controlled, adventure games following **ACTION QUEST™**, presenting a brand new collection of dangers and puzzles. You, as a ghost, travel through a network of 30 rooms in search of valuable prizes while, at the same time, try to survive the many perils encountered. Of course, a mere ghost cannot overcome all the evil powers striving to block his journey. Luckily, you are not a mere ghost, but are equipped with the power of transmutation, allowing you to take on the form of other, sometimes more useful, objects. Who knows when a torch or a hammer might be just what the witch doctor ordered.

Locating all 30 rooms and the 20 prizes scattered throughout requires a player with fast response, physical coordination, and intellectual resourcefulness. Of the 20 prizes, no two can be acquired

through exactly identical methods. Regardless of which factors most interest you in a real-time action game, you are sure to find them among the wide variety of challenges located in **GHOST ENCOUNTERS™**.

Available from your local Atari retailer or send \$29.95 in check or money order (California residents add 6½% sales tax) to JV Software Inc.

ALSO AVAILABLE

Don't forget to ask for the original **ACTION QUEST™** with its own unique and imaginative assortment of puzzles, prizes, and perplexing predicaments. Another challenging journey through an entirely different network of rooms and prizes.

Also available in 16K for \$29.95 from your local retailer or JV Software Inc.

Atari® and 400/800™ are trademarks of ATARI, Inc.

JV SOFTWARE, INC

3090 MARK AVE. SANTA CLARA, CA 95051

videodisc to go search out an image. Also, there aren't enough of those [videodisc] units out there yet."

But he is excited over the possibilities of three-dimensional video games. "I've already seen some prototypes of arcade machines which use the same type of 3-D effects as the movies, the red-blue technique. We'll probably see this and also polaroid 3-D, at least in the arcades."

Total Immersion

Fred D'Ignazio, author and **COMPUTE!** columnist, thinks realism will be achieved by isolating the player from extraneous stimuli – of which there is plenty in most arcades – by "immersion" in the game environment. Arcade games would look something like those automatic booths in which people have their pictures taken, and players might even don helmets, headsets, and goggles. "All you would see visually would be your game screen, maybe wraparound," he says. "And you'd have a better environment for sound effects, too, and especially voice synthesis. You could even have voice-responsive commands, which even today's technology would support to a degree. And you'd need more controls, foot pedals and everything."

Nor would you be limited to playing a lifeless computer. D'Ignazio says arcade games could be hooked up to each other so people could play against other humans – maybe in another part of the city, or even another state – absolutely anonymously. "A lot of people play these games – at least, I know I do – because you don't have to compete with another human face-to-face. You can play the computer. But if you could play another person anonymously without having to confront them face-to-face, it would be a new challenge for a lot

Fred D'Ignazio.

CREDIT: Karen Tam, Raleigh News And Observer

of gamers."

What's more, the hook-ups could serve another function: "You could have news bulletins. 'Joe Smith just got a high score on *Galaxians* in Cincinnati.'"

This kind of telecomputing, or "telegaming," is already here in a simpler form. Although communications over phone lines between personal computers are still too slow to permit realtime, multi-player, arcade-style games, a few games are available which allow several players to compete head-to-head using phone modems. CompuServe, a leading information utility, offers two space warfare games, *Megawars* and *Decwars*. Up to ten people can simultaneously play either – a CompuServe subscriber merely signs onto the system and joins the game in progress. Although the game processing is handled by a large PDP-11 computer at CompuServe's base in Columbus, Ohio, the players are pitted against each other, communicating through their keyboards. Both games are text-only (no graphics).

Scott Adams's Adventure International sells a telecomputing game called *Commbat*. *Commbat* is a bit different than *Megawars* or *Decwars*; it allows only two players, but bypasses the need for a central computer. Instead, the players compete against each other using their own computers, linked over the phone lines by modems. Also, the game has graphics. The graphics are very simple, though, since *Commbat* allows Apple, Atari, and TRS-80 users to compete interchangeably, and those computers' graphics systems are normally incompatible.

Still, all of these games allow the sort of anonymous telegaming that D'Ignazio says could someday immerse the gamer in an elaborate environment of sight, sound, and sensation.

On the other hand, if you're the nervous type who would react to this "total immersion" by degrading into a screaming meemie, you might prefer computer games as a spectator sport. You know, Sunday afternoons on NBC. "I think there'd be a great audience for watching world-class video game players," says D'Ignazio. "You could have instant replays, slow-motion, and commentators going over their moves."

What's that, you say the video combat on TV got your adrenalin pumping? Anyone who wanted to work off a little "displacement aggression," as psychologists call it, could take up boxing at the local amusement park. "Instead of driving bump-em cars or riding roller coasters or shooting at ducks in a shooting gallery," suggests D'Ignazio, "you'll be able to have robot wars by controlling your own little robots."

D'Ignazio also says video games will be found in unusual places, not just arcades. They'll be built

A WORLD OF ENTERTAINMENT FROM

Reston Software^{T.M.}

Paint

by
Capital Children's Museum
Washington, D.C.

PAINT, one of the most exciting packages now available for use on the Atari® Home Computer, represents a dramatic artistic breakthrough. It enables individuals who thought they couldn't "draw a straight line" to create colorful works of art on the computer. Utilizing the fantastic graphic capabilities of the Atari® computer, the Capital Children's Museum has developed a fascinating software program. It is also accompanied by a book which gives you instructions, suggested ideas and activities to try with PAINT, an 8-page color insert, and an entertaining history of traditional art and computer graphics.

The PAINT disk provides access to hundreds of colors and textures, allowing you to produce a virtually limitless number of artistic patterns and variations in the pictures you create. This learn-by-doing combination of software disk and book is the first ever to join advanced computer technology with personal expression.

FEATURES INCLUDE:

- SimplePaint for very young children and SuperPaint for more advanced "artists."
- Art Show, which allows you to save your paintings on a blank disk and display them later in a slideshow format.

- Zoom, to give you a close-up look at works in progress and to allow you to add fine finishing details to paintings.
 - Nine paint "brushes" in 81 sizes.
 - Automatic Fill, Circle, Line and Rectangle
 - On-the-spot mixing and changing of colors
- For the Atari® 800 (48K) and soon to be available for the Atari® 400 (16K)

Software/Book package: \$39.95

- Animated Text & Font capability
- Picture-to-Shape conversion
- Video editing features, which include Freeze Frame, Fast Forward, Rewind, Delete/Insert Frame & Playback
- Real-time Animation Input!!!
- Sync Pulse for film or video recording
- Library of preprogrammed figures & backgrounds in addition to the ones you will want to create yourself Available for the Atari® 400/800 and the Apple® II Plus, allowing you to use any pictures created in Atari® Graphics Mode 7 or Apple® Hi-Res graphics.

QuickFlix

by
Interactive Picture Systems

*Instant Animation for Everyone
A Movie Maker Product from Reston Software*

QUICK FLIX is powerful, simple-to-use software for the development of games and lively animated sequences. It is a flexible yet easy-to-work program designed for non-programmers and programmers alike. Animation sequences can either be played directly or from within a BASIC program.

FEATURES INCLUDE:

- Make Shape (with zoom and fill functions)
- Make Background (with Apple® Hi-Res or Atari® GR.7 pictures)

into the backseats of cars to keep rowdy tots occupied; implanted in the ceilings of bedrooms; reduced to book-size and placed in dentist waiting rooms next to the *National Geographic*s; installed in hospital rooms and nursing homes to entertain the bedridden; loaned by public libraries, and, of course, carried by teen-agers onto subways. He thinks they might even be built into eyeglasses, so the true addict can throw a switch and see video games on the inside of the lenses.

Commodore's Tomczyk carries it one step further: "The concept of *TRON*, when you are really the computer – and the computer is you – is definitely going to happen. That's the ultimate. The trends of the pricing and power and technology indicate that is really going to happen. The physics of the fantasy expressed in that movie are probably impossible, but we are moving in that direction. We are moving toward the ultimate *TRON*."

The Future Or Fantasy?

But not everyone agrees with this fantastic view of the future. Crawford, the respected Atari expert, says the role of technology in future computer games is constantly overblown. "All these people predict that in coming years we'll be able to plug into our computers, and be surrounded by colorful 3-D images, and wonderful sound, and we'll just be able to think and all these things will appear, and

it'll be just a gas.... I reject all that. I don't think it's going to happen, and I don't think it has to happen.

"A lot of people mention new technologies as the engine of change in computer games," explains Crawford. "But I don't see technological developments as the driving force in computer games. I don't even see technology as the limiting constraint in creating computer games. I think the main constraint is lack of creativity and imagination."

Just as the technology of the automobile has not changed drastically over the past 50 years, neither must the technology of computer games, he argues. Technology remains fairly static if it is perceived as adequate, and Crawford believes most people are satisfied with the current state of computer games. "The development of cars since 1932 has been more in the way of polish than the way of new technology.... Although I believe the technology of new hardware will be forced upon us, I don't believe we'll need it to develop the computer games of the future."

Crawford's theory, though apparently the minority viewpoint, might come as welcome relief to those who are less than thrilled with the concepts of "total immersion" and "the ultimate *TRON*." Maybe you won't have to worry about running into a monster on the subway after all.

The Beginner's Page

Writing Your First Game

Richard Mansfield
Senior Editor

If you are tempted to write your own games, go ahead. It's a good way to learn to program. Games are basically the same as any other kind of programming.

Computer games fall into two broad categories:

1. imitations of old standards (checkers, Othello) and
2. games (Space Invaders, PacMan) which could not be played without a computer. This second category is more difficult to program for several reasons. For one thing, you've got to think up a whole new, and entertaining, concept and then adjust the action until it is just hard enough to be challenging but not so difficult that people want to give up.

This category (basically "arcade" games) is especially hard to program precisely because a good computer-only game exploits all of the computer's special attributes: speed, color, sound. To do this well, to make things look and respond just the way you imagine them, requires a good bit of programming experience. Usually, too, several things are happening *at once* in an arcade game. This often means that such a program must be written in machine language, which is far faster than BASIC.

High Card Slice

Old standards, on the other hand, can often be the best way to get started programming games. You already know the game concept, and cards or dice or game boards are fairly easily constructed and manipulated on your computer screen. To illustrate, let's take a look at a simple simulation of one of the oldest card games, "High Card." The rules are simple: you place a bet, and then you draw a card from the deck. The computer, your opponent, draws a card too, and the highest card wins the money.

One simplification here is that there is no attempt to represent the cards on the screen. The entire game relies simply on words ("Ace of Spades," for example) when cards are drawn.

Like most computer programs, the program can be visualized as having four distinct zones: initialization, main loop, subroutines, data tables. We can go through the steps in programming this game by looking at each zone separately.

Initialization

From lines 10 through 80 we are "teaching" the computer some basics about this game. Initialization is the activity which must take place before any of the action can begin. Computers are so fast that they will zip up through these lines and start things off in the main loop at line 100 in a flash. However, as programmers, we are aware that several preliminary events took place inside before anything else.

In line 20, the computer discovers that there is a variable called "dollars" which is to equal 500. It sets aside a section (like a small box) in its memory which it labels "dollars." When the game is running, it will add or subtract from this "box" (lines 230-240) to keep a running total of how much money you have left to bet. From time to time (line 110), it will check the box and report to the player how much he has. The box labelled "dollars" is called a *variable* because during the game the amount in it will vary.

Lines 30 through 60 are simple enough — they ask the player to give his or her name. The computer "memorizes" it in another "box" called "name\$" and can now speak more personally to the player in lines 140 and 230. Also, the computer prints the rules of the game in line 60.

Line 70 "reads" four names (the face cards) from the data tables in lines 510 on. It also makes a "mental note" that it already READ four items. So, when it's asked to READ again (line 80), it will start with the next unread item of data which will be "clubs." By now, the computer has "memorized" a variety of important facts: the player's name, the amount of his or her betting purse, the names of the face cards, and the suits of a standard deck. In less than a second, the computer has grasped and filed away the necessary facts to go on to the main loop where all the action takes place.

The Main Loop

After checking that the player has money to bet, the computer asks for the bet, checks again that the bet is possible, and then runs through one cycle of the game starting in line 160. At this point, a programmer might find it worthwhile to visualize the steps involved in the game: 1. draw a card for the player; 2. draw for the computer; 3. decide who won; 4. adjust the player's purse.

Since both draws are essentially identical actions (the only difference will be that we say "Bob draws a..." instead of "The computer draws"), we don't need to program the draw twice. This is where subroutines come in handy.

Good News for Kids...

Adventure on a Boat

Robby the Robot Catcher

Sky Rescue

Telex: 206995

The Subroutine

Twice in the main loop, we GOSUB 300. First the player, then the computer, draws. Line 310 randomly picks two numbers, the card and the suit. If line 320 finds that this selection matches the one drawn just before by the player, it goes back for another draw. Line 330 makes the *name* of the card be the number if it wasn't a number higher than 11 (a face card).

Then line 340 announces the draw using three variables. The first variable (player\$) is set up in either line 160 or 190 as appropriate. Then the card\$ and suit\$ variables are selected from the lists that were "memorized" back in the initialization phase (lines 70-80). The subroutine then RETURNs to the main loop.

Lines 210-240 decide and announce the winner of this round. First, if the variable "card" (the computer's card) is greater than (>) "yourcard," the computer is declared the winner in line 240, the purse is adjusted, and the main loop is restarted (GOTO 100). If the cards are equal, nothing happens to the purse and the next round begins. Notice that we don't need to say "IF YOURCARD > CARD" at the start of line 230 to test if the player has won. It's the only possible thing if the computer has gotten this far.

Once you've solved a particular problem, you'll find you can use the solution in many future games. This subroutine which draws cards, for instance, would work just as well for Poker, or Blackjack, or dozens of other games. Subroutines are handy not only because they can be used repeatedly within a program, but because they can be saved and used repeatedly in future programs. So think up a simple, traditional game and teach it to your computer. There is probably no more pleasurable way to learn programming than to write a game.

Introducing our exciting new family of video computer games from

IT-IS-BALLOON™

ENJOY THE GOOD LIFE WHILE YOU PILOT YOUR BALLOON OVER TREES, MOUNTAINS, FORESTS AND INDIANS. WATCH YOUR FUEL, LOOK FOR METEOR STORMS AND JET PLANE ATTACKS!

KAYOS™

WELCOME TO THE WORLD OF KAYOS. ALL GROUND LIFE HAS BEEN DESTROYED. YOU ARE UNDER CONSTANT ATTACK BY DEADLY FORCES. HOW LONG WILL YOU SURVIVE.

Mad-Netter™

YOU ARE THE MAD NETTER BEAUTIFUL BUTTERFLIES ARE EVERYWHERE! COLLECT AS MANY AS YOU CAN BUT DON'T GET STUNG BY THE BEES, CHASED BY DOGS, OR BIT BY A SNAKE!

POGOMAN™

POGOMAN IS AS MUCH FUN TO PLAY AS IT IS TO WATCH! POGO THROUGH THE CITY OVER CARS, CATS, HYDRANTS AND EVEN A CHICKEN. FUN FOR ALL AGES.

It's sometimes a challenge, but very good games can be written for computers with small amounts of free memory. If you're programming on an unexpanded VIC, Atari, Sinclair, or pocket computer or any other system with few bytes of RAM, these suggestions are worth remembering.

Programming Games On Computers With Limited Memory

Charles Brannon, Editorial Assistant

One of the most valuable elements of a computer system is its volatile memory, RAM. This "workspace" holds the program you're working on, its variables, and even the screen display and "system software." Managing memory efficiently becomes vital when writing games of any complexity.

There are many programming tricks you can use to save memory. The following list contains some of my favorite techniques – and many more can be intuited:

- Emphasize color and change. Any kind of movement will generate excitement. And don't forget sound. Sound effects can add sparkle to your program very economically. Most computers use no extra memory for sound. Various combinations of FOR/NEXT loops usually suffice for simple, yet pleasing, sound effects.

- Use "keyboard" graphics, or low-resolution graphics, imaginatively, and you can save thousands of bytes more than when you use a high-resolution screen. Remember that color changes are as important as movement to stimulate the eye.

- Abbreviate text and prompts. Avoid using players' names. Use their initials if possible. Unless unfeasible, never put written instructions into a program. Don't overuse strings, especially when a little math will permit the use of numeric variables. Both of these statements will extract the rightmost character of a number:

```
A = VAL(RIGHT$(STR$(N),1))
A = 10*(N/10-INT(N/10))
```

- Limited RAM does not permit the luxury of easy-to-follow programs. Use REM statements sparingly (or not at all), to document subroutines or obscure program segments. You can write in

REM statements on a paper listing of your program. Use short variable names (not applicable to Atari). If you use a long constant more than once, such as 3.1415927 for pi, define it as a variable (PI = 3.1415927). This technique can save six bytes per use on the Atari, even for simple constants like 0.

- Compact program lines. Each use of a colon can save from three to five bytes, depending on the computer. Don't use spaces when entering a program, unless your computer automatically deletes spaces (e.g., Atari BASIC) or unless they are necessary for proper interpretation.

- Simplify coding. If a certain routine or formula is used more than once, generalize it into a subroutine or defined function (DEF FN if your computer's BASIC has this command). Don't have long sections of IF/THEN statements. For example: you can use "boolean arithmetic" to reduce the space-wasting IF/THEN statement. Try this line on computer: PRINT 1 = 2. Your system would return with 0, indicating a "false" answer. Now try: PRINT 2*2 = 2 + 2. It should return either 1 or -1, meaning "true" (non-zero, 2*2 = 4 = 2 + 2). You can convert statements like:

```
IF A>0 THEN A = A-1
```

to:

```
A = A-(A>0), or A = A + (A>0)
if your computer returns a -1.
```

- Program control can be simplified with statements like ON/GOTO. Break your task into blocks. Each block performs a discrete task, and a given block can "call," or use, another block. Not only is this structured programming technique easier to use, but it also saves memory by encouraging you to develop tight, fast "blocks." A bonus is that you can often use these programming building blocks in other programs.

- Don't overlook machine language. It's well worth learning, and the benefits you reap in high speed, programming techniques, and overall efficiency can repay your effort many times. "Hybrid" programs of both BASIC and machine language let you enjoy the best of both worlds.

If worst comes to worst, you can use a technique called "chaining," where one program loads and runs the next. This technique is prone to problems and is awkward to use. On tape, the programs must be contiguous, and the second program can not return to the first. Nevertheless, chaining is valuable for "initialization" code such as loading character sets or machine language, displaying the game's rules at the start, or reading or defining variables (if your BASIC permits chained programs to share variables). Chaining permits you to run programs of almost any size. C

HOW TO MAKE YOUR VIC-20 AWESOME

Right out of the box, your VIC-20® from Commodore is one great little computer. And it gets even better with DATA 20's easy to buy, easy to install, and easy to use enhancements. Here are four ways you can get new power and more sophisticated capabilities from your VIC...

VIDEO PAK gives you a computer that outperforms systems costing twice as much. Plug our cartridge into your expansion port, and your display instantly goes to the industry-standard 24 lines, with a choice of 40 or 80 upper and lower-case characters. At the same time, you up your memory from 5K to 20K or 70K, so you can handle more sophisticated functions—including most 8032 software. Our package also includes a terminal emulator and a screen print feature. VIDEO PAK is a must for word processing—and your key to increased performance on everything from games to spread sheets. Suggested retail is just \$299.95 including 16K—or \$399.95 for 64K.

PRINTER INTERFACE is simple, yet sophisticated. Flexibility, continuous visual monitoring of the data transfer functions, and easy installation make this an exceptionally smart buy! A glance at the status lights, and you know if the printer is hooked up, if the data buffer is full, and if data is being transmitted.

Easily configured DIP switches match your VIC-20 to most popular printers. The DATA 20 interface comes with cable and connector, needs no assembly, and virtually troubleshoots installation for you. Suggested retail: \$69.95

EXPANSION CHASSIS lets you use 4 cartridges at once. Run a series of compatible memory, software, or game cartridges of any make. Just pop in any cartridge with the standard 22-pin edge connector. And don't worry about your VIC-20 power supply—our chassis protects it with a built-in 500ma fuse. Suggested retail: \$64.95

MEMORY CARTRIDGE boosts your brainpower to 20K. Here's an ideal first add-on for your VIC-20. And when DATA 20 gives you more memory, you can forget about headaches. Our cartridge is housed in a rugged plastic case and features 200ns RAM's for reliability. Suggested retail: \$99.95

Check out our **AWESOME** peripherals. Ask your computer dealer for a first-hand look at our extensive capabilities, high quality, and very reasonable prices. Or send \$3.50 for a copy of our current catalog on VIC-20 compatibles.

Don't touch that dial! FM radio could do a lot more than provide background music while you're programming — when a new venture to broadcast software gets under way next year. "We're thinking about transmitting the Top Ten programs each month," says Stephen Wozniak, co-founder of Apple.

Tune In Software (On Your FM Radio)

Tom R. Halfhill
Features Editor

It's another late night and you're slaving over a hot computer, wearily wearing your fingers to the nubs typing in that huge program listing for "Space Marathon V. 98.6." Surely, in this age of computerization, there must be a better way, you think grumpily for the hundredth time. Meanwhile, you tune your FM radio to a favorite station for background music.

An idea strikes: what if you could download programs off the air, much like the way data is transmitted over phone lines between computers with modems?

Your brainstorm is too late. Somebody has already thought of it.

Starting in January — if plans go according to schedule — a pilot project will get under way in the Washington, D.C.-Baltimore area. Computer programs will be broadcast over the FM airwaves by National Public Radio stations into the homes and businesses of charter subscribers. The programs (and other digital information) will be decoded by special "radio modems" leased for a monthly fee, and fed directly into computers, terminals, or printers — maybe even while the subscribers sleep. Six months after this test project, plans call for the service to expand nationally, bouncing the signals off a satellite to all cities reached by NPR stations.

The operation will be run by INC Telecommunications, a newly formed partnership between the nonprofit NPR network and the National Information Utilities Corporation (NIU), a supplier of telecommunications services and information products. The joint venture brings together two vital components: NPR's satellite transmission network and NIU's telecomputer hardware.

NPR, known for its news ("All Things Con-

sidered"), educational programs, and classical and jazz music, broadcasts over a national network of 267 FM stations by leasing 12 channels on Westar IV, a Western Union communications satellite. The new service will take advantage of this same network. NIU is contributing the technology for encoding and decoding the data into radio signals, including the small "radio modems" which subscribers will lease.

For Business And Home

Although the system is designed to have wide business applications, in some cases replacing the use of phone lines for beaming computer information throughout the country, INC is playing up the home applications, too. Significantly, two backers of INC are Stephen Wozniak — co-founder of Apple Computer — and Jack R. Taub, founder of the Source Telecomputing Corporation, which owns The Source. The Source is one of the major information utilities for personal computerists with phone modems. Taub started NIU in 1981. Wozniak is helping on the software end, putting together the programming which will attract home subscribers.

Already they are talking about such things as the "Video Game of the Week." We might even see a new definition of radio's traditional "Top 40": tomorrow's "hit list" may well be the most popular computer programs instead of records. It could open up a huge new market for the cottage software industry, provide specialized information for certain groups of subscribers, and possibly even reduce software prices by drastically cutting distribution costs.

"Wozniak is really excited about this as a way of getting the prices of software down so people are less inclined to steal it," says Jack Ault, president of NIU. "He thinks we can get the software down to the point where it is so inexpensive that it will be actually cheaper and easier for the person to download it at home than to go out and pirate it. Plus you would get all the support inherent in that."

The Little Black Box

The key to the system is what Ault calls a "radio modem," a book-sized black box linking personal computers and terminals to the airwaves. Actually, the box is not a true "modem," which means "modulator-demodulator," a two-way device. The radio modem is strictly a one-way device, a demodulator. Crammed into the eight-inch by four-inch by two-inch deep box with the demodulator is an FM subcarrier receiver controllable from the point of transmission. It's very much like the black boxes leased to subscribers by certain pay-TV stations known as "super TV."

Each box is individually addressable by a com-

PET/CBM

PaperClip

Professional Word Processor at a Breakthrough Price

PaperClip™ performs all the advanced features found in Word Processors costing much more. . .

- 1) Full screen editing.
- 2) Copy/Transfer sentences and paragraphs.

puter at the transmission source. For example, if subscribers to these "super TV" services pay an extra fee to watch a championship boxing match, the station remotely activates their black boxes — and no one else's — for the duration of the fight. Everyone else gets a scrambled signal. The same thing can be done with the new computer service: highly specialized software and data can be broadcast to only those customers who are interested in receiving it (and in paying for it). Subscribers would receive only the programs or data they have subscribed to.

Because the radio modem is controllable from the transmission point, unattended reception is possible, too. As Ault envisions it, someday the radio modem will be left on 24 hours a day. Just before a transmission is sent to a certain group of subscribers, a signal is broadcast to their modems which switches on their computers or terminals. After the information is received and stored on disk or printed out, another signal is broadcast to turn off the devices. It could all happen while a subscriber sleeps.

The radio modems, now at the working prototype stage, have RS-232 interfaces to be compatible with practically any computer or terminal. Ault says an IEEE-488 interface is in the works, too. The modem includes a buffer memory to temporarily store incoming information, so it will work not only with computers and smart terminals, but also with dumb terminals and stand-alone printers. The modems will be leased, not sold, and will be serviced by INC Telecommunications at regional service centers.

If you're worried about losing your favorite NPR programs to an unintelligible stream of digitally encoded bleeps, don't be. The computer transmissions will be inaudible to regular FM radio listeners. The new service will broadcast on a "sub-carrier," an unused portion of the frequency band assigned to each NPR station. Some NPR stations, for example, now use subcarriers to broadcast special programming for the blind. The new service uses a different subcarrier and will not displace this programming.

Tuning In To VisiCalc

What sorts of services can we expect from INC? Just about everything, it seems. Ault points out that the system can distribute data on a regional, as well as national, basis.

Businesses and the government can lease time to transmit data to remote offices throughout the country, bypassing costly phone lines. Businesses could also subscribe to receive specialized business news and stock reports. School systems could sign up to receive special educational software and

information. Home computer users could subscribe to get the programs and information that interest them. It seems that INC is aiming to do for telecomputing what cable is doing for television: providing a selection of subscription services for specialized audiences.

Wozniak foresees a big future in the mass distribution of software directly to homes and businesses. People could sign up to buy word processing packages or *VisiCalc* over the air, and even games. He thinks this could slash software prices by reducing the packaging and distribution costs, and also by piling up massive sales in a very short time. Instead of selling a program the usual way for \$200, it could be offered to INC subscribers for \$50. If 10,000 subscribers signed up, the software producer would reap \$500,000 — in one day, and without packaging or shipping a single disk.

As a bonus, revisions and patches for bugs could be transmitted at very little cost to everyone who bought the original program, says Wozniak. Demo versions of programs could even be transmitted as advertisements. Video game fanatics could subscribe to the "Game of the Week" and be assured that they're the first on the block to get every new release.

"We're thinking about transmitting the Top Ten programs each month, plus maybe another 100 of the lower-end, lesser-known programs," says Wozniak. "My concept of it is that perhaps all 100 programs that are transmitted every month are sent each day. So users who perhaps don't have much memory could save a few different programs each day of the month, try them out, and decide whether to keep them or not."

That ought to satisfy even the most brain-fried video game freaks.

How Much Will It Cost?

At this point, you're probably wondering how much it will cost to subscribe to this new service. The answer isn't clear yet. Wozniak speculates that the monthly subscription fee might be something like \$20 to \$50. INC's backers promise it will be cheaper than mass downloading of programs and information over phone lines from existing utilities such as The Source or CompuServe. Their argument is that a one-way system is inherently cheaper than a two-way system. Anyway, they say, INC is intended to complement, rather than compete with, the phone-linked information utilities. Each system has its own applications. The INC system, which is described as "point-to-multipoint" instead of "point-to-point," is better suited to mass distribution than the phone-line systems.

"There's no way 100,000 people could tie up 100,000 phone lines downloading something from

THE MOSAIC RAM SYSTEMS FOR ATARI*

CLEARLY THE BEST

MOSAIC 32K RAM

THE SCREEN CLARITY TEST

THE COMPETITION

YOU CAN SEE THE MOSAIC DIFFERENCE

WHAT THE EXPERTS HAD TO SAY

A.N.A.L.O.G. 400/800 MAGAZINE said in a 32K RAM board comparison test: "The Mosaic 32K RAM showed no sign of interference and gave the best screen clarity" and "Mosaic uses what we feel are the highest quality components which may improve reliability".

INTERFACE AGE said after replacing the Atari memory board with a Mosaic 32K RAM: "Once in place there is no noticeable change in screen clarity" and "in view of its excellent performance it should be a serious choice for those Atari owners intending to expand their memory."

Each Mosaic RAM board gives you more than just the best screen clarity but also the best in reliability, flexibility, and compatibility. The Mosaic RAM systems offer you the best in every way — these features prove it.

- Works in both the Atari 400* & 800* computers.
- 4 year guarantee.
- Complete instructions.
- Test cycled 24 hours for reliability.
- Gold edge connectors for better reliability.
- Quick no-solder installation.
- Full flexible memory configuration.
- Can be used with 8K, 16K and future products.
- Designed to take advantage of Atari 800's superior bus structure.
- Designed for inter-board communication in Atari 800.
- Allows Atari 800 to have 2 slots open for future expansion.
- Always the best components used for superior screen clarity and reliability.
- Low power design for safety and reliability.
- Available companion board (\$5) to allow running The Mosaic RAM systems independent of other boards.

THE MOSAIC RAM SYSTEMS FOR THE SERIOUS ATARI OWNER.

THE MOSAIC 32K RAM

For the serious Atari owner. This is the 32K RAM board you've been hearing about. It has every feature you could want from a RAM board and more features than any other board offers. Each Mosaic 32K RAM comes with complete instructions so in a few minutes you will have expanded your Atari 800 to 48K RAM. The Mosaic 32K RAM works as well in the Atari 400, but we suggest the NEW Mosaic Expander.

THE MOSAIC EXPANDER

This is the most effective way you can expand to 32K RAM for your Atari 400 computer. And at almost the 16K price! The revolutionary Mosaic Expander is a memory board with 16K RAM in place and open slots to add 16K more from the Atari 16K board that comes with your Atari 400. Each board comes with complete instructions so in a few minutes you will have expanded to 32K RAM.

The Source," explains Wozniak.

In other words, by its nature, the new service will share all the advantages that mass telecommunications media have over single-channel communications lines. It's more efficient for a radio station to broadcast the news at once to thousands of listeners than it is to individually call up those people on the telephone and tell them what's happening.

"It's such a simple and efficient system, and so obvious, in fact, that you wonder why it hasn't been done before," says Wozniak. "Maybe it just makes

too much sense. Sometimes things that make good sense are so obvious that nobody sees them."

Care to doubt this reasoning? Just remember, Wozniak took another obvious idea in his garage a few years ago and put together the Apple I computer – which made him a millionaire. He thinks the INC service could prove equally popular. So popular, in fact, that he doesn't see the need for a big push to sell the new service to consumers.

"I don't think that'll be necessary, not once word gets around. It'll catch on, just like The Source caught on."

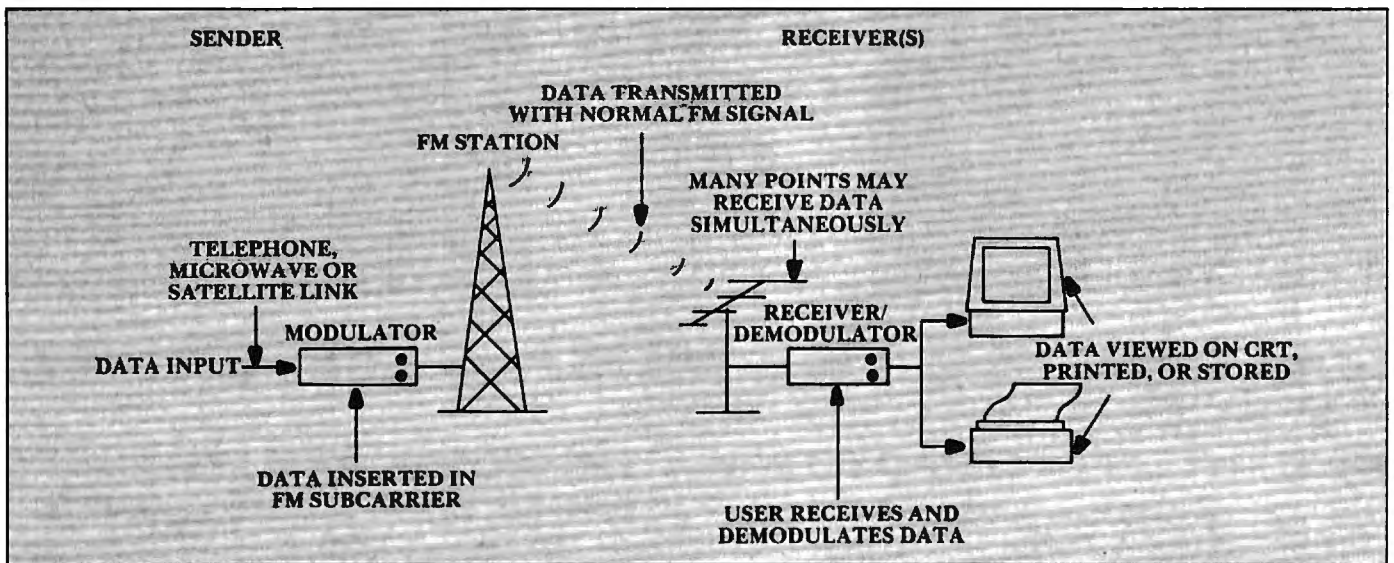

Figure 1. FM SCA Subcarrier Data Delivery – local FM stations are the final link in the transmission.

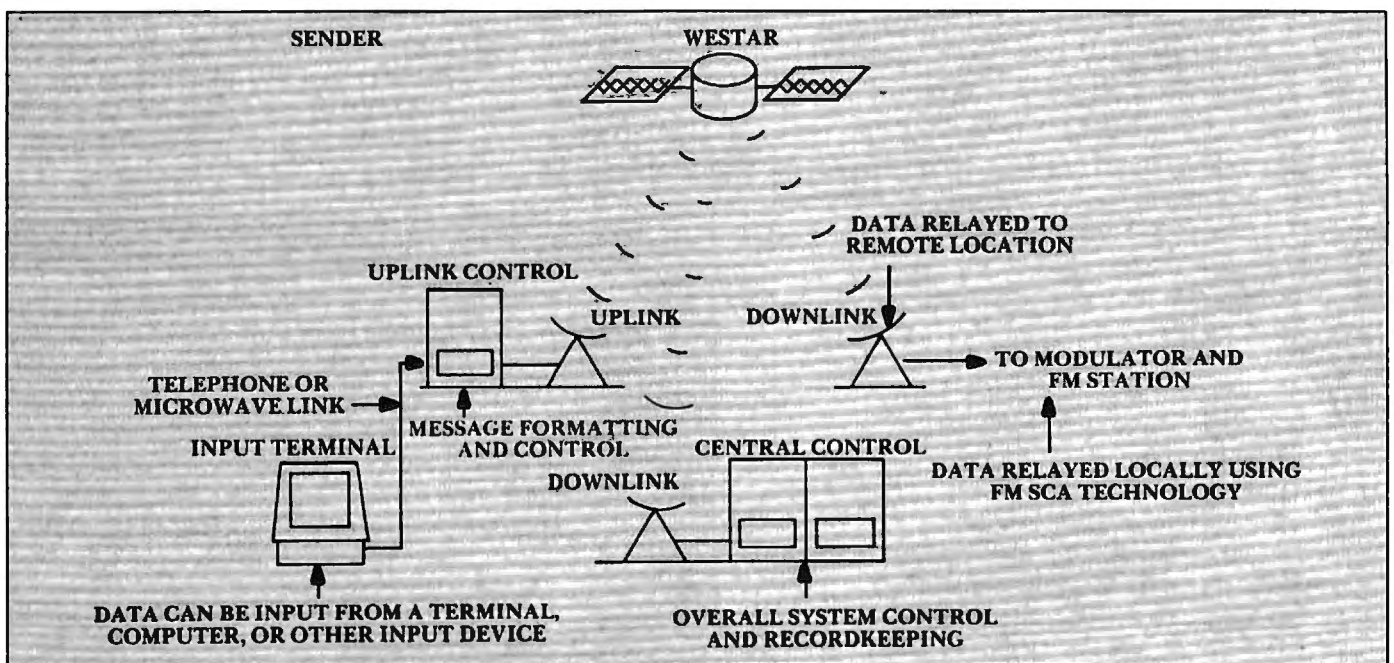

Figure 2. Using a satellite network with the FM SCA Subcarrier System brings a computer program through space to your computer. ©

Available now!

Make your fun and games computer get serious For only \$79.95

VIC-20[®] The Wonder Computer of the 1980's. Less than \$300. One heckuva lot of fun. But if you're using your VIC-20 strictly for recreation and fun, we at Micro-Systems think you're not getting your money's worth. Because we've designed the Micro-Systems VIE Cartridge which allows you to interface VIC to all existing Commodore IEEE peripherals (8050, 4040, 2031, and printers) for only **\$79.95**. In addition, we've designed the V-232 RS-232 Interface board to allow the VIC-20 to communicate with various serial devices such as printers, modems, and other systems—**NOT JUST A BUFFER DRIVER**—for only **\$45.00**. Also available are a full range of Ram Expansion Cartridges in increments of 8K, 16K, and 24K of ram expansion memory at very competitive prices. If you need to access more than one cartridge in your VIC-20 expansion port, we have the solution. The V-Expander is now available with 6 additional expansion ports DIP selectable.

And if you want to keep the fun in your computer, Micro-Systems has developed five all new video games (**VICTORIDS, MOBILE ATTACK, CRACK, GUARDIAN, and QUARK**) Available in Cartridge; Cassette (requires 8K expansion); and disk (requires IEEE interface above and 8K expansion); all compatible with VIC-20.

Available from Micro-Systems

VIE Cartridge (IEEE-488)	\$ 79.95	V-Expander (6-slot)	\$ 85.00
VIC-20 Color Computer	\$259.00	V-232 RS-232 Interface	\$ 45.00

Navigate your starship through the oncoming meteors, shoot them out of the way if you can, or your ship will be destroyed. If you get into a really tight spot, switch into hyperdrive. Versions for all PET/CBMs and Atari.

Meteor Storm

Emil Engels
Springfield, VA

In "Meteor Storm," the player must navigate his ship through a dense space disturbance. The player's ship, remaining at the top of the screen, is maneuvered left and right by pressing the (4) and (6) keys, respectively. The player's ship is equipped with a laser, fired by pressing the (F) key. The laser is capable of destroying meteors (10 points each). Hyperspace can be entered by hitting the SPACE bar and can be left by pressing any other key; while in hyperspace, the ship is invulnerable, but no points are awarded. The difficulty factor can be selected by the player, and the game's high score and high scorer are recorded by the computer.

One of the most interesting features of the program itself is the use of scrolling. A random line of meteors is PRINTed at the bottom of the screen at the beginning of each game cycle. This scrolls all the other lines of meteors up one line. (It also scrolls the ship off the screen. The ship is, however, immediately rePOKEd into position.) The effect of this scrolling is that the ship appears to move down through the meteor storm.

Atari Notes

The Atari version of Meteor Storm, 4.5K in length with all REM statements removed, can barely squeeze into an 8K Atari 400. But it will not run without some code shortening and simplification, since only 5.3K of memory is free on an 8K Atari, and the program reserves additional space for strings and player/missile graphics.

After the game starts, you will see a flashing arrow at the bottom center of the screen. Move it with the joystick to select game difficulty. Moving it to the right makes the game harder; moving it left, easier. This provides about 40 skill levels. After you press the trigger button to select the difficulty, your player — a glowing, wedge-shaped, missile-firing spaceship — will appear at the bottom of the screen facing an

onslaught of descending meteors which scroll from top to bottom. Your only defense is your laser cannon, which is fired with the trigger button. Move your ship left and right with the joystick, evading meteors, and fire on any meteors in your path. You get one point for each meteor hit. If all else fails, and destruction seems imminent, push the joystick forward to enter hyperspace. The meteor field will scroll at high speed, but your ship will be invisible, safe from the meteors. Pull back on the joystick to return from hyperspace. This is no small feat, since you must try to come out of hyperspace into an area free of meteors. Once you've tried hyperspace, you'll see why it's the move only of a desperado. Another feature allows high-scoring players to enter their initials. But you'd better be good — you have only one chance!

ALL THE EXCITEMENT . . . WITHOUT THE QUARTERS!

Datasoft™ brings the thrills of a video arcade to your living room with four new programs for your 16K Atari® 400/800 Home Computer. In **Canyon Climber** you explore the beauty and meet the challenges of the Grand Canyon. Face angry goats, fierce Indians and overbearing birds. Next, step up and try your luck at **Shooting Arcade**. Take aim at stampeding elephants, waddling ducks and jumping bunnies. Then, join the tortoise and the hare as they race across **Pacific Coast Highway**. But watch out for rush hour traffic on the road and slippery boats in the water. And finally, run away to the circus in **Clowns and Balloons**. You're in the spotlight as you catapult to the very heights of the big top to bust the balloons. So go to the arcade tonight without leaving your house. Check with your local software dealer or send check or money order with \$2.00 postage/handling. California residents, add 6% sales tax.

Available on cassette or diskette. Suggested retail price \$29.95

SYNCRO Software for ATARI™ 400/800 HOME COMPUTER.

Now from SNYCRO, the people who brought you
Mar Tesoro, Drac is Back, Alien Hell and Maze of Death. . .

ASTRON IV ©1982

An all graphic adventure game for the Atari* 400/800* Home Computer. 16K Cassette 24K Disk

As space warriors of the galaxy you penetrate ASTRON IV® to destroy the pirate asteroid. You battle several types of robots and the deadly ORBITRON with your space vehicle equipped with Z-bolts. You must penetrate four levels of the asteroid destroying the power panels that control the enemy's power. Once the panels are destroyed you must then escape. You may even battle each other for control.

FEATURES

Programmed in Hybrid Basic for fast action.	
One or two players.	Power stations
Automatic scoring	Joystick operated
Bonus Points	All Color

Wordmania® 1982 is a challenging word game with many unique features.

Players may compete individually or in the two player mode. This program has been developed for ages 5 through adult and will offer a challenge even to the most skilled player.

Wordmania® 1982 has been developed as an educational program in several respects, to improve typing abilities, word recognition, spelling, concentration and make learning fun.

Do you have a mixed-up Rubik's Cube sitting around? Your computer can tell you how to solve it step-by-step. There are versions of the solution here for PET/CBM and Atari – it requires 16K RAM memory. The author will make a tape copy (for Commodore machines only) for \$3 if you don't want to type it in.

Rubik's Cube Solved

Dieter Kuespert
Glendale, AZ

Here is a general solution for the problem of the Rubik's Cube. It absolutely does not matter what the combination of colors is on your cube when the program is started. There are differently designed cubes on the market having a variety of color combinations on the various planes.

The only deviation from the generality is the requirement that you use the letter "W" for white. If this is not done, the program assumes a wrong input. There is this required initial condition under all circumstances:

White has to be in the middle of the upper plane! Throughout the whole procedure it is mandatory that only single slices are turned, never the cube as a whole.

The program has been written in BASIC only. It is for use with a PET/CBM computer. As, however, no unusual program techniques are used, it could not cause any difficulties to adapt it to other Microsoft computers. Due to its generality, it was not possible to fit the program into 8K of memory. It takes about 14K instead, which permits use of a 16K computer.

At the start the program requests the color combination of the cube as it exists. A question mark appears in the respective field for which the first letter of the relevant color has to be keyed in. This has to be done carefully, as no correction is possible except to restart the program from the beginning. In practice it has proven unnecessary to provide a correction routine. The cube is displayed as if it were folded open. The letter "W" is also displayed as a reminder. It is easy to assign the fields to the cube accordingly.

After input of the last letter, the program starts to check for the fields of the white plane, which will appear on top of the cube after the appropriate instructions have been executed.

The cube will subsequently be solved in slices from top to bottom. The number of necessary moves is not optimized because this would require more than 16K of memory. Therefore, in order to find a field of a certain color, you are asked to turn slices until this color appears at a certain spot which is the only one checked every time. This will require some additional moves.

The subroutines necessary for keeping track of all fields are grouped at the end of the program. There is one for each kind of turn. The display of the required turn is connected to the exchange routine. After the display is on the CRT, the exchange is performed by the program. At the same time the plane of the actual cube is turned by the player. Thus the time is used in an optimal way. After the cube is solved, the computer so indicates.

As this is a rather long program, I am willing to save you the boring work of typing all those GOSUBs. Just send a tape or disk and \$3 for a copy. (PET/CBM machines only.) Don't forget to include a self-addressed, stamped mailer.

Dieter Kuespert

Fly the **SPACE SHUTTLE**

from your **ATARI®**

SPACE SHUTTLE

By Paul Kindl

Join the crew of the *Space Shuttle* as they prepare to take the next step into the world of space travel. Take control of the world's first reusable spaceship, the *Space Shuttle*, and in an accurate full graphic simulation, place yourself in the cockpit. Pilot the *Space Shuttle* through take-off with booster stage separations, orbit, descent down the glide path and landing to touchdown — complete with a chase plane and scrolling runway visible through the cockpit windshield. You assume command throughout all phases of the mission aided by complete instrumentation.

Price: \$29.95 32K Diskette

SPACE EGGS

By Gebell & Thompson from Sirius Software
"It will crack you up!" The Space Spiders, Lecherous Lips, Wicked Wolves and the universally-feared Fuzzballs are attacking. Shoot your SPACE EGGS, and watch out! Joystick optional. (Includes full color iron-on T-shirt transfer.)

48K Disk, \$29.95 *Save 20%!*
Now Thru Nov. 1 You Pay Only \$23.96

PREPPIE

By Russ Wetmore from Adventure International
Okay, Preppie: I dare you to cross that alligator-filled river and recover your golf ball. Remember, danger lurks everywhere, from speeding golf carts to monster frogs. With 28 colors and loud sound to match your madras coat. Even the not-so-preppies in your set will love it! 1 or 2 players; multiple skill levels; joystick required.

16K Tape, \$29.95 *Save 20%!*
Now Thru Nov. 1 You Pay Only \$23.96

THRESHOLD

By Warren Schwader & Ken Williams
You, alone, can save the Earth Federation from the lawless allans who roam our galaxy. Not only have these invaders been attacking our home planet—they're also raiding our space colonies! Space travel has become increasingly dangerous, as has friendly trade. But supplies must go through. As the pilot of the Federation fighter THRESHOLD, it's all up to you! High resolution graphics and sound plus "save the game" feature. Requires joystick.

40K Disk, \$39.95 *Save 20%!*
Now Thru Nov. 1 You Pay Only \$31.96

CAPTIVITY

From Program Design, Inc.
The most advanced maze game for the Atari! You must guide your robot through the maze, with the aid of a 3-D view on the screen. 5-color, high-res graphics, sound effects, 20 game variations and an infinite variety of mazes. Requires joystick.

24K Tape, \$24.95

GHOST ENCOUNTERS

From JV Software
You're a ghost in this real-time adventure, trying to find the 20 treasures hidden a network of 30 rooms. You may have to transmutate into other forms in order to solve the puzzles and avoid the dangers. You'll have to be fast and clever to figure this one out! Requires joystick.

16K Tape or Disk, \$29.95

Also available from JV Software:

ACTION QUEST

16K Tape or Disk, \$29.95 *Requires joystick.*

INSTEDIT

By Sheldon Leason from APX
This is the best character set editor we've seen. Using your joystick, you can modify characters; or create characters, script or multi-character objects easily! Your modified character is displayed in all six graphic modes simultaneously. And, you can save your character sets for use with BASIC or assembly source code. Comes with detailed user manual. Requires joystick.

16K Tape or 24K Disk, \$22.95

BATTLE OF SHILOH

From Strategic Simulations
The first wargame for the Atari! Now Civil War buffs can engage in a realistic simulation of a major battle. Marching through the war-torn countryside, strategically using the forests, creeks, hills for defense, you recreate every facet of the battle on a hex-grid map. If you had been in charge, would we still be whistling "Dixie"? 1 or 2 players.

32K Tape or 40K Disk, \$39.95

AIR TRAFFIC CONTROLLER

By David Mannering from Creative
Wonder if the air traffic controllers are really under stress? Want to see what all the fuss is about? This program will give you a taste of what goes on in those towers as you try to guide 28 aircraft safely through your airspace. This advanced version has five separate control areas from which to choose, as well as other enhancements.

16K Disk, \$19.95

THE HOME FILING MANAGER

From Atari
Throw out your file boxes—use the Home Filing Manager Instead! Now you can create, edit, print, store and retrieve your files with this one easy-to-use program. Great for organizing books, record albums, tools, antiques, stocks, addresses... and your computer programs.

16K Disk, \$49.95

CLOWNS AND BALLOONS

From DataSoft by Frank Cohen
A huge bunch of balloons is stuck at the top of the circus tent. How do you get them down? By bouncing a clown on a trampoline, high enough to burst them, of course! You must break the balloons in order, one row at a time—if you miss any, the whole row fills up again. Aim your clowns where you want them by moving the trampoline to just the right position. 1 or 2 players; multi-skill levels; joystick or paddle required.

16K Tape or Disk, \$29.95

THE COSMIC BALANCE

From Rapid Fire (SSI)
Design your own spaceship, then fight a battle with it to test your design on-the-spot. The goal is to create a ship that's powerful, fast, maneuverable—and armed with the most effective weapons—to tip the COSMIC BALANCE in your favor. 1 or 2 players; requires joystick.

48K Disk, \$39.95

VISICALC HOME AND OFFICE COMPANION

By Castlewitz and Chisasky from Osborne/McGraw-Hill
Fifty VisiCalc models for home and office, including: investments, inventory, sales forecasts, payroll, personal net worth, home budget planning, family insurance needs. Each comes with model listings, sample printed reports and narrative.
A must for every VisiCalc owner!

GAMES & RECREATIONS

From Reston. This new book is packed with games and ideas on how to create your own. You'll discover the special Atari capabilities of the keyboard, graphics, sound and color. The book provides an entertaining way to learn more about general programming, too. Part I: Learning Through Games. Part II: Games for the Atari. Part III: The Atari Special. Plus seven appendices.

Softcover, \$14.95 Hardcover, \$19.95

MASTER MEMORY MAP

From Santa Cruz Software If you are serious about programming the Atari, this booklet could become one of your most important tools. A highly detailed map of the Atari's memory, it details thousands of locations and routines. Using this booklet makes easier the use of display list, player/missile, and interrupt graphics. The "Miscellaneous Notes" section contains a wealth of knowledge picked-up by Santa Cruz in their explorations of the Atari. Also included are notes on the new GTIA graphics chip.

Softcover, \$6.95

KATIE AND THE COMPUTER

By D'Ignazio; Illustrated by Gilliam from Creative Delightful, full-color picture book about Katie, who falls into the land of Cybernia, inside her father's home computer. She learns how a computer works during her adventures with Colonel Software, the Bytes and a ferocious Program Bug. Ages 4 to 10.

Hardcover, \$6.95

6502 ASSEMBLY LANGUAGE SUBROUTINES

By Leventhal and Saville from Osborne/McGraw-Hill If you're interested in using assembly language quickly, this book is ideal. It describes general 6502 programming methods, provides code for more than 40 subroutines to help you improve your programming skills, debug or revise an existing program; add instructions and addressing modes.

Softcover, \$15.99

ATARI SOUND AND GRAPHICS

By Moore, Lower and Albrecht from John Wiley This self-paced, self-teaching guide will have you seeing and hearing things on your Atari in no time—even if you're a complete beginner. You'll learn to compose and play melodies, draw cartoons, create sound effects and games. Each section teaches something new in BASIC, the most commonly used computer language.

Softcover, \$9.95

PICTURE THIS! An Introduction to Computer Graphics for Kids of All Ages

By David D. Thornburg from Addison-Wesley This book promises to become the "modern replacement for coloring books and crayons". It's a learn-by-doing manual that uses PILOT, a simpler language than BASIC, and Turtle Geometry to teach kids to create pictures in full color from simple lines to complex angles and curves. Recommended for use in conjunction with PILOT Cartridge.

Spiral-bound, \$14.95

ATARI ASSEMBLER

By Don & Kurt Inman from Reston While the Atari Assembler Cartridge comes with an operating manual, it assumes that you already know assembly language. If you're new to the Atari or its 6502 processor, this book is a must. The Inmans guide you through the rudiments of this fascinating type of programming in clear, easy steps. Includes full listing and description of 6502 mnemonics and addressing modes. Recommended for use in conjunction with Assembler Cartridge.

Softcover, \$12.95

INSIDE ATARI DOS

By Bill Wilkinson from Compute The comprehensive manual on the disk File Manager System (FMS), commonly known as Atari DOS 2.0S. Contains the only complete and official listing for the system, plus a full description of: the external view, charts & tables, various interfaces and functions of individual subroutines.

Spiral-bound, \$19.95

COMPUTERS FOR PEOPLE

By Willis and Miller from Dillithium Do you need a computer for your business? Your home? Which one would be most useful? Which software should you consider? You don't have to be an electronics wizard to answer these questions... just read this book! It will guide the complete novice, step by step, to the selection of the best system for your needs.

Softcover, \$7.95

DE RE ATARI

From APX Translated from Latin, the title of this book is "All About Atari!" and it means what it says! Used in combination with Atari's Technical Reference Manual, advanced programmers will be able to learn to exploit the many hardware and operating system features that make the Atari 400/800 so tremendously versatile. Includes a useful discussion of the new GTIA chip. Once you know Atari BASIC and assembler, this book is a must.

Loose leaf (binder not supplied), \$19.95

COMPUTERS FOR KIDS

Atari Edition By Sally Larsen from Creative The BASIC programming manual written for kids, from flowcharts to color graphics, including the sure-to-please program, "Scare Mom with an Elephant." Detailed instructions and sketches plus glossary of statements and commands. With lesson plans and tips for parents and teachers.

Softcover, \$4.95

STIMULATING SIMULATIONS, Atari Version, 2nd Edition

How To Follow The Computer's Instructions:

You must keep the same face of the cube towards you at all times. Start with white in the middle of the upper (facing the ceiling) face. As you make the moves, imagine that the cube is held firmly in a vice in *the same position* throughout. Rotate individual slices, but the whole cube stays in position from start to finish.

An "arrow" will appear on screen for each move, and you respond by turning the slice on which the arrow sits in the direction the arrow points. Turn one rotation only per move. (See Figure 1.) If the computer wants you to turn that slice three times, the arrow will reappear in the same place three times.

There are only two other possible moves: the front (the side closest to your body) and rear faces (the one furthest away from you). If a strange "curved" arrow appears, that means that you should rotate the entire front face *one move* in the direction the arrow curves. To perform the same move for the back side, the computer will announce that you should turn the rear side. The arrow will appear curved as it does for a front-side rotation. (See Figure 2.)

It sounds a little complicated, but it isn't when you get started. There are really only two different types of moves to make. The computer will wait until you have moved; then you hit a key, and it announces the next move.

BORED?

Here's some great games
to keep you entertained

DATASOFT

Sands of Egypt

It's a high-resolution adventure with a new twist—it's animated. You play the part of an English explorer who is lost in the desert. As you wander through the desert in search of your yet to be determined goal the SANDS OF EGYPT reveal many secrets (if you know the right questions to ask). All screens are in high-resolution, full color graphics.

Cat No. 4285 Atari, 16K, disk \$29.95

SYNAPSE SOFTWARE

Nautilus

Definitely a new type of game for the Atari computer. A one or two player game. NAUTILUS features split-screen play allowing simultaneous action and viewing by the player or players. One player's mission is to destroy the underground city from a submarine while avoiding destruction. The other player (or the computer) is, at the same time, racing to preserve the city by destroying you. Each screen features high-resolution graphics and INDEPENDENT scrolling game maps. Definitely a tough challenge to master.

Cat No. 4255 Atari, 32K, cass \$29.95

Cat No. 4286 Atari, 32K, disk \$29.95

SIRIUS SOFTWARE

Snake Byte

SNAKE BYTE starts out politely. You (the snake) may accept or decline the presence of the Perilous Purple Plums who haphazardly bounce around the screen. Next, simply concentrate on slithering around the screen, chomping down apples as you go. Every time you devour an apple, your snake grows longer. If you're not fast enough, penalty apples appear. As you eat the apples, your snake grows longer, so beware. If you run into the walls, the Perilous Plums, or even your own tail you will break your fangs. If you're a good snake and eat all your apples, a door will appear at the top of the screen which leads to another of the 28 mazes in SNAKE BYTE. You only have three sets of fangs, so be careful.

Cat No. 4256 Atari, 48K, disk \$29.95

AUTOMATED SIMULATIONS

Dragon's Eye

DRAGON'S EYE, an overland adventure, invites the player into a completely detailed world of fantasy involvement. Your mission is to rescue the Seven Provinces from the curse of the Dragon's Eye. It is a perilous task, but the rewards are great. Treasures of true potency will be found by those who seek out the Eye-Treasures that are guarded by foul dragons, golems, ghosts, and a variety of things that go bump in the night. Can you be the mighty One who can forever banish the Evil Necromancer? Only time will tell.

Cat No. 4270 Atari, 40K, disk \$29.95

AVALON HILL

Voyager

A solitaire computer game that challenges the human player to explore the four levels of an alien spacecraft's maze-like corridors and rooms in 3-D simulated graphics, all the while avoiding robots programmed to blast any intruders. In order to win, the human must destroy all power generators and escape or hunt out and annihilate the killer robots. Includes color-animated graphics and sound effects.

Cat No. 4105 Atari, 24K, cass \$29.95

Cat No. 4104 Atari, 32K, disk \$34.95

SYNCR0

Astron IV

You are a space warrior of the galaxy and your assignment is to penetrate and destroy the pirate asteroids, Astron IV. As you enter the asteroid a Power Beam closes the only exit behind you. You are now locked inside and your only hope for escape is to destroy the power panels contained in a multi-level complex deep inside the planet. You battle several types of robots and the deadly ORBITRON with your space vehicle equipped with Z-bolts. One or two players may compete against the computer or against each other for control of ASTRON IV.

Cat No. 4258 Atari, 16K, cass \$19.95

Cat No. 4259 Atari, 24K, disk \$24.95

JV SOFTWARE

Ghost Encounters

GHOST ENCOUNTERS is a 16K assembly language real-time adventure game. You, as a ghost, travel through a network of 30 rooms in search of valuable prizes while, at the same time, try to survive the many perils encountered. Of course, a mere ghost cannot overcome all the evil powers striving to block his journey. Luckily, you are not a mere ghost, but are equipped with the power of transmutation, allowing you to take on the form of other, more useful, objects. Locating all 20 prizes scattered throughout requires a player with fast response and a keen wit.

The Adventures of PROFESSOR VON CHIP & ORBIE

TRICKY TUTORIALS (tm)

There are many things that the ATARI computers can do either better, or easier than other small computers. The following series of programs is designed for anyone who is at least familiar with BASIC programming. What each tutorial offers is similar to an extensive magazine article with all discussion in as simple language as possible, plus you get MANY examples already typed in and running. The instruction manuals range from 10 to 50 pages, and some tutorials fill up a complete tape or disk. There is little overlap in what is taught, so anyone wanting to know all they can should buy them all (my banker thanks you). ATARI buys these from us to use in training their own people! Rave reviews have been published in *ARTIC*, *ANALOG*, *CREATIVE COMPUTING*, and even *INFOWORLD*. You trust *INFOWORLD*, don't you?

TT #1: DISPLAY LISTS—This program teaches you how to alter the program in the ATARI that controls the format of the screen. Normally, when you say "Graphics 8", the machine responds with a large Graphics 8 area at the top of the screen and a small text area at the bottom. Now, you will be able to mix various Graphics modes on the screen at the same time. The program does all of the difficult things (like counting scan lines). You will quickly be able to use the subroutines included in your own programs.

16K Tape or 24K Disk. **\$19.95**

TT #2: HORIZONTAL/VERTICAL SCROLLING—The information you put on the screen, either GRAPHICS or TEXT, can be moved up, down, sideways, or diagonally. We provide the basic methods and leave the rest up to your skill and imagination. Includes 18 examples to get you started, with several using a small machine language subroutine for smoothness.

16K Tape or 24K Disk. **\$19.95**

TT #3: PAGE FLIPPING—Now you don't have to redraw the screen every time you change the picture or text. You will learn how to have the computer draw the next screen you want to see while you are still looking at the previous screen, then flip to it instantly. You won't see it being drawn, so a complicated picture can seem to just appear. Depending on your memory size and which graphics or text modes you are using, you can instantly look at up to 50 pages. The basic method takes only 9 lines and the usefulness is infinite.

16K Tape or 24K Disk. **\$19.95**

TT #4: BASICS OF ANIMATION—This program shows you how to animate simple shapes (with some sound) using the PRINT and PLOT commands, and it also has a nice little PLAYER/MISSILE GRAPHICS game you can learn from. The P/M example is explained and will get you started on this complicated subject (more fully explained in TT #5). This would be an excellent way to start making your programs come alive on the screen with movement! Recommended for beginning users.

16K Tape or 24K Disk. **\$19.95**

TT #5: PLAYER/MISSILE GRAPHICS—Learn to write your own games and other animated applications! The tutorial begins with many small examples that complement the 50 page manual, then gradually builds up to a complete game where everything you need to know is fully explained. Also included are two machine language utilities that you can use to animate Players with from BASIC. Next we include two of the best editors currently available: one for editing playfield shapes (backgrounds); and one to edit your players, and all in glorious Technicolor! Everything except the two editors run in 16K Tape or 32K Disk.

\$29.95

TT #6: SOUND AND MUSIC—Unless you have spent many years experimenting with the four voice channels, you will learn a lot from this one! Learn to play standard notes, chords, and whole songs using some simple "tricks". One of the nicest parts are the examples of special sound effects that you can refer to whenever you need a sound for a program or to impress a friend. This program will be of interest to all ages and levels of experience!

16K Tape or 24K Disk. **\$19.95**

SPECIAL DISCOUNT

Order the first six tutorials in a 3-ring binder for \$99.95, a \$30.00 savings!

TT #7: DOS UTILITIES—We at Educational Software have been shocked by some of the prices others are charging to offer you small utilities to help in the use of your Disk Drive. We now offer you all of the following plus explanation as to how each was written, and how to use them: A UNIQUE MENU PROGRAM, AN AUTORUN.SYS BUILDER, DISK INSPECTOR (LOOK AT SECTORS), DISK JACKET PRINTER, AUTOMATIC FORMATTER, RECORD SAVE AND LOAD UTILITY.

32K Disk Only. **\$29.95**

MASTER MEMORY MAP (tm)

This book is the most valuable source of information for your ATARI you can buy. It starts out by explaining how to PEEK and POKE values into memory, so that even new computer owners can use many of these "Tricks". Then you are given 32 pages of the memory locations that are the most useful, along with hints on how to use many of the locations. Finally, it includes hints on problems you may be having with the computer and discusses the new Graphics modes 9 to 11. Even ATARI buys this book from us!

\$6.95

CONTACT YOUR LOCAL DEALER or ORDER BELOW

We have other fine programs for ATARI computers.

Write for a catalog.

Send us your programs to sell too!

USER SUBMITTED PROGRAMS

MINI-DATABASE/DIALER—stores and edits up to 8 lines of information such as names & addresses, phone numbers, messages, inventories, or anything you want.

It has the usual sort, search, and print options, but it also has an unusual feature: If your file includes phone numbers and your phone company allows touch-tone phone signals, the program will DIAL THE PHONE NUMBER FOR YOU! 16K Tape or 24K Disk. **\$24.95**

THE GRAPHICS MACHINE—allows the ATARI to act like more expensive graphics computers using simple commands like line, box, circle, polygon, fill, and save screen to get a high resolution picture you can save on disk in only five seconds! Many more features! 48K Disk Only. **\$19.95**

BOB'S BUSINESS—14 small business type programs accessed from a common menu. 16K Tape or 32K Disk. **\$14.95**

MINI WORDPROCESSOR—A simple text editor to write, save, and print several pages at a time. 32K Tape or Disk. **\$19.95**

KID'S #1—Includes a MATH QUIZ, a children's TREASURE HUNT, and a DIALOGUE program. 16K Tape or 24K Disk. 3 for . . . **\$14.95**

KID'S #2—SPELLING BEE, WORD SCRAMBLE, and TOUCH. 16K Tape or 24K Disk. 3 Educational games for . . . **\$14.95**

PLAYER PIANO—Turns your keyboard into a mini-piano and more. 24K Tape or 32K Disk. **\$14.95**

DOG DAZE—Two cute little doggies race for the fire hydrants, shoot their bones, and just have a lot of fun! A fast action program for all ages. 8K Tape or 16K Disk, in machine language. **\$16.95**

GRAPHIC SYMBOL LABELS—for your keyboard to remind you of the built-in Graphics symbols. 2 complete sets for . . . **\$2.95**

OUR NEWEST PROGRAMS

* OUR BEST GAME *

SPACE GAMES—Our family is being attacked by ALIENS, and only you can save us. A comic book manual will guide you through three games that test your ability in space skills. Includes ALIENS, SURVIVE, and ROBOT ATTACK, and is for all ages. The first two games require 16K for Tape. The last game and all Disk users need 32K. **\$24.95**

MATHS FOR FUN—Another ENGLISH import teaching basic math skills. Very colorful and enjoyable to use. For ages 5 to 16. 16K Tape or 24K Disk. **\$19.95**

TT #10: SOUND EFFECTS—From laser blasts to ringing phones, this tutorial will show you how to make unique sound effects in all of your programs! 16K Tape or 24K Disk. **\$19.95**

MARATHON—This is a unique math quiz for one or two players. You are in a race to move your runner across the screen first! There are four levels of play with five modes of operation for each. The game uses joysticks for all input, so play is easy for young children. This wonderful learning tool is imported from ENGLAND for your learning pleasure. Your kids will never even notice they are playing an EDUCATIONAL program. 16K Tape or 24K Disk. **\$19.95**

TT #8: CHARACTER GRAPHICS—Character Graphics is the best way to animate your ATARI! Make letters look like space monsters, gunfighters, or a myriad of other shapes. Use our editor to create these multicolor shapes and then we'll show you how to move them around the screen. This tutorial even shows how our Space Games were written! 16K Tape or 24K Disk. **\$19.95**

To order COD, VISA or MasterCard call — (408) 476-4901

By mail include \$3.00 postage (USA only) or \$1.50 Memory Map only—
California residents add 6.5% TAX.—Specify Tape or disk.

BUSINESS OPPORTUNITY

Service & Maintain Coin Operated Micro-Computers In Libraries

DEALER REPRESENTATIVES WANTED
PART OR FULL TIME
NO ROYALTIES, NO FRANCHISE FEE

Exceptionally lucrative ground-floor opportunity to participate in the explosive Micro-Computer Market. The Computer Bus offers Community minded Micro-Computer owners the chance to develop their own successful business within a relatively short period of time with this innovative Microcomputer concept. The prognosis for success has never been better.

If you are accepted as a Computer Bus "Learning Center" Dealer you will operate your own sales and rental business from your home or office, featuring a product line of uncompromising quality and outstanding company support.

Investment required \$3,000, secured by extensive computer software and hardware. Selected territory, leads, national and regional advertising, technical support and full back-up service.

For additional information call toll free

COST EFFECTIVE SOFTWARE

BY

"The Best Little Software House In Texas"

HOMEBASE by SOFT SECTRE is a versatile database program for the home, small business or lab. In a MENU driven format HOMEBASE utilizes TWENTY COMMANDS: CREATE, ADD, LIST, CLIST, CHANGE, CONCATENATE, SEARCH, SUM, SORT, RUBOUT, LABELS, LOAD, PRINT, SAVE, DIRECTORY, HELP, DRIVE, AUDIO, LOWER CASE, END

HOMEBASE is ideal for MAILING LISTS (we use it ourselves), INVENTORIES, TEXT PROCESSING (forms), PARTS LISTS. "USER FRIENDLY" with AUDIO FEEDBACK. Why buy several programs? Purchase the ONE program that will handle all of your database needs. HOMEBASE by SOFT SECTRE will SAVE you TIME and MONEY!

All the advantages of Mupet, PLUS...

MUPET II saves money and time too!

Mupet II offers all the advantages of Mupet, plus:

- Can protect against incorrect use of harmful disk commands.
- No more printer interface - background printing supported on IEEE, RS 232C and parallel ports included in controller.
- Programmable 32K RAM controller provides user defineable operating systems.
- Up to 16 computers may be connected to central printer and disk drives.

Integrate intra-office terminals for common data access allowing independent analysis for such functions as:

- Accounting
- Sales forecasts, budgets and orders
- Production scheduling
- Word processing

The only product available capable of serving Daisy Chained Commodore Computers up to 100 feet.

SHIPPING NOW!

MUPET II
a small price for
huge capabilities, from:

\$995.00

Atari Notes

Because of the extreme length of this program, a full converted program is not feasible. Instead, use the following suggestions to convert Rubik's Cube Solver to the Atari as you are typing it in. If you prefer, you can type in the program first, LIST it to tape or disk, and then use an Editor (such as the Atari Assembler/Editor Cartridge) with search and replace to make "global" changes to the text. You can then use ENTER to read the converted program with BASIC.

1. Change all occurrences of "NEXT" without a variable to "NEXT I".

2. Text preceded with "[RVS]" should be entered using the Atari Logo key.

3. PRINT statements with the [HOME] character should be rephrased:

```
from: PRINT "[HOME][06 RIGHT]"
to:   POSITION 0,0:PRINT "[06 RIGHT]"
```

4. All TAB statements should be converted as in:

```
from: PRINT TAB(TB);T$
to:   POKE 85,TB:PRINT T$
```

5. The PRINT statements to draw the arrows will have to be converted for use with Atari keyboard graphics. (See below.)

6. GET statements such as:

```
GET B$(K):IF B$(K)=" " THEN
```

should be changed to:

```
GET #1,A:B$(K+1,K+1)=CHR$(A) (see below)
```

7. Substitute line 150 below, and add line 100:

```
100 GRAPHICS 0:POKE 752,1:POKE 82,0:
    OPEN#1,4,0,"K:"
150 DIM A$(10),B$(10),C$(10),D$(10),E$(10),
    F$(10),T$(10),U$(10)
```

8. Strings (of course) will have to be changed. Generally, all references to variable xx\$(n) will become xx\$(n+1,n+1). For example,

```
1170 IF C$(4)=D$(5) THEN 1190
```

becomes

```
1170 IF C$(5,5)=D$(6,6) THEN 1190
```

Here's where SEARCH and REPLACE come in handy. Just use ten patterns, such as:

```
REP/$(0)/$(1,1)/A
```

Watch out for statements like A\$(I), which should become A\$(I+1,I+1), or A\$(10-K), which should be A\$(11-K,11-K).

```

COMPUTE! The Resource.

PET SPEED[®]

lets **COMMODORE** users do
more...with less...with ease

Petspeed is not only going to change the way you think about your Pet Basic programs—it's going to change the way you use them.

It turns your painfully slow programs into fast, smooth-running, professional software.

Nothing can match the speed, compatibility and trouble-free performance of Petspeed.

Optimizes Any Program

While most compilers simply translate from one language to another, Petspeed analyzes your source program and eliminates unnecessary complexities. This speeds your processing time dramatically.

Programs are reduced to smaller components and reassembled into a far more efficient form.

For example, Petspeed:

- automatically uses faster integer arithmetic whenever possible
- automatically handles frequently occurring variables and arrays
- automatically calls all subroutines at maximum speed
- properly locates subroutines for optimum performance
- reduces the size of large programs so less memory is needed

- runs twice as fast as *any* other compiler

Totally Compatible

Petspeed will work with any combination of Commodore 4000 and 8000 series systems.

It will compile any Basic application.

And, Petspeed is already in daily use in major companies around the world, helping them work more efficiently and more profitably with their Commodore computers.

Easy-To-Use

You don't have to add compiler directives. Simply type in the program name, and in less than two minutes you'll see your program run significantly faster.

You'll see improvements no one can match.

Built-in Security

Petspeed is provided with a special security device, but you won't need a special runtime key for any compiled programs.

Instead, you can build in your own protection.

No one else can list your Petspeed code, so no one can tamper with your completed programs.

Your programs belong to you and you alone.

If you'd like to do more work in less time with your Commodore computer, contact your local Commodore dealer today. Or, call or write us for complete information and the name of the dealer nearest you.

HARDBOX® puts volume information storage and multi-user capability at your fingertips.

Hard Disk Interface

HARDBOX is the intelligent controller that lets you add a Corvus hard disk drive to your Commodore computer. In fact, you can chain up to 4 hard disk drives of 6, 11 or 20 Megabyte capacities.

Compatible with CBM DOS versions 1 and 2, the HARDBOX operates with existing Commodore programs and appears to the Commodore as a high speed, high capacity floppy drive.

Multi-User System

Create a multi-user network by adding the Corvus Constellation multiplexer to your hard disk system. With a HARDBOX at each work station, up to 64 users can simultaneously access the same drive.

As a multi-user system, the HARDBOX provides:

- Separate user areas on each hard disk.
- Multi-user work areas for shared programs.

- File and record locking for shared databases.
- Password protection of user areas.
- Access to any user area from any station using the password.

Video Cassette Backup

The HARDBOX supports the Corvus *Mirror Option*. This provides a high-speed, low cost means of backup, using a commercial video cassette recorder. Backup speeds of 7½ kilobytes per second let you save contents of a

10 MByte drive in less than 20 minutes. Video cassette capacity is approximately 100 Megabytes.

Hardware Requirements

- Commodore 3000, 4000, or 8000 series computer with BASIC 2 or 4.
- One HARDBOX and PET-IEEE cable per work station.
- Corvus bare drive and ribbon cable.
- Access to a floppy disk or cassette.

For more information on how you can make your PET and CBM more useful in your business, contact your local Commodore dealer. Or, for more information and the name of the dealer nearest you, call or write us today.

This challenging and fast-paced game is for the VIC (5K) and Atari computers. Try to collect as much treasure as you can, but keep an eye on the monster!

Superchase

Anthony Godshall
Elkhart, IN

"Superchase" is an arcade-style game where you try to eat all the treasures before the monster of dungeons eats you! Sounds easy, doesn't it? Well, it isn't quite that simple. The faster you go, the faster he goes. What's the point in going fast? If you go fast, you get more points.

Here's how the game works. You get to choose your skill level. Hit a key between 1 and 9. After this, the maze is drawn. Following this, the treasures are put in, and you appear in the upper left-hand corner. Take off!

If you clear the maze of all the treasures, you will receive a bonus, depending on your skill level and score, and will start a new screen with a higher skill level. Don't be disappointed if you don't get a good score the first time. I find that most people learn quickly.

The monster will follow in your exact footsteps, so you can duck into a side passageway and let him go past if you know where you have been. If you are trapped, try to make him accelerate. When he is accelerating, you can run past him. Do this by moving back and forth as fast as you can.

If you don't want to spend the time to type the VIC version in, send me a cassette, a self-addressed, stamped mailer, and \$3:

Anthony Godshall
137 Wagner
Elkhart, IN 46516

Do You Know Your Apple or Atari Can Already Talk?

**An exciting new
breakthrough:**

***This disk can
now make your
computer speak!***

It's the **Software Automatic Mouth — S.A.M.**
The brand new, all-software, high quality speech synthesizer
from **DON'T ASK.**

S.A.M. gives you:

Unlimited vocabulary

Full inflection at your control

Effortless access from BASIC

Separate pitch and speed control

Thorough, instructive owner's manual

Easy-to-learn phoneme spelling system

And automatic English-to-speech conversion

Elaborate internal pronunciation rules for natural-sounding speech

S.A.M. for the APPLE II/II+ includes:

8 bit digital-to-analog converter and audio amplifier
on a board (amplifies the sound of all your APPLE
games).

- S.A.M. on disk
- Complete documentation
- English-phoneme dictionary

Only \$124.95

APPLE is a trademark of APPLE COMPUTER, INC.

S.A.M. for the ATARI 400/800 includes:

- S.A.M. on disk
- Complete documentation
- English-phoneme dictionary

Only \$59.95

Note: On the ATARI, screen blanks during
vocal output.

ATARI is a trademark of ATARI INC.

**Hear S.A.M. at your favorite computer store today.
For more information, contact:**

2265 Westwood Blvd., Ste. B-150
Los Angeles, California 90064. (213) 397-8811

- For a copy of the owner's manual, specify computer and send \$2.00 to **DON'T ASK.**
- You can order **S.A.M.** directly from **DON'T ASK.** Add \$2.00 for shipping and handling to your check or money order (or order C.O.D.).

Dealer inquiries welcome
Talk is cheap

We turn your VIC into a real computer for only

\$249

Great news for HAM's... Now you can see what you hear!

The TDK-20 'HAM interface' is a complete RTTY and MORSE code system for the VIC-20 computer. It comes in a single cartridge which you can plug in either a standard VIC-20 or in an expansion box. The cartridge includes two converters, one for MORSE reception and the other for RTTY. Just plug it in and you can read what's in the air on your VIC-monitor!

Computer World offers you its sensational videocartridge. Just plug it in, connect a video monitor with your VIC-20 and enter the world of professional computing. Discover word-processing, accounting etc.

Our new videocartridge has remarkable features for only \$249

- 40 or 80 column display (switchable from BASIC, without losing any program in memory);
- VIC and CBM/PET graphics;
- BY adding this board you can expand your VIC to 32K RAM, instead of 27.5K. (Note: you only need the expansioncard and 3.8 and 16K RAM cartridges);
- Upper and lower case characters with true decoders;
- Full cursor control;
- Program editing in 40 and 80 column mode;
- No alternations needed to your VIC;
- No external power supply needed;
- Fits in ARFON or Commodore expansion box;
- Now you can LOAD every Commodore or VIC program and adjust it to 40 or 80 columns;
- Operates with all ROM cartridges, except those working in the area A000 Hex to C000 Hex;

SUPER EXPANDER INCL. VICTOOL

Looking for high resolution graphics? Buy Commodore's super expander. But... it doesn't work together with the programmers aid. The solution: buy our SUPER VICTOOL, the toolkit that works perfectly with the super expander. Our SUPER VICTOOL adds 18 commands to your VIC, i.e. AUTO, DELETE, DUMP, FIND, HELP, OFF, RENUMBER, STEP, TRACE, TEXT, GRAPHICS, LINE, CLEAR, DRAW, PUT, FILL, SET, POINT, CIRCLE. ROM cartridge and manual

\$79.-

\$59.-

Memory Expansion

If you want to expand your VIC with more memory you'll need this unique expander. Now you can have 7 more slots for programmers aid, RAM packs, etc. Computer World offers you this expander (with 1 slot completely tested) for \$59.- (Add \$9.- for each extra connector).

Features:

- RTTY transmit/receive;
- Audio input;
- 8 buffers to store text;
- LED tuning indicator;
- MORSE transmit/receive 6 Wpm tot 60 Wpm;
- Every Baudrate i.e. 45, 50, 57, 75, 110, 150, 200, 300 Baud;
- Every shift, 170, 225, 425, 850 Cs.;
- Old or New tones, 1275 or 2125 Cs.;
- WRU mode; CD ID; PTT

\$183.-

VICPHONE Leave the dialing to your VIC!

\$59.-

VICPHONE is a mailinglist program and an interface between your VIC computer and your telephone. Type the name of the person you want to speak and your VIC looks in its memory and dials automatically the correct number. On your (TV)screen you'll see name and phonenumber.

Terms: Shipment will be made in one week after receipt of your order. VISA, MC, or check accepted. Add \$10.- for shipping.

Parallel Interface

A real pro printer for your VIC? Order our printer driver with cable! Please specify EPSON or OKI printer.

\$129.-

VIC-20

The friendly computer

- V 6 **FOUR ACROSS**
Vertical game for two players; similar to tic-tac-toe. \$9.95
- V 10 **SNAKE**
Like the Arcade game SURROUND. One or two players. \$9.95
- V 12 **BREAKOUT**
Adaption of the classic Ping-Pong against the wall. All time favorite. \$9.95
- V 78 **BRICK**
The computer has a brick float across the screen and it disappears before it hits the window. You have to stop the brick before it breaks the glass. \$7.95
- V 79 **SHOOT**
You have to shoot a moving object. The game has five different skill levels. \$7.95
- V 80 **REVERSE**
This game is played with two sets of pegs. The board starts with a set of pegs at each end and you must reverse them. \$7.95
- V 81 **CAPTURE**
You have to capture the two beasts by containing them in the brick cage that you build. It has nine skill levels. \$9.95
- V 82 **WORLD CAPITALS**
An entertaining and educational variation of STATE CAPITALS. \$9.95
- V 83 **JACKPOT**
You must see this one armed bandit in action to believe it. Full color graphics and sound. \$7.95
- V 84 **STATE CAPITALS**
The computer displays a state or capital; the student types in the corresponding capital or state. Even corrects spelling mistakes. \$9.95
- V 85 **HANGMAN**
Unbelievable graphics and sound with a twist of humor. Kids of all ages will love this one. \$9.95
- V 86 **TAC-TAC-TOE**
The perennial favorite, a fast-paced colorful game. Try if you can to beat the VIC. \$7.95

- V 87 **MEMORY**
The VIC challenges your memory to the ultimate degree. Just like the old T.V. show Concentration. \$9.95
- V 88 **MATCH**
Hand and eye coordination are a must in this game. Beat the clock and get the maximum number of points. \$7.95
- V 89 **MONKS**
A devilish game of logic. It will have you glued to the VIC for days. \$7.95

V 428 INTRUDER-SCRAMBLE
Just as fine as the arcade game. Machine language. A must! \$19.95

- V 90 **MOSAICS**
A variation of Rubics cube for the VIC. This game has never been seen before for any computer. We wrote the program but could not solve the puzzle. \$9.95
- V 91 **SENKU**
If you like thinking logically, this one will challenge you all the way! Based on the popular game of Mastermind. \$7.95
- V 92 **MAGIC PAD**
A mini-version of Visi-Calc for the VIC. Allows storage and retrieval of data from cassette; invaluable for personal and business use. Turns VIC into the perfect record keeper. \$20.00
- V107 **BINARY NUMBERS**
This program is designed to introduce you to the binary number system and the conversion to binary from base 10 numbers and back. \$9.95
- V108 **BOMBER**
You must decide who you want to fly for. You then get to pick a target and your experience level. \$9.95
- V151 **BIZZ-BUZZ**
Math game that tests the student on division by 2&3. Good for elementary school students. With color and sound. \$9.95
- V152 **MISSILE COMMAND**
You have three bases and you must destroy as many space ships as you can before you run out of missiles. \$9.95
- V153 **TANK VS. UFO**
The tank is moving back and forth along the base and you must shoot the UFO before it shoots you. \$9.95

- V190 **BIORHYTHM**
Just like the biorhythm charts you find in books. \$9.95
- V191 **BLACKJACK**
Just like Blackjack in the casinos. \$14.95
- V192 **BEST STRAIGHT LINE**
This program finds the equation for the best straight line through the desired points on a graph. \$9.95
- V194 **SNAKMAN**
Pacman for the VIC. \$24.95
- V197 **ASTROBASE-2001**
Destroy the alien invaders from space as they attack your planet. Requires 3K memory expander. \$9.95
- V199 **SUBROUTINES**
The use of this standard programming technique allows you to save much room and effort. Typical uses are stressed. \$14.95
- V299 **ACAT HAS NINE LIVES**
You're an alley cat who is trying desperately to defend himself from unidentified deadly objects. Fast paced game. \$7.95
- V300 **PSYCHIC MISSILES**
The object of the game is to guess where the target will be, then fire the missile! This program will exercise your psychic ability. Requires \$9.95
- V301 **BEECHA GOTCHA**
Play "Beecha Gotcha." If the harpoon hits the monster fish, I "beecha." If the monster eats the boat, I "gotcha." Requires 3K expander. \$9.95
- V302 **AIR ATTACK**
By Richard Leiman
You must shoot down enemy aircrafts with your limited supply of missiles. \$7.95

Here is a game for VIC and Atari that teaches math while it entertains.

MathMan

Andy Hayes
San Jose, CA

Here's a program which proves that computer-aided math practice need not be boring. In the guise of a game, MathMan teaches multiplication facts by presenting random problems. The player (or student) types in the answer and presses RETURN. If he is correct, his friends gathered below cheer, but if the player fails to guess correctly, one of his friends will run away in shame. If all six friends flee, the game is over.

A good player can advance to the next level by successfully completing ten problems. The problems get successively more difficult, so this single program will provide challenge for almost any elementary school child. (Adults may also enjoy the animation!)

Program 1: VIC Version

TODAY'S MENU

For Your VIC™ 20 and ATARI® 400/800

Games

ASTROBLITZ

Protect your planet by destroying enemy saucers.

TRASHMAN

Drive the garbage truck and empty the city's trash cans. But watch out for the flies.

CITY BOMBER

Level a city to make it easy to land. Take off and do it again.

ACTION GAMES

SEAWOLF, BOUNGOUT, or MIE TRAP. You'll need sharp eyes and quick hands for these.

Education

EDUCATIONAL/RECREATIONAL (I & II)

Put fun into learning math, spelling, and spatial relationships.

LOGIC GAMES

The computer is thinking. You should be, too.

Personal

HOUSEHOLD FINANCE

Schedule the family budget, account for expenditures, and face the tax man with a smile.

HOME INVENTORY

Make a record of what you own and revise it as you go. Find out what you've got in seconds.

DECISION MAKER

What should you do about virtually anything? Here's help.

LOAN ANALYZER

Home, car, boat... whatever. How much can you afford to pay out?

Choose an Entree:

Maybe it's a colorful and challenging game like ASTROBLITZ, TRASHMAN, or CITY BOMBER; perhaps an educational game like HANGMAN or MATH HURDLER; maybe a basic diet of household concerns like HOME INVENTORY, HOUSEHOLD FINANCE, or DECISION MAKER.

Take your pick. All you have to supply is your VIC™ 20 or ATARI® 400/800 and your own ideas about how to put our software to use. We supply the rest: competitive games, educational games, down-to-earth personal programs, and simple instructions that make everything easy to digest.

What you see here is part of the menu for today. We'll be adding more, so check our menu from time to time. It's growing, and it's all take home.

Contact your local outlet.

The Simplest, Most Complete Computer Literacy Course Available

I Speak BASIC

**eliminate
the mystique
of computers...**

Machine-Specific for Apple™, and PET™ Micros

- Details basic components and operations of your specific machine.
- All programming examples and commands are written in the BASIC version for your computer.

Includes Everything Needed for an Introductory Course

- 15-session course includes:
 - Student Text: begins each lesson with learning objectives followed by definitions of key terms, programming examples, in-class exercises, assignments, a summary, and practices.
 - Teacher's Manual: contains special annotations and suggestions to aid in lesson planning and teaching methods. Includes answers to all quizzes and practices.
 - Exam Set: provided on spirit duplicating masters.

No Previous Experience Required

- Students (and teachers) learn BASIC programming and get complete understanding of computer operations and functions.
- Introduces the basic parts of a computer through easy-to-understand diagrams.
- Teaches the hows and whys of programming, defining key terms and BASIC concepts.
- Teaches students how to write, run, even modify programs.
- Details common problems and solutions.
- Includes a lesson on the video-display graphics of each microcomputer.

Field Tested

Field tested in Philadelphia by Aubrey B. Jones, Jr. Teachers and students used in-class exercises, reviews, performance evaluators, and quizzes. It has since been adopted by many schools across the country.

*ATARI™ version soon to be available

There are versions of this exciting adaptation of Tag for the Atari (16K required) and PET/IBM with Upgrade or 4.0 BASIC. Each game involves a special extra feature which makes the action all the more challenging: the pursuer can become the pursued without warning and without tagging the other player!

TAG

Ed Davis
Rumford, ME

When playing real-life tag with only two players, nobody really wins because the number of tags per player remains constant. But in computer Tag, the clock decides who will be the champion. Every 15 seconds, if the person who is *It* cannot tag the other, the computer will reverse the *It* player. This feature allows a real fight for points. If you are not skilled in attacking, you can become skilled in evasive tactics and win the game.

Before the game starts, the players must input their names. Then, the computer will ask for the "color" of the playing arena. "Color" simply describes which keyboard character will appear as the border of the arena.

Then, you set a point limit by inputting a number from one to infinity. Game length is determined by the amount of time it takes for any one player to amass the predefined number of points.

The computer then draws a large square area the length and width of the screen and fills this area with 180 obstacles that players must dodge in their quest for victory.

The Controls

The PET number pad serves as the control for the right-side player. The "QWE", "ASD", and "ZXC" keys serve as the controls for the left-side player. These are movement controls, and the "5" or the "s" keys will stop the player from going further than he wishes. To quit a game in progress, typing "%" will cease all function, and no points will be given to either player. This feature exists because the computer will sometimes surround a player with obstacles before battle, causing a shutdown of the afflicted player's actions.

Sound Effects

The sound effects in Tag are mostly simple loops. The sound output is for CB2 sound users. If you

are not using sound, or just want to make the game movements a little faster by eliminating the sound loops, just remove the sound GOSUBs (lines 10-81) and install RETURNS. There are six different sound effects.

Machine Language

The machine language program built into Tag will work on all 40-column Commodore PETs. Even though the starting address is 826, and starting here on 4.0 ROMs sometimes messes things up, the program always works on the Fat-Forty that I use, and it works on the 4016, 2001, and 8032 models as well. The machine language program simply reverses all the characters on the screen by SYS826. (Typing SYS826 again will restore the screen to normal.)

STARBASE HYPERION™
 By Don Ursem

Become absorbed in this intriguing, original space simulation of war in the far future. Use strategy to defend a front line Star Fortress against invasion forces of an alien empire. You create, deploy, and command a fleet of various classes of space ships, while managing limited resources including power generators, shields and probes. Real time responses are sometimes required to take advantage of special tactical opportunities. Use of color, sound, and special graphics

add to the enjoyment of this program. At least 24K of RAM is required.
 On Cassette — \$19.95 On Diskette — \$22.95

NAME THAT SONG

By Jerry White

Here is great entertainment for everyone! Two players listen while the Atari starts playing a tune. As soon as a player thinks he knows the name of the song, he presses his assigned key or joystick button. There are two ways to play. The first way requires you to type in the name of the song. Optionally, you can play multiple choice, where the computer asks you to select the title from four possibilities. The standard version requires 24K of RAM (32K on diskette) and has over 150 songs on it. You also get a 16K version that has more than 85 songs. The instructions explain how you can add songs to the program, if you wish. Written in BASIC.

On Cassette — \$14.95 On Diskette — \$17.95

QS FORTH

By James Albanese

Want to go beyond BASIC? The remarkably efficient FORTH programming language may be just for you. We have taken the popular fig-FORTH model from the FORTH Interest Group and expanded it for use with the Atari Personal Computer. Best of all we have written substantial documentation, packaged in a three ring binder, that includes a tutorial introduction to FORTH and numerous examples. QS FORTH is a disk based system that requires at least 24K of RAM and at least one disk drive. Five modules that may be loaded separately from disk are the fig-FORTH kernel, extensions to standard fig-FORTH, an on-screen editor, an I/O module that accesses Atari's operating system, and a FORTH assembler

AND MORE...

STARBASE 3.2 (Available for all computers) Price: \$13.95 Cassette \$17.95 Diskette
This is the classic space simulation, but with several new features. For example, that rocket you shoot at the invisible robot warning you also has some long-standing in other quadrants. The robot also attacks with high light and infrared sensors and more alien shots. The strategy is to be where the laser is located by three heavy destroyers and a starbase. (3.2 is reserved) The 3.2 version gives you the software reviews in N.A.C.G. 80 Software Catalog and Game Merchandise

LIL' MEN FROM MARS (Atari only) Price: \$19.95 Cassette \$23.95 Diskette
Defend yourself! The little men from Mars are not to get you if you don't get them first. This is a hilarious high resolution cartooned graphics (on video) game which starts you with 6 of the Atari's power. Requires one joystick.

ALVIN (Atari only) Price: \$17.95 Cassette \$21.95 Diskette
ALVIN is a great role game. You are commanding a highly maneuverable ship working in the neutral enemy area. You are attempting to reach three cities in the same time trying to avoid their defenses (the MISSILE COMMAND) in reverse. Also, your radar has been damaged so that you can only see dimensions. This would normally be a great game that you also have to control with high-thermo precision. As long as you are above three air trails you have the advantage and are safe. However, high level bombing takes considerable skill. Therefore to achieve your goal the best strategy is to zoom down past a bombing run while the enemy's rail of range and quickly retreat to the skies. A hot game. Requires 16K.

FSCAF FROM VOLANTUM (Atari only) Price: \$15.95 Cassette \$19.95 Diskette
Bring the action and excitement of an arcade into your home with FSCAF FROM VOLANTUM! In this exciting new adventure you are a ship around obstacles and shoot them. However, the door does not stay open indefinitely. If you fail to escape in time the door closes and a new guardian appears. Sometimes you can smash through the door by repeatedly chopping away at it. (Other times it requires you.) As the higher levels of play more obstacles and guardians appear, adding to the excitement. Uses high resolution graphics and sound. Runs in 16K.

ALPHA FIGHTER (Atari only) Price: \$13.95 Cassette \$17.95 Diskette
Two excellent graphics and action programs in one! ALPHA FIGHTER requires you to destroy the alien starships passing through your sector of the galaxy. ALPHA BATTLE is in the path of an alien fleet. You have to hit it to get by and the game ends. Both games require the joystick and get progressively more difficult with the higher you score! ALPHA FIGHTER will run on 16K systems.

THE RINGS OF THE EMPIRE (Atari only) Price: \$14.95 Cassette \$18.95 Diskette
The empire has developed a new battle station protected by rotating rings of energy. Each time you blast through the rings and destroy the station, the empire develops a new station with more protective rings. This exciting game runs on 16K systems. Requires extensive graphics and sound and can be played by one or two players.

INTRUDER ALERT (Atari only) Price: \$15.95 Cassette \$19.95 Diskette
This is a fast paced graphics game which places you in the middle of the "Intruder" having just stolen its plans. The intruder has been detected and you must find and destroy it at all costs. You must find and destroy the intruder before the plan is lost. The levels of difficulty are provided. INTRUDER ALERT requires a joystick and will run on 16K systems.

MIDWAY (Atari 128 only) Price: \$14.95 Cassette \$18.95 Diskette
MIDWAY is an exciting extension of the game of Battleship. It mixes the challenges of strategy and tactics. Your opponent is another human or the computer. Color graphics and sound are both included. Runs in 16K.

GOLF PRO (Atari only) Price: \$17.95 Cassette \$21.95 Diskette
Both realism and beautiful graphics are joined together in GOLF PRO to produce the best golf simulation available. It really does give you the feel of the game. You can see the green of the fairway, the blue of the water hazards, and the white sand of the traps. You will roll with a wind, use your wedge on the sand trap, and putt on the green just as would be done on the course. Show off the Atari in your triumph with GOLF PRO. Requires 16K and one joystick.

GAMES PACK I (Available for all computers) Price: \$14.95 Cassette \$18.95 Diskette
GAMES PACK I contains the classic computer games of BATTLESHIP, LINEAR BATTLE, HANGMAN, HORSE RACING, and more. These games have been combined into one large program for ease of play. They are individually accessible by a consistent menu. This collection is worth the price just for the DYNACOMP version of BATTLESHIP K.

GAMES PACK II (Available for all computers) Price: \$14.95 Cassette \$18.95 Diskette
GAMES PACK II includes the games CRAZY FIGHTS, JOTTO, ACEY-DEUCEY, LUD, WUMPUSS and others. As with GAMES PACK I, all the games are loaded as one program and are called from a menu. You will particularly enjoy DYNACOMP's version of CRAZY FIGHTS. Only pay \$5.00 more per program when you can buy a DYNACOMP collection for just \$14.95.

MOON PROBE (Available for all computers) Price: \$12.95 Cassette \$16.95 Diskette
This is an extremely challenging "shoot 'em up" program. The user must drop from orbit to land at a predetermined target on the moon's surface. You control the thrust and orientation of your craft plus above the rate of descent and approach angle. Runs in 16K Atari.

SPACE TRAP (Atari only, 16K) Price: \$14.95 Cassette \$18.95 Diskette
This galactic "shoot 'em up" role game places you near a black hole. You control your space craft to escape the black hole and attempt to land on many of the alien ships as possible before the black hole closes about you.

SUPER SUB CHASE (Atari only) Price: \$19.95 Cassette \$23.95 Diskette
SUPER SUB CHASE simulates and destroys missions. Set your course and follow an eye on the ocean as you hunt for the hidden submarine. Not the depth charge explosion depth and watch them sink towards the sub. This is an addictive game which takes advantage of the Atari's graphics and sound capabilities. One or two players. joystick(s) required.

TWO PLAYER GAMES

TWO PLAYER GAMES (Available for all computers; 32K diskette only)
DYNACOMP has secured the distribution rights to the best of the Atari's two player games. These two-player games were originally written for the North Star computer, but have since been converted to play on all of the computers currently supported by DYNACOMP. Because our licensing and development costs were so low, DYNACOMP offers these programs (run in a diskette) for only \$19.95 cassette, \$23.95 disk. If you like our games, then this is a bargain you can't pass up!

Ver #1 PANZER and BLITZKRIEG

PANZER
Date: 23 Nov. 1943 Place: Eastern front, west of Kiev, Russia. The Russians have just liberated Kiev and are moving quickly to reach the German forces which are preparing for a last desperate attempt to halt the Russian advance.
BLITZKRIEG
Date: Spring 1940 Place: Northern France. The German blitzkrieg in the east was complete. Germany had turned its attention to the west. France. The German forces have penetrated the Ardennes and Meuse. The fortress of Dunkirk, the defense of the Allied-Somerset position, and the final collapse of the French armistice in the south has all passed. And, now the drive to Paris.

Ver #2 STARSHIP TROOPERS and INVASION OF THE MUD PEOPLE

STARSHIP TROOPERS
Date: Fourth Century. Place: Aeneid planet of Shon. The first alien battle on the planet Shon which will mark equal forces of Terran and alien units. The outcome will set the course of the conflict, for the planet of Shon is a key position in the solar war.
INVASION OF THE MUD PEOPLE
A Prussian army battalion has been dispatched to a remote village area to investigate the destruction of many local dwellings and the disappearance of most of the villagers. If you succeed, have reported strange creatures appearing from swamps of dunes, mud holes which have odds, being forming as soon as the terrain.

Ver #3 FALL OF THE THIRD REICH and ARMORCAR

FALL OF THE THIRD REICH
Date: March, 1945 Place: Remagen, Germany. The allies under General Eisenhower had recaptured the Rhine. The Germans had failed in destroying the Ludendorff railroad bridge, allowing several allied divisions to cross before it finally collapsed on March 17. And, the allies began their drive on Berlin.
ARMORCAR
Date: 2 Feb. 1944 Place: Minsk, Russia. A German front-line unit is hard pressed for radio equipment and armor. A relief convoy of armored cars must reach them through partisan-infested terrain.

Ver #4 MIDLT SURIBACHI and MIDDLE EARTH

MIDLT SURIBACHI
Date: Feb. 1942 Place: Iwo Jima. The Japanese opposed the United States Marine Corps on the narrow island of Iwo Jima. The Japanese were in a desperate situation. The Japanese were in a desperate situation. The Japanese were in a desperate situation.
MIDDLE EARTH
Date: 1942 Place: MIDDLE EARTH. Through a maze of tunnels, caverns, and rocks, passages were discovered leading from an inactive volcano in South America. A team of United Nations' researchers have undertaken a mission in an uncharted territory that is the Middle Earth. After a perilous journey spanning a period of several months, the mission has arrived at the peak of a land of flowers, streams, rivers, and unbroken vegetation. And, there the creators of MIDDLE EARTH appeared unannounced by the most frightening horror stories created by man.

CARD GAMES

BRIDGE MASTER (Available for all computers) Price: \$21.95 Diskette
This is the classic card game which is the favorite of the Master of the Game. This is the most comprehensive bridge program designed to provide hours of challenging competition. Bidding features include the Blackwood convention, Stayman convention, pre-emptive openings, and recognition of demand bids and jump-shift responses. After play has begun, the program will keep the same hand, with the option of switching cards with your computer opponent. This feature allows you to compare your bidding and playing skills in BRIDGE MASTER. Bonus for game contracts and slams are awarded in duplicate bridge. Doubled contracts are scored based on a computer assigned vulnerability. A score card is displayed at the conclusion of each hand. The score card displays a summary of total hands played, total points scored, number of contracts made and set, and % bids made. BRIDGE MASTER is in itself, the best computer bridge program available.

BACCARAT (Atari only) Price: \$18.95 Cassette \$22.95 Diskette
This is the classic card game which is the favorite of the Master of the Game. This is the most comprehensive bridge program designed to provide hours of challenging competition. Bidding features include the Blackwood convention, Stayman convention, pre-emptive openings, and recognition of demand bids and jump-shift responses. After play has begun, the program will keep the same hand, with the option of switching cards with your computer opponent. This feature allows you to compare your bidding and playing skills in BRIDGE MASTER. Bonus for game contracts and slams are awarded in duplicate bridge. Doubled contracts are scored based on a computer assigned vulnerability. A score card is displayed at the conclusion of each hand. The score card displays a summary of total hands played, total points scored, number of contracts made and set, and % bids made. BRIDGE MASTER is in itself, the best computer bridge program available.

GIN RUMMY (Apple diskette only) Price: \$22.95 Diskette
This is the best rummy computer implementation of GIN RUMMY existing. The computer plays exceptionally well and the IHRES graphics are superb. What else can be said?

POKER PARTY (Available for all computers) Price: \$19.95 Cassette \$23.95 Diskette
POKER PARTY is a draw poker simulation based on the book, POKER, by Oswald Jacoby. This is the most comprehensive version available for microcomputers. The party consists of yourself and six other computer players. For all these players, you will get to know them, have different personalities, in the form of a voice, or propensity to bluff or fold under pressure. Practice with POKER PARTY before going to that expensive game tonight! Apple II cassette and diskette versions require a 32K or larger Atari II.

GO FISH (Available for all computers) Price: \$14.95 Cassette \$18.95 Diskette
GO FISH is a classic children's game. The opponent is a friendly computer which is smart enough to play with you. It is small enough to easily master. The Apple and Atari versions employ high resolution graphics for the display of hands. A must for children! Runs in 16K.

BLACKJACK COACH (32K TRS-80 only) Price: \$29.95 Cassette \$33.95 Diskette
BLACKJACK COACH teaches and evaluates professional playing methods. This program will coach you using the Basic and the Computer Counting Methods. The BLACKJACK COACH can be used in automatic, in strategy play, or in the playing and betting strategies you select. Extensive summary reports present the strengths and weaknesses of various methods of play. All the standard player options are included: Insurance, splitting pairs, double down and surrender (optional). A line printer may be used to collect data. If you risk money at the table, increase your skills with the BLACKJACK COACH.

THOUGHT PROVOKERS

MANAGEMENT SIMULATOR (Available for all computers) Price: \$25.95 Cassette \$29.95 Diskette
This program is both an excellent teaching tool as well as a stimulating intellectual game. Based upon similar games played at graduate business schools, each player or team creates a company, which manufactures three products. Each player attempts to increase sales, reduce production expenses, production volumes, marketing and design expenditures etc. The most successful firm is the one with the highest stock price when the simulation ends.

FLIGHT SIMULATOR (Available for all computers) Price: \$19.95 Cassette \$23.95 Diskette
A realistic and extensive mathematical simulation of take-off, flight and landing. The program utilizes aerodynamic equations and the characteristics of real aircraft. You can practice instrument approaches and navigation using radials and compass bearings. The more advanced files can also perform loops, half-loops and similar aerobically maneuvers. Although this program does not employ graphics, it is exciting and very addictive. See the software review in COMPTONIC. Runs in 16K Atari.

VALDEZ (Available for all computers) Price: \$17.95 Cassette \$21.95 Diskette
VALDEZ is a computer simulation of seaplaner navigation in the Prince William Sound/Vulder Narrows region of Alaska. Included in this simulation is a realistic and extensive 256 x 256 element map, portions of which may be viewed using the ship's alphanumeric radar display. The motion of the ship itself is accurately modeled mathematically. The simulation also contains a model for the tidal patterns in the region, as well as other traffic (incoming tankers and drifting icebergs). Chart your course from the Gulf of Alaska to Vulder Harbor! See the software review in 80 Software Critique, Personal Computing and Creative Computing.

BACKGAMMON 2.0 (Available for all computers) Price: \$19.95 Cassette \$23.95 Diskette
This program tests your backgammon skills, and will also improve your game. A human can compete against a computer or against another human. The computer can even play against itself. Either the human or the computer can double or generate dice rolls. Board positions can be created or saved by replay. BACKGAMMON 2.0 plays in accordance with the official rules of backgammon and is never to provide many fascinating sessions of backgammon play.

FROG MASTER (Atari only) Price: \$17.95 Cassette \$21.95 Diskette
The Atari FLY has never a more FROG MASTER contains exciting arcade features in addition to being a high educational program. It is a fast-moving high-concentration game for 1-4 players. You score by making touch-downs on the opponents' goal line - if the goal is down get there first. But your players (tadpoles and frogs) must be trained. This is accomplished by going to the rear and using the right momentum to get the right momentum. The obstacles are your own tadpoles. Your criteria must prevent barriers and avoid line backs then, after you think. Many will fall by the wayside, but some will get through. As they learn, you can learn their heads to see how they think. As you learn them, they reward you. The "thought provokers" simulated demonstrate the hard type of animal learning - operant conditioning - with stimuli in high school and college courses. As you teach them, they teach you. Learning takes place! Great graphics! Runs in 16K. Requires no joystick.

FOREST FIRE (Atari only) Price: \$14.95 Cassette \$18.95 Diskette
Using excellent graphics and sound effects, this simulation puts you in the middle of a forest fire. Your job is to direct operations to put out the fire while compensating for changes in wind, weather and terrain. Not protecting valuable structures can result in startling penalties. Life-like variables are provided to make FOREST FIRE very suspenseful and challenging. No two games have the same settings and there are 2 levels of difficulty.

CRANSTON MANOR ADVENTURE (North Star, SuperBrain and CP/M only) Price: \$19.95 Diskette
At last! A complete role playing game for North Star and CP/M systems. CRANSTON MANOR ADVENTURE takes you into mysterious CRANSTON MANOR where you attempt to gather fabulous treasures. Lurking in the manor are wild animals and robots which will not give up the treasures without a fight. The number of rooms is greater and the associated descriptions are much more elaborate than the current popular uses of Adventure programs, making this game the top on its class. Play can be stopped at any time and the status stored on diskette.

SPACE EVACUATION! (Available for all computers) Price: \$15.95 Cassette \$19.95 Diskette
Can you colonize the galaxy and evacuate the Earth before the sun explodes? Your computer becomes the ship's computer as you explore the universe to relocate millions of people. This simulation is particularly interesting as it combines many of the exciting elements of classic space games with the mystery challenge of ADVENTURE.

MONARCH (Atari only) Price: \$14.95 Cassette \$18.95 Diskette
MONARCH is a fascinating economic simulation requiring you to survive as the ruler of your nation's leader. You determine the amount of acreage devoted to industrial and agricultural use, how much food to distribute to the population and how much should be spent on pollution control. You will find that all decisions involve a compromise and that it is not easy to make everyone happy. Runs in 16K Atari.

RUBIK'S CUBE SOLVER (Available for all computers) Price: \$14.95 Cassette \$18.95 Diskette \$21.45 Disk
Solving the Rubik's cube puzzle is an exercise in algorithmic logic and is a "natural" for computer calculation. The RUBIK'S CUBE SOLVER allows you to input the starting state of the 24 facing elements of the cube. It then solves the problem one step at a time with each step chosen as a well-defined rule of the cube. Can you solve the cube in fewer steps. In any case it sure beats disassembling the cube or prying off and replacing the colors! Requires 16K.

AVAILABILITY

DYNACOMP software is supplied with complete documentation containing clear explanations and examples. Unless otherwise specified, all programs are available on 5 1/4 inch floppy disks. Atari II requires 24K. Except where noted, programs are available on ATARI, PET, TRS-80 (Level II), NEC and Apple (Apple II) cassette and diskette as well as North Star single density, double density, compatible diskette. Additionally, some programs can be obtained on standard IBM 5 1/4 inch single density, double density, compatible format. CP/M floppy disks for systems running under MBASIC or CBASIC (for example, Altos, Texas Instruments Zenith and many others). 5 1/4 inch CP/M diskettes are available for the North Star SuperBrain and Osborne computer systems.

*ATARI, PET, IBM, NORTH STAR, CP/M, IBM, OSBORNE, SUPERBRAIN, NEC PC-8000 and XEROX are registered trademarks and/or trade marks.
**Except where noted, all TRS-80 Model I/II programs are available on cassette tapes for the TRS-80 Model III. Exceptions: VALDEZ, CRIBBAGE, GRAFIX, CHESSMASTER. TRS-80 diskettes are not supplied with either DOS or BASIC.
***For more North Star disk-based systems.
****For Altos systems, see IBM BASIC.
*****For SUPERBRAIN systems running under MBASIC or CBASIC (see above).

MISCELLANEOUS

CRYSTALS (Atari only) Price: \$14.95 Cassette \$18.95 Diskette
CRYSTALS is a random, pseudo-random graphics display accompanied with simple algebraic formulas. The patterns are built. In ten patterns are the same, and the combined effect of the sound and color features of the Atari. Runs in 16K.

NORTH STAR SOFTWARE EXCHANGE (NSSE) LIBRARY
DYNACOMP now distributes the 23 volume NSSE Library. These diskettes each contain many programs and offer an outstanding value for the purchase price. They should be part of every North Star user's collection. Call us now DYNACOMP for details regarding the contents of the NSSE collection. Price: \$9.95 each/\$8.95 each (4 or more). The complete collection may be purchased for \$159.95.

5 1/4" DISKETTES (soft sector/ten sector) Price: \$39.95 20 Diskettes
As you might imagine, DYNACOMP purchases diskettes in large quantities and at wholesale prices. We want to pass the savings along to you!

BUSINESS AND UTILITIES

PORTFOLIO MANAGEMENT (Apple only) Price: \$49.95 two 5 1/4 Diskettes
The PORTFOLIO MANAGEMENT package was written by a stock broker to help manage portfolios for individual customers. With this program data files can be easily created and kept up to date. A variety of reports can be generated for clients which are printed and professionally laid out. The user may define his/her most investment categories.
PORTFOLIO MANAGEMENT is a top quality, professional tool which will not only provide you with new conveniences, but will also serve to reduce your appearance as an effective and up to date advisor in your client's. Comes complete on two diskettes, along with a 200 page instruction manual.

PERSONAL FINANCE SYSTEM (Available for all computers) Price: \$39.95 Diskette
It's a simple but effective, menu-oriented system composed of ten different programs. Besides recording your expenses and tax deductible items, PFS will sort and summarize expenses by payer, and display information on expenditures by any of 26 sub-deferred checks by month or by payer. PFS will even prepare monthly bar graphs of your expenses by category. This powerful package also includes a disk drive, automatic monthly (12x) (ATARI) 32K (IBM) 64K and will store up to 400 records per disk and over 1000 records per disk by making a few simple changes to the program. You can record their plus cash expenses so that you can finally see where your money goes and eliminate guesswork and tedious hand calculations. Contains high speed machine language source. PFS has been demonstrated on network (CBS) TV.

FAMILY BUDGET (Apple and Atari only) Price: \$34.95 Diskette
FAMILY BUDGET is a menu-oriented record-keeping program. You will be able to keep track of cash and credit expenditures as well as income on a daily basis. You can record tax deductible items and charitable donations. **FAMILY BUDGET** also provides a continuous record of all credit transactions. You can make debit, cash and charge entries in any of 21 different expense or income accounts as well as 5 payroll and tax accounts. Data are easily reviewed giving you complete control over an otherwise complicated (and unorganized!) subject.

TEXT MASTER II (Apple 32K, diskette only) Price: \$49.95 Diskette
TEXT MASTER II is a general purpose text editor for the Apple II computer. It features powerful English-oriented commands which permit the complete manipulation of textual information. The information treated may be correspondence, computer programs, data to be used by other programs, and more. **TEXT MASTER II** also interfaces with any other Apple II. The minimum system requirements are 32K of RAM, AppleSoft or ROM, at least one disk, and a lower case adapter. **TEXT MASTER** can process any length file segment. Thus it is possible to process files as large as a diskette. Comes complete with an efficient 10 page manual. **TEXT MASTER II** is now also in a single volume, 1000 lines long. The system's editing 3 is a user upgrade. The system's editing 3 in **TEXT MASTER** are: COLLECT, USE, EXECUTE, NONUM, INSERT, MERGE, STOP, RETURN, DELETE, SAVE, COPY, FILL, REPLACE, WAIT, MOVE, LENGTH, LIST, RESAVE, CLEAR, AUTO, RETRY, APPEND, SET, MANUAL, CHANGE, SCRATCH, SHOW, CATALOG, MODIFY, COMPARE, NUM, DISPLAY, HELP.

INTELINK I (Atari only) Price: \$49.95 Diskette
The Intelink package contains a menu-driven collection of programs for facilitating data transfer between systems such as through a full duplex modem (requested for use). In one mode of operation you may connect to a data service (e.g., THE SOURCE or MicroNet) and quickly load data such as stock quotes into your diskette for later viewing. This greatly reduces "connect time" and thus the service charge. You may also record the complete contents of a communications session. Additionally, programs written in BASIC, FORTRAN, etc., may be built offline using the support text editor and later "uploaded" into another computer, making the Atari a very smart terminal. Even ATARI-BANK programs may be upgraded. Further, a command file may be built offline and used later as a controlling input for a time-sharing system. This is one of the many features of time-sharing commands and programs, and the Atari will transmit them as needed, both in processing. All this adds up to saving both connect time and your time.

PAYFIVE (Apple II plus diskette, two disks required) Price: \$149.95
This is an exceptionally flexible employee payroll system with extraordinarily good human engineering features. PAYFIVE prints checks and completes the required federal, state and local forms for up to 148 employees. The pay methods may be hourly, salary, commission or any combination. There are multiple options for pay periods, and they also can be used in any combination. PAYFIVE includes many other features and comes extremely well documented with a 200 page manual. The manual may be purchased separately for \$30 and that payment later applied to the software purchase.

SHOPPING LIST (Atari only) Price: \$12.95 Cassette \$16.95 Diskette
SHOPPING LIST stores information on items you purchase at the supermarket. Before going shopping, it will remind you of all the things you might need, and then display (or optionally print) your shopping list and the total cost. Adding, deleting, changing and storing data is very easy. Runs with 16K.

TAX OPTIMIZER (Available for all computers) Price: \$59.95 Diskette
The TAX OPTIMIZER is an easy-to-use, menu-oriented software package which provides a convenient means for analyzing various income tax strategies. The program is designed to provide a quick and easy data entry. Income tax is computed by all major tax systems, maximum and alternate minimum tax. The TAX OPTIMIZER also computes and immediately displays the effect of critical financial decisions. TAX OPTIMIZER has been thoroughly field tested in CPA offices and is now complete with the current tax tables in its data files. TAX OPTIMIZER is tax deductible!

STOCK MASTER STOCK PLOT (Apple 48K) Price: \$59.95 Diskette
This is a full-featured stock portfolio management and analysis system. Ten years of records on up to thirty stocks may be maintained. You may record prices, revenue earnings, share, B/M, quarterly earnings and dividends, transfer times, long short term gains, P. L. indicators, D/E, P. NASDAQ and MORE! You may plot (HERE) the price history of any stock against any other, time, or the index. Portfolio value may be calculated at any time. Comes complete with superbly written instructions and sample files on a second diskette.

TURKEY AND MENU (Atari only) Price: \$17.95 Diskette
TURKEY is a utility program which allows you to create automatic diskettes rapidly. Simply load and run **TURKEY**, load the program diskette, and answer the questions. The **TURKEY** diskette also comes with DOS 2.0 and includes another program, **MENU**. **MENU** lists the contents of your diskette alphabetically, and permits the running of any BASIC program on the diskette by typing a single key. **TURKEY** and **MENU** provide you with the ability to run any program on your diskette by simply typing on the computer and pressing a single key.

STOCKAID (Atari only) Price: \$29.95 Diskette
STOCKAID provides a powerful set of tools for stock market analysis. With **STOCKAID** you can display point and share charts, as well as bar charts with volatilities. You can also examine long term moving averages and on-balance volume ratios. **STOCKAID** allows you to input daily data with a single diskette storage capability of 259 days x 16 stocks. Includes all stock dividend and split adjustment capabilities. A very professional package!

NYINDEX (Atari only) Price: \$29.95 Diskette
NYINDEX is a comprehensive software package for storing, reviewing and plotting New York Stock Exchange information. The daily data is stored into the computer's memory and alternate diskettes. You may view and print graphical displays include the above plus the index oscillator, cumulative advances, declines and moving averages. Data entry and editing is easy. The diskette includes more than two years of advance data. **NYINDEX** is an excellent companion to **STOCKAID**.

PLAYER-MISSILE GRAPHICS TABLET (Atari only) Price: \$19.95 Diskette
The PLAYER-MISSILE GRAPHICS TABLET is a menu-driven program to take the drudgery out of developing fast color displays in GRAPHICS MODE 7. No longer will you have to locate the colors of your graphics card and calculate PLISTs and DRAWITs. With **PMG** you will be able to easily design a colorful graphic display with your joystick and save them on diskette for later recall.

LIFE CYCLE ANALYSIS AND DEPRECIATION (Apple diskette only) Price: \$39.95 Diskette
This software package contains a menu-driven program for generating reports for use in calculating and displaying a variety of reports. You may prepare annual costs, find the present worth, create depreciation schedules and finally tax deduction. The evaluation techniques conform to standards set by federal agencies. This is an invaluable package for any businessman who has invested in equipment. LIFE CYCLE ANALYSIS features on-line data file creation, set-up and program formatted hard-copy reports for use in presentations or for the professional keeping purposes. When used for generating tax information, this package is tax deductible! Requires 48K. Comes on two diskettes.

MICROMAGIC (Apple diskette only) Price: \$39.95 Diskette
The emphasis of this program is clearly the MAGIC! MICROMAGIC offers outstanding versatility in its ability to function as a stand alone report-generation package or as a utility program to create stunning graphical graphics for use in other programs. The secret lies in MICROMAGIC's special graphics editor. You control a graphics cursor directly from the keyboard, creating high resolution images using all 16 available colors. When you are done with a picture, it can be saved on disk with a single key command. Up to 24 pictures can be saved as "frames" of a movie, and then played back again to reveal almost amazing sequences. The effects are truly stunning. This package comes complete with an excellent program on a menu-driven program, on that get immediate results. No programming skills are necessary to use MICROMAGIC. If you have been frustrated by the effort required to create graphics images with your computer, MICROMAGIC will delight you.

SHAPE MAGICIAN (Apple II, 48K, diskette only) Price: \$29.95
At last! An utility for painlessly creating graphics shapes for the Apple. Create, edit and save up to 30 shapes which can then be used to develop arcade games or to simply enhance your programs. Add that professional touch!

EDUCATION

HEDGE PODGI (Apple 48K only) Price: \$14.95 Cassette \$18.95 Diskette
Let HEDGE PODGI be your child's teacher. Presenting any key on your Apple will result in a different and intriguing "bopping" related to the letter in number of the thank-you. The program is graphic, color and sound playback. A child in his/her home can learn to read and sound playback. A child in his/her home can learn to read and sound playback. A child in his/her home can learn to read and sound playback.

TEACHER'S AIDE (Atari and PET only) Price: \$13.95 Cassette \$17.95 Diskette
TEACHER'S AIDE consists of three basic modules contained in one program. The first module provides addition and subtraction exercises of varying levels of difficulty. The second module consists of multiplication problems which the student may create with the load operator and on the subject answers in the long hand procedure. Several levels of complexity are provided here as well. The third module consists of division problems, one particularly nice feature of the division module is that the long hand division steps can be displayed along with the remainder in order to check, demonstrate the procedure by which the remainder is derived. Using **TEACHER'S AIDE**, you may create a drill, but rather a learning experience.

DIGITAL FILTER (Available for all computers) Price: \$39.95 Cassette \$43.95 Diskette
DIGITAL FILTER is a comprehensive data processing program which permits the user to design his own filter function or choose from a menu of filter forms. In the output design menu the shape of the frequency transfer function is specified by directly entering points along the desired filter curve. In the menu mode, ideal low pass, high pass and bandpass filters may be approximated to varying degrees according to the number of points used in the calculation. These filters may be optimized, also be smoothed with a Hamming function. In addition, multiple Butterworth filters may be selected. Features of **DIGITAL FILTER** include plotting of the data before and after filtering, as well as display of the chosen filter functions. Also included are convenient data storage, retrieval and editing procedures.

DATA SMOOTHER (Not available for Atari) Price: \$19.95 Cassette \$23.95 Diskette
This special data smoothing program may be used to rapidly derive useful information from noisy, bimodal and engineering data which may require special curve and smoothing features choice in degree and range of fit as well as smoothed trend data and derivative calculation. Also included is automatic plotting of the input data and smoothed results.

FOURIER ANALYZER (Available for all computers) Price: \$19.95 Cassette \$23.95 Diskette
Use this program to examine the frequency spectra of limited duration signals. The program features automatic scaling and plotting of the input data and results. Practical applications include the analysis of complicated patterns in such fields as electronics, communications and business.

TFA (Transfer Function Analyzer) Price: \$19.95 Cassette \$23.95 Diskette
This is a special software package which may be used to evaluate the transfer function of systems such as feedback amplifiers and filters by examining their response to pulsed inputs. TFA is a major modification of **FOURIER ANALYZER** and contains an engineering-oriented digital wave-form frequency plot as well as data editing features. Whereas **FOURIER ANALYZER** is designed for educational and scientific use, TFA is an engineering tool. Available for all computers.

HARMONIC ANALYZER (Available for all computers) Price: \$24.95 Cassette \$28.95 Diskette
HARMONIC ANALYZER is designed for the spectrum analysis of repetitive waveforms. Features include data file generation, editing and storage, retrieval as well as data and spectrum plotting. One particularly unique facility is that the input data need not be equally spaced or in order. The original data is sorted and a cubic spline interpolation is used to create the data file required by the FFT algorithm. This feature is particularly useful in cases where the input data is not equally spaced or in order. The original data is sorted and a cubic spline interpolation is used to create the data file required by the FFT algorithm.

REGRESSION I (Available for all computers) Price: \$19.95 Cassette \$23.95 Diskette
REGRESSION I is a unique and exceptionally versatile one-dimensional least squares "polynomial" curve fitting program. Features include very high accuracy, automatic degree determination, automatic error analysis, automatic library of fitting functions, data curve and residual plotting, a statistical analysis of the fit, as well as smoothed trend data and derivative calculation. Also included is automatic plotting of the input data and smoothed results.

REGRESSION II (Available for all computers) Price: \$19.95 Cassette \$23.95 Diskette
REGRESSION II is designed to handle those cases in which the parameters are multidimensional (possibly non-linear) in the fitting function. The user simply inserts the functional form, including the parameters (A1), A2, etc. (no need for BASIC statements here). The desired result may be manipulated and plotted with **REGRESSION I**. Use **REGRESSION I** for polynomial fitting, and **REGRESSION II** for those more complicated functions.

MULTILINEAR REGRESSION (MLR) (Available for all computers) Price: \$24.95 Cassette \$28.95 Diskette
MLR is a professional software package for analyzing data sets containing two or more linearly independent variables. Besides performing the basic regression calculation, this program also provides ready in-use data entry storage facilities and relative error analysis. The program also includes a means for storing the solution by itself for the independent variables. The number of variables and data size is limited only by the available memory.

ANOVA (Not available on Atari cassette or for PET/IBM) Price: \$39.95 Cassette \$43.95 Diskette
In the past the ANOVA (analysis of variance) procedure has been limited to the large mainframe computers. Now **DYNACOMP** has developed a powerful program for use on personal computers. For those concerned with ANOVA, the **DYNACOMP** software package includes the 1-way, 2-way, and N-way procedures. Also provided are the Yates 2^k-P factorial designs. For those unfamiliar with ANOVA, do not worry. The accompanying documentation was written in a tutorial fashion by a professor in the subject and serves as an excellent introduction to the subject. Accompanying ANOVA is a support program for building the data base. Included are several convenient features including data editing, deleting and appending.

BASIC SCIENTIFIC SUBROUTINES, Volumes 1 & 2 (Not available for Atari)
DYNACOMP has the exclusive distribution for the software used to produce the BASIC SCIENTIFIC SUBROUTINES, Volumes 1 and 2 by Rudolph C. H. Heisterkamp, an advertisement in BUYT magazine. These subroutines have been assembled and documented in chapters included with each collection in a menu program which selects and demonstrates each subroutine.

Volume 1
Collection #1 Chapters 2 and 3 - Data and function plotting, complex variables and functions.
Collection #2 Chapter 4 - Estimated statistics and vector operations.
Collection #3 Chapters 5 and 6 - Random number generators (Poisson, Gaussian and 1) series approximations.
Price per collection \$16.95. Cassette \$20.95 Diskette.
All three collections are available for \$44.95 (three cassette) and \$53.95 (three diskette).

Volume 2
Collection #1 Chapter 7 - Linear polynomial multidimensional parametric least squares.
Collection #2 Chapter 7 - Series approximation techniques (interpolation, inversion, eigenvalue shifting, etc.).
Collection #3 Chapter 8 - Functional approximations by iterative and recursive.
Collection #4 Chapter 8 - LOGNED approximations in trigonometric, hyperbolic, exponential and logarithmic functions.
Collection #5 Chapter 9 - Table integration, differentiation and integration (Newton, Lagrange, splines).
Collection #6 Chapter 9 - Methods for finding the real roots of functions.
Collection #7 Chapter 9 - Methods for finding the complex roots of functions.
Collection #8 Chapter 9 - Optimization by steepest descent.
Price per collection \$18.95. Cassette \$23.95 Diskette.
All eight collections are available for \$99.95 (eight cassette) and \$129.95 (eight diskette).
Because the text is a part of the documentation, BASIC SCIENTIFIC SUBROUTINES, Volumes 1 and 2 are available from DYNACOMP for \$139.95 (cassette) and \$179.95 (diskette).

BASIC SCIENTIFIC SUBROUTINES, Vol. 1 (319 pages) \$19.95 + 75¢ postage
BASIC SCIENTIFIC SUBROUTINES, Vol. 2 (700 pages) \$23.95 + \$1.50 postage
See reviews in BUYT, DYNACOMP, DYNACOMP and ALL'S.

SOFTNET (Apple II and TRS-80 48K diskette only) Price: \$129.95
SOFTNET may be used to create models of liquid pipe line systems to analyze their flow performance. Up to 150 nodes and 100 links can be used to create a model of a pipe line system. The model may be used to analyze the flow performance of a pipe line system under a wide variety of conditions. The model may be used to analyze the flow performance of a pipe line system under a wide variety of conditions. The model may be used to analyze the flow performance of a pipe line system under a wide variety of conditions.

FILTER ANALYSIS (Apple only) Price: \$19.95 Cassette \$23.95 Diskette
FILTER ANALYSIS is the ideal program for determining the frequency response of passive filters. Any number of RLC components may be included, any number of poles retained. **FILTER ANALYSIS** features its own menu language which makes circuit description simple. Results may be printed in tabular format or plotted in **FILTERS** (decibel, versus log-frequency).

ACTIVE CIRCUIT ANALYSIS (Available for all computers) Price: \$35.95 Cassette \$39.95 Diskette
With **ACAP** you may analyze the response of an active or passive component circuit. The circuit may be defined on equal steps in frequency, and the resulting complex voltages at each component node may be examined. The frequency response of a filter or amplifier may be compared with results from complex and phase plots. The program may be used for a complete analysis of the range of voltage responses in each result from tolerance variations in the components. **ACAP** runs in learn and user. Circuit descriptions may be saved onto cassette or diskette to be recalled at a later time for examination or editing. **ACAP** should be part of every circuit designer's program library. Requires 48K.

LOGIC SIMULATOR (Available for all computers) Price: \$35.95 Cassette \$39.95 Diskette
Ten different digital logic inputs to determine the output of a logic circuit. The circuit may be defined on equal steps in frequency, and the resulting complex voltages at each component node may be examined. The frequency response of a filter or amplifier may be compared with results from complex and phase plots. The program may be used for a complete analysis of the range of voltage responses in each result from tolerance variations in the components. **ACAP** runs in learn and user. Circuit descriptions may be saved onto cassette or diskette to be recalled at a later time for examination or editing. **ACAP** should be part of every circuit designer's program library. Requires 48K.

BEAM DEFLECTION (Available for all computers) (disk, diskette only) Price: \$29.95 Diskette \$33.45 Disk
BEAM DEFLECTION is the first in **DYNACOMP**'s new series of structural analysis software packages. It consists of two programs. The first program permits the development of data files which describe the problem. For example the end of the beam may be fixed or clamped free. The beam may be uniformly supported by an elastic bed, or held up by springs, a uniformly placed and having differing spring constants. The elastic bed or the end of the beam may be along its length. The load may be uniformly distributed or it may be discrete. The beam may be pinned at various points along its length. And so on. All this information may be easily entered and defined using the data input program. Following this the analysis program is called. The calculated results are the stress and deflection of the beam, both in numerical and graphical form, since the input data is saved, errors may be readily removed with modification, thereby permitting iterative design. The documentation which comes with **BEAM DEFLECTION** clearly shows how to use the software. In addition, thorough test programs are also included and demonstrated to insure that you understand how to use the program. All helpful theoretical information is supplied in the appendix.

STATIST II (Not available on Atari cassette or for PET/IBM) Price: \$19.95 Cassette \$23.95 Diskette
This is a statistical inference package which helps you make your decisions in the face of uncertainty. In an interactive fashion you can build and edit data files and test the differences in means, variances and proportions. **STATIST II** will also perform data file analysis as well as data file correlation and regression. This menu-driven statistical package is rounded out with a chi-square contingency test and a uniform and normal random sample generator. The documentation is written by a college professor who guides you through the various tests.

ORDERING INFORMATION

All orders are processed and shipped within 48 hours. Please enclose payment with order and include the appropriate computer information. If paying by VISA or MasterCard, include all numbers on card. Purchases orders accepted. Shipping and Handling Charges: Domestic (including books) one unit First Class. Outside North America: Add 15% (Air Mail).

Quantity Discounts: Order 10% when ordering 3 or more programs. 20% when ordering 5 or more. Dealer discount on orders available upon request.

8" CP M Disks Add \$3.50 to the base diskette price for each 8" floppy disk (IBM soft sector CP M format). Programs run under Microsoft BASIC or BASIC-90.

5 1/4" CP M Disks All software available on 8" CP M disks is also available on 5 1/4" disks. North Star, Osborne, Superbrain and NEC format.

Ask for DYNACOMP programs at your local software dealer. Write for detailed descriptions of these and other programs from DYNACOMP.

ABOUT DYNACOMP

DYNACOMP is a leading distributor of small system software with sales spanning the world. Currently in excess of 50 countries. During the last three years we have greatly enlarged the DYNACOMP product line. We have maintained and improved our high level of quality and customer support. The achievement in quality is apparent from our test results and customers and the various reviews in such publications as **COMPUTERWORLD**, **80 SOFTWARE REVIEW**, **ANALOG**, **TELEVISION**, **COMPUTER** and **BUYT**. **DYNACOMP** software has also been chosen for demonstration on network television. Our customer support is as fast as our phone. It is always friendly. The staff is highly trained and always willing to discuss products to give advice.

Atari Notes For Tag

Charles Brannon
Editorial Assistant

Plug a joystick into jacks one and two, and get ready for some furious chasing and desperate dodging. After the game initializes, each player can type in his initials (three letters). You then select the final score (what you play to) from 1-10. Press **OPTION** to increase the final score, and **SELECT** when the desired number appears. The game will begin with player one in the upper left-hand corner, and player two in the opposite corner. Player one will be flashing, which indicates that he is *It*.

Whoever is *It* has to chase down and catch the other player in order to claim a point. If *It* fails to score within 15 seconds, the players "switch roles," and player two is *It* and has his chance to catch player one. The "switcheroo" is signaled by a loud bell, so when you hear it, change direction fast!

Play consists of *It* trying to catch the "victim" as fast as possible, while the "victim" tries to evade *It* for at least 15 seconds. Both players must maneuver about the screen, turning and twisting among a maze of pink rocks. But if you dally too long, the rocks will wake up, open their eyes, and further confound the conflict. Don't let one of the Living Rocks touch you.

Tag With A Twist

Tag for the Atari uses character graphics in graphics mode one, but with a twist. Usually, if you want a redefined character set along with letters and numbers, you are limited to redefining punctuation and other special symbols and have to wait 10 to 15 seconds for a **POKE** loop that downloads the ROM character set to RAM.

Tag, however, uses a Display List Interrupt (DLI) to "flip" the character set midway down the screen. This lets you use the upper portion of the display for normal text (using the entire character set), and the lower portion for as few or as many custom characters as desired. The DLI used in Tag also changes the screen colors, so you get five colors in each portion, for a total of ten simultaneous colors.

Flipping Out

Another interrupt-driven machine language routine in Tag uses Count-Down Timer #2 to "flip" the character set pointer every 16/60ths of a second. In Tag, there are two character sets. The first character set, for example, displays one view of a running person. The other character set, at an offset of 512 bytes, displays another view.

When the CHBASE pointer is switched between the two views, the character appears to be running. Character set flipping can also be used to represent blinking, flashing, spinning, bouncing, or any other simple motion. And, since the flipping is controlled by machine language, the motion is fast and regular. It also simplifies the BASIC program.

Tag - Atari version

COMPUTE!

The Resource.

Take Command!

Take command of the USS Ranger and let Battle Trek's hi-res graphics, exciting sound-effects, and joystick control turn your Atari into a battle cruiser! As Commander of the Ranger, you must navigate, activate shields, manage power, and monitor enemy ships, destroying them if possible with positrons, mesons, and probes. Your assignment is especially difficult because the enemy commander, who has skills equal to yours, has some clever strategies of his own. Battle Trek, a realistic and difficult game for the thinking spacewar fan.

Atari 400/800, 32k, disk drive & paddle. On sale at your local computer store or send check for \$39.95 to:

Programs not guaranteed against loss, misuse or system difficulties.

Defend your energy pods against the fifteen amok robots.
For Atari and PET/CBM.

Laser Barrage

Sean Igo
Ogden, Utah

Here is a one-player game for 40-column PETs. It is packed with action and fun. [To run it on the 80-column machines, use the program on pg. 130 of **COMPUTE!** #12 — Ed.]

The Idea

In this game, 15 enemy robots are after some fuel pods of yours. You must defend the ten pods. The robots must touch a pod to eat it, but you may zap robots with a laser.

All the robots pick a pod to pursue. They will flatten anything in their way (except each other) to get it. This includes the barriers that are scattered about (which you will bounce off).

When a robot destroys a pod, whether or not it was his objective pod, he will pick a new one to go after.

Figure 1

A sample playfield. Robots are Diamonds, Barriers are Grids, Fuel Pods are Circles, and the Player is the V.

Laser Barrage has eight main routines, and all are noted in the program by a REM statement.

Set Up Playfield – draws playfield, initializes variables, places pods, robots, barriers, and player, defines functions.

Move Player – increments the position of the

player and scans the upcoming space in the event that the player is moving.

Fire Player – shoots the player's laser. The laser spans five spaces and will destroy pods as well as robots. Watch where you shoot! The ray will not destroy barriers.

Move Robots – moves one robot one space toward its target pod. The player and robots alternate moving, so the game goes a lot faster than if the player waited for all the robots to move.

Rotate Player – rotates player clockwise, counterclockwise, or 180°.

You Win You Lose – deliver a message of appropriate nature.

Instructions – instructions preceded by a small graphic laser effect.

Tips For Playing

When the game starts, it is OK to patrol around and blast robots at your leisure. But when the game winds down to the last few robots or pods, it is wise to guard a single pod or a small group of them and attack robots approaching. If you can keep your laser between them and their target pods, you will do better. Even if you save only one pod from destruction, that is better than losing.

When patrolling around, you must remember these guidelines. When in doubt, STOP. Don't run into a robot because that causes instant destruction. Running into pods is alright because that only stops you. Barriers are treacherous, for you will bounce off them, possibly into a robot.

**THE MOST POWERFUL
PROGRAMMING AID
AVAILABLE FOR ATARI BASIC**

Wish your ATARI BASIC had some of the features of the big computers?
NOW YOU'VE GOT IT!

Introducing
BASIC COMMANDER

BASIC COMMANDER is an all machine language program that is co-resident with both the ATARI BASIC cartridge and your program, occupying only 4K of RAM. Perform all of the following additional functions at machine language speeds!

RENUMBER - All line numbers and references. Extensive error trapping. Renumber a 500 line program in less than 3 seconds.

BLOCK DELETE - Imagine! Delete from 1 to 32,000 lines of code in 1 second, and not have your computer lock up!

AUTONUMBER - Automatically generates line numbers and places the cursor in typing position. Speeds program entry 30 to 50%.

PROGRAMMABLE KEYS - 3 keys you can program so that with a single keystroke you can enter any line you can legally type in ATARI BASIC!! Use up to 108 characters.

BASIC COMMANDS - Single keys allow LOADING, RUNNING, ENTERING, LISTING, and much more!

DOS FUNCTIONS - Single key access to DOS functions, directly from your BASIC program. There is no reason to go to DOS!

VARIABLES - A single key produces a list of all variable names used in your program, and the total number of variables used.

Experience the Magazine of the Future . . .

for the Atari 400/800

The Programmer's Institute's magnetic magazines will entertain, educate, and challenge you.

Each issue features ready-to-load programs ranging from games, adventures, home applications and utilities to personal finance, educational, and our unique teaching programs. Our magazines include fully listable programs, a newsletter containing descriptions and instructions for all programs, and notes on programming techniques used.

"Received my first copy . . . it's great! Please rush to me one of each back issue, so I'll have a complete set."

R.G., Chicago, IL

"Not only are the games fun and the applications useful, but the quality of the programs is excellent."

S.P., Midwest
Computer Software Sales

COMING SOON: VicVideo for the Vic-20 and PCM magazine for the IBM personal computer.
Plus Educational Software for the Atari 400/800.

ORDERING INFORMATION

Subscriptions*	Cassette	Diskette
Year	\$50.00	\$75.00
½ Year	\$30.00	\$45.00
Trial Issue	\$10.00	\$15.00

* Add \$2.00 postage and handling.
ALL SOFTWARE REQUIRES 16K.

Beat the clock! Outsmart your friends!

WORDRACE

The high-speed dictionary game

At last, an educational game that's really fun to play! You start each turn with a word, 6 definitions, and a counter set to 600 points. As time passes the points tick away. The sooner you pick the correct definition, the more points you get, but the sooner you guess wrong, the more points you lose.

3 levels of play on one disk:

- Beginner (ages 9-14) • Regular • Challenge
- 2000 words and definitions
\$24.95

APPLE: 48K — disk — APPLESOFT ATARI: 32K — disk — BASIC

Now available on cassette for the ATARI 400/800
Features: Beginner's and Intermediate WORDRACE

YOU CAN PLAY 3 NEW GAMES

WITH YOUR WORDRACE

DISKETTE:

The next disk in the WORDRACE System. Use it along with your WORDRACE disk to play:

- CLAIM TO FAME (600 famous people in history)
- SPORTS DERBY (600 pieces of sports trivia)
- Plus more vocabulary words

\$19.95

Requires WORDRACE disk

Admit it: you've cursed out your computer.
Every programmer does it eventually. Ever wonder how it would reply?

Try **ABUSE**
The insult program.

- Funny • Unpredictable • Interactive
- Guaranteed to call you something you've never been called before!

\$19.95

ATARI: 40K — disk — BASIC
APPLE: 48K — disk — APPLESOFT

Atari Notes

Charles Brannon
Editorial Assistant

The Atari version of Laser Barrage requires 16K and a joystick. When you RUN the program for the first time, you'll see the message "PLEASE WAIT", and if you turn up your TV volume control, you'll hear a series of random tones as the custom character set for the game is initialized.

Subsequent RUNs will not require the initialization, thanks to line 1080, which checks if the character set is already POKEd in. This technique is very useful if a program will be RUN many times at one sitting. It can be used with machine language programs to PEEK a certain location to see if a particular opcode is present. If not, a READ/POKE loop can be called to put the machine language code into memory.

Go After The Amok Robots With Z-Beams

You start the game with three ships. The screen is filled with "energy pods," blue robots, and brick-like obstacles. Each robot picks a pod to attack, and then moves towards it with deadly deliberation. If a robot contacts a pod, the pod bursts and collapses, and the robot instantly picks another target to destroy.

Your ship, which can be controlled in eight directions with the joystick, can fire a powerful "Z-beam" in whatever direction it is currently facing. Your mission is to clear the screen of robots by destroying each one with your Z-beam. You get one point for each robot you eliminate; and when you

clear the screen, five points for each surviving pod.

You then face a new screen of pods and robots, but each new level challenges you with two additional robots. You know you're really good (but in big trouble) when you have 15 or more robots to deal with. The game can handle up to 64 robots, but it is inconceivable that anyone could withstand the "Laser Barrage" that long. (But if you're superhuman and manage to, you can change lines 1640 and 1650, memory permitting.)

A Speedy Technique

One interesting thing about this game is its fast execution speed, a feat normally impossible in BASIC. Character graphics (with a custom character set) allows you to create detailed, colorful games, but you are limited (without using special techniques, such as fine scrolling) to a single character of resolution. This makes motion seem rather coarse compared to player/missile graphics.

Nevertheless, character graphics in modes one and two provides a great deal of flexibility. Unlike player/missile graphics, a single POKE to "screen RAM" determines the X,Y position of a character. PEEK can be used like LOGATE to check for collisions. This simplicity allows you to program games in BASIC that will run pretty fast.

One last note on the importance of positioning BASIC subroutines to maximize speed. Laser Barrage has a large section of "initialization" code, which is run only once at the beginning of the program. When all this code was moved to the end of the program, the game ran twice as fast!

**You've invested a lot of time and money into your computer . . .
It's time that investment paid off!**

THE COLOR ACCOUNTANT

The Programmer's Institute introduces **THE COLOR ACCOUNTANT**, the only complete personal financial package specifically designed for the Atari 400/800 computer. This unique package includes:

- | | | |
|-----------------------------------|---|-------------------------|
| 1. Complete Checkbook Maintenance | 5. Payments/Appointments Calendar | 8. Home Budget Analysis |
| 2. Chart of Accounts Maintenance | 6. Color Graph Design Package
(graphs any files) | 9. Decision Maker |
| 3. Income/Expense Accounts | 7. Stock Market Analysis | 10. Mailing List |
| 4. Net Worth Statement | | |

After the initial setup, **THE COLOR ACCOUNTANT** requires less than an hour of data input each month.

The checkbook maintenance program is the key to the entire package. Once your checkbook is balanced, the checkbook summary file will automatically update the home budget analysis, net worth, and income/expense statements. You can then graph any file, record bills and appointments, make decisions, print a mailing list, analyze various accounts or stocks, and even calculate taxes.

All programs are menu-driven and allow add/change/delete. Each file and statement can be listed to screen or printer, and saved to cassette or diskette. **THE COLOR ACCOUNTANT** also comes with 40 pages of documentation that leads you step-by-step through the entire package. The Atari 400/800 requires 24K for cassette and 32K for diskette for this package. (\$74.95 cassette, \$79.95 diskette).

See your local dealer or order direct:

THE TAX HANDLER

The perfect supplement to **THE COLOR ACCOUNTANT**, *The Tax Handler* includes:

1. Complete Form 1040
2. Schedule A (Itemized Deductions)
3. Schedule G (Income Averaging)

This year let *The Tax Handler* prepare your taxes (\$24.95 cassette, \$29.95 diskette).

Tara Computer Products

PUT AN END TO YOUR MEMORY EXPANSION PROBLEMS!

With the only logical choice for 48K memory expansion of the Atari 400. Upgrade with the new Tara Computer 48K RAM card for the 400.

Features:

- Easy installation.
- Cooler, less power hungry operation compared to standard 16K or 32K products.
- Uses state-of-the-art 64K Dynamic RAMs.
- Extends 400 useable memory to 48K.
- Allows higher performance 800 software to be run on your 400.
- Quality construction with gold edge connector.
- Allows for disk operation.

Increase the performance of your personal system efficiently and economically with the new Tara Computer 48K RAM card. Available direct from Tara Computer or from select dealers.

Teaching With Games

Harvey B Herman
Associate Editor

Sometime ago I took part in a "District Day" for gifted and talented elementary school students. The program was hosted by the University of North Carolina at Greensboro. Workshops were organized by 32 university faculty members on topics ranging from computer technology to Appalachian folk music. I collaborated with a colleague from the Physics Department in a presentation, to a group of very bright kids, of small computers. Our objective was to give the students, in the short time available, some appreciation of the laboratory uses of computers in the physical sciences. I thought it might be useful to others to describe the rationale behind my part in the program.

Realtime Clocks

The computers used in the workshop were various model Commodore PET/CBMs. One of the features of these computers, as I am sure regular **COMPUTE!** readers are aware, is their built-in, realtime clocks. One of the variables in BASIC, TI\$, is set aside (reserved) to keep track of hours, minutes, and seconds. Typically, the clock is set by equating this variable to the current time; e.g., at 9:30 a.m. type TI\$ = "093000". If the value of TI\$ reads 094502 after using the computer for a short time, the user would know that 15 minutes and two seconds have elapsed since the clock was last set.

Another reserved variable, TI, keeps track of 1/60th second intervals (jiffies) since the PET was turned on, or TI\$ was set. Either variable can be used in a program in which the computer interacts with the environment at specified time intervals. Let us take as an example a program written to make measurements every ten minutes. Ten minutes translates to 36,000 jiffies. When the jiffy counter (TI) has increased by this amount, or the minutes segment of the string variable TI\$

has increased by ten, the program should then take whatever action is required to make the measurement.

Attract Them With Games

Elementary students love to play games; *Pac-man* alone is a billion dollar industry. I decided to write an original game for the workshop in which time is an integral part. The students would play this game, the time guessing game, first. Later, when we had their attention, a discussion could begin on the laboratory uses of small computers where keeping track of time is essential. A scientific computer program used in a laboratory setting will undoubtedly have similar algorithms. We tried to focus on these aspects of the program without attempting in any way to make sophisticated programmers of the students – virtually impossible in the limited time for the workshop. I believe that it was indeed possible, however, to impart some understanding of scientific applications of computers to bright kids, many of whom already have home computers.

Time Guessing

A listing of the program accompanies this article. Readers should feel free to use it just as a game, or as a point of departure for a discussion on measurements with computers, as we did.

The program is relatively short and should be easy to follow. It begins with optional instructions. The object is to start and stop a clock, with a key press, coming as close to ten seconds as possible without going over. A player enters his or her name, and then presses any key. When players feel ten seconds is up, they press any key again. It takes some practice before one can reliably reach 9.90 seconds or greater, while still staying below ten. The last and best player's score for that session is displayed after each turn. At the conclusion of the game, all the students' names and their times are displayed in summary fashion.

There are two features of this program which perhaps should be incorporated in most applications at this level:

1. A return without data in response to an input statement will not stop the program. In my experience, this is the single most confusing part of PET BASIC to non-computerists. (It has been corrected in the VIC.)

2. The time values are not displayed to nine significant figures, but are rounded to a more realistic 1/100 of a second. It always bothers me to see unnecessary digits reported for an experimental measurement. Of course, rounding has an additional benefit; it makes for neater and easier to read tables at the conclusion of the program.

The time guessing program was developed on

a 40-column PET, but will work on 80-column CBMs and 22-column VICs, with minor editing of the output statements. If you do use this program, I hope your students will enjoy it as much as these workshop participants said they did.

Friends Of The Turtle

David D. Thornburg
Associate Editor

LOGO Is Not Just Child's Play

Revolutionary periods are more than a time of change – they are often a time of great confusion as well. Those of us who are excited about the emergence of computer languages tailored to people's needs may be less sensitive than we should be to the way our message is being received.

In the case of LOGO and Atari PILOT, this has had unfortunate consequences. Several readers have written to suggest that LOGO and Atari PILOT are "kid's" languages and are thus not worthy of serious attention. They cite as evidence Papert's *Mindstorms*, a book on LOGO and kids; my books, *Picture This!*, *Picture This Too!*, and *Every Kid's First Book of Robots and Computers*; various magazine articles; the very existence of the Young People's LOGO Association, etc.

Admittedly, much of the public enthusiasm for these languages has been devoted to the fact that, like English, PILOT and LOGO are effective communication tools for children. Let us remember, however, that while English is the language for "Baa, Baa, Black Sheep," it is also the language for James Joyce's *Ulysses* – the latter is definitely not for children.

The key to LOGO's power is twofold. First, much of it is very easy to learn, and first-time users find that within a short time they are able to do "interesting" things. (To me, the generation of logarithmic spirals is interesting, but the repeated printing of my name on the screen is not. BASIC has an easy time with the latter [as does LOGO], and has a horrible time with the former.) Second, LOGO is extensible by the user. This capability of LOGO, while of utility to youngsters, makes it a tremendous problem-solving language for users of any age. LOGO users readily develop skills in top-down programming and in the creation of building-block procedures that not only impart a logical order to programs, but also make them much easier to debug. When one adds to this such features as recursion, local variables, and list manipulation, it is obvious that LOGO is far more than just a kid's language. In fact, it is a far more useful language

for many applications than many of the popular computer languages in use today.

Keep in mind that LOGO was a product of the artificial intelligence community. I assure you that something that is just a kid's language does not hold the interest of the MIT computer science department for over a decade.

Is turtle geometry easy to use? Of course it is. But, do LOGO's detractors know that finite differential geometry (turtle geometry's formal name) is a major tool for exploring some aspects of pure mathematics that have evaded analysis by traditional analytic geometry?

Those who think that LOGO is only for kids should read *Turtle Geometry* by Abelson and diSessa. If their treatment of relativity theory is too tame for your kids, try reading Buckminster Fuller's *Synergetics* (Fuller independently developed finite differential geometry and used it to make some very interesting discoveries).

My Stanford graduate students get slowed down by that book, but perhaps LOGO's detractors will find it trivial reading. Fractal geometry – the subject of this column a few months back – lay virtually unexplored for more than 50 years because mathematicians lacked the tools to do the job.

This July it was my pleasure to give a lecture on the consequences of dimensionality on the conservation rules of geometry. Apple LOGO was my principal tool.

The reason I even care about this argument is that it has the promise of becoming a self-fulfilling prophecy. I have heard Apple dealers tell customers that LOGO is a kid's language. I have seen languages like Radio Shack Color LOGO that are excellent turtle graphics environments, but lack the list manipulation and other features that characterize a full LOGO implementation. In short, I have seen much confusion in the marketplace regarding LOGO and Atari PILOT.

So, please, know that languages like LOGO are marvelous tools for children – and that they are marvelous tools for almost everyone else as well. The power of a good tool is restricted only by the capabilities of its user. LOGO is a good tool.

Those Logophobes who feel like giving the language a second chance should read Harold Abelson's new book from Byte/McGraw Hill. The book is published in two editions, *Apple Logo* (for the LCSi LOGO sold by Apple), and *Logo for the Apple II* (for the MIT LOGO sold by Terrapin and Krell).

This book is excellent for all LOGO users simply because it is far more than a reference work. Abelson has managed to combine descriptions of LOGO primitives with projects that deepen the user's familiarity with the language. The first 60 pages are devoted to turtle graphics, and the remaining 150 concentrate on the other aspects of

LOGO that make it a complete computer language. Thus, in addition to turtle graphics, readers become well versed in list manipulation, recursion, hierarchical structures, etc.

While it is fair to say that no prior experience in programming is required to read this book, those of you who

are learning LOGO as a replacement of or supplement to another language will not find Abelson's book excessively wordy. The text follows several presentation styles: reference material, sample procedures, and projects for the user to solve on his or her own. Except for elementary grade school children, I can't think of any LOGO users who would not benefit from this book.

How To Grapple With A Turtle

In my last column I showed Apple LOGO users how to print screen images on the Silentyper printer. The Silentyper has many features (low cost, quiet

operation, etc.), but it doesn't produce pictures with very high contrast. For high contrast one must consider using a dot matrix impact printer.

Because I need high quality screen images for various reasons, I invested in the Grappler printer interface card (from Orange Micro) for use with my Epson MX-100 printer. I have not done an exhaustive search of the printer interfaces for the Apple II, but I can't think of much I would want to do that can't be done with the Grappler.

For example, this printer interface allows you to print a screen image at double size (rotated by 90 degrees) so it fits perfectly on an 8.5 by 11 sheet of paper. I enjoy the results of this print mode so much that I haven't explored any of the others.

To generate such prints for the Epson printer (there are Grapplers for other graphics printers as well), you should enter

SETSCRUNCH 0.84

before drawing any pictures. This compensates for the dot aspect ratio of the Epson printer. If you are using another printer (or another printing mode), you may have to experiment by drawing squares with various settings of SETSCRUNCH (or .ASPECT for those of you with MIT LOGO) until you get a picture that is perfectly square. The following procedure is all that is needed to generate a full-page image of your graphics screen. This procedure is written in Apple LOGO and assumes that the Grappler card is plugged in slot 1 of the Apple:

```
TO PRINTPICT
MAKE "CTRL CHAR 9
.PRINTER 1
PRINT WORD :CTRL "GDR
PRINT CHAR 12
.PRINTER 0
END
```

This procedure gets the printer's attention with the character ctrl-I (CHAR 9), followed by letters that set the various options. G indicates that we want a graphics image, D means it should be double size, and R means it should be rotated by 90 degrees. If you want to use the enhanced print mode of the Epson printer, add an E to the list, and you will get a much denser print (with a longer print time, of course).

That's all there is to it! The accompanying figures are taken from my next book, tentatively titled *Discoveries of Beauty*. (This book should appear from Addison-Wesley about January 1983.) Most of the illustrations for this book were generated with the procedure shown above. As you can see, the Grappler lets your Epson printer do a fine job printing pictures generated with LOGO on your Apple computer.

A Monthly Column

The World Inside The Computer

Fred D'Ignazio is a computer enthusiast and author of several books on computers for young people. He is presently working on two major projects: he is writing a series of books on how to create graphics-and-sound adventure games. He is also working on a computer mystery-and-adventure series for young people.

As the father of two young children, Fred has become concerned with introducing the computer to children as a wonderful tool rather than as a forbidding electronic device. His column appears monthly in **COMPUTE!**

This game will appeal to children of all ages. And it can teach both programming and subjects like English or history while it entertains.

The Story Game

Fred D'Ignazio, Associate Editor

Have you ever played MAD LIBS?[®]

MAD LIBS is an assortment of wacky party books designed to appeal to the six-year-old in all of us. Each book has a theme – monsters, movies, super heroes, current events, geography, mysteries, or whatever. A MAD LIBS book is a collection of stories, songs, and rhymes with key words left out. You select the words needed to complete the stories. But you must do it blind.

You play MAD LIBS by first picking a *reader*. The reader selects a MAD LIB from the book. Then he (or she) asks people for words to help fill the blanks in the MAD LIB. "Give me a plural noun," the reader might say. Or, "I want the name of a person in this room." The reader fills in the blanks, taking care to hide the story from everyone else in the room.

When all the blanks are filled, the reader stops asking questions and reads the completed story. Depending on people's moods and personalities, the completed MAD LIB might sound philosophi-

cal, ridiculous, funny, or shockingly raunchy. For example, an exchange between Mickey Mouse and Minnie Mouse might go as follows:

MINNIE: Mickey! Will you stop doing those _____ exercises.

MICKEY: Aw, shucks, Minnie. I have to keep my _____ in shape.

MINNIE: Well, watch out for the _____. Just look at the way your _____ hangs down over your _____.

To fill in the above blanks, the reader would ask people to volunteer an adjective, a plural noun, an adjective, and two singular nouns. Depending on people's answers, the above passage could end up anywhere from banal to cute, or from innocent to X-rated.

Computer MAD LIBS For Kids

Japanese author Mitsumasa Anno has a book out called *Topsy-Turvies* (Weatherhill, 1970). Anno likes to play games with your vision and sense of perspective. The book is filled with colorful pictures of topsy-turvy buildings and people capable of walking up walls and strolling on ceilings. The book stretches the visual imagination in the same way as the bizarre paintings and drawings by M.C. Escher.

MAD LIBS games can do the same thing for kids' *verbal* and *literary* imaginations. And the "reader" who chooses the stories and asks for words can be a computer.

As a parent or teacher you can choose a MAD

LIBS-type "skeleton" story from just about anywhere: a picture book, the Bible, a fairy tale, a comic book, a TV program, a song, a poem, or your own imagination. Or you can draw from yours or your child's personal experiences — sort of a fill-in-the-blank autobiography.

After you choose the source for a story, pick out a particularly vivid section of only about 25-300 words. You need to keep it short and fast-paced to maintain the child's interest.

Now go through the story and pick the key words you are going to leave out. Vary your choices. Try to take out different parts of speech: proper nouns (names), adjectives, adverbs, verbs, exclamations, plural nouns, and so on.

Next, type the story into your computer. The program will consist mostly of PRINT statements, like:

```
500 PRINT "FOUR SCORE AND SEVEN YEARS
    AGO OUR ";NOUN1$
510 PRINT "BROUGHT FORTH ON THIS
    CONTINENT"
520 PRINT "A NEW ";NOUN2$;"."
```

The variables NOUN1\$ and NOUN2\$ contain the child's answers to questions that the computer "reader" asked earlier. It asked the questions using PRINT and INPUT statements like:

```
200 PRINT "A PLURAL NOUN";INPUT NOUN1$
210 PRINT "A SINGULAR NOUN";INPUT
    NOUN2$
```

No matter what subject you choose, the computer stories are sure to fascinate children. They are likely to play the same story over and over, trying new words each time. And each time children try a new word, they immediately see its effect. The effect might be dramatic, zany, or silly. But it teaches children the different parts of speech and their roles in a sentence or in a story.

This also stretches children's imaginations and increases their confidence in using new words. After all, it's just a game. They can experiment with new words without being afraid of looking dumb. There won't be any all-knowing adults or smart aleck peers around to laugh at him if the words make the story crazy or absurd. Instead, it will be fun. And they can change the words on the program's next go around.

Dark Stories

We have a family tradition. Each night, my three-year-old and six-year-old take a bath and get into their pajamas. Then they tumble into bed, climb under the covers, and I turn out the lights. Then I tell them a "dark story." (It might be happy or sad, frightening or funny. It's a *dark* story because it can be told only in the dark.)

I make up a new dark story each night. A dark

story is usually a heroic fantasy with lots of evil monsters, princes, princesses, spaceships, and adventures. The stories change, but two things remain the same. First, my daughter Catie is always the story's heroine, my son Eric is always the hero. Second, no matter where the stories end up — in a dismal dungeon or on a faraway planet — they always start someplace that is familiar to my children. That someplace might be their bedroom, their school, or their backyard.

Computer Fairy Tales

I tell a new dark story each night. I don't tell a new story just because I love to be creative. I do it because my memory is so bad. By the time bedtime arrives each night, even the previous night's dark story is usually nothing more than a faint smudge in my memory.

You and your family can create a new dark story each night, too, regardless of the state of your memories and imaginations. The storyteller can be your computer.

You can write programs that combine dark stories with our fill-in-the-blank program. What you get are fractured *fairy tales*. The kids can invent the new words to add to the fairy tales each night. If they are old enough, they can type them in themselves. And you can turn off the lights in the room where you keep the computer to make the fairy tales into true-blue dark stories.

At the end of this month's column I have a sample computer "story game" program for you to try. It takes up 4024 bytes and is written in Atari BASIC. It is a very simple, straightforward program that consists mostly of PRINT statements. It should be easy to modify to run on other popular computers. The only fanciness in the program is that it makes the stories appear in the enlarged Atari (graphics mode 2) character set.

Once you see how to create your own computer fairy tale, you can add to the program or change it completely. Right now, for example, the program asks only for nouns (proper names, places, things). You can add adjectives, verbs, nonsense words, etc. Also, the story is in a fairy tale format appropriate for short bedtime dark stories. But it needn't be. You can rewrite the story to be about anything. Whatever appeals to you and your kids.

And if you are a teacher, not a parent, you can use the story idea in your classroom. You can make up a story-writing assignment that combines programming, language arts, and history or social studies. The subject of the story is up to you.

The Story Game Unraveled

Lines 50-120: Program documentation (REM statements) and a data section. The child's answers are stored in variables ten characters long to

ARBITER 1.4 MULTI-USER DISK SYSTEM FOR COMMODORE 4.0 COMPUTERS

OVER THREE HUNDRED IN USE ACROSS ONTARIO

Since September 1981 **BATTERIES INCLUDED** has been installing the ARBITER system in classrooms of Commodore BASIC 4.0 computers. The computers are connected to CBM Disk Drives and printers. All users have access to all disk drives and printers plus a host of commands to make this system configuration really usable!

THE ARBITER 1.4 SYSTEM IS READY TO GO!

FEATURES

- 1) Easy installation.
- 2) Uses no RAM or Utility Sockets.
- 3) Up to 32 computers in one system.
- 4) System self initializes on power up.
- 5) Operation is completely transparent to the user.
- 6) Extended commands allow a friendly multi-user environment.
- 7) System design virtually eliminates interleaved printer output.

SPECIAL COMMANDS

@ S- Allows students to protect files with a five character password. A three character user ID is forced into the file name.

@ L- Allows the students to load protected files if the password code is known.

LISTC- Used to produce program listings with a Commodore printer. Clumsy OPEN, CMD, LIST, PRINT#, CLOSE sequence not needed. It overcomes the listing problems found on other multi-user hardware systems.

LISTP- Used to get program listings on systems which have an ASCII printer. The cursor control characters are expanded and displayed in brackets. e.g. <home>

ALL FILE TYPES ARE SUPPORTED- During relative or sequential file access a delay has been built in so the computer will retain control of the system until the file is closed.

TEACHER UTILITY- A utility is supplied on disk to allow the teacher to produce a hardcopy listing and output from any of the protected or unprotected files selected. Once the files are chosen from the disk directory the teacher may do other tasks while the job is completed.

IF YOUR CLASSROOM WAS DESIGNED TO TEACH COMPUTER LITERACY OR
STRUCTURED BASIC THEN THIS SYSTEM WAS DESIGNED FOR YOU.

Arbiter and Arbiter 1.4 are copyrights of Batteries Included.

\$150⁰⁰

accommodate normal-sized words. The words could be longer, but you have to keep the size of your screen in mind, or you get word wraparound (the tail end of the word gets printed on the next line).

Lines 500-940: On line 535, the program clears the screen. On lines 540-560, the program prints the *game title*. There is a delay loop on 560 and in many other places throughout the story to slow the story down to the reading level of the child. You need to adjust these loops up or down to fit your kid's reading level.

On lines 800-940, the program asks the child for words to complete the story. My kids almost always put themselves in as the story's heroes. Their other answers are usually a surprise. Sometimes they are a shock! (Watching the child fill in story parts can be a real learning experience for the alert parent or teacher.)

Lines 950-1390: Lines 950 to 1008 print out the story title (taken from the child's answers). The title is partly centered and displayed in a special color (blue).

On lines 1009 to 1350 the computer tells the story. The lines are double-spaced and designed to accommodate the child's answers so they fit on the screen. The story stretches across several screens. Each screen is fairly full without being crowded with words. You can think of each screen as a "page" in a storybook.

Lines 1365 to 1390 print "THE END" (a key story ingredient) in a special color (blue, again).

Lines 1395-1480: Lines 1395 to 1430 enable the child to see the same story again (over and over and over!). Or the child can go back to the beginning of the program and invent a whole new story.

When the child is tired of making up stories, he reaches lines 1435 to 1480. The program says good-bye to the child, then clears the screen one last time and closes up shop. The POKE command on line 1445 makes the Atari screen cursor turn invisible for the computer's "good-bye" message. The POKE command on line 1475 makes the cursor reappear.

Next Month

Next month I'll show you how to teach the computer friend introduced in this column last month how to play games. The sample game will be the "Story Game" program you see below. You will be able to add up to 50 games to the friend's repertoire.

A Monthly Column Learning With Computers

A good simulation is a game so real, so responsive, that it seems to imitate a real situation. Here are two reviews of excellent educational simulations and some ideas on how to create a simulation of your own.

Computer Simulations: Learning Through Exploration, Discovery, And Play

Glenn Kleiman
Teaching Tools: Microcomputer Services
Palo Alto, CA

I hear and I forget;
I see and I remember;
I do and I understand.

Many educators have extolled the virtues of learning through exploration, discovery, and play. These modes of learning are active – guided by the learner's own curiosity and interests. They provide opportunities to acquire new information, discover general principles, test ideas, and develop thinking and problem-solving skills. Active learning is both more enjoyable and more effective than learning that is imposed upon students. In *Democracy and Education*, the American philosopher John Dewey, one of the most influential advocates of active, experiential learning, wrote:

The fundamental fallacy in methods of instruction ... consists in supposing that we can begin with ready-made subject matter of arithmetic, or geography, or whatever, irrespective of some direct personal experience.... The first stage of contact with any new material must inevitably be of the trial and error sort. An individual must actually try, in play or work, to do something with material ... and then note the interaction of his energy and that of the material employed. This is what happens when a child at first begins to build with blocks, and it is equally what happens when a scientific man in his laboratory begins to experiment with unfamiliar objects.... [Effective methods of education]

give the pupils something to do, not something to learn; and the doing is of such a nature as to demand thinking, or the intentional noting of connections; learning naturally results.

Active learning has traditionally been limited by the number of objects, places, and experiences available for students to explore. But suppose we could make almost any type of experience available to students. They could learn about zero gravity environments by spending an hour in one. They could learn about city government by becoming the mayor and members of the city council. They could perform genetic engineering experiments with DNA, no matter how dangerous and unfeasible such experiments would be in actuality. They could experience being businessmen, air traffic controllers, architects, real estate brokers, generals, explorers, archeologists, or astronauts. Computer simulations make it possible for students to experience some aspects of all these roles and situations.

A computer simulation is a dynamic representation of a real object, situation, or environment. A representation reflects the main properties of an actual object or event as, for example, a map represents a city. A map, however, is static – it does not change in response to any type of actions. A simulation is called a *dynamic* representation because it responds and changes in a manner analogous to the real object, situation, or environment. Simulations can be actively explored, and students can

WIN \$5,000 Plus Royalties!*

**For the best
Talking Game**

**For the Atari®
or Apple® II+**

Using the VOICE BOX™

Now you can make your Atari® 400/800 or Apple® II games and other programs come alive with the VOICE BOX by the Alien Group — the first low-cost, smart speech synthesizer with unlimited vocabulary.

Add jokes to your programs. Insults. Compliments. Help messages. Stories. Alien voices. Animal roars. Have your computer talk to the fire department or police in emergencies. To kids. Or blind people. Teach touch typing with immediate spoken feedback. Or just about any other subject — the fun way. Or help a speech-impaired friend communicate . . . the possibilities are limitless.

The VOICE BOX plugs into your Atari's serial port. And talks directly through your TV set. Or into any Apple II slot. No power supply or special interfaces needed.

Just select from its simple screen menu. A dictionary with thousands of common words (on diskette or cassette) automatically translates your text into speech. It's that easy.

But don't let its friendliness fool you. The VOICE BOX has all 64 phonemes (basic sounds, like "ah") built in. So you can precisely create any word or sound you can imagine. And store it all on diskette or tape. Names or foreign language words, for example. Or wierd non-human languages.

Let me entertain you — The VOICE BOX is creative too. It will crack you and your friends up with non-stop random, grammatically correct sentences, using words you specify. It

Speech Synthesizer

also has an amusing talking face with lip-sync animation — a real crowd-stopper. Best of all, you can call the VOICE BOX from any BASIC program and make your program really hum — literally!

Singing Apples? — Apple owners get all these capabilities too — as a plug-in card plus diskette. Or there's a deluxe version with the dictionary in ROM (no diskettes to bother with), speaker, and ability to "sing" (hey we're not making this up folks) in any key. (Both Apple versions require 32K or more. Applesoft and DOS 3.3).

Don't confuse the VOICE BOX with "dumb" speech synthesizers that can't learn new words. Or software-based ones with lower speech quality — and an annoying tendency to blank out the display when they talk. The VOICE BOX is a true breakthrough in speech synthesis. Small wonder thousands of Atari and Apple owners have already bought the VOICE BOX.

The VOICE BOX is available now at leading computer stores throughout the world. Or direct from the Alien Group, with 10-day money back guarantee if you're not completely satisfied.

VOICE BOX For Atari. \$169.00

16K and 32K versions included
(Specify diskette or cassette).

VOICE BOX for Apple II+ \$139.00.

(Requires speaker.)

VOICE BOX for Apple II+ \$215.00

(Includes dictionary in ROM and singing capability. Comes with speaker.)

Enclose check or money order, Visa or Mastercard#. Please include expiration date.

CHECK YOUR LOCAL COMPUTER STORE FOR TALKING "VOICE BOX" VERSIONS OF YOUR FAVORITE GAMES FROM LEADING GAME COMPANIES

*Win a \$5,000 prize — plus royalties — for the best Atari 400/800 or Apple II+ game using the VOICE BOX. Deadline: May 30, 1983. Write for contest details.

Please mail to: The Alien Group, Department PT-2, 27 W. 23 St., N.Y., N.Y. 10010
Or call in order to (212) 741-1770

learn from experiencing how the simulation responds to their actions.

Some simulations, such as the board game Monopoly, are familiar to almost everyone. Monopoly is a simulation of a real estate market. Each player assumes the role of an investor who buys, sells, and trades properties, trying to gain good locations to build houses and hotels, thereby amassing a fortune.

Children can learn a great deal from playing Monopoly. The game involves rents, taxes, utility bills, and banking, as well as financial successes and failures. Players must decide how to spend a limited amount of money wisely, and they learn about making investments for future returns. They practice and develop skills at negotiating, skills that can be developed only through experience. Money is constantly exchanged, so math skills are developed. I first learned about percentages as a result of landing on the dreaded income tax square and having to pay 10% of my assets. Some reading is required – I also learned the meaning of *assets*.

Simulations are never complete and precise representations. The aim of a simulation is to capture the main characteristics of what is being represented. The precision and completeness required depend upon the purposes for which the simulation will be used. For example, a fairly simple simulation of an airplane is sufficient for children, but a precise, detailed simulation is required to train pilots.

Computer simulations can be more complex, precise, and complete than any other type of simulations. Many things, such as zero-gravity environments and genetic engineering experiments, can be reasonably simulated only with a computer. Computer simulations can capture more aspects of reality and give people more flexibility in how they explore and experience the simulated environment.

A Roadtrip Simulation

A program called *Roadtrip* is a good example of a simulation which is both enjoyable and educational for children. Like many simulations, *Roadtrip* takes the form of a game. The aim of the game is to complete a 900-mile car trip from Dullsville to Greenstone Park. The player has a maximum of two days and \$200 to spend. Along the way, he has to make many decisions like those in an actual trip.

The *Roadtrip* program is for Apple II computers and makes excellent use of high resolution, color graphics. The screen displays show a car dashboard and the views through the windshield and rear view mirror (see Figure 1). The dashboard has a speedometer, odometer, gas gauge, clock, alternator, and oil warning lights. The views

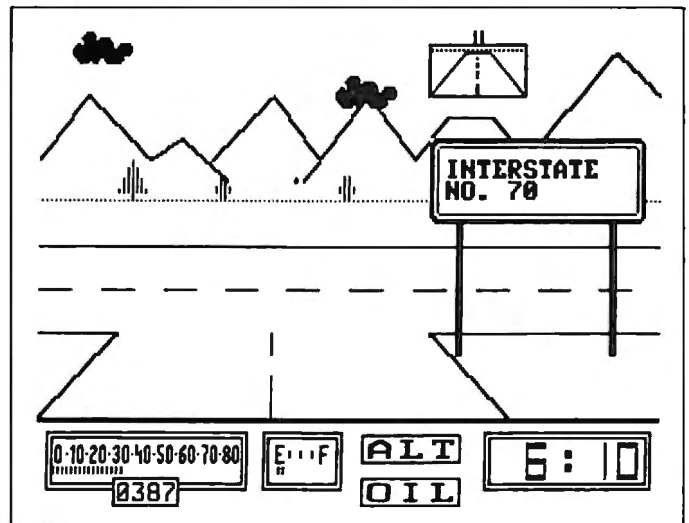

Figure 1.

through the windshield and rear view mirror change each time the car moves. The programmers of *Roadtrip* paid careful attention to every detail. For example, the sun comes up in the morning, and the stars appear at night.

While in the car, players have seven commands available. Pressing *F* moves the car forward; *R*, *L* and *T* turn the car to the right, left or completely around; *S* lets the player change the speed; *\$* displays how much money is left; and *M* displays a map. The map is important: there are many crossroads and it is easy to get lost. Many a *Roadtrip* traveler has ended up in the swamp or Slipdisk City.

Along the way, players pass through towns where they can purchase gas, go to a restaurant, and check into a hotel. If you run out of gas, the game is lost. Failing to get sufficient food and rest increases the likelihood of an accident. If you get to a town late at night, the gas station and restaurant may be closed.

This simulation contains a number of events which may occur along the way. The computer's randomization capability is used, so it is impossible to predict if and when each event will occur. You may get a flat tire or have other car problems, have to wait for trains, pass hitchhikers, run into roads closed for construction, and so on. If you exceed the speed limit, you are likely to be stopped by a police car, be delayed, and have to pay a fine. Excessive speed, like lack of food and rest, makes accidents more likely.

Roadtrip provides an opportunity for children to explore and learn about car travel. Map reading is critical to success, as is careful attention to the amount of money being spent, getting enough food and sleep, and obeying speed signs. This program lets children experience in play many of

PET Educational Software Also Available

Announcing . . . THE WHOLE PET CATALOG

A two year compendium of the **Midnite Software Gazette** and other resources for users of Commodore, CBM, PET, and VIC computers.

The Whole PET Catalog contains:

- Over 500 independent reviews of commercial products.
- Over 700 education programs reviewed & organized by course.
- Over 200 reviews of free games.
- Information on over 1,800 free programs.
- Information about dozens of PET and VIC user groups.
- Many pages of hints and helps for all Commodore users.
- "Commodore's Family Tree", by Jim Butterfield.
- Completely reorganized and greatly expanded edition.
- Typeset and printed full-size on bond paper.
- In all, 320 pages of useful information.

If you've seen **Midnite** before, directly or reprinted in the **TorPET** newsletter, here it is, complete in one volume, completely reorganized for easy reference, and greatly expanded with new information from members of the Toronto PET Users' Group.

"I still use my copy of **The Best of the PET Gazette** regularly. It was a treasure trove of information, and a great bargain for \$10 three years ago. I hope you'll feel the same way about my **Whole PET Catalog** someday. Considering that it's three times as long, completely organized by topic, printed on bond paper instead of newsprint, typeset instead of dot matrix printed, bound instead of stapled, and still only \$10, in spite of inflation, I'm sure you will."
—Jim Strasma, Contributing Editor, *Micro*

the situations people encounter while traveling.

Roadtrip was created as a class project by students of Jay Dean at the University of Minnesota. For Apple II computers with Applesoft, it is a public domain program, available (with two other class project simulations) for \$10 from Softswap, San Mateo County Office of Education, 333 Main Street, Redwood City, CA 94063. For a catalog and order forms, send \$1.00. *Roadtrip* uses a utility program called *Higher Text* to create type fonts. You do, however, have to obtain *Higher Text* and transfer the files to the *Roadtrip* disk. *Higher Text* is available for \$40 from Synergistic Software, 5221 120th Avenue, S.E. Bellevue, WA 98006. (*Higher Text* is a very useful utility program if you do any programming yourself. It lets you create all kinds and sizes of type fonts on the Apple high resolution screen.)

A Logic Machine's Simulation

I have just received a review copy of an innovative new program which includes computerized simulations, tutorials, and demonstrations, combined into an educational game. The program, called *Rocky's Boots*, teaches about the building blocks of computer systems, such as AND, OR and NOT logic gates, flip-flops, clocks, delays, sensors and actuators. The operation of each device is explained and demonstrated. The simulation game has players use simple logical devices to build and test machines.

There are six levels in the program. Within each level is a set of rooms, each of which contains an explanation, demonstration, exercise, or other information. The player controls a cursor, moving it among the rooms by using either a joystick or the keyboard.

The first level of the program teaches how to move and pick up objects. The second level begins the lessons on building machines. The cursor contains electricity, so when it is placed on a socket of a device, electricity flows through the device. The flow of electricity is shown by the color orange.

Several *actuators* (devices which perform actions when connected to electricity) are introduced. These include a clacker which makes noise, a thruster which moves, and a boot which kicks. The player must discover what each one does by activating it with electricity from the cursor.

The concepts of *input* and *output* are then illustrated, and *sensors* are introduced. Each sensor detects a certain class of objects. One sensor detects green objects, another detects square objects, and so on. When a sensor detects an object, it sends electricity out. Players can, for example, connect a green sensor to a boot actuator, so that whenever a green object is detected, the sensor will send elec-

tricity to the boot actuator, which will then kick the green object. The program provides several practice rooms in which players can build and test all sorts of machines.

After some of the fundamentals are mastered, players are introduced to NOT, AND and OR logical gates. A NOT gate has one input line. When there is no electricity at the input line, the NOT gate sends electricity through its output line. When there is electricity at the input line, none is sent out. AND and OR gates each require two inputs. AND gates send electricity out only when there is electricity at both inputs. OR gates send electricity out when there is electricity at either one (or both) of the inputs.

Once these devices are understood, players are ready to try various games. Each game involves building a machine which will kick certain objects. For example, in one game the machine is to kick circles and squares, but not to kick triangles or crosses. Players receive points when their machine kicks an appropriate object and lose points if their machine kicks an inappropriate object. Once the machine is built, the player can throw a switch which causes various objects to flow into the room. The machine can be slowed or stopped at any point so its operation can be watched carefully.

Figure 2 shows a device which will kick squares and circles. The two boxes on the right are sensors. The top one detects circles, the bottom one detects squares. They are connected by wires to the input lines of an OR gate. The output line of the OR gate is connected to a boot actuator. When a square or circle comes into the room, the appropriate sensor will detect it and send electricity to the OR gate. Since electricity at either input causes electricity at the output of the OR gate, power is sent to the

Figure 2.

boot, which kicks the object.

The other levels of the program add more devices, such as flip-flops, clocks, and delays. It then presents a series of games requiring the building of progressively more complex machines. Players can explore all sorts of combinations of simple logical devices.

Students can learn a great deal by actively exploring and playing with *Rocky's Boots*. It presents a carefully structured environment so that new knowledge and understanding are built step-by-step. Children can explore this environment at their own speed and follow wherever their interests lead. *Rocky's Boots* is an exciting and innovative program, one which makes the often proclaimed educational potential of personal computers a reality.

Rocky's Boots is available for \$75 from The Learning Company, 4370 Alpine Road, Portola Valley, CA 94025.

Creating A Simulation Program

Many other simulations are available. Some examples are: *Lemonade*, a simulation of a very small business; *Oregon Trail*, a simulation of traveling across the U.S. in the 1800s; *Three-Mile Island*, a simulation of controlling a nuclear reactor; *Windfall*, a simulation of the oil market; and *Air Traffic Controller*.

Since simulations are widely touted as having great educational potential, it may seem surprising that few good simulations are available. The reason is that good simulations are very difficult to create.

In order to create a simulation, you must first create a model of what is being simulated. You then translate the model into a computer program, designed for students to learn by exploring and playing. Often it is necessary to simplify the model, so students can manipulate certain factors and come to understand their effects.

Consider, for example, what we would have to do to create a simulation game which would allow students to role-play running a city government. Perhaps we could have one student take the part of the mayor and others the police chief, chairman of the board of education, city council members, and so on.

Students would have to control raising and spending money in their simulated city. We could arrange the program so students can set sales tax and property tax rates. But of course simply raising taxes does not always bring in more money. Raising sales taxes in a city often leads to more people shopping outside the city, so fewer tax dollars are collected. Raising property taxes may lead to businesses leaving the city, thereby lowering the tax base. The simulation program would have to

include equations which reflect the effects of these factors. We might also include other ways cities raise money, such as from the state or federal government, tourism, or municipal bonds.

The students should be able to allocate how the available funds would be spent. In a realistic simulation, the city would not have sufficient income for everything the city council would like, so the various departments would have to compete for funding. The simulation should reflect some of the complexity of real cities. For example, departments which pay their employees well might function most efficiently, but overpaying some employees can cause problems. For example, raising police department salaries might result in reduced crime, but it might also cause the firemen to strike for equal wages.

Random events might be built into the simulation. A snowstorm, hurricane, or epidemic could cause difficulties which require funds to be reallocated. A gas shortage would put an excess strain on public transportation, while a visit by a foreign dignitary would require many policemen to work overtime, straining the department's budget.

We would also have to consider evaluating how well the students run the city. Do we require a balanced budget, good schools, public transportation, sanitation and parks, and minimal crime? Should we count whether more people and businesses move into the city than leave it? What about the amount of tourism?

I have described just a few of the initial considerations in creating this simulation. Many other factors could be included, and the program should reflect some of the complex interactions of a real city. Creating a good simulation program requires an expert's knowledge of what is being simulated, combined with skill in designing and implementing programs.

Computer simulations provide new ways of teaching and learning. They certainly have great potential in education. However, creating programs which fulfill this potential is a difficult task, one which requires a great deal of effort by talented and knowledgeable people. C

In Part I last month you were introduced to two Applesoft programs that create a powerful new language for the Apple. This language, called Turtle PILOT, combines PILOT, turtle graphics, and all of Applesoft's commands and functions. Turtle PILOT resembles Atari PILOT, allowing you to translate PILOT programs for the Atari to the Apple. The features of Turtle PILOT described last month were just the beginning. This month, along with the PILOT language for Atari, we will deal with the most interesting features of Turtle PILOT: the turtle graphics. Turtle graphics will add new commands to your computer which make high resolution graphics easier. At the end of this article you will find listings of three example programs in Turtle PILOT. These programs can be typed using the Editor and then translated to Applesoft or Atari BASIC with the Translator, as described in Part I.

Part 2

Turtle PILOT: Including PILOT For Atari

Alan Poole
Loomis, CA

Introduction To Turtle Graphics

Turtle graphics gives you control over an imaginary and invisible turtle that lives on the screen. This turtle has a set of colored pens. When you instruct the turtle to move, it will leave a trail with its pens. All turtle commands must be preceded by a G: instruction. If there are no commands in the object of a G: instruction, page one of Apple high resolution graphics will be turned on without clearing. (This would result in Graphics 7 on the Atari.) Below is a description of each of the 11 turtle commands. Each description is followed by several examples using the command.

CLEAR

The CLEAR command sets Apple's high resolution graphics page one and clears the screen. (Atari goes to full-screen Graphics 7 and clears the screen.) This is identical to Applesoft's HGR command.

```
G: CLEAR
GY: CLEAR
```

TURN

The TURN command is followed by an expression. The value of the expression is the number of degrees added to the angle the turtle is presently

headed. A positive number turns the turtle clockwise, and a negative number turns it counter-clockwise.

```
G: TURN 90
G: TURN A
G(V<10): TURN N + INT(X*RND(1))
```

TURNTO

This command will change the angle of the turtle. The turtle's angle will be set equal to the value of the expression following the TURNTO command. Zero degrees is north, 90 degrees is east, 180 degrees is south, and 270 degrees is west.

```
G: TURNTO 20
GN: TURNTO ABS(K) + 8
```

DRAW

The DRAW command will move the turtle at the angle it is presently heading, leaving a trail on the screen as it moves. The value of the expression following the DRAW command is the distance the turtle will move. If the turtle hits the edge of the screen, it will stay at the edge.

```
G: DRAW 25
G: DRAW D-6
GY(L<>1): DRAW RND(1)*50
```

GO

The GO command is similar to the DRAW command, except the turtle will not leave a trail.

```
G: GO 50
GY: GO S1 + ABS(S2)
```

GOTO

This command moves the turtle to new coordinates on the screen without leaving a trail. The GOTO command is followed by the x and y coordinates separated by a comma. The coordinates the turtle uses are more like a normal graph than Applesoft's high resolution coordinates. The origin is in the middle of the screen instead of the upper left-hand corner. As you move up the graph, the y coordinate increases. As you move to the right, the x coordinate increases. The range of x coordinates is from -139 to 140, and the range of y coordinates is from -111 to 80.

```
G: GOTO 0,10
GN: GOTO -50,-5
GY(W>5): GOTO X,Y*N+2
```

PEN

The PEN command changes the color of the pen which the turtle uses to draw. It may be followed by the color names BLACK, GREEN, VIOLET, WHITE, BLACK2, RED, BLUE, or WHITE2. If the colors on your monitor are different, the color names can be changed in lines 5410-5445 of the Translator program. The PEN command may also be followed by UP or DOWN. Setting the pen to UP will cause all DRAW commands to move the

turtle without leaving a trail. DOWN will return the pen to normal. A final option with the PEN command is to use the color ERASE. This will set the pen to the background color, which is normally black unless changed with a SCREEN command.

```
G:PEN RED
G:PEN ERASE
G(C=1):PEN UP
```

SCREEN

This command will clear the entire screen to the color that follows the SCREEN command. The color names are listed above under the PEN command.

```
G:SCREEN BLUE
GN:SCREEN WHITE2
```

FULL

Sets full screen graphics mode with no text at the bottom of the screen.

```
G:FULL
```

MIX

Sets the mixed text and graphics mode with four lines of text at the bottom of the screen.

```
G:MIX
```

QUIT

The QUIT command turns off the high resolution graphics and returns to the text mode. It is identical to Applesoft's TEXT command.

```
G:QUIT
```

Multiple Turtle Commands On A Line

The object of a G: instruction can hold up to six turtle commands. The commands are separated by semicolons. Below are some samples of multiple turtle commands on the same line.

```
G:DRAW 20; TURN 90
G:CLEAR; SCREEN BLUE; PEN RED; TURNT0 10
```

Turtle Loops

Suppose you want to draw a square. You could use the following series of commands.

```
G:DRAW 50
G:TURN 90
G:DRAW 50
G:TURN 90
G:DRAW 50
G:TURN 90
G:DRAW 50
G:TURN 90
```

This seems like a lot of work to draw a simple square. Wouldn't it be easier if there were a simple way to loop turtle commands? This is one of the features included in Turtle PILOT. You can place up to six turtle commands between parentheses and put an integer in front of them for the number of times to loop them. For example, the following

instruction would draw the same square as the eight instructions above.

```
G:4(DRAW 50; TURN 90)
```

There are limitations with these loops. A loop cannot be placed inside another loop. Also, a command cannot be outside a loop on the same line. The following instructions would *not* be legal in Turtle PILOT.

```
G:4(DRAW 30; 3(TURN 120; DRAW 10))
G:PEN WHITE; 6(DRAW 75; TURN 60)
G:10(DRAW L; TURN 36); QUIT
```

Using High Resolution Page Two

If you write a long Turtle PILOT program that uses turtle graphics, you may find that there isn't enough memory. An extra 8K in the Apple's memory can be used by drawing on page two of high resolution graphics instead of page one. To do this, use a B:HGR2 instruction instead of G:CLEAR. All other turtle commands will work normally on page two.

PILOT Variables

Last month I mentioned that variables beginning with Q cannot be used in a Turtle PILOT program. This is not exactly true, but you must know how to use them correctly. Q variables are used in the translated program to execute some of the PILOT instructions. Below is a description of each of the variables and some possible uses for them in programs.

QM: This variable holds the number of the item that successfully Matched last. If more than one item Matched, QM will equal the number of the first item. This variable can be very useful, especially with programs containing a question with multiple choice answers. Program 3 with this article illustrates this.

QC: Conditioner flag, 0 = N, 1 = Y.

QR: Right margin, normally set to 40.

QI\$: User's last response with an Accept instruction. The Match instruction normally uses the last response, but a string can be used instead by setting QI\$ equal to the string immediately before the Match instruction. For instance, the following instructions would search for the word "TO" in R\$.

```
C:QI$ = R$
M:TO
```

QX,QY: Coordinates of the turtle.

QA: Angle of turtle.

QL: Length of line drawn by turtle.

QP: Pen position, 1 = UP, 0 = DOWN.

QB: Number of background color. Changes after a SCREEN command.

Q\$(25): List of items to be Matched.

Q(31): List of values for pitches of notes.
 QT\$: String to be Typed.
 Q1, Q2, QT, QI, QK\$: Temporary variables.

Next month will be the third and last article on Turtle PILOT. We'll translate an Atari PILOT program to Turtle PILOT, provide some documentation on the Editor and Translator programs, and include PILOT for Commodore machines. If you want more information on turtle graphics and PILOT, read the "Friends Of The Turtle" column in **COMPUTE!**

```

```

Turtle PILOT For The Atari

Charles Brannon
 Editorial Assistant

Use Program 1, the Turtle PILOT Editor, to enter and edit PILOT programs. Program 2, the Translator, converts your PILOT program into a BASIC program that is ready to RUN. Program 1 requires 32K with a disk, or 24K with a cassette. Program 2 requires 40K with a disk, or 32K with a cassette. By adjusting the MAX variable (line 1410 in Program 1, line 240 in Program 2), you may be able to adapt PILOT to systems with less RAM.

Using Atari Turtle PILOT

Using the Turtle PILOT Editor is like typing in a BASIC program, but there are some important differences. The Editor has 13 commands to help you type in, edit, save, and load PILOT programs (see the Quick Reference Chart). Each command is acknowledged with an "OK" prompt. If you see the "READY" prompt, you've somehow returned to BASIC.

The ADD command is used to enter programs sequentially. Just type "ADD," and you will be prompted with a line number. You can then type in a PILOT line, which will be added to the end of your program. For example,

```
1>T:What is your name?
2>A:NAME$
3>
```

Press RETURN> alone on a line to exit the ADD command. While in the ADD mode, you can't cursor up to change previous lines, so be careful. You must use ADD to add lines to the bottom of your program, but you can use cursor-based editing to change any line already typed. Simple syntax

checking is performed. The line must start with a valid PILOT command and must contain a colon.

List, Insert, Delete

LIST is used, as in BASIC, to display the program you are working on. Just type "LIST," and you will be asked for the starting and ending lines to list. "Default" answers are automatically provided, so if you want to list the whole program, just press RETURN twice. Otherwise, type over the default answers. While the program is listing, you can press "ESC" (for Escape) to abort the listing (used like the BREAK key, which is disabled in this program).

LMOD will find and list a specified module. For example, if you have a module named "*TURTLE," just type LMOD, and answer the prompt with "TURTLE" (the asterisk is supplied for you).

If you want to insert a line between two lines, enter "INS" (for INSeRT), and answer the prompt with the line number at which you wish to insert. The given line and all following lines will be "pushed down," and the given line will show as "BLANK." You can then LIST the program and cursor up to the blank line and make your addition.

To delete a line from a program, just type in its line number and press RETURN. The program will be automatically renumbered. To delete a range of lines, just type "DEL" and enter the start and end lines of the block of lines you want to delete. Use the NEW command to erase the entire program.

When using LOAD and SAVE, supply the complete filename (either C: or D:name), but don't use the optional three-character extender, as this is supplied automatically by the program. If you have a PILOT program in memory and type LOAD, the Editor will assume you want to append a program to the end of the one in memory. If you don't wish to do this, hit RETURN to exit the LOAD command, enter "NEW," and then type LOAD again.

Disk users will find the "DIR" command very helpful. It displays the directory of drive 1. Used in conjunction with PON, you can have a hardcopy listing of the directory. The PON command "turns on" the hardcopy option. After a PON command, all output will be sent to the printer (assuming you have one attached and turned on). You can use this feature to print listings of your PILOT programs. Use POFF to "de-select" the printer.

You can exit the Editor with either "BYE" or "RUN." The former will simply restore the break key, clear the screen, and return you to BASIC. "RUN" will run the Translator on disk-based systems. Make sure you save the program you're

working on before you use "RUN" or "BYE."

Operation of the Translator is very simple. Just answer the filename prompt with the name of your PILOT program (you don't have to type D:). If you are using a cassette, position the tape to read the PILOT program, press PLAY, and answer with "C:". Press RETURN when you hear the beep. The Translator will then read in the PILOT

Quick Reference Chart

Editor Commands

ADD	Adds lines to program from keyboard.
LIST	Displays program.
LMOD	Lists module.
INS	Inserts line.
DEL	Deletes range of lines.
NEW	Erases program.
LOAD	Enters or appends program from tape or disk.
SAVE	Saves program to tape or disk.
DIR	Lists disk directory.
PON	Sets hardcopy feature.
POFF	Clears hardcopy feature.
RUN	RUNs Translator (disk only).
BYE	Exits to BASIC.

Turtle PILOT Commands:

T:	Type line. Use \$ and # to include variables.
A:	Accept (ask for) input.
M:	Match last accept with list of items separated by commas. Sets Y/N flag.
J:*LABEL	Jump to indicated label.
U:*MODULE	Use (call, GOSUB) indicated module (subroutine).
E:END	Used to stop program or end a module.
C:Compute.	Used to calculate variables. Similar to B:
R:Remark.	Used to comment your program, like REM in BASIC.
S:Sound x,y	x = tone, y = duration. Uses only voice 0. Use B: and SOUND for other effects.
B:line	Compile a BASIC line.
*	(No colon) Indicates a label.
G:Graphics	(see below)

Graphics Subcommands

CLEAR	Clears screen; enters Graphics 7.
TURNTOA	Points turtle to angle A.
TURN A	Rotates turtle A degrees.
DRAWN	Moves turtle N units, leaving a trail.
GON	Moves N units without leaving a trail.
PEN RED	
PEN GREEN	
PEN BLUE	
PEN ERASE	Selects drawing color.
PEN UP	
PEN DOWN	Permits or prevents drawing.
SCREEN ATARI	
SCREEN APPLE	Sets scale of drawing. (See text).
GOTO X,Y	Go to absolute coordinate (-79/79-47/47).
FULL	Removes text window.
MIX	Enables text window.
QUIT	Goes to Graphics 0.

program and start to work on the translation. If you have a cassette, insert a blank tape, rewind it, and press RETURN when you hear two beeps.

When the Translator is finished, you can use ENTER to read the completed BASIC program into memory. (Use ENTER "C" for cassette or ENTER "D:name.ENT" for disk, where "name" is the name of the program.) The Translator automatically NEWs itself out on completion, so you don't have to worry about the program-merging effect of ENTER. You may want to change the "NEW" on line 390 to "END" while you are typing in and correcting the program. For safety's sake, SAVE a copy of the Translator before you RUN it.

The "BASIC" program which results from your efforts will run as is and will mimic the action of the PILOT program, albeit slower.

A Note On Graphics

This PILOT system was converted from the Apple version published last issue. Since Apple graphics differ from Atari graphics, a few things need to be mentioned. The Apple used high-resolution page one, which permits eight simultaneous colors, while the Atari version uses Graphics 7, a four-color mode with less resolution than the Apple screen. To allow Atari users to enter Apple programs without changes, the SCREEN command can be used in your PILOT program to select the "scale" of points plotted. SCREEN ATARI is the default mode, but if your program includes SCREEN APPLE, all coordinates are "scaled" from Apple coordinates (0-279) to Atari coordinates (0-159). All unimplemented Apple colors are plotted in COLOR 1.

An Intriguing New Release from **COMPUTE! Books:** Every Kid's First Book Of Robots And Computers

By David Thornburg

From the author's preface:

"This book allows children to develop skills in computer programming and geometry through the use of a commonly available toy - the Big Trak™ robot vehicle. Programming is introduced as the communication tool through which the child conveys instructions to the machine. Once the machine's language limitations are understood, it can be made to follow any procedure which has been entered by the user.

"Our use of turtle commands as the programming language mirrors the process-based descriptions commonly used by children. For example, a child is likely to describe a nearby location, such as a friend's house, by a procedure (Go two blocks, turn right, go another block, turn left,...). Because turtle geometry has been incorporated as the graphics environment in several computer languages available for the popular desk-top computers, these programming ideas can continue to be used as the child learns to operate other computers."

In *Every Kid's First Book Of Robots And Computers*, author David Thornburg conveys a uniquely exciting learning experience for children, parents, and teachers. The book uses Big Trak, PILOT/LOGO type languages, and Turtle Tiles™ to explore the concepts and techniques of robot/computer programming. Turtle Tiles, included with every book, are designed to provide hands-on programming experience to children without access to a Big Trak or a personal computer. Additionally, the Tiles can be used in conjunction with either of these items to share and reinforce the exercises in the book.

This VIC game demonstrates how the motor-impaired can communicate in several ways with a computer — using only the button on a joystick. There are also suggestions on adapting the game for the blind, to other computers, and for use with other kinds of input devices.

A Bi-monthly Column

Micros With The Handicapped

Susan Semancik and C. Marshall Curtis
The Delmarva Computer Club
Wallops Island, VA

Many kinds of computer entertainment require keyboard interaction or other motor coordination that can be difficult and even impossible for motor-impaired individuals. This month we'll digress from our series on developing a daily communications program to explore how a game program can be modified to accept alternative input devices in order to allow the motor-impaired to interact with it.

In this "Color Master" game, the computer randomly fills a four-block pattern, choosing from seven colors, with repeats possible. The user tries to duplicate the hidden color pattern within ten guesses. The user's guesses are usually given by typing a letter or number for each color in the guess. To make this game more accessible to the motor-impaired, a menu of choices the user can make will be presented on the computer's screen, with a moving vertical arrow indicating the current menu choice which will be made if an input device is activated.

Figure 1 shows a typical layout for this game on the VIC computer's screen. The blocks for the user's ten possible guesses appear in the middle of the screen and are initially set to all white. A horizontal arrow will point to the current guess on which the user is working. The menu of choices appears at the bottom of the screen and includes blocks in each of the seven possible colors, movement left or right within the four blocks of the current guess, speeding up (+) or slowing down (-) of the menu's arrow, and requesting the computer to score the user's current guess. An advantage of a menu-driven game is that no written directions are needed to see what options are available during the game, since the choices are always visible in the menu.

The computer will score a guess in two ways, which are described at the top of the screen. Under the P-score, the computer will tell how many of the colors in the user's guess are correct colors in the right positions. The C-score will tell how many other colors are correct, but in the wrong positions. When the two scores add up to four, the user will have identified all of the colors in the hidden pattern. If the P-score is exactly four, then their positions are correct as well, and the game ends. Each time a P-score occurs, a whistle sound will be heard as an audible reward.

When the game is over, at the top of the screen will appear a score, which is inversely related to the number of guesses used to successfully duplicate the hidden pattern. The score ranges from a low score of zero, if not guessed within ten tries, to a top score of ten, if guessed in one try. The user's best score is also recorded at the top of the screen.

When the program is run, a horizontal arrow will point to the first row of white blocks which the user will be filling with his/her first guess. The first block of this row will be flashing to indicate that the user's response will be with respect to this block. A moving vertical arrow will point in turn to each of the possible responses the user can make from the menu. Program 1 assumes a joystick is attached to the VIC, and that the user will push the joystick button to indicate a response.

The program can be changed to permit the use of other means of input that may be more suitable to the needs of a particular handicap. Even sounds could be used in place of the colors so that a blind person could also participate, though fewer choices and a review option might be needed in this case as well. Lines 1040, 1080, and 241 need to be changed so that any activity on the joystick will indicate a user's response. (However, joystick movement to the right will *not* be picked up by this routine. Change the = 158 in lines 1040 and 1080 to <>190, and change line 241 to = 190 instead of <>158.) To change it so that any activity on a device attached to the user port will indicate a user's response, change the 37139 in line 9 to 37138. Also change the = 158 in lines 1040 and 1080 to <>255, and the <>158 in line 241 becomes = 255. Table 1 contains a description of the program's variables so that the program's logic will be easier to follow.

Try converting some of your favorite games to a menu-driven approach for alternative input. In future columns, the rest of our series on developing a communications program will provide additional techniques in this area.

P.O. Box 36
Wallops Island, VA 23337*

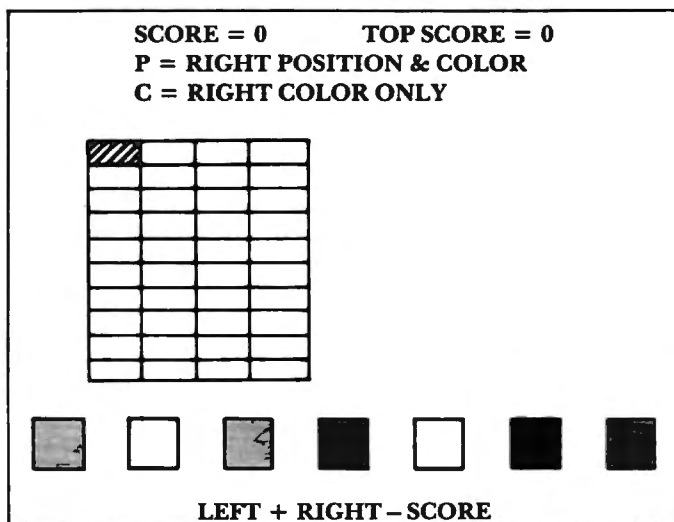

Figure 1.

Table 1.

- Line 4** DE controls the time delay for the arrow moving through the menu. Note: After a selection is made, the arrow pauses again at that selection, thereby allowing immediate multiple selections of a menu item.
- Line 5** C() contains the color codes for the menu blocks.
- Lines 9, 10** V1, V2, and PL control spacing and positioning within the menu for the vertical arrow.
- 37139 sets the data direction register for the joystick.
- 36879 sets the screen to a cyan border with a black background.
- 36878 sets the volume for sound.
- Line 20** Draws ten rows, each with four white blocks.
- Line 22** H() contains the computer's hidden color pattern.
- Lines 24,26** Print the menu.
- Line 30** At the start of the game, a horizontal arrow points at the first row of white blocks. L contains the screen line for the current guess row of blocks.
- Line 40** P indicates which block in the current guess row will flash. G() contains the user's guess, which is preset to all white.
- Line 50** B contains the color map location for the screen location of the flashing block; S is the screen location of the flashing block.
- Line 75** Looks for a SCORE response.
- Line 80** On a LEFT response, moves the flashing to the next block on the left in the current guess row, as long as it isn't already the leftmost block.
- Line 90** On a RIGHT response, moves the flashing to the next block on the right in the current

guess row, as long as it isn't already the rightmost one.

- Lines 100-110** Set the flashing block in the current guess row to the selected color.
- Line 120** Indicates the next block to the right will be the next block to flash, if not already at the rightmost block in the current guess row.
- Line 140** K() is a copy of the hidden pattern and will be used for scoring.
- Line 150-170** Y counts the P-score, which is the number of matches in both position and color.
- Lines 171-175** Whistle sound for each P-score.
- Lines 180-190** B counts the C-score, which is the number of matches only in color.
- Line 195** Checks for end of game by a correct guess.
- Line 200** Checks for end of game by running out of guesses.
- Line 210** Points to the next guess row.
- Lines 220-230** Reveal the hidden pattern.
- Lines 222-229** Update the score and top score.
- Lines 240-242** Wait for the user to respond before starting a new game.
- Line 1000** V contains the current menu item number. VL contains the screen location of the current menu item.
- Line 1020** Positions the vertical menu arrow.
- Line 1030-1060** Flash the current block in the guess row and delay the arrow at the current menu item.
- Line 1040** Looks for a user's response on the joystick button.
- Line 1080** Waits for the user to release the joystick button in order to eliminate a "keyboard-bounce" type problem.
- Lines 1089-1110** Code menu item's function with respect to the arrow's position.

Review:

Four Atari Games

Charles Brannon
Editorial Assistant

As software developers discover and exploit more and more of the Atari's features, the games become more colorful, dazzling, and exciting.

DataSoft's four new games, *Canyon Climber*, *Pacific Coast Highway*, *Clowns And Balloons*, and *Shooting Arcade*, are of this type. All these games show off the graphics and animation capabilities of the Atari. New graphics techniques are used to allow fine scrolling of multicolor playfield objects at varying speeds (a feat normally impossible, but it looks like it's done here with DLI's and the four-color character modes 4 and 5).

Shooting Arcade is a most attractive game, with a display just like the carnival game. Bouncing, quacking, twisting, and flashing targets invite you to shoot, but you had better be accurate — you have a limited supply of bullets. Run out of ammunition and the game is over. If you clear the screen, you

Shooting Arcade

can shoot a cagey bear for bonus points, and play again against a faster set of targets.

There is a row of faces that alternate between

happy and sad. Hit a sad face and you get another bunny to shoot. The music, color, and smoothness are sure to make the game popular.

Rush Hour At 1.79 MHz

DataSoft is sure to score a hit with its *Pacific Coast Highway*. As either a turtle or a rabbit, you must try to cross a busy California freeway as you try to make it to the beach. Once there, you must hop (yes, the turtle can hop!) from surfboard to surfboard in search of the ultimate goal, bonus points.

The game is divided into two screens, a highway and a water scene. Each successful crossing makes the game more difficult. In the two-player game, the classic contest of turtle vs. rabbit is re-enacted.

Pacific Coast Highway

Pacific Coast Highway

A frustrating aspect of the game is that if one player gets hit (or takes a plunge), both players have to start over.

Canyon Climber

The animation is in "strips" of screen (a by-product of the graphics technique), but it suits this game very well. If you didn't know better, you'd think the Atari could control dozens of multicolor "sprites," as cars whiz and hum, and boats drift lazily along. The police car even flashes its lights!

Canyon Climber is similar to *Donkey Kong*, in the way that *Pac-Man* is like *Head-On*, or *Galaxians* is like *Space Invaders*. *Canyon Climber* is a "theme" game, where a little man you control with a joystick can run, jump, climb, wield a shield, blow up bridges, leap over obstacles in a single bound, or even fly! It's not an adventure game. These possibilities are just integrated into the game, as hitting barrels with a hammer is part of *Donkey Kong*.

Canyon Climber is really several games in one. The first level involves setting charges on various bridges, and then detonating them. You must evade malevolent goats that are determined to butt you to the bottom of the Grand Canyon. Assuming success, you advance to the second screen, where you dodge Indian arrows (or grab a shield that temporarily deflects them) as you wend your way to the top.

If you make it this far (don't count on it), you soar into the air as you progress to the third screen. Here you leap from rock to rock as you attempt to scale the canyon walls. Meanwhile, pesky (and surprisingly intelligent) birds overhead rain down rocks upon your weary head. If you can withstand this final barrage, you find yourself standing triumphant at the top of the Grand Canyon. The attainment of your goal is rewarded by a charging goat who knocks you all the way back to the first screen.

To fit a large-scale screen onto a standard TV set is quite a challenge. DataSoft uses small playing characters, but detailed settings. The graphics are less elaborate (and the colors are mostly Arizona

Clowns and Balloons

dun and orange) than the other DataSoft games reviewed, but the overall animation and execution are perhaps the best of the four.

Shenanigans At The Circus

A seemingly simple game, *Clowns and Balloons* involves maneuvering a clown-driven trampoline across the bottom of the screen with either a joystick or paddle controller. A third clown climbs a ladder and leaps out to seeming doom. Ah, but that's your job, to save the clown, and what's more, bounce him to the top of the big top! Rolling along across the top three rows of the screen is an array of colorful circus balloons.

What this boils down to is an unusual janitorial duty. You try to clear the screen of balloons. Clear out a row at a time to reap bonus points. Meanwhile, a mischievous monkey keeps blowing up more balloons. More balloons will appear if you clear an upper row before a lower one, but the monkey does not stir from his high-wire perch, unless you clear the screen when he tips his hat at you.

The animation remains fairly simple, though smooth. The sound and music are some of the best I've heard. Despite the simple theme, *Clowns and Balloons* turned out to be great fun, and inspired hours of frenzied joystick twisting. Perhaps its appeal can be compared to that of *Breakout*, a similar game where you bounce a ball to clear out a brick wall. *Breakout* is one of the most popular games in arcade history (that's B.P. – Before *Pac-Man*).

With the release of these games, DataSoft has issued an implicit challenge to game producers: use the Atari's features to the utmost.

Review:

High Orbit For Apple

Erann Gat
Oak Ridge, TN

I opened the package with anticipation. *High Orbit* seemed pretty ordinary for a computer game: a disk, some P.R. from Gebelli Software, the company that sells *High Orbit*, and a sheet of rather cryptic instructions.

I booted the disk in the usual way, and *High Orbit* immediately became very unordinary. My mouth fell open as I listened to the fastest disk boot I had ever heard. I later timed the furious "clickclickclick" of the head stepper motor: it was reading seven tracks per second! Apple DOS generally reads a track and a half per second.

The program then went into a nice demo mode which included some animated three-dimensional graphics, but nothing to give a clue as to what the game was all about. I tried for five minutes to start the game. I tried every key, but nothing worked. Oh well, when all else fails, read the directions. Aha! Control-R starts the game.

High Orbit starts with three dots that zoom onto the screen from the depths of space, which is gratifyingly free of stars. The object of the game is to "construct a space station" by moving a little fuzz ball (which represents a piece of the station) onto each of the dots using a tractor beam. To make it a bit more challenging, the dots spin around each other in a circle, and you can use the tractor beam for only a limited amount of time before it has to recharge. On top of that, there are the ubiquitous enemy spaceships that zip onto the screen and destroy your fuzz balls, so you have to start all over again. (You can destroy enemy spaceships, *if* you are fast enough, and that is a big "if.")

When (and if) you manage to maneuver a fuzz ball onto each of the dots at the same time, the space station is suddenly transformed into an abstract, three-dimensional shape which undergoes some breathtaking gyrations, splits in two, and starts spinning again.

The next phase is to "energize" the space station by moving yet another fuzz ball into the center (and I do mean the *exact* center) of the station and zapping it with your laser. Enemy spaceships will again try to destroy your supply of fuzz balls before you can get one fuzz ball into the center and

destroy it.

If you are successful, the station stops spinning, becomes rainbow colored, and turns itself inside out, depositing the "crew" in deep space. The crew of the space station is just three little humanoid figures which pop onto the screen and do not move. The space station drops back into the depths of space, giving the impression that the crew is being launched into high orbit (hence the name of the program).

The last and final phase consists mainly of watching a shuttle pick up the crew. According to the instructions, you have to move the crew in front of the shuttle with your tractor beam, but I never had to. The shuttle seems to know where to go, and it will even destroy enemy spaceships that stray too close.

So how do you lose? Enemy spaceships cannot destroy you; in fact, you cannot be destroyed at all. Aye, but here's the rub: the space station must be constructed and energized before time expires. You get about two minutes to finish. If you do not, the game stops, and "mission incomplete" flashes on the screen.

If you do manage to complete a station within the time limit, you get a new station to build, but this one has four points instead of three. This goes on until you complete a six-point station. Then you go back to three points, but enemy spaceships get more aggressive. Every time you complete a station, a little colored square appears in a long hollow bar at the bottom of the screen. The bar is very long; I managed to fill up only about one-fifth of it with colored squares. You can always restart the game at the point where you last ran out of time.

High Orbit is a unique and challenging game. The graphics are well done and use the Apple's color capabilities to their fullest. It is a joy to play, provided you use a joystick. Paddles can be frustrating, and keyboard control was a frightening experience. (One nice feature of the keyboard control, though, is that you can redefine which key controls which function.) There seem to be enough levels of difficulty to keep even the best player occupied for a long, long time (although I was not able to get past the first few levels!).

All in all, *High Orbit* is an excellent game for all ages. It is challenging but not frustrating, simple but not boring. It requires a 48K Apple II with a disk drive. A joystick is not necessary, but it is *very* desirable.

Review:

Raster Blaster

G. L. Kopp, Indianapolis, IN

After Atari introduced video games to America, old-fashioned, flipper-smashing, steel-ball-rebounding, mechanical pinball faced a notable decline in popularity until manufacturers moved into the computer age and introduced some incredibly sophisticated pinball. Now the game is back, this time in video format.

Raster Blaster, first produced for the Apple, is now available in an Atari version. The game boasts the standard fare of point-counting obstacles in its display: channels along the top which are lighted when the ball passes through them; four round bumper posts; targets in the center and on one side; a spinner and "ball saving shields" at the bottom which are always functioning during "easy" play, but must be turned on by hitting targets in the "hard" version (the only difference between the two). In addition, "Raster Blaster claws" can be enabled, which catch up to three of five balls allotted during play (a new ball replaces the one caught each time) and then releases them for multiple-ball play once all three claws have been activated.

Although the game is a masterfully written program, it is not without a glitch (I hesitate to call it a "bug.") Most of the time, the player will be able to give the ball the old one-two flip — slightly deflecting it off the tip of one flipper and catching it a split second later with the other. Often, however, if one flipper is up (they stay in that position until the fire buttons are released) and the ball passes just beyond it toward the bottom of the screen, the second flipper will not function, even though the ball is in its range. There are other occasions when the player must endure the non-functioning flipper phenomenon as well, though infrequently.

Another adjustment a pinball wizard must make is in holding the globe on the flipper to apply more than blind luck to direct it where he wants it. In mechanical pinball, the ball slides along the flipper on release until it reaches the *kill* point you know so well from playing a machine until your fingerprints are gone. Sorry, not so in the video version. Once in motion, always in motion, is the computer game style. The ball bounces lightly on the flippers, which puts the player into partnership with luck.

On the other hand, there are occasions in which the ball can be observed to pass *through* a flipper which is actually in the way of the other flipper's return shot. This rarity does make you smile and glance about to see if anyone noticed that a law of physics was broken in your favor. This same break has been observed to go the other way, however, allowing the ball to pass right through the bottom side channel railing and slip out-of-play behind the flippers.

In spite of its shortcomings, though, *Raster Blaster* is addictive, which speaks well of any arcade game. About the only feature true pinball fanatics will find missing is being able to flip the ball so hard it slaps the inside of the TV screen. Requirements for play are a disk drive, 24K of memory, *two* joysticks (accommodating one to four players), and a good deal of patience.

Raster Blaster, \$30

Four New Cartridges For VIC-20

Harvey B. Herman
Associate Editor

It seemed like Christmas in July when I received these cartridges to review. They turned out to be excellent examples of the full capabilities of the VIC. Some may have received more play than others, but all were challenging and fun to use. I think most adults will be very pleased with their purchase, and the kids who are arcade game freaks will especially like two of them (*Omega Race* and *Gorf*). *Sargon II Chess* is more a thinking person's game, and *Visible Solar System* is an interesting educational tool.

I am truly amazed at the ingenuity of machine language programmers. In the video games particularly, they use all the VIC's features. That is, color, sound, and graphics are integrated into a tour de force of gamesmanship — my word for their art. The programmers seem to be improving with each new release, so I hesitate to give numerical ratings as I am not sure what the future will hold.

Omega Race

An alien race, the Omegans, run a contest to improve their fighting skills. You are an Omegan fighter, and the command ship which you control must evade and destroy three types of enemy ships and two kinds of mines. Points are awarded for each ship and mine destroyed. The contest is played between two concentric rectangles. The central rectangle is impenetrable and displays the current score, the previous high, and the number of your remaining ships (turns). Force field boundaries, which resemble rubber bands, keep the players inside the outer rectangle.

The game is very fast-moving and difficult to master. Enemy droid ships start out with limited fire power, but improve with time. They occasionally become enemy command ships which are more deadly and become even more so when they

Omega Race

metamorphize into widely spinning death ships. Watch out for newly laid mines!

At the start of the game, you are given a choice of screen and character colors, three or five ships (turns), and either joystick or paddle control of your ship. I found paddle control easier to use, and my tiny testers agreed. I never scored very high, but one of the testers easily scored over 135,000 points starting with five men. Many of the testers preferred this game over any of the others reviewed here. A real winner for the VIC.

Gorf

The Gorfian Empire poses a major threat to the Earth. Narrative translation: Get them before they get you, or you "bite the dust."

Gorf really is four games in one. You are in control of a fighter under attack. The Gorfian attacks come in waves. Wave I is called "Astro Battles" and is reminiscent of *Space Invaders*. Three rows of Droids, controlled by a Gorf, keep coming

Gorf: Vanquish the Laser Armada

Gorf: Evade and Eliminate in 3-D

Gorf: The Final Challenge - The Mother Ship

at you. You have some protection by a force field, but that doesn't last long. Kill or be killed is your motto throughout all the waves. Wave two, assuming you survive wave one, is called "Laser Attack." Two groups – a Gorf, three attack ships and a laser ship – have a serious grudge against you. Keep out of the way of the laser power ray, or you'll be sorry. The third wave, called "Space Warp," is the most difficult. The attacks come in a spiral formation and could make you dizzy if you watch too long. Avoid the smart torpedoes which seem to zero in on you. The flagship wave is the only remaining hurdle. You must destroy the flagship's power reactor while dodging fireballs and chips from the damaged vessel. The reward for completion of all four missions is a promotion and the right to oppose an even more powerful Gorfian force.

I find this game fascinating to watch while an "expert" plays. You are in a different world. I can't seem to get past the first or second waves, but experts can evade the enemy for mission after mission. How do they do it? I have no explanation except to say that I have the same feeling of awe when I watch professional sports on television. Why can't I do that – it looks so easy?

Sargon II Chess

Chess is considered a more "serious" game. Parents who would object to their child playing a video game would probably not object to chess. Chess certainly requires more thinking than most games, although the video games do have their own best strategies. Many people feel that the thinking associated with chess is good for us, and could carry over into other areas. Whatever the case, *Sargon II* is both fun and thought-provoking at the same time, and cannot help but make more people interested in one of the world's oldest games.

Sargon II probably has the best reputation of all the microcomputer chess programs. You are playing against the computer. At the start, you are given a choice of white or black pieces and the level of play. Beginners should choose level 1 or 0. Twenty seconds is given as the average response time for level 1. If you are a masochist, you can choose level 6, where the average response time is four hours! Of course, the play is much better at the highest levels as the computer is "thinking" further ahead.

The chess board is displayed with stylized pieces, which take a little getting used to at first. After awhile there is no problem. The last five moves are shown in a box next to the board. The notation used to show moves is algebraic (E2-E4) as opposed to descriptive (P-K4). However, the capture of a piece and castling is shown by X and O-

Sargon II Chess

This program has several nice touches:

1. Moves can be made either by typing the from-to locations with the keyboard or with a joystick. In the latter case, the cursor is placed over the piece, which is then "picked up" and "set down" at the new location.
2. It is possible to correct errors or try a chess problem with the set-up mode. I tried a few simple chess problems, with which *Sargon II* had no trouble. This mode could be used to correct the only deviation from normal chess rules that I could find – pawn promotion was always to a queen.
3. At the higher levels, *Sargon II* will, at your request, tell you what it thinks is your best move. You are free to accept or reject this suggestion. It is usually a good suggestion!

I would guess that this is the most sophisticated program available for the VIC.

Visible Solar System

This program can hardly be called a game – it begins with a computer simulation of the solar system. You are in command of a spaceship which is on a tour of a scaled model of the planets in orbit around the sun. Additional features include a section displaying descriptive models of each of four planets and an "astrocalc," which gives detailed facts about the first six planets. Do not expect any unfriendly extra-terrestrials to appear when you use this program. If they do, turn off the VIC.

I would expect this simulation to get more classroom than home use. Flying through space shows in realtime perspective what can only be read about in textbooks. You have complete control of the position of the spaceship in three dimensions. The screen shows what one would see from an operator-controlled television camera. It can be

positioned to view at any angle in an arc of 180 degrees relative to the ship. It does take some practice to get a feel for the program, and the preliminary text that comes with the cartridge is quite helpful. However, I believe an experienced teacher would be even more so.

In spite of my minor objections, *Visible Solar System* is the kind of program I would like to see more of. We have plenty of good games – I like to play them myself – but what we really need is more programs which can be used in teaching. They probably are more difficult to write effectively, and they may not sell as well, but they have a unique value.

Review:

CURSOR: Issues 23 Through 28

Marlene R. Pratto
Greensboro, NC

If your school is fortunate enough to own and use PET/CBM microcomputers, you can build your software library with programs from *CURSOR*. *CURSOR*, a cassette magazine, is published by Ron Jeffries of Code Works in Goleta, California.

Programs on *CURSOR* cost less than one dollar each, but are worth much more. I have classified *CURSOR* programs from issues 23-28 for children from kindergarten to eighth grade. In addition to five general classifications, I have added a sixth classification, TL, for Tools. Tools are those *CURSOR* programs which enable a user to program more effectively and with less effort (for example, *X-REF*) or to do other work more efficiently than without a program (*Repair*).

These tool programs may be used in a school setting. *X-REF* provides a cross-reference of variables used in a program, and *RE-NUM* renumbers the lines in a BASIC program.

One kind of "tool" program can also be used in schools to aid teachers, media specialists, and administrators in their work. In addition, students may use these tools to learn more about current and potential uses of computers. These programs enable the students to "do work" rather than to gain skills to be used later or to learn a body of knowledge. The children will learn skills and gain knowledge, but in a context different from the drill and simulation programs frequently used with children.

The *Repair* program mentioned previously can be used as a library checkout system. The program forms a file of items to be repaired. A record for a customer consists of a tag, name, amount, and location. A school media center could use the program to keep track of the books checked out to various rooms or units within the school. The tag would be the call number of the book; the

name, the title of the book; the amount, the due date, such as 12.3 for December 3; and the location, the room number or unit. The program could also be used for checking out books to individuals, depending on the call number to identify the book and using the name as the name of the borrower.

The program is flexible, menu driven, and easy to use, and could be used by children in the media center. What a nice way to introduce children to the variety of uses of a computer.

The *Mail* program from *CURSOR* 25 is quite valuable. *Mail* creates and maintains a file of names for generating mailing labels. Letting children think of other ways to use the *Mail* program will help them learn new uses for other computer programs. One great advantage of *CURSOR* programs is that they are not protected; we can list them, change them, or make them into new programs when we or the children want to or are able to.

Several of these programs are usable by two persons at the same time. Among these is "*Mwhiz!*". A mathematical statement is printed on the screen. Each person tries to determine if the statement is true or false and then to press the appropriate button before the other person. This certainly makes learning mathematics enjoyable.

Maxit is a clever and challenging game which can be played against the PET to learn some skills and strategy (hence the DT classification below) before playing with another person. Other two-person programs are *Ambush!* and *Tank!*.

One program, *Safe!*, can be played by sight-handicapped children. The program simulates cracking a safe – the child listens to the clicks as he turns the knob by pressing the number pad. The game does use graphics, but the player does not have to look at what is on the screen to "crack the safe."

Enigma should send many children on a search for information about coding and decoding in World War II. Using and learning about *Enigma* is fascinating.

Strictly speaking, *Printsit* requires a printer so that children may print the pictures they have made on the screen. However, the program can be enjoyed whether or not the pictures can be saved.

Some of the *CURSOR* games can be played at several levels. Younger children can start playing at the lowest level, and as they build up playing skills they can move to higher levels. Older children can start at higher levels. Frequently, the highest level in a game is a real challenge to even the best computer users. Multiple levels allow many children in a school to use the same programs. This provides for discussion among the different age levels and for a pleasant learning atmosphere.

One of the most congenial programs from these *CURSOR* issues is *Miser*, an adventure game. *Miser* was played continuously for two months at Erwin Open School, where it was the topic of both intense and casual conversations. Children exchanged information about what was hidden where. They used a thesaurus to look up alternative words when they could not make the computer take action. Some people think that personal computers will lead to fewer human conversations, but this program resulted in much conversation and cooperation.

Perhaps adventure style games have benefits beyond the social involvement and program solving. Because *Miser* and other adventure games have a restricted set of words that they understand, the player may know what to do, but not how to make the computer do it. This is similar to learning a programming language. The potential programmer may know what he/she wants the computer to do, but he/she must learn the words of the programming language used. Each computer language is a small subset of the language that humans know.

One of the programs, *Test*, will help teachers in grading. This program is nicely designed and even has its own example data to demonstrate what it does.

Our school here continues to find *CURSOR* an excellent resource for its PET microcomputers. The children have maintained their interest in computing over the past two and one-half years, and the newer children are quick to make friends with the PETs.

Review:

Meteorites And Red Alert For Sinclair/Timex

Tom R. Halfhill
Features Editor

As popular as the Sinclair ZX-81 computer has been in the U.S. (reportedly 300,000 sold), it has been an even bigger hit in the country of its birth, Great Britain. There, the ZX-81 (and its predecessor, the ZX-80) is the microcomputer most often found in thousands of households and hundreds of schools. For one thing, it has been available there longer than in the U.S.

It's no surprise, then, that some of the best software written for the Sinclair has come out of Britain. The large number of Sinclair users there has created both the market and the labor pool for quality software development.

A New York firm, Softsync, Inc., recently arranged to import some of that British software. Softsync's first two releases are arcade-style space games. They are being sold in Britain by a company called Quicksilva under the names *Asteroids* and *Scramble*. However, Softsync is repackaging and selling the games here as *Meteorites* and *Red Alert*.

The games are as playable, and the action as fast, as games available for machines costing many times the Sinclair's \$99.95 price.

Both are one-player games compatible with the new Timex TS-1000, a version of the ZX-81 that Sinclair has licensed the watch company to market in the U.S. Both games come on cassette tape and require the 16K RAM memory expansion module.

Meteorites

Meteorites (néé *Asteroids*) is patterned after the popular coin-op arcade game. Basically, you have to defend your spaceship against oncoming hailstorms of space rocks. The game starts with your ship

centered on the screen while meteorites drift randomly by. To aim, you press the "6" key to rotate the ship counterclockwise, and the "7" key to rotate clockwise. Pressing the "0" key fires a stream of torpedoes. Hitting the "9" key fires the engines and moves the ship in whatever direction it is pointed.

Because of the Sinclair's low graphics resolution, it was not possible to represent the ship with a graphics shape. Instead, the game uses a numeric character from "1" to "8" to represent the ship and its orientation. That is, the character "1" means the ship is pointed "north" (the 12 o'clock position); a "2" means the ship is pointed northeast; a "3", east; and so on. Although this might sound awkward, I had no trouble adapting to the system.

The meteorites start off as graphics shapes, and split into five "0" characters when hit by your torps. These smaller pieces are then blasted out of existence by further hits. Screen wraparound is supported, which means objects can leave one side of the screen and emerge on the other.

Although the graphics effects in *Meteorites* are sparse (there are no fancy explosions), it is a tribute to the 3K machine language program that so many objects can be moving on the screen at once without noticeably slowing down the action.

According to the instructions, a bonus spaceship is awarded at 10,000 points, although my coordination deficiencies foiled persistent attempts to verify this feature.

Interestingly, the game's skill level can be varied by POKing numbers into certain memory locations. For example, you can increase the number of points at which bonus ships are awarded, or vary the number of ships you start off with, or change the firing pitch of torps. These features should keep the game challenging for advanced players.

Red Alert

Red Alert resembles the popular arcade game *Defender*. A random landscape of mountains and valleys scrolls horizontally at the bottom of the screen, lending illusory motion to your spacecraft. This ship can be moved up or down with the cursor-up and cursor-down keys (the "7" and "6" keys, respectively). The control is surprisingly responsive, and it takes some flying practice to keep from clipping tall peaks or bumping into the top screen border — especially since either mishap blows the ship to pieces.

There's not much opportunity to dally around practicing, though. For one thing, flocks of alien ships keep zooming across the screen head-on into your path. The aliens try to destroy you in three ways: by firing missiles, by kamikaze charges, and

by tricking you into dodging so fast that you hit either a mountain or the top of the screen. The last tactic is often the most annoying; just when you're congratulating yourself for evading the latest wave, you suddenly notice that your ship is rocketing headlong into a cliff. Unfortunately, there's no ejection seat.

You can do more than just dodge around, of course. Pressing another key fires your own missiles at the aliens, and they're even worse at evasive actions than you are. Knocking off a couple of them at the outset makes it easier to dodge the rest.

Red Alert would be good enough if this were all you had to worry about, but the programmer tossed in two more wrinkles. First, there are alien bases on the ground which present additional scoring opportunities. Daring (and presumably skillful) pilots can skim the surface, blasting the alien bases with missiles. This is a risky maneuver, however, since the slightest descent (accidental or provoked by the aliens above) reduces your ship to flying fragments.

Anyway, some of the bases are in valleys, protected from your missiles by flanking slopes. This forces you to resort to another method — your bombs. Pressing the "9" key drops one or a few

bombs at once, destroying anything on contact. Like flying the ship, however, it takes some practice to learn how to properly "lead" the targets.

As a final twist, there are also some alien ships based on the surface. If you don't destroy them before they take off, they launch into a kamikaze path straight for your spacecraft.

The most amazing thing about *Red Alert* — and *Meteorites* — is that so much complex action happens simultaneously at relatively high speeds. Many Sinclair owners have been frustrated because so much software for their machines is written in BASIC. Both of these games are written in machine language, and it shows. In both cases the programmers have made the most of the Sinclair's capabilities. Of the two, *Red Alert* has the better graphics and arcade-style play, but both are top-shelf games that Sinclair users deserve.

Book Review:

PET Fun And Games

Jim Butterfield
Associate Editor

CURSOR magazine has been notable for several reasons. It's not a paper publication; the magazine is issued on cassette tape containing a "cover program" and five other PET/CBM programs. The programs are entertaining and of very high quality. And the price is surprisingly low.

CURSOR's programs haven't been exclusively games; a number of serious applications and utilities have been included over the years. But it's the games we remember best, and many of the *CURSOR* games have been memorable.

While *CURSOR* magazine ceased production with issue 30, back issues can still be obtained, and *CURSOR* may be making the transition from magazine to software house. Your dealer may stock the back issues or you may write *CURSOR* magazine at the address given in the book's Introduction.

Tape To Paper

If you can get the programs on tape, why bother with the book? After all, you can list the programs yourself. Well, the book is quite inexpensive. It is a collection of many "favorite" programs all in one place. And the program listings are useful for study. It's handy to have the game and its instructions in an easy-to-find location.

Since the book is limited to BASIC programs, some of *CURSOR*'s excellent machine language programs are not included. No worry: there's quite enough good material here to keep the reader busy and entertained. I must confess that I miss some of the classics that are too big to fit into the book: Ken Morley's "Phuzzy" and "Wuzzy" stories, for example.

Users who have both tape and book versions of a program may notice slight differences. These are usually small, cosmetic, and of no great importance.

The Games

If the book were called "PET Exercises, Simulations, and Challenges," it might enjoy more appeal in the

educational community. The word "games" seems to be taboo in some quarters. Yet games are what they are, and they're great fun.

The back cover of the book claims that 30 games and puzzles are included. I count 31. Thirteen of them are written by Glen Fisher, one of the book's editors. The remaining 18 are by various contributors. I wish that the authors' names had been included in the table of contents. There's no easy way to find a given author's programs. I would also have liked to see a cross-reference to the particular *CURSOR* issue which carried the game.

The games are divided into six sections: Action Games, Puzzles, Games of Risk, Games of Strategy, Games of Chance, and Games for Fun. These sections are somewhat arbitrary. Many games could be listed in any of several divisions.

Some are old standbys. *Reversi* and *Master Mind*, for example, are well known in many versions: ancient, computer, and commercial. Others are new, witty, and well suited to computers. *RAT-RUN* and *FIRE*, for example, are nicely animated and play well.

There are many styles of games. Some are action, some thoughtful. Some have the computer

as an active player; in others, the computer just enforces the rules. Some are involved with handling words and numbers, others with graphic objects. You'll get a good cross section with this book.

VIC-20[®]
COMMODORE

"Pixelator" is an easier way to design custom characters for the VIC. Three accompanying programs let you save and load the character data from cassette and convert it into DATA statements — ready to use in a program. If you don't want to type everything in, the author has offered to make tape copies (see information at the end of the article).

PIXELATOR

James Calloway
Morrisville, NC

The first time you design your own characters on the Commodore VIC-20, the process can be downright thrilling. Marking off graph paper in eight by eight squares and drawing in a figure. Converting each line into a number as if the dark squares were binary one and the light squares were binary zero. Storing the numbers in memory.

Then you POKE the magic address, 36869. The screen fills with gobbledygook. But wait! Isn't that a space ship there where the "A" of READY is supposed to be? And that three-legged alien must be the "D."

Once the thrill wears off, the work can turn to drudgery. Converting your design into numbers is bad enough, but the job of typing all those numbers into DATA statements is not only boring but also subject to typographical error. A slip of the finger and your beautiful rocket cruiser looks as if it had been shot full of laser holes.

Designing Characters With Pixelator

A program called "Pixelator" restores some of the thrill of designing screen characters. Pixelator gives you four large eight by eight work areas on the screen for creating, editing, and comparing characters. Pixelator then stores those characters in RAM. On standard VICs with 3.5K memory, Pixelator will store up to 64 characters. With additional memory, the program will store up to 128 characters; it also can retrieve from memory any character you have already stored. You can even copy from the VIC's own ROM character set and change those characters to suit your needs.

Like most small computers, the VIC stores mosaics or maps of its characters in ROM (addresses 32768 to 36863). Unlike some other computers, whose characters may be five pixels wide by seven pixels tall, the VIC's characters are eight by eight. (A pixel is simply the smallest portion of the video image that a particular computer can control.) That makes the VIC's characters look a bit squat,

but it's a tidy use of memory. Eight bytes are needed to describe a single character, with each byte corresponding to a horizontal line of the character. The vertical information comes from breaking the bytes into binary ones and zeros, corresponding to dark and light areas.

Just Enough Memory

By POKEing different numbers into address 36869, you can change where the Video Interface Chip looks for its character maps. You do this automatically when you change the keyboard from graphics to text mode. Graphics is a value of 240 at 36869, and text is 242. The value in between, 241, represents reversed graphics characters, but using the reversed characters doesn't normally change the value at 36869.

A value of 252 moves the map location to 4096, the start of standard 3.5K memory. Above 252 the corresponding address increases by increments of 1024, up to 7168 for a value of 255. Because of the length of the Pixelator program, it uses the highest value. (For a fuller explanation of what happens at address 36869, consult Jim Butterfield's "Browsing the VIC Chip" in the April 1982 issue of **COMPUTE!**.)

The Pixelator program, once it is up and running, consumes almost 3K of memory. On VICs that haven't been expanded, that leaves just room enough to store 64 characters. That limit coincides with the fact that the second half of the map memory starting at 7168 corresponds to screen memory in most machines. We'll discuss a way of getting around this 64-character limit later.

Of course, with expanded memory, all you have to do is select a memory location that doesn't interfere with screen memory. Sometimes the problem is solved automatically because the screen memory moves (as do the screen color addresses). The three variables in line 20 allow you to change the program to compensate. XX is map memory and should always be a multiple of 1024. SC is screen memory. CL is color memory.

When you run Pixelator, you first are offered a choice of creating a new character or retrieving an old one from memory. The choices are color-coded green and cyan, respectively. If you select "new character" by pressing the programmable key F1, the border changes from white to green, and you are asked to select one of the four work frames by keying F1, F3, F5, or F7. Next you are asked to select the character at the address where you intend to design a new shape.

Four Options Following Design

Once you've selected a character, you'll see a half-height dot screen figure pop up in the top left corner of the frame. That's your cursor, and you

can move it anywhere within the frame by using the cursor controls. To design a character, use the space bar. SHIFT/SPACE leaves a trail of red spaces in its wake. Without shifting, the SPACE bar returns the spaces to white. You can clear a cluttered frame simply by holding the SPACE bar down until all the red is gone.

After you have worked on the character to your satisfaction, you have four options. F1 stores your creation in the appropriate eight bytes of memory and then returns you to the opening format. F3 aborts the frame, returning you to the opening format without storing the character. F5 renames the character, enabling you to reassign it to a memory location different from the one for which it originally was named. This is of more use when retrieving characters from memory than when creating new ones, but it works in both modes. F7 allows you to work on a series of characters without having to go through the "select frame - select character" process every time. The command stores the current character, jumps to the next frame, and increments the character name. You can keep doing this until you have stored the question mark, at which point you are returned to the opening format.

If at the opening format you opt to retrieve a character from memory, the border changes to cyan, and you are given five choices. F1 retrieves from RAM; i.e., it accesses either characters you have already stored or whatever garbage happens to be in memory at the time. F2 accesses the VIC's ROM characters from the graphics mode, and F4 calls up the reverse of those characters. F6 and F8 are for text mode, the latter key again applying to reversed characters. You can freely mix characters from all modes and modify them to suit your needs. (If you need a full alphabet to go along with your custom characters, there is a short cut, provided you store your characters at 7168. After POKEing 255 into 36869, you can use RVS ON to get any normal character from "@" to "?". RVS OFF gives you your custom characters. This works only at 255.)

From there you are asked to select frame and select character again, but if you call up a graphics character (or, in text mode, an uppercase character) from ROM, you will be asked to rename it to something with a screen value less than 64. You now have the same options as before: to store, to abort, to rename, or to store and increment. If you have renamed a character, both the original character and its new name will be incremented.

Saving Your Custom Characters

More than likely, you will want to use Pixelator to create characters for use in some other program,

such as a video game. Three shorter programs allow you to save the information the Pixelator has created. To save the characters directly on cassette as a data file, interrupt the Pixelator with the STOP key and type NEW to get rid of the program. Then load "Pixaver" into the VIC. Pixaver allows you to save a block of characters of any size, up to 64, on tape as a single data file. The first number in the file represents the screen value of the first character; the second number is the last character. This allows you to record as many different blocks as you like. Each file will contain the information necessary to store the data in the right place. Also, for convenience, each file will be tagged with the name of its first character. Now you can turn your VIC off.

The "Pixeloader" program will read the data off the cassette and enter it back into memory. Notice line 10, which sets the value of XX, the start of map memory. By changing that value, you can load character data into many different memory locations, thus bypassing the 64-character limit. Be sure that XX is a multiple of 1024, or else the characters won't properly correspond to the keyboard.

A third accessory program, called "Pixdata," will convert a block of RAM character memory into DATA statements, one for each character. The line numbers of the DATA statements will correspond to the screen value of the characters, plus 5000. DATA statements are highly inefficient, memory-wise, for storing that information, but they are much more convenient than cassette data files because they can be included within a program, which saves you the trouble of loading the characters separately.

Pixdata is not as user-oriented as the other programs because it has been stripped down to bare essentials. You probably will have to modify some lines of Pixdata each time you run it. The values SR and LS initialized in line 30, for example, represent the first and last characters, respectively. If you have only 3.5K of free RAM, don't do more than 30 characters at a time, because you'll run out of memory.

What makes Pixdata interesting is that it self-destructs, saving you the chore of deleting it line by line to make room for your own program. (If you type Pixdata in by hand, be sure to save it on tape or disk before trying it.)

The secret of Pixdata lies in the way the VIC-20 stores BASIC lines. The first two bytes of a line represent the address of the *next* line. The third and fourth bytes are the line number. After that, the line consists of numbers that represent either tokens for BASIC commands (the token for DATA is 131) or the ASCII values of string characters. All numerals are treated as strings, so a DATA state-

22-40-80 HIKE!

Expand your VIC to 80 columns.

Quantum Data's new Video Combo Cartridge brings you: 40 or 80 column display, plus 16K RAM and PROM socket. **\$299⁰⁰**

With the Video Combo Cartridge from Quantum Data you can now have 40 or 80 column display, 16K RAM and PROM all in one cartridge. It comes set for 40 column Display compatible with the VIC video modulator and your home T.V. Then, when you are ready to upgrade to 80 columns and a video monitor, just make a simple,

no-cost change inside the cartridge. Instructions are provided. Also provided is a socket for a PROM, 16K of memory and AC adaptor. If you don't need memory, then 80 columns can be yours for only \$199.50. A listing of the driver software is provided at no charge. A programmed PROM containing this software is also available for \$19.95.

ODI expander:

- Expands Basic user memory up to 24K in 8K steps
- PROMS may be mixed with RAM in 8K blocks
- 8K can be assigned to machine language area
- Plugs directly into VIC expansion port
- Low power, no additional power supply required
- Professional Quality, full buffering on all signals
- Small size: 6 x 4.5 inches.

16K expander \$149.95
24K expander \$199.95

ODI Printer RS-232 interface:

- Provides RS-232 voltage conversion for VIC serial port
- Allows use of a wide variety of RS-232 peripherals including printers, modems and voice synthesizers
- Low power CMOS circuitry requires no external power supply
- Small size: 2½ x 3 inches

Printer \$49.95

ODI Minimother:

- Adds 3 slots to the memory expansion port
- Removable card guides allow either boards or cartridges
- Requires no additional power supply
- Fused to protect VIC power supply from overload
- Simple plug-in installation

Minimother \$69.95

QUANTUM DATA, INC.

ment may need as many as three bytes to represent a single numerical value. The number 128, for example, becomes 49, 50, and 56. Throw in a 44 for each comma, and you see why a DATA statement can use up more than four times the memory needed to store the numbers it represents.

Pixdata starts creating DATA statements at 5120, which is represented by the variable ZZ in line 40. Line 10 also sets 5120 as the end of BASIC memory, thereby protecting the DATA statements from the program itself. When Pixdata finishes creating DATA statements, it POKEs the low-high values of ZZ into the first and second bytes of line 1, the line that says "REM DELETE THIS LINE AFTER RUNNING." This causes BASIC to skip from line 1 to the first DATA statement, ignoring the rest of Pixdata in between. When you delete line 1 (simply type a "1" on a blank line and hit RETURN), the line editor compacts the DATA statements to the beginning of memory, destroying Pixdata in the process. If by adding RAM you have changed the start of BASIC memory, be sure to adjust the two addresses in line 170 accordingly before running Pixdata.

To use the DATA statements in a program, you will need a line like the following:

```
FORL=SR TO LS:FORM=0TO7:READ C:POKE
XX+L*8+M,C:NEXTM:NEXTL
```

The values of XX (map memory), SR (first character screen value), and LS (last character) should be the same as they were in Pixdata.

Pixelator and its companion programs should take some drudgery out of designing characters, but the programs themselves aren't much fun to type in from scratch. I will be glad to make cassette dubs of the programs for the standard fee of \$3 a copy. Write "Pixelator" on a blank cassette and send it with a stamped, self-addressed mailer to James Calloway, Route 2, Box A-2, Morrisville, NC 27560.

The following articles in **COMPUTE!** provided valuable information and inspiration for the Pixelator: Jim Butterfield's "VIC Memory Map Above Page Zero" (January 1982); Doug Ferguson's "Large Alphabet for the VIC" and Butterfield's "More VIC Maps" (March 1982); Butterfield's "Browsing the VIC Chip" and Charles H. Gould's "Renumber VIC-20 BASIC Lines the Easy Way" (April 1982).

MIS VIC-20 SOFTWARE

TWO NEW ARCADE GAMES! 100% MACHINE 100% FAST

You were on a routine patrol through an uncharted asteroid belt when you were caught in a . . .

GALACTIC CROSSFIRE

Will you survive?

• **GALACTIC CROSSFIRE** is a multi-color hi-res arcade game that runs on the unexpanded VIC-20 JOYSTICK REQUIRED.

• **ALIEN SOCCER** is a multi-color hi-res arcade game that runs on the unexpanded VIC-20 using JOYSTICK, KEYBOARD, or PADDLES.

GALACTIC CROSSFIRE and **ALIEN SOCCER** are available on cassette with complete documentation, enclosed in an attractive vinyl binder for \$14.95 each.

MIS produces the finest educational, recreational, and functional software available for the Commodore VIC-20 Personal Computer. Ask for MIS software at your local computer store or order direct from MIS. VISA, MASTER-CARD, phone orders, and C.O.D. accepted. California residents add sales tax.

ALIEN SOCCER

MIS

250 Fern Rock Way
Boulder Creek, CA 95006
(408) 338-9546

Life begins at 40!

Especially with **TERMINAL-40**, the NEW standard of excellence in telecommunications for the VIC-20. This unique program gives **40-character lines** and **smooth scrolling** entirely through software; no expensive hardware to buy! **TERMINAL-40** also features a **4K (or larger) Receive Buffer** with screen review and printer output. Function keys are defined for instant access to frequently-used modes. Fully programmable Baud, Duplex, Parity, Wordsize, Stopbit, and Linefeed; supports control characters. Requires standard VIC-20 with 8K memory expansion and suitable modem. VIC printer optional. 24 p. manual.

TERMINAL-40 . . . \$29.95

UN-WORD PROCESSOR 2 . . . \$19.95

The improved UN-WORD retains the practicality and economy of the original. Easy-to-use text entry and screen editing. Use with any size VIC (5K to 32K). Supports VIC printer, RS-232 printers*, and now parallel printers*, too. Handy user Menu selects: single- or double-space, form feed, print width, number of copies. Supports printer control codes. With complete documentation.

Word Processing may be the single most-popular application for the VIC, and UN-WORD does so much for so little. *Don't miss out!*

Expansion Board for the VIC 20

GOSUB International, Inc. presents

The CARDBOARD for the VIC 20! The CARDBOARD is an expansion motherboard for use with Commodore's VIC 20. It has six slots that will accept any VIC-compatible cartridge in any configuration.

Increase RAM up to 40K and use several utility ROMs plus have several games online, all switch selectable!

The CARDBOARD can be daisy-chained, giving the user an almost unlimited number of available expansion slots.

A system reset switch has also been added to the CARDBOARD allowing the user to select and/or restart games without turning off the computer.

All this for only \$119.95 plus \$1.50 S/H
VIC Light-Pen only \$24.95

To order send check or money order to:

GOSUB International, Inc.
501 E. Pawnee, Suite 430
Wichita, Kansas 67211
(316) 265-9858

VISA and MasterCard phone orders also accepted
Send \$1.00 for catalog of other VIC 20 items and software.

VIC 20/PET/CBM OWNERS

WALLBANGER - Blast your way through the dodge'm, blast'm, and attack modes. If you destroy the bouncing balls before they destroy you, the walls close in for the next round. Wallbanger is written in machine language, has great sound, and encourages complex strategies.

KMMM Pascal for PET/CBM \$85

A subset of standard Pascal with extensions.

- Machine language Pascal Source Editor with cursor oriented window mode
- Machine Language P-Code Compiler
- P-Code to machine language translator for optimized object code
- Run-time package
- Floating point capability
- User manual and sample programs

Requires 32K Please specify configuration.

EARL for PET (disk file based) \$65

Editor, Assembler, Relocator, Linker

Generates relocatable object code using MOS Technology mnemonics. Disk file input (can edit files larger than memory). Links multiple object programs as one memory load. Listing output to screen or printer. Enhanced editor operates in both command mode and cursor oriented "window" mode.

RAM/ROM for PET/CBM

4K or 8K bytes of soft ROM with optional battery backup.

RAM/ROM is compatible with any large keyboard machine. Plugs into one of the ROM sockets above screen memory to give you switch selected write protectable RAM. Use RAM/ROM as a software development tool to store data or machine code beyond the normal BASIC range. Use RAM/ROM TO LOAD A ROM image where you have possible conflicts with more than one ROM requiring the same socket. Possible applications include machine language sort (such as SUPERSORT), universal wedge, Extramon, etc.

RAM/ROM - 4K \$75
RAM/ROM - 8K 90
Battery Backup Option 20

SUBSORT by James Strasma \$35

Subsort is an excellent general purpose machine language sort routine for PET/CBM computers. Sorts both one and two dimensional arrays at lightning speed in either ascending or descending order. Other fields can be subsorted when a match is found, and fields need not be in any special order. Sort arrays may be specified by name, and fields are random length. Allows sorting by bit to provide 8 categories per byte. The routine works with all PET BASICs, adjusts to any memory size, and can co-exist with other programs in high memory.

SuperGraphics 2.0 NEW Version with TURTLE GRAPHICS

SuperGraphics, by John Fluharty, provides a 4K machine language extension which adds 35 full featured commands to Commodore BASIC to allow fast and easy plotting and manipulation of graphics on the PET/CBM video display, as well as SOUND Commands. Animations which previously were too slow or impossible without machine language subroutines now can be programmed directly in BASIC. Move blocks (or rocketships, etc.), or entire areas of the screen with a single, easy to use BASIC command. Scroll any portion of the screen up, down, left, or right. Turn on or off any of the 4000 (8000 on 8032) screen pixels with a single BASIC command. In high resolution mode, draw vertical, horizontal, and diagonal lines. Draw a box, fill a box, and move it around on the screen with easy to use BASIC commands. Plot curves using either rectangular or polar co-ordinates (great for Algebra, Geometry and Trig classes.)

The SOUND commands allow you to initiate a note or series of notes (or even several songs) from BASIC, and then play them in the background mode without interfering with your BASIC program. This allows your program to run at full speed with simultaneous graphics and music.

Seven new TURTLE commands open up a whole new dimension in graphics. Place the TURTLE anywhere on the screen, set his DIRECTION, turn him LEFT or RIGHT, move him FORWARD, raise or lower his plotting pen, even flip the pen over to erase. Turtle commands use angles measured in degrees, not radians, so even elementary school children can create fantastic graphic displays.

Specify machine model (and size), ROM type (BASIC 3 or 4)
SuperGraphics in ROM \$45

Volume discounts available on ROM version for schools.

for PET/CBM Computers

FLEX-FILE is a set of flexible, friendly programs to allow you to set up and maintain a data base. Print files with a versatile Report Writer or a Mail Label routine. Programmers will find it easy to add subroutines to their own programs to make use of Data Base files.

RANDOM ACCESS DATA BASE

Record size limit is 250 characters. The number of records per disk is limited only by the size of each record and the number of records per disk is limited only by the size of each record and the amount of free space on the disk. File maintenance lets you step forward or backward through a file, add, delete, or change a record, go to a numbered record, or find a record by specified field. The Find command locates any record when you enter all (or a portion of) the desired key. Field lengths may vary from record to record to allow maximum packing of information. Files may be sorted by any field, and any field may be specified as a key. Sequential files from other programs may be converted to Flex-File format, and Flex-File records may be converted to sequential (WordPro, PaperMate, other word processors may also use Flex-File data). Maximum record size, fields per record, and order of fields may be changed at any time.

MAILING LABELS

With typical record size of 127 characters, each disk can handle over 1000 records (about 2800 with 8050 drive). Labels may be printed any number wide, and may begin in any column position. There is no limit on the number or order of fields on a label, and two or three fields may be joined together on one line (like first name, last name, and title). A "type of customer" field allows selective printing.

REPORT WRITER

Print any field in any column. For numeric fields, use decimal point justification (and round to any accuracy). Define any column as a series of mathematical functions performed on other columns. These functions include arithmetic operations and various log and trig functions. Pass results of operations such as running total from row to row. At the end of the report, print total and/or average for any column. Complete record selection, including field within range, pattern match, and logical functions can be specified individually or in combination with other parameters.

FLEX-FILE BY Michael Riley \$80
Please specify equipment configuration when ordering.

PROGRAM YOUR OWN EPROMS

Breadboard Iron for PET/CBM \$79
EPROM Programmer with software for all ROM versions. Includes all hardware and software to program or copy. 2716 and 2532 EPROMs.

PORTMAKER DUAL RS232 SERIAL PORT 63
Two ports with full bipolar RS232 buffering. Baud rates from 300 to 4800. For PET/CBM, AIM, SYM.

FORTH for PET

BY L. C. Cargile and Michael Riley \$50

Features include:

- full FIG FORTH model.
- all FORTH 79 STANDARD extensions.
- structured 6502 Assembler with nested decision making macros.
- full screen editing (same as when programming in BASIC).
- auto repeat key.
- sample programs.
- standard size screens (16 lines by 64 characters).
- 150 screens per diskette on 4040, 480 screens on 8050.
- ability to read and write BASIC sequential files.
- introductory manual.
- reference manual.

Runs on any 16K or 32K PET/CBM (including 8032) with ROM 3 or 4, and CBM disk drive. Please specify configuration when ordering.

Metacompiler for FORTH \$30
simple metacompiler for creating compacted object code which can be executed independently (without the FORTH system).

PaperMate 60 COMMAND WORD PROCESSOR

by Michael Riley

Paper-Mate is a full-featured word processor for CBM/PET. Paper-Mate incorporates 60 commands to give you full screen editing with graphics for all 16K or 32K machines (including 8032), all printers, and disk or tape drives.

For writing text, Paper-Mate has a definable keyboard so you can use either Business or Graphics machines. Shift lock on letters only, or use keyboard shift lock. All keys repeat.

Paper-Mate text editing includes floating cursor, scroll up or down, page forward or back, and repeating insert and delete keys. Text block handling includes transfer, delete, append, save, load, and insert.

All formatting commands are imbedded in text for complete control. Commands include margin control and release, column adjust, 9 tab settings, variable line spacing, justify text, center text, and auto print form letter (variable block). Files can be linked so that one command prints an entire manuscript. Auto page, page headers, page numbers, pause at end of page, and hyphenation pauses are included.

Unlike most word processors, CBM graphics as well as text can be used. Paper-Mate can send any ASCII code over any secondary address to any printer.

Paper-Mate functions with 16/32K CBM/PET machines, with any printer, and with either cassette or disk.

To order Paper-Mate, please specify configuration.

Paper-Mate on disk or tape 40.00
PaperMate works on 16K VIC and Commodore 64 also.

BASIC INTERPRETER \$200

Designed to support the CBM 8096 (8032 with add-on 64K board). A full interpreter implementation to automatically take advantage of the extra memory available to the 8032.

PEDISK II from cgrs Microtech

5" 40 track, 1 drive, 143K \$525
5" 40 track, 1 drive, 286K 690
8" IBM 3740 format, 77 track, 250K 995

JINSAM Data Base Management System for CBM. Comprehensive version available for most configurations.

COPY-WRITER Word Processor 159
Works like expensive word processors, plus has added features like double column printing, and shorthand generator. For PET/CBM and Apple.

CASH MANAGEMENT SYSTEM \$45
Easy to use. Keeps track of cash disbursements, cash receipts, cash transfers, expenses for up to 50 categories.

WRITE FOR CATALOG

Add \$1.25 per order for shipping. We pay balance of UPS surface charges on all prepaid orders. Prices listed are on cash discount basis. Regular prices slightly higher. Prices subject to change.

Hex	Decimal	Description
0000	0	Chip directional register
0001	1	Chip I/O; memory & tape control
0003-0004	3-4	Float-Fixed vector
0005-0006	5-6	Fixed-Float vector
0007	7	Search character
0008	8	Scan-quotes flag
0009	9	TAB column save
000A	10	0=LOAD, 1=VERIFY
000B	11	Input buffer pointer/# subscript
000C	12	Default DIM flag
000D	13	Type: FF=string, 00=numeric
000E	14	Type: 80=integer, 00=floating point
000F	15	DATA scan/LIST quote/memry flag
0010	16	Subscript/FNx flag
0011	17	0=INPUT;\$40=GET;\$98=READ
0012	18	ATN sign/Comparison eval flag
0013	19	Current I/O prompt flag
0014-0015	20-21	Integer value
0016	22	Pointer: temporary strg stack
0017-0018	23-24	Last temp string vector
0019-0021	25-33	Stack for temporary strings
0022-0025	34-37	Utility pointer area
0026-002A	38-42	Product area for multiplication
002B-002C	43-44	Pointer: Start-of-Basic
002D-002E	45-46	Pointer: Start-of-Variables
002F-0030	47-48	Pointer: Start-of-Arrays
0031-0032	49-50	Pointer: End-of-Arrays
0033-0034	51-52	Pointer: String-storage(moving down)
0035-0036	53-54	Utility string pointer
0037-0038	55-56	Pointer: Limit-of-memory
0039-003A	57-58	Current Basic line number
003B-003C	59-60	Previous Basic line number
003D-003E	61-62	Pointer: Basic statement for CONT
003F-0040	63-64	Current DATA line number
0041-0042	65-66	Current DATA address
0043-0044	67-68	Input vector
0045-0046	69-70	Current variable name
0047-0048	71-72	Current variable address
0049-004A	73-74	Variable pointer for FOR/NEXT
004B-004C	75-76	Y-save; op-save; Basic pointer save
004D	77	Comparison symbol accumulator
004E-0053	78-83	Misc work area, pointers, etc
0054-0056	84-86	Jump vector for functions
0057-0060	87-96	Misc numeric work area
0061	97	Accum#1: Exponent
0062-0065	98-101	Accum#1: Mantissa
0066	102	Accum#1: Sign
0067	103	Series evaluation constant pointer
0068	104	Accum#1 hi-order (overflow)
0069-006E	105-110	Accum#2: Exponent, etc.
006F	111	Sign comparison, Acc#1 vs #2
0070	112	Accum#1 lo-order (rounding)
0071-0072	113-114	Cassette buff len/Series pointer
0073-008A	115-138	CHRGET subroutine; get Basic char

007A-007B	122-123	Basic pointer (within subrtn)
008B-008F	139-143	RND seed value
0090	144	Status word ST
0091	145	Keyswitch PIA: STOP and RVS flags
0092	146	Timing constant for tape
0093	147	Load=0, Verify=1
0094	148	Serial output: deferred char flag
0095	149	Serial deferred character
0096	150	Tape EOT received
0097	151	Register save
0098	152	How many open files
0099	153	Input device, normally 0
009A	154	Output CMD device, normally 3
009B	155	Tape character parity
009C	156	Byte-received flag
009D	157	Direct=\$80/RUN=0 output control
009E	158	Tp Pass 1 error log/char buffer
009F	159	Tp Pass 2 err log corrected
00A0-00A2	160-162	Jiffy Clock HML
00A3	163	Serial bit count/EOI flag
00A4	164	Cycle count
00A5	165	Countdown, tape write/bit count
00A6	166	Tape buffer pointer
00A7	167	Tp Wrt ldr count/Rd pass/inbit
00A8	168	Tp Wrt new byte/Rd error/inbit cnt

With this short program for the 5K VIC, you can make any key on the keyboard represent any other key. This gives you the freedom to make an alphabetic keyboard, a numeric keypad, or any keyboard plan you need.

The VIC Keyboard Redefined

Amihai Glazer
Assistant Professor of Economics
University of California
Irvine, CA

You might need to use a numeric keyboard on your VIC. As it is, all numerals are situated on the top row of the keyboard instead of being conveniently arranged in a square pattern which makes data entry easy. This program creates just such a keypad in the center of the keyboard, as shown in Figure 1. Thus, for example, hitting the space bar will be equivalent to hitting "0," and hitting the "R" key will have the same effect as hitting the "7" key.

Not only will the screen show numerals each time the appropriate keys are pressed, but the computer will actually interpret these alphabetic keys as the corresponding numerals. The program also allows the user to redefine *any* key as any other key. You can, for example, rearrange your keys in alphabetical order, or create any keyboard you like.

Type in the program and RUN it. To enable the new interpretation of the keys, type SYS 7424 and hit RETURN. You now have a numeric keypad. To return to a normal keyboard, just hit the RUN and RESTORE keys simultaneously (alternatively, you can execute the statement POKE 655,220: POKE 656, 235). Executing a SYS 7424 will bring back the numeric keypad.

You can also redefine keys of your own choosing. Type GOTO 220 and hit RETURN. Now enter pairs of keys: the key you want changed, and then its new meaning. To stop the program, hit the F1 key. Thus, if you want the key labelled "=" to mean "*", hit the "=" key, then the "*" key, and then the "F1" key. To turn on these new definitions, type SYS 7424 and hit RETURN.

What's Happening

The program works as follows. Normally, during interrupt processing every sixtieth of a second, the VIC calls the decode logic machine language program, whose address (\$EBDC) is in the jump vector in locations \$028F-\$0290. Our machine language program in locations \$1D00-\$1D14, however, sends the VIC to another machine language program we've put in locations \$1D15-\$1D24.

This program picks up the code for the key just pressed, given in location \$CB. It then indexes into a recode table (beginning in location \$1D27, decimal 7463), and puts the new code back into location \$CB. Processing continues by jumping into the normal decode logic program in ROM, which is at location \$EBDC.

The program's Lines 10-110 insert these two machine language programs into memory. Lines 120-140 initialize the recoding table, and lines 150-200 recode the keys in the form shown in Figure 1. Custom recoding by the user is provided for in lines 220-330. The recoding table is initialized in lines 230-250. CO\$ and CN\$ get the key that is being redefined, and its new definition. The codes the VIC uses for these keys are obtained from location 203 (\$CB); CO and CN are assigned these values. A code of 39 (representing the "F1" key) stops the program. The appropriate changes in the recoding table, which will be used by the machine language program, are performed in lines 310-320.

Figure 1.

```
10 REM CHANGE KEYBOARD
20 POKE 52,29: POKE 56,29:CLR
30 FOR I=7424 TO 7462
```

COMMODORE MAX PROGRAMMERS!**

Academy Software is now actively seeking quality programs for these new computers. We are especially interested in educational, musical, utility and high quality original game programs. Submit samples attention New Program Mgr. All submissions will be held in strict confidence.

FOR THE VIC-20®

ALL PROGRAMS ON CASSETTE AND RUN IN UNEXPANDED VIC

• TYPING TUTOR - \$12.95

If you've ever wanted to learn touch typing, this is for you! Makes learning the keyboard easier. 4 programs on one tape teach the keys in the correct progression. Automatically advances to new keys as your skills develop. Highly praised by customers. "Fantastic", "Excellent", "High quality".

• WORD INVADERS - \$10.95

Sharpen up your touch typing skills by blasting the invading words out of the sky before your base is destroyed. Four levels of difficulty match the letters as learned on our TYPING TUTOR program. Typing can be fun!

• FLASHCARD MAKER & FLASHCARD QUIZ - \$10.95

2 programs on one tape allow you to prepare your own study material and make it easier to learn. Quiz program has options for study, full test and easy learning mode. Keeps score and allows re-test of missed questions or entire set. Used by school systems. Includes sample data tape with 50 states and their capitals.

Shipping & handling \$1.00 per order
California residents add 6% sales tax

Visa and Mastercard orders must include full name as shown on card, card number, and expiration date.

NEW CBM-64 AND VIC-20 PRODUCTS

***** CBM-64/VIC-20 PRINTER INTERFACE *****

Model MW-302 \$119.95

This unit will interface your VIC-20 or CBM-64 to standard parallel printers such as Epson, Centronics, C. Itoh, and many others. Allows printing of full upper and lower case.

Switches to select device addresses 4 through 7. Also select ASCII or PET ASCII and bit 8 output.

36 pin connector on end of 2 foot cable. Compatible with most Centronics, Epson, etc. printers.

MW 302 PRINTER INTERFACE

***** SYSTEM 310 *** \$1195.00**

Consists of CBM-64, MX-80, Printer interface MW-302, and C2N cassette (CBM-64 sold separately for \$595)

***** DIGITAL TO ANALOG CONVERTER
OR 8 CHANNEL ANALOG TO DIGITAL
CONVERTER *****

Model MW-304v \$129.95

Allows your VIC or CBM to output analog signals or digitize up to 8 analog channels.

Intelligent Software

For the Commodore VIC-20, 64, PET, and CBM

Honestly, Bill, you've gone too far. Now who is going to believe that Mail List allows random access to 1150 files per disk, interfaces with Word Processor Plus to provide mass mailing capabilities, runs on ALL Commodore machines (V2 BASIC; min. 16K, disk drive, printer req'd.), and (you can't be serious!) costs just \$50, INCLUDING the word processor?

Well, we'll just have to see.

Also available: Copycalc (an electronic spreadsheet), \$20 (\$15 w/another program); W/P (12K, printer req'd.), \$30; BB MGR (12K req'd.), \$20; more. All prices include shipping; Calif. residents add 6%. Please specify hardware configuration. Catalog available.

William Robbins, Box 3745, San Rafael, CA 94912

... when you're through playing games.

VIC PET APPLE SOFTWARE

GRAPHVICS - super graphics package adds 18 commands to VIC BASIC Plot 152 x 160 points Hires & Multicolor modes on same screen! Text & graphics screens Save/load pictures to/from tape or disk Req. 3K/8K expander W/sample programs & user's manual \$25 [\$30].

VIC/PET VIGIL - Interactive Games Language - Program your own or play the 9 games included With 60+ powerful commands Easy to learn VIC version has color and sound (requires 3K/8K expander) Complete with user's manual \$35 [40].

VIC/PET PIPER THE MUSIC MACHINE - Simplest way to compose, conduct and play music Complete control of notes, rests, volume, repeats, tempo W/sample compositions and user's manual \$25 [\$30].

VIC HIRES/MULTICOLOR GRAPHICS UTILITIES - Add graphics to VIC BASIC Requires NO extra memory Plot points, lines and boxes in fine detail 104 x 152 points W/sample programs and manual \$20 [\$25].

NEW VIC/PET TINY BASIC COMPILERS - Produces true 6502 code Subset of BASIC supports all floating point operations Compiler listing optional if you have memory (16K PET, 8K expander VIC) For OLD, NEW, 4.0, 8032 PET or VIC with 3K 8K expander \$25 [\$30].

NEW VIC JOYSTICK DRAWING - Paintbrush for VIC MULTICOLOR mode pictures Requires 3K/8K expander and a joystick \$15 [\$20].

NEW LUCKY CHANGING for VIC - colorful fortune teller gives you insight into your life from an Oriental perspective Includes manual and 275 page guide Requires 8K expander \$30 [\$35].

NEW VIC BASIC Reference Card - Only \$2.50 [\$3.00].

PET MACHINE LANGUAGE GUIDE - hidden talents in your Old New or 4.0 ROM PET/CBM 30+ routines fully detailed \$9 [\$11].

PET TINY Pascal PLUS+ - structured language Editor, Compiler and Interpreter All programming constructs and graphics For NEW 4.0 8032 ROMS & 32K memory Disk \$50 [\$55], cassette \$55 [\$60].

NEW APPLE II DYNASOFT PASCAL - complete dev't system Editor, Compiler, Interpreter & Supervisor Data types scalars, char, array, pointer, integer Hires, Lores, machine language interface, sample programs user's manual Disk \$50 [\$55]; W/optional source code \$85 [\$90].

VIC BUDGETEER - Get control of your expenses with this visual planner Requires 3K,8K expander Available September \$25 [\$30].

VIC MACHINE LANGUAGE GUIDE - Available September \$10 [\$12].

Atari Rainbow: Colors By Page Flipping

Robert W. Myers
Charlotte, NC

Have you ever wanted more colors than are provided on your Atari? Here's how you can mix colors to produce new colors. The demonstration program uses four colors in Graphics mode 2, which are mixed two at a time to produce a total of ten different colors.

Blending Colors

All this color, like most everything on the TV screen, is really an illusion. The blending of colors takes place because the displays are changed back and forth so fast that our eyes cannot keep up with the changes. Therefore, we see only one color, which is a mixture of the colors in all the different displays. You can mix more than two colors at a time, but as the number of displays increases, the amount of flicker on the screen increases too. The practical limit is four displays mixing at once. But the ten colors that my program produces seem like a rainbow compared to the four colors normally allowed by the CTIA chip.

This mixing is done by using multiple screen RAM areas and changing the Load Memory Scan (LMS) bytes in the display list during the Vertical Blank Interrupt. I realize that this sounds like a very complicated thing to do, but it's not.

Understanding The Display List

The Display List is a program for the ANTIC chip, which is a microprocessor that controls the TV screen so that the 6502 can be free to spend more of its time doing computational chores. The Display List is in RAM, and the first byte of the Display List can be found at $PEEK(560) + 256 * PEEK(561)$.

Usually you will find that the first three bytes are the code that causes the black area at the top of the screen (to insure that nothing is lost due to overscan of the TV). The next byte is the LMS byte which sets the D6 bit (64 decimal). Added to this 64 is the ANTIC Graphics mode number, which is given in Table 1.

The LMS is a three-byte instruction. The $64 + mode\#$ is the first byte; the second and third

bytes are the address of the beginning of screen RAM.

This address is what we are interested in here. Rapidly changing it allows us to switch from one picture to another and back. We cannot do this address swapping from BASIC; it is far too slow. The LMS bytes are changed by a short machine language routine that is run 60 times a second while the picture is blanked out as it returns to the top of the screen to begin the next frame. This is *Vertical Blank Interrupt*.

The routine loads the LMS bytes with the address of the first (normal) screen RAM, then it does an exclusive-or with one of the memory locations. This causes the memory location to toggle between 0 and 1. This 0 or 1 is used to determine whether a branch will be taken or not. If the branch is taken, the next instruction is $JMP \$E462$, which puts the interrupt back in normal operation. If the branch is not taken, then the LMS bytes are changed to the address of the other (alternate) screen RAM. Then comes the $JMP \$E462$.

Using VBI

The VBI is amazingly easy to use. All you do is write your routine that is to run during the interrupt. Then write a machine language program that puts the high byte of your routine's address into the X-register, the low byte into the Y-register, and the number seven into the accumulator. Finally you $JSR \$E45C$. This second machine language program is at lines 160, 170, and 180 of my program.

After setting up your VBI to change the LMS, you print or plot and move one set of your screen RAM to the other (alternate) location that you have specified to the LMS. This technique should be usable with any multicolor display mode or any combination of display modes not only to mix colors, but also to mix text and graphics, to display mixed resolutions, etc.

NOW ATARI GIVES YOU MORE COMPUTER FOR YOUR MONEY.

Any way you look at it, the affordable ATARI 800™ Home Computer offers you the best value around. With its expandable memory capacity (up to 48K), the ATARI 800 Home Computer offers you a full range of sophisticated programs spanning everything from home finance to home entertainment. A variety of easy-to-connect accessories lets you expand your ATARI 800 Home Computer as your requirements grow.

Plan and analyze your budget, organize your files or balance your books. The ATARI 800 Home Computer is so versatile and easy to use, the sky's the limit. But why stop there? Enjoy Star Raiders, Asteroids, Missile Command and the sensational home version of Pac-Man™ computer games that make the most of the ATARI 800 Home Computer's exceptional color, graphics, sound and animation capabilities. Whatever your computer needs, the ATARI 800 Home Computer has what you're looking for.

GONE

This disk and program
was destroyed by a simple spill of milk.

NOW YOU CAN PREVENT A TOTAL LOSS

The Replica 1+1 Backup and Utilities Systems Package makes it possible for the user to build a complete reserve library to replace a damaged or faulty disk when necessary.

PROGRAM FEATURES

DISK BACKUP: Copies the sections of the disk which contain data, and also permits read and write without verify, speeding up the backup process considerably. Copies 'bad sectors' with ease. **UTILITIES PACKAGE:** Scans any ATARI disk, providing the user with information as to which sectors contain data, which are empty and which are 'bad'. Includes a sector editor which allows the user to see and modify data within a sector. Disassembles a sector into machine language op codes. Searches for a series of bytes or a string within a section of a disk. Includes a custom format scan and patch analysis enabling the user to backup any presently available* ATARI computer disk. And much more. . . .

To receive the Replica 1+1 package and documentation fill out the coupon below and send \$50 to:

There's nothing wrong with the way the CBM/PET/VIC writes data to sequential files. But sometimes it can be useful to pack the data in order to save space or aid certain types of processing.

PACK UP YOUR DATA

Jim Butterfield
Associate Editor

If your program contains a statement like `PRINT#1,V` and if you execute that statement when `V` contains a value of, say, 159, five characters will be placed on the file: Space, 1, 5, 9, and RETURN. Caution: if you don't have a 4.0 BASIC, one more character will be put to the file – a Line Feed – and it may give you problems. In this case, your program should say `PRINT#1, V;CHR$(13);` and be sure to include both semicolons. This applies to the VIC as well as to earlier PET/CBM units.

This is ideal for many purposes. An `INPUT#..` statement executed at a later time will receive the characters just as if you had typed them on the keyboard, and the value of 159 will be input. All neat and orderly. What's more, the file is made up of conventional ASCII characters: it may be manipulated by text editors, sent to a communications line, or handled in a number of conventional ways.

But occasionally – rarely! – we might find a need to change the rules. We might have a utility program (notably a sort routine) that wants to handle the data in “columns” as if it were on a punched card. In this case, we would want to organize our data more formally. On the opposite side of the coin, we might need to crunch our data – it's very large and the file size is becoming a problem.

Formatted Data

Normally we would write the various fields of a computer record as individual items. To write name, initials, address, and balance, we might write:

```
PRINT#1,N$
PRINT#1,I$
PRINT#1,A$
PRINT#1,B
```

and it's written. Corresponding `INPUT#` statements would bring it back when needed. It's fairly compact and not hard to handle.

If we wanted to go into “fixed column” format, we'd need to make decisions. The name might be

fitted into columns 1 to 15; the initials into columns 16 to 18; the address into columns 19 to 40; and the balance into columns 41 to 46. Now that we've made the decisions, we must pack the data that way.

Each field of data must be fitted to the fixed size. If the name were too long, we would need to trim it back with `LEFT$(N$,15)`; if it were too short, we'd need to extend it with spaces by coding `N$+“ ”`. We can do both together by writing `LEFT$(N$+“ ”,15)`. We must be sure to allow enough spaces to fill needed space; it's most convenient to define a lot of spaces as `S$`, which will make our coding more compact.

Names must align on the left, so that the `B` of `BUTTERFIELD` will fall into the same column as the `P` of `PUNTER`; in this way, a column sort will place the two names in correct alphabetic order. Numeric values must go the other way: 123 and 45 must be placed so that the 3 and the 5 digits are lined up. This is called “right justification” and is done with the `RIGHT$` function: `RIGHT$(“ ”+STR$(B),6)`. One caution on numerics: be careful with fractions; it's usually better to change everything to integer values, such as cents rather than dollars-and-cents.

The whole record then becomes:

```
S$ = “ ” (spaces)
R$ = LEFT$(N$+S$,15)+LEFT$(I$+S$,3)+LEFT$(
A$+S$,22)+RIGHT$(S$+STR$(B),6)
```

Note that, in this case, every record will be exactly 46 characters long.

When we read this record (one `INPUT#` statement will do the job), we must extract the various fields. This is quite easy if we use the `MID$` statement:

```
N$ = MID$(R$,1,15)
I$ = MID$(R$,16,3)
A$ = MID$(R$,19,22)
B = VAL(MID$(R$,41,6))
```

The strings will be their original values, except that they will be padded out with extra spaces to make up the specified length.

Packing Them In

In contrast to the previous formatting, binary packing saves space. It makes the information almost indecipherable, however, unless you have the key. Also, as we crunch the information together, we lose the capability to manipulate the data with other programs, since what we are writing is not readable ASCII.

The principle is this: why store a value like 169 in five bytes of storage when the binary value of 169 will fit into one byte? It's a dangerous road. We must be sure to leave enough space for the size of the number we plan to hold. Two bytes, for example, will hold an integer value from zero

NEW FROM KILO

PET/CBM Expansion Adaptor \$139⁰⁰ (order KEACom)
is a true expansion BUS that allows:

- Direct memory access
- Multi-processing
- I/O expansion
- Memory expansion
- Alternative operating systems

Write or call for application notes explaining full capabilities. Great for those PET/CBM's with soldered-in ROMS.

Upgrade to KTERM + from KTERM
\$47⁰⁰ (order KTERM-U)

Other software for PET/CBM users
Run time linking loader \$33⁹⁵ (order KRTLL)

Allows: Linked loading of BASIC programs anywhere in memory; runtime linking of BASIC program segments; saving BASIC machine code loads during BASIC execution. Creates M.C. virtual memory

Screen form \$49⁰⁰ (order KSF)

Create invoice and other forms by using the cursor to layout CRT input/output display fields. Avoid input statement problems. Avoid programming get commands formatted printing. Programmed controlled status line similar to WORDPRO'S.®

RS-232 Adaptor for PET®/CBM® \$89⁰⁰ (order KUART)

- Bidirectional, full duplex serial port
- Uses 6551 ACIA baud rates 50 to 19200, software selectable
- Plugs into processor socket

Full use of 6551 features including

- Interrupts
- Modem control lines

Serial port and modem control lines use RS232 voltage levels.

Cable – 2 foot-PC board connector to RS232
\$19⁰⁰ (order KUART-C)

Software support for RS232 adaptor
KTERM – simple terminal program \$14⁰⁰ (order KTERM)
Use your PET/CBM and a modem to The Source and other networks

KTERM in ROM (specify address) \$27⁰⁰ (order KTERM-R)

KTERM + – Use your PET/CBM as your own information management system. Send and receive disk files over telenetworks. Supports ASCII, WORDPRO, MAE and PETSki file formats. Use to print to serial printers. Convert PETSki to ASCII. Print a file or transmit it as background task under interrupt control while using your computer.
\$57⁰⁰ (order KTERM +)

Special Offer
Order RS232 adapt-
or by November 30
and we will ship
KTERM for the
price of KTERM +

to 65535.

When we print binary values to a file, we must abandon all our "normal" formatting rules. For example, a value of 13 stored in binary will be indistinguishable from a RETURN character, so we won't be able to use the INPUT statement to read it. A word of caution to cassette tape users: two characters cannot be written to tape files: CHR\$(10) (Line Feed) and CHR\$(0) (Null). This makes cassette tape of limited use in building packed files.

Let's write some packed numbers to a file. We'll assume that the numbers will fit into two bytes, so the values will range from zero to 65535. We'll write ten numbers to a binary file:

```
100 OPEN 1,8,2,"0:DATABIN,U,W"
```

Note that we designate the file as type USR (User). This is the same as Sequential. We just want to mark it as being in unusual format.

```
110 FOR J=1 TO 10
120 INPUT V:IF V<0 OR V>65536 GOTO 120
130 V%=V/256:L=V%*256
```

We have split V into low and high bytes.

```
140 PRINT#1,CHR$(L);CHR$(V%);
```

Don't forget the semicolons.

```
150 NEXT J
160 CLOSE 1
```

Ten numbers have been written into 20 bytes. Now let's read them.

```
100 OPEN 1,8,2,"DATABIN,U,R"
110 FOR J=1 TO 10
120 GET#1,A$,B$
```

We must use GET; INPUT can't cope.

```
130 PRINT ASC(A$+CHR$(0))+ASC(B$+CHR$(0))*
256
```

The CHR\$(0) is needed to allow for zeros; they will be received by the GET statement as a null string.

```
140 NEXT J
150 CLOSE 1
```

We've just coded numbers very compactly. One hundred numbers would fit into 200 bytes or one disk sector. Similar numbers in conventional sequential files would take up three or four sectors.

Most of the time, you'll want to stay with ordinary data files. They are more orderly and easier.

But you can build special types of files if you wish. Formatting and compacting are perfectly logical manipulations. Use them with care – when you need them. C

PET Tape Head Alignment

Louis F. Sander
Pittsburgh, PA

Though Commodore tape systems are quite reliable, if you're having problems **LOADing** programs which were *not SAVED on your cassette drive*, the culprit is probably head alignment. Here's a simple technique to eliminate most of the trial and error from the process of PET head alignment.

Connect an audio amplifier between the **READ** and **GND** pins on your tape player. (See Figure 1.) This will allow you to listen to your tapes as they are loaded, or even when the tape is running under manual control.

Then do your head alignment *while the tape is running*. As you turn the adjustment screw, the sound quality will make a definite transition from mushiness to crispness and back to mushiness. At the center of the crisp area, the tape and the head are in excellent alignment, and **LOADing** should be easy. I have used this method for several months and have found it to be useful for aligning my head to *any* foreign tape; then by using one of my own previously recorded tapes, I can easily return my head to its original state.

If you are using an amplifier to produce sound with your PET, that amplifier will work perfectly for head alignment. I use a Radio Shack #277-1008 cigarette-pack-size unit that I bought for \$11.95,

but almost any audio amplifier will do the job.

The cassette connector's **READ** and **GND** pins are identified in Figure 1. They are also plainly labeled on most PET printed circuit boards, right at the place where the recorder connector plugs in. You can make your connections to these pins by temporarily inserting wires or straightened paper clips into the back of the connector, where they will be able to touch the metal pins, or by contacting the appropriate points on the printed circuit board itself. Connect the shielded or grounded amplifier input wire to **GND**, and the other one to **READ**.

The voltages on these pins are very low, so there is no electrical shock hazard, but for PET's sake you should be very careful not to touch **READ** and **GND** together, or to apply any external voltages to these points.

An extra benefit of connecting the audio amplifier to the tape deck is that it lets you hear whatever PET hears. I've found this to be exceptionally useful for detecting defective tapes, for guaranteeing good **LOADs**, and for telling when PET is searching a blank area on the cassette.

PET Cassette Connector, Front View C

- * Re-define any or all keys as any keyword (full or short form) or as any string up to 255 characters long!
- * Auto line numbering which can feed a string of up to 127 characters as well!
- * Extended DOS support (requires DOS 2A or greater)!
- * Never enter another file name! All file commands work from the directory!
- * Supports multiple disk drives!
- * List BASIC programs, sequential and relative files without loading them into memory!
- * TRUE PROGRAM MERGE (overlay). Supports subroutine libraries!
- * Load and run machine language programs with parameter passing!
- * Supports multiple printers!
- * Automatic printer output with paging plus formatted listings with full ASCII code conversion including cursor control and special characters for non-CBM™ printers!
- * Edit text files and assembler source code without leaving BASIC!
- * Renumber part of a program or even change the order of lines!
- * Over 700 FIND/CHANGE commands including variable names ("A\$" will not match "BA\$"), pattern matching with "wild-cards", and even commands to remove spaces and REM's!
- * Three TRACE modes including trace variables!
- * Does not affect BASIC program operation!
- * One AUTO-BOOT DISKETTE works for ALL PET™ or CBM™ computers (BASIC 2.0 or greater with at least 16k of RAM). SYSRES™ requires NO ROM SPACE or extra boards, so you can take it with you if you want to use another computer. It may be put above the screen if you have RAM there. It boots automatically without disturbing any program in RAM!
- * If, for any reason, you are not satisfied with the SYSRES™ system, you may return it along with any back-up disks (within 30 days) for a full refund. Your disks will be erased and returned to you.
- * Diskette and Extensive Manual - only \$95 (Please specify disk drive model when ordering.)

SOLIDUS INTERNATIONAL CORPORATION

The two programs offered here use only the three Atari console keys to input answers. These programs should be useful for children as well as for programmers interested in learning more ways to use their machines. Requires at least 16K of memory.

Adding By Counting: Atari And Pre-schoolers

Stephen Lewy
Bowie, MD

Using computers to teach young children can be fun and challenging. The Atari's design makes it extremely easy for young children to use. The Atari offers numerous ways other than the keyboard for a child to input answers.

Program 1, called "Add," simply teaches a very young child to add by presenting a simple addition problem and an equivalent number of symbols for each number in the problem. By counting the symbols, the child can decide on the answer. The child then presses the SELECT key until his/her answer (with the appropriate number of symbols) appears on the screen. In addition, the word for each number in the problem appears.

```

5 ***** FIVE
+ 2 ### TWO
-----
7 *****

```

To find out if an answer is correct, the child holds down the OPTION key. Program 3, which must be added to Program 1, contains the sub-routines for the computer's response for correct and incorrect answers, as well as some music and sound. If the child gives an incorrect response, he/she is given another try. If the answer is correct, the child hears a song and then is given the option of another problem.

"Match," Program 2 (which also must be merged with Program 3), is designed similarly to Add, except in this case the child must match the word for a number with the correct number.

The Merge Timesaver

Neither Program 1 (Add) nor Program 2 (Match) will RUN alone. Each needs to be merged with

Program 3. This was done in order to avoid having to type program lines unnecessarily. Program 3 should be typed and LISTed to disk (LIST"D1:<filename>") or to tape (LIST"C:"). Then type Program 1 and ENTER Program 3 to merge Programs 1 and 3 (Disk: ENTER"D1:<filename>"; Tape: ENTER"C:"). You can repeat this operation to use Program 2. This avoids your having to type Program 3 twice. Also, all three programs can be merged into one by adding a menu option for the user at line 35 and changing lines 40 and 50 to IF-THEN statements based on the selection from the menu:

```

35 POSITION 3,2: PRINT "Press |SELECT| for
   ADD": POSITION 3,5: PRINT "Press |OPTION|
   for MATCH"
40 IF PEEK(53279)=5 THEN GOTO 300
50 IF PEEK(53279)=3 THEN GOTO 1400
60 GOTO 40

```

These two programs (Add and Match) have been written so that they can be merged easily.

Line 30 contains a long string which is used to print the word for the number chosen at random. Lines 105 and 115 in Add and line 230 in Match are used to select the appropriate characters from the string NUMBER\$(line 30); this is more easily studied in line 230.

Here is a summary of the major sections of the program.

```

100-115 print the proper number of symbols and the
        word for the numbers.
120-130 select numbers for problems.
200-220 position answer and symbols on screen.
230    selects proper characters from NUMBER$.
240-260 select symbols to be used.
300    begins main program for Add.
318-360 print problem and go to subroutine to print
        symbols.
380-430 are routine to select answer.
450-460 check for correct answer.
520(5000-5520) correct response.
600-695 incorrect response.
1400   begins program for Match (select a number).
1430-1445 print the word for the number.
1450    prints number.
1460-1520 select answer.
1610-1620 check for correct answer.

```

Program 1.

The New Standard

The following is from a review by Analog 400/800 magazine comparing programs for personal finance for Atari* computers...

“ The programs we will discuss are *Personal Financial Management System* from Atari, *A Financial Wizard* from Computari, and *Budgetmaster* from Sunrise Software.

All three programs begin with the basic premise of setting up a budget, helping you follow it, and giving you an idea of where you are spending your hard earned dollars.

A Financial Wizard from Computari is by far the best of these programs, and will be the standard of comparison for the others. There are 26 expense categories available that are easily adapted to your personal requirements; 21 are regular expense accounts, one is reserved for salary and four are usage categories for record keeping, such as gas and electric usage. You then input your budgeted amounts.

The check entry mode is very simple to use. After asking you what month you are entering, the program prompts you to enter the check information including whether or not it is tax deductible. Come tax time, you will really appreciate this function and the Check Search mode which will search by Name, Category, Check # or tax deductible checks.

The way *A Financial Wizard* displays and handles your tabulations is excellent. You can chart your actual expenses vs. your budget by month, by category or Year to Date. Tabulations by month give you a list of all categories, how much you spent, how much you budgeted, the dollar amount plus or minus your budget and the percentage of your total income you are spending on each category. The tabulation by category also gives you actual expense vs. budget, the difference, and the average amount you are spending. Besides the charts, you can also look at your expenses vs. budget in bar graph form, again by month or by category. There it is in black & white (and blue and gold). The amount you budgeted vs. the amount you spent.

Everything about this program is excellent, but where it really outshines the rest is in the Check Reconciliation. In effect, it gives you your bank statement on the screen, a complete list by month of all your checks and deposits.

Graphics, while really not a factor in the quality of programs of this type, do make your budgeting chores a little more pleasant. Again *A Financial Wizard* comes out on top.

The version of *A Financial Wizard* that was reviewed is version 1.3. We have been told that a version 1.5 is coming out. This newest version will be enhanced in a few ways. There will be a check writer option. You enter your checks as if they have already been written, the program will perform all of the previously mentioned functions and if you have a printer, will print out your checks, you just sign and mail. Bank compatible checks will be available from Computari; ordering information will be in the package. There will also be an audit feature. User compatibility is excellent, and is set up with most of the instructions on the screen so you are not constantly referring to the instruction manual.

We strongly recommend this program.”

A Financial Wizard 1.5 The Ultimate System

- Budget—forecast 26 expense categories
- Check Entry—easy data entry—scan & correct 26 major & 36 sub-categories—information block
- Check Search—single or multiple parameters—(up to seven) to search entries
- Tabulations—detailed expense vs. budget by month, year-to-date, category
- Bar Graphs—screen displays in graph form expenses vs. budget—by month or category—printing with graphic capable printers
- Check Reconciliation—fast clearing of resident checks & deposits, complete summary report
- Checkwriter—print your custom checks
- Printouts—most popular printers • Audit Report
- Multi-Colored Graphics • Audio Enhancements
- 7 Utility Programs • User-Friendly Operation
- Easy To Use Instruction Manual
- Tinted Plastic Storage Case

The system is designed for Atari computers having a minimum of 24K and operating from a disk drive. The price is only \$59.95 plus \$3 for handling/postage. If your dealer does not have *A Financial Wizard*... Telephone orders are accepted on Mastercharge or Visa credit cards. Mail order must be accompanied by check or money-order or credit card #. Dealer inquiries invited. (405)751-2783.

PRETZELLAND™
SOFTWARE
PRESENTS:

AFFORDABLE ATARI (R) SOFTWARE

ANDROID ATTACK™
The nuclear reactor in our Top-Secret installation has malfunctioned and is in danger of melting down! You've been chosen to go in and manually release the cooling water. Now only one problem remains- there isn't time to deactivate the Security Androids guarding the unmanned installation, so you'll have to fight your way in, release the water, then escape before the entire underground laboratory fills with water! If you survive this mission, we've got another for you, only this time there are more levels to get through and the Androids are meaner!

AAAAARRGGG™
The fabric of space has been weakened by Atomic bomb testing! Strange little creatures are popping out of hyperspace all over Earth. It's up to you to catch as many of these little critters as you can, before they overrun the world! The creatures come in five types, each with its own point value. The higher its value, the quicker it pops back into hyperspace, so you've got to work fast. Every now and then, one little creature appears which is so charged with energy that it zips all around the screen briefly, then disappears. If you can catch this **SUPER AARRGGG**, there are bonus points and time for you, but don't get **POISONED** by little green men!

STARBASE ASSAULT™
A fleet of alien warships has surrounded your Starbase, firing deadly plasma torpedoes in an attempt to knock out its protective force field rings and destroy it! You've got to aim the station's laser cannon, rotating and firing it rapidly, to blast the aliens and their torpedoes. As the battle continues, the aliens attack in ever greater numbers - up to 5 at a time and from 8 different directions! Every hit by an alien drains your force field. A high score bonus will partially replenish your energy supply, but when the last energy ring is gone, your Starbase is destroyed!

FOR 16K CASSETTE OR 24K DISK  EACH...\$16.95

ASK FOR PRETZELLAND SOFTWARE AT YOUR LOCAL DEALER, OR ORDER DIRECT. PLEASE ADD \$2.00 SHIPPING FOR MAIL ORDERS. C.O.D. ORDERS ACCEPTED BY PHONE. CALL OR WRITE FOR OUR ILLUSTRATED LISTING OF AFFORDABLE GAMES FOR YOUR ATARI 400/800 (R).

For PET/CBM, Upgrade or 4.0 BASICs, with disk, this program will make the changes necessary so that any program will start itself RUNning. It need not be the first program on the disk — the program itself, when LOADED, will take control of the computer.

PET Self-starting Programs

Richard Mansfield
Senior Editor

There are some programs which are used so often that it is convenient to put them first on a disk if you use BASIC 4.0. Located on the disk as the first program, it will then automatically LOAD and RUN if you hit the RUN key. (Upgrade BASIC's RUN key tries to load from the tape drive.) "Bootfixer," however, will make *any* program self-starting.

If you have a disk of frequently used utilities, it might be worthwhile making every one of them self-starting. With 4.0 BASIC, you could have any one of them up and running with a simple dL" name. Also, people who have never used a computer would find this method of RUNning simpler to learn. All they would need to do is turn on the machine, insert a disk, and type in the name of the program they wanted: then the computer takes over. Built-in disaster prevention, such as a program with a disabled STOP key, should eliminate many of the start-up crashes experienced by novices.

Making The Mock Stack

Before Bootfixer can change another, target program, you must first prepare a special, slightly longer version of the target. It will include page one (memory from 256 to 511), which is the secret of automatic RUNs. It's easy. If your target program is called "HEXDUP," LOAD it normally and then type SYS 4 to get into the monitor. Type: .M 00C9 00C9 (RETURN) (this shows you the program's highest location in memory), and you will see something like:

```
00C9 C5 04 00 00 00 00 00
```

We only care about those first two hex numbers. To reSAVE the program with a different name (HEXDUP1), switch the two hex numbers and add one. In this case, HEXDUP ended in memory at 04C5, so we make it 04C6 during the

monitor SAVE. Normally, a BASIC program starts at 0401 hex, but we are going to SAVE this special version from 0100, the bottom of the stack. So, type in the following fashion (substituting your program's new name and the correct end address plus one found at 00C9):

```
.S "HEXDUP1",08,0100,04C6
```

That's it. We now have a version of HEXDUP which contains a false page one, a mock stack, which will be loaded in whenever HEXDUP1 is loaded. The computer puts all of its machine language RTS addresses (the same as BASIC's RETURN) on the stack. Bootfixer will now do two things to HEXDUP1. It will replace part of the false stack (on HEXDUP1 while it sits on the disk) with 60 03 60 03, etc. This has the effect of sending control of the computer to address 0361 when HEXDUP1 is loaded into the machine. Second, a little machine language routine is inserted into HEXDUP1 at 0361 to make it start a BASIC RUN when control is sent via the false stack to 0361.

To transform HEXDUP1, just LOAD and RUN Bootfixer. It will ask you for the name of the program you want fixed and then move into the disk and make the necessary changes. If you accidentally give it the name of a program not yet prepared to be fixed, it will report that to you and close all files without doing any damage. Replace lines 480 and 490 with 481 and 491 if you use Upgrade BASIC.

Machine language programs can be made self-starting too. Find out the starting address of the machine language program, and replace the CHR\$(96) in line 420 with the least significant byte *plus one* and the CHR\$(3) in line 440 with the most significant byte. This will send control directly to the machine language program following a LOAD.

PROOFREADING SOFTWARE

NEW ... THE MOST ADVANCED SPELLING CHECKER SOFTWARE
AVAILABLE FOR COMMODORE WORD PROCESSORS.

Now you can rapidly eliminate misspellings from your word processing text. Spellmaster can quickly pay for itself in reduced clerical time spent on correcting misspellings.

SPELLMASTER

by Dwight Huff & Joe Spatafora

Features include:

40,000 Word Capacity. Spellmaster (CBM 8050 version) is delivered with a 19,000 word dictionary, allowing the user to add up to 21,000 words.

Direct Screen Editing of Mistakes. Words "suspected" to be incorrect are displayed in "reverse video" on the screen; simply correct the mistakes and resave your corrected file ... ready to be printed.

Add Words with a Single Keystroke! Spellmaster makes it easy to Permanently Add any correctly spelled word in your text to your User Dictionary.

Menu-Driven and User Friendly. The average user can learn to operate Spellmaster in 30 minutes.

Complete Documentation is provided to guide you through Spellmaster on a step-by-step basis.

Machine Language Speed allows a large Wordpro4+ textfile to be Proofread in 2 minutes or less. Proofreading of linked files is easy and automatic.

Legal and Medical Dictionaries are available to add 4500 technical terms to the dictionary.

Compatible with the Commodore 8032, 4032, 8096, SuperPET, & the Commodore 64. Operates with the Commodore 2040, 4040 and 8050 Disk Drives. WordPro, Wordcraft, & Silicon Office versions available.

Spellmaster \$199 Legal/Medical Modules \$75

For VICs without memory expansion, these gaming routines will help speed up BASIC considerably.

VIC Joystick And Keyboard Routine

Michael Kleinert
Nanuet, NY

In the Fall 1982 issue of *Home and Educational COMPUTING!* was an article by David Malmberg entitled "Using the VIC Joystick," which demonstrated a short BASIC routine for reading from the joystick. After adding that routine to one of my game programs, I discovered that BASIC can just be too slow for some games. My attempts to speed up that routine were unsuccessful, so I decided to write one in machine language for reading from the joystick. I designed the routine to be most suitable for game purposes, especially those in which you must guide an object around the screen by using the joystick.

Entering The Machine Coding

Type in the BASIC loader provided in Program 1. For those who may not have a joystick or might like to use the keyboard, I have included an identical routine for the keyboard in Program 2.

Using The Routines

Both routines are very similar. Each checks for up, down, left, and right. Accounting for diagonal directions would require longer and more complex programming. The keyboard version will look for the depressing of four keys, which I have defined as I (up), M (down), J (left), and K (right).

I designed the routines for controlling the movement of an object on the screen, and I suggest the following format:

```
10 POKE A,B: SYS 7168: POKE A,32: A = A + PEEK(1)
-PEEK(2): GOTO 10
```

In the above line, A is the memory location of a character's position on the screen, and B is the character code of the desired character. First the character is POKEd onto the screen, and then the subroutine is called with SYS 7168. The subroutine checks for any movement of the joystick (or for

keys being pressed). If it detects the joystick being pushed in any direction, it places an appropriate numerical value into location 1 or 2. These values will be used to update the position of the character being moved. First, the old character must be erased. This is accomplished by the command POKE A,32. The character is erased by POKing a space onto the same screen position (A). After it has been erased, its position can be updated by adding the contents of memory location 1 and subtracting the contents of memory location 2. Do this as shown above, with the command $A = A + \text{PEEK}(1) - \text{PEEK}(2)$.

If the routine does not detect the joystick or keyboard being depressed, the values in these two memory locations will be set to zero, and the variable A (character's position) will remain the same.

Avoiding Leaving The Screen

If the joystick is pushed up (or the "I" key is pressed on the keyboard), the routine will place a value of 22 into memory location 2. This causes the number 22 to be subtracted from the current screen address contained in variable A, and is the basis for accomplishing upward movement of a character on the screen. Similarly, a character is moved right, left, and down in this fashion.

In order to keep the character from going off the top or the bottom of the screen, more complex programming is required. An appropriate method is illustrated in Program 3. The program is not a game, but simply a demonstration for the use of the routines. It will scatter several boxes, as obstacles, on the screen and will enable you only to move your "player" around the screen with the joystick or keyboard. It is the basic structure for a game.

If you are going to use the joystick, enter in lines 10 to 40 from Program 1. If you are using the keyboard, copy the lines from Program 2.

When you are ready to use one of the routines in your own BASIC program, do the following. Place lines 10 to 40 from Program 1 or lines 10 to 30 from Program 2 at the beginning of your program. Then, wherever you wish to utilize the routine in your program, give the command SYS 7168. To update the character's position, use the method which I described above.

Other Applications

There are many other uses for these routines. You may use them in simple delay loops to temporarily stop the program and wait until something is pressed.

To check for a desired direction on the joystick or a key on the keyboard, use the values from Figures 1 and 2. For example, if you are using the

keyboard subroutine and want the program to wait until the letter "I" is pressed on the keyboard, you PEEK location 2 as follows:

```
100 SYS 7168: IF PEEK (2) <> 22 THEN 100
```

This will call the subroutine, and the program will not proceed until the value in location 2 is equal to 22.

If you are using the joystick and want to wait until it is pushed to the right, you follow the same basic format: PEEK memory location 1 for a value of one. For example:

```
100 SYS 7168: IF PEEK(1) <> 1 THEN 100
```

The Firing Button

A "firing" button is not accounted for in either of the two routines, since it would require a line of BASIC. If you would like to check for the firing button, you would place the following step into your program:

```
200 IF PEEK(37137) > 69 THEN GOSUB (Line number)
```

After the GOSUB, you would place the line number to which you wish to send the program if it finds the firing button depressed.

If you wish to check for a "firing" button on the keyboard, you may use the following line, which checks for any depressing of the SPACE BAR (the one I usually use).

```
200 IF PEEK(197) = 32 THEN GOSUB (LINE #)
```

The Demo Program

Briefly, here's a description of the function of each line in the demonstration, Program 3.

- 5 Limits the end of BASIC to protect the machine language routine, clears variables, and sets "A" equal to 7800 (the character's memory location on the screen).
- 10 READs the machine code from the DATA statements and POKEs the values into memory, starting at 7168.
- 20-40 Contain the machine code for the routine in DATA statements.
- 50 Clears the screen and then POKEs the color red onto each screen location.
- 60 Puts obstacles on the screen in 30 random screen locations.
- 70 POKEs the character onto the screen, calls the subroutine, and then sets "B" equal to the updated address.
- 80 If the new address is found to be off the screen, or if it is occupied by a box, the character remains stationary and the program goes back to line 70.
- 90 The new screen position has been accepted,

so the old character is erased. The program goes back to line 70 to go through the same process.

Both routines can be used on a VIC with any amount of memory and can be placed anywhere in the user's RAM. In order to keep things relatively simple, I wrote the demonstration program for a 3.5K VIC; it will not work on a VIC with any memory expansion. These routines help speed up programs a great deal.

Skyles Electric Works Presents

The VicTree™

- ...Leaves your new Vic (or CBM 64) with 35 additional commands.
- ...Branches out to most BASIC 4.0 programs.
- ...Roots into most printers.

New from Skyles: the VicTree, a coordinated hardware and software package that allows your Vic to branch out in unbelievable directions and makes it easier than ever to do BASIC programming, debugging and to access your disk. And the new VicTree provides routines to interface the Vic to the powerful ProNet local network. 8kb of ROM — 4kb for the BASIC commands, 4kb for disk commands and interfacing to ProNet — plus 4kb of RAM for miscellaneous storage. Perfect not only for the new Vic but also for the Commodore 64. Unbelievably simple to use and to install, the VicTree gives you all the additional BASIC 4.0 commands to allow most BASIC 4.0 programs to work on your new Vic or CBM 64.

Now only \$89.95...or \$99.95 complete with Centronics standard printer cable. (Cable alone \$19.95.) Available now from your local dealer or order through your Visa or MasterCard toll free: (800) 227-9998 (California, Canada, Alaska, Hawaii: (415) 965-1735) or send check or money order directly to:

WUNDERWARE PROUDLY PRESENTS

State of the Art
Games for your VIC 20

Send for game catalog. Including these and more.

The Mad Painter—This game is a little unique and a lot of fun. You control a paint brush, moving it around a colorful maze. Your job is to paint the entire maze. This is not as easy as it sounds, because in the maze with you are two voracious Bristle Biters (they love paint brushes). Occasionally you will receive a visit from an Invisible Stomper who leaves footprints in your fresh paint. Requires joystick. \$9.95 cassette, \$12.95 disk

Bank Robbers!—This is a lot of fun and slightly different. Your two partners in crime have made it to the roof of the VIC NATIONAL BANK and they're throwing the money down to you. Catch as much of it as you can but it's not easy, the way it drifts around. Slash it in the trunk of your getaway car and go back for more. In the end, the police will arrive and you will discover that crime, indeed, does not pay—but it's kind of fun! Specify keyboard or joy-

stick. \$9.95 cassette, \$12.95 disk.

Munchmaid—Dots...monsters...a maze...and munchmaid! Guide munchmaid around the maze eating dots and avoiding monsters. If she eats a special dot, the tables turn, and she can chase the monsters! Munchmaid keeps top score and initials on the screen. Requires joystick and 3k memory expansion cartridge. \$12.95 cassette, \$15.95 disk.

*Price includes Postage & Handling. *Catalog is included with order. *Foreign orders & COD's: Please add \$3.00. *Prices are subject to change without notice. *At your dealer or send check or money order to:

VIC SOFTWARE VIC

ALIEN INVASION — Arcade style excitement for your VIC. Look out here they come. Aliens are descending from the sky. Move your laser into position and defend the earth. The attacks are unending — can you survive or will Vader rule the galaxy. Many extras on this one. 20 levels of play. \$12.95

CATTLE-ROUNDUP — The cows are loose in the maze. You have 2 minutes to get each cow back into the corral. You can push, coax and call the cows. Some cows are not very smart and some are very stubborn. You will have to help them. Be careful that you don't leave the corral gate open. Color graphics and sound. Eight levels of play and a time limit. \$12.95

HEAD ON — Your car moves forward around the race track. You can move up, down, right and left. Try to score points by running over the dots on the track. Watch out for the crusher — if you crash you lose a car. Four cars and bonus levels. Full color graphics and sound. Fast action and very addicting. 9 levels of play. \$12.95

SNAKEOUT — Blocks appear on the screen at random. You move up, down, right and left and try to move your snake over the blocks. Each block that you get raises your score. Keep building your score but watch out because the escape routes keep getting smaller. Time limit, color graphics and sound. 3 games on this cassette. Snakeout — 2 player Snakeout and Trapper. 9 Levels of Play. \$12.95

BOMB'S AWAY — Can you stop him? The crazy bomber drops the bombs from the top of the screen. You get 3 buckets to catch them. Before you know it bombs are falling so fast you wonder when he will stop. Just when you think you have him under control your bucket gets smaller. Is your hand quicker than your eye? \$12.95

TARGET COMMAND — Move your laser into position and get ready for some quick action. Different types of missiles are dropping. How many can you shoot down. They all travel at different speeds and different levels. You must be fast on the trigger to get them all. Time limit, bonus points and very addicting. Color graphics and sound. Arcade style fun. 10 levels. \$12.95

BUG BLAST — Now it's your turn to get even. Bug blast makes it easy. Blast thru the cactus and wipe them out. But watch out for the higher levels. Just when you think everything is under control the attackers seem to be everywhere. Will they ever stop. Now you can get even — if you dare. If you like Centipede you are gonna love BUG BLAST. \$12.95

CRICKET — Can you help Cherp get across the roadway and river. He has to dodge trucks and cars to get to the center. Then help him get across the river. He can jump floating logs and turtles to get across. Watch out for gators — they love crickets for lunch. How many times can you get across? \$12.95

A BASIC game is translated into machine language. The comments in the program will teach you how to PLOT, DRAWTO, COLOR, etc., in your own machine language games.

Insight: Atari

Bill Wilkinson
Optimized Systems Software
Cupertino, CA

Last month marked the first anniversary of this column in **COMPUTE!**, and I didn't even notice it. Which tells you how busy I am. We, like almost everyone in the software industry, are beginning to realize that survival comes only to those who diversify. So we are busily introducing new products and concepts. We think the net effect is beneficial to everyone: for us it means a chance to grow and try new approaches; for the user it means newer and better products with a wider choice than ever.

Of course, with the wider choice comes the obvious problem: which one of several competing packages should the user buy? I think I am asked that question only slightly less often than its predecessor: which computer should I buy? I usually sidestep the issue by saying something like this: "Find a software package that seems to do exactly what you want it to do. Ask for references from satisfied customers. When you are convinced that the software will suit your needs, buy the computer that is needed to run the particular software."

The most common problem I see is people buying too little computer for the problem they want to tackle. And, while the problem is sometimes related to the speed of the chosen machine (let's face it, you shouldn't be doing realtime voiceprint analysis with an Atari), the more common problem is simply lack of memory — both kinds of memory, RAM and disk.

This month, I have several topics of interest to Atari aficionados. And, of course, the monster listing of the assembly language version of the "Boing" game (the BASIC version was published last month). Please — hear my disclaimer: I am not nor do I claim to be a game programmer. I am quite aware that Boing is not the epitome of the gamer's art. Rather, I am here attempting to show the fundamentals of writing graphics games in assembly language. So don't type this game in expecting a miracle program; use it for instructional purposes only. Add to it, experiment with it, and chalk it up to experience.

A Boo-Boo

Well, so far we've encountered only one substantial mistake in our book, *Inside Atari DOS* (published by **COMPUTE!**). The error occurs in the text on page 11 and in the diagram (Figure 2-3) on page 14. Both correctly indicate the contents of the last three bytes of a data sector (the "link" information), but both assign the wrong order to these bytes. The byte containing the "number of bytes used in sector" is the *last* byte of the sector (byte 127 in single density sectors), *not* byte 125 as shown. Then the bytes shown as 126 and 127 move up to become 125 and 126, respectively.

Our apologies for the misinformation; we hope it didn't affect too many of you adversely. I think the mistake came about because of the comment in the listing at line 4312 on page 87, where the file number and sector link bytes are called "bytes 126, 127." Well, they are, if you are numbering from 1 to 128. The tables, etc., in the book are all numbered from 0 to 127; but recall that sectors on the disk are numbered from 1 to 720 (instead of 0 to 719). I don't know why we humans have such a hard time counting from zero, but we do. And computers have a hard time counting from any other number. Oh well.

Incidentally, the only other error in the diagrams that I have found occurs on page 21, where the labels "SABUFH" and "SABUFL" at the heads of the two columns are reversed.

CP/M For Atari?

I often get asked whether OS/A+ will run CP/M programs on the Atari (since externally OS/A+ looks very, very similar to CP/M — not an accident). But, you simply can't run CP/M on a 6502 (the heart of any Atari or Commodore or Apple). So how do Apple II owners run CP/M? Simple. They plug a card into their machine that essentially disables the 6502 and runs a Z-80 CPU instead. Why not do the same with an Atari?

First, let me say that I don't think that, as a practical matter, it is possible to *replace* the 6502 in the Atari 400/800 with another CPU (e.g., a Z-80). The reasons are many, but the primary one is the fact that the Atari peripheral chips (particularly Antic) seem somewhat permanently married to the 6502. However, there is no real reason that one could not put a co-processor board in the third slot of an 800 (the co-processor would probably have to have its own memory, though, to avoid interfering with the Atari's DMA and interrupt processing). This is essentially how some manufacturers have added 8086 capability to Apple II's. But it is expensive, since we now must pay not only for a CPU but also for 65K bytes of RAM and some sort of I/O to talk to the "main" 6502 CPU.

COMPUTE! Subscriber Services

Please help us serve you better. If you need to contact us for any of the reasons listed below, write to us at:

COMPUTE! Magazine
P.O. Box 5406
Greensboro, NC 27403

or call the Toll Free number listed below.

Change Of Address. Please allow us 6-8 weeks to effect the change; send your current mailing label along with your new address.

Renewal. Should you wish to renew your **COMPUTE!** subscription before we remind you to, send your current mailing label with payment or charge number or call the Toll Free number listed below.

New Subscription. A one year (12 month) US subscription to **COMPUTE!** is \$20.00 (2 years, \$36.00; 3 years, \$54.00. For subscription rates outside the US, see staff page). Send us your name and address or call the Toll Free number listed below.

Delivery Problems. If you receive duplicate issues of **COMPUTE!**, if you experience late delivery or if you have problems with your subscription, please call the Toll Free number listed below.

10072 Balsa St., Cucamonga, Ca 91730

CASDIS - machine language program that allows you to transfer most "boot" tapes and cassette data files to disk. No special programming knowledge required. Programs that normally read cassette files during execution may be up-loaded to disk and operate normally without software modifications. Only difference is the program is on disk and loads at disk transfer speeds.
Diskette only \$25

Utility Programs for the ATARI 400/800

CASDUP - machine language program that allows you to copy most "boot" tapes and cassette data files as easily as you normally copy a BASIC tape.
Cassette only \$20

FULMAP - (avail. late '82) machine language utility package for developers of BASIC programs. Features: variable cross reference generator lists all program variables alphabetically with line numbers which reference them; line number cross reference generator which tells you how and where all line numbers are used; address utility which lists all indirect address references and tells you where they are used. This program resides in high memory and accessed from BASIC by entering "MAP". All outputs can be dumped to a printer.
Cassette or Diskette \$40

DISASM - machine language program that allows you to disassemble machine language programs. You can load a file from cassette or disk and the program will display all the file's addresses and their contents in hex, ASCII (if any), and 6502 op code mnemonics. All outputs can be dumped to a printer.
Specify Cassette or Diskette \$25

DISDUP - machine language program for sector level copying of disk information. User may specify single sector, range of sectors or all sectors on a disk to be copied. Copies may be made with or without a read verify. Sectors which cannot be read from or written to are displayed on the screen and optionally to a printer.
Diskette only \$25

Please add \$2 shipping & handling per program. California residents add 6% sales tax

Back-up policy: Our disks are protected against casual copying, but we appreciate your potential need for a back-up copy. If you add \$10 to your order for a program, we will send you two (2) copies of the program disk. Our normal replacement guarantee applies to both copies. This offer does not apply to dealer sales.

But doing this leaves you stuck with using the Atari serial bus to get data on and off a disk. And, aside from the slow speed, in my opinion an Atari 810 is really too small for practical CP/M work. So, what's the solution, if any? Actually, I've heard of a couple and know of one that is now working.

The first CP/M solution is to simply treat the Atari as an intelligent terminal and hook it up to a CP/M system. While this sounds like overkill, remember that most CP/M systems do not come with a terminal (screen and keyboard), and none can offer the color graphics capabilities of the Atari. But Vincent Cate (alias USS Enterprises) of San Jose, California, has come out with a hardware/software package that does more than make an Atari into an intelligent terminal. His package also allows most CP/M based computers with a 19,200 baud serial port to effectively replace the disk(s) and printer of an Atari computer.

The CP/M system is turned on and started up first, and it fools the Atari into believing that it is an 810 disk drive (just as does the 850 Interface Module in diskless systems). It thus boots a mini-pseudo-DOS into the Atari which simply passes file requests over the serial bus to the CP/M system. A great idea for someone who has a CP/M system and wants either to get a graphics terminal or to justify buying a game machine.

The primary limitation of this system is simply that you won't be able to read or write Atari-formatted diskettes, though it may be possible to CLOAD from an Atari cassette and then SAVE to the CP/M disk. You won't be compatible with the rest of the Atari world, but for games you probably don't care. At \$150, this is the cheapest CP/M to Atari connection, but it does presume the prior purchase of a CP/M-based system.

L. E. Systems (alias David and Sandy Small, et al.) has another method of doing co-processing: remove the cover of your 800 and replace it *and* the OS ROM board with an extension of the Atari's internal computer bus. On this bus one can stick more memory cards, disk controllers, and (of course) a Z80 card with its own 65K of memory. If your goal is to build a super powerful graphics machine, with access to the vast CP/M library, this is a workable approach (about \$1900 with two disk drives, *plus* the cost of the Atari 800).

However, for about the same money, you could buy a *real* CP/M machine (such as the Cromemco C-10) with 80-column screen, full function keyboard, built-in printer interface, bigger disks, etc. And then, if you wished, you could hook up your Atari via Vincent Cate's interface. The L. E. Systems' approach, though, assures lightning fast data and control flow between the Z80 and the 6502. More importantly, it allows you to con-

tinue to buy and use Atari-compatible disk-based software.

Finally, my rumor mill says that by the time you read this there will be a product available which will function as a more or less conventional Atari-compatible disk controller (à la Percom). But, at the flip of a switch, it will instead boot up and run CP/M (internal to the controller box), treating the Atari as an intelligent terminal, much as Vincent Cate's system does with more conventional CP/M computers.

Do I have any recommendations? Not really. Personally, I like my 128K Byte Cromemco (with 10 Megabyte hard disk and dual 1 Megabyte floppies) for serious software development. But when I think about it, I realize that the thing that makes this system so nice is *not* the CP/M compatibility (I almost never use CP/M, preferring to stick with Cromemco's Cromix). Rather, it is simply nice to have all that disk space available on command. So why get CP/M? Because you want to get into exotic compiler languages or because you need some very sophisticated business packages. Fine. But for games? Home finances? Learning how to program in BASIC? Graphics? I suggest you avoid CP/M.

Going With Boing

At last, we have here the complete listing of Boing as written in assembly language. As much as practicable, I have done a direct one-for-one translation from BASIC to machine code, without taking advantage of most of the foibles of the machine. Perhaps the only major change I have introduced is also the most unnoticeable from a casual reading of the source: I have made all the variables (which are six-byte floating point numbers in BASIC) into single bytes. This is *not* always possible. Sometimes, when writing in assembler, one needs numbers greater than 255; then one "simply" uses two-byte integers (or three or four-byte integers, or floating point even).

Except that, on a 6502, that "simply" isn't so simple. There are no 16-bit (or larger) instructions on a 6502, and one must simulate them using series of eight-bit loads, adds, stores, etc. For example, if this program were using Mode 8 graphics, where the horizontal position can vary from 0 to 319 (thus requiring a two-byte number to hold it), all of the code involving the "X..." variables would be larger and more complex. Lesson to be learned: use byte-size numbers whenever possible on a 6502.

Anyway, with regard to the listing of Boing, please note that I didn't leave enough space between my BASIC line numbers to allow my assembly language to share the numbering scheme. So I have put the BASIC lines into the listing in a way that makes them stand out for ease of reading.

FIRST and FINEST

In Systems Software for Atari and Apple

MAC/65

First we delivered Atari's Assembler/Editor (the cartridge).

Then we produced our enhanced "EASMD."

Now OSS is introducing the finest integrated assembly language development system yet!

In addition to being ideal for writing small, "quick and dirty" subroutines and programs, MAC/65 shows its full power and speed when used with even the most complex of large assembly language source files.

Naturally, MAC/65 is upward compatible with both EASMD and the Atari cartridge. And, of course, the object code output is also compatible with OS/A+, Atari DOS, and/or Apple DOS, as appropriate.

MAC/65 \$80.00*

OS/A+

Optimized Systems Software — the group that produced both the first Apple DOS and the first Atari DOS — now brings you OS/A+, which combines the finest features of these and other successful personal computer operating systems.

OS/A+ is the first and finest operating system available for both Apple II and Atari computers and features a keyboard-driven, easy-to-use command processor. In addition to several simple resident commands, OS/A+ allows logical and readable requests for even the most sophisticated utility commands. In fact, the user can even add system commands as desired.

But the real power and flexibility of OS/A+ is its ability to easily interface to devices and disk drives of virtually any kind and size. File compatibility (with Apple DOS or Atari DOS, as appropriate), device independence, batch processing, easy of use — OS/A+ truly brings the finest in operating systems to your computer.

AND NOW OS/A+ (for standard Atari or Apple drives) is included as a part of every standard OSS language package. Versions of OS/A+ for some higher capacity drives available at extra cost.

Unless otherwise noted, all OSS products require 48K and at least one disk drive. We recommend 64K for the Apple version of OS/A+.

SpeedRead+

The first and still finest speed reading tutor designed for you to use on your computer is available only from OSS.

SpeedRead+ uses time-proven techniques to train you to instantly recognize words and phrases, and yet it goes far beyond what mere mechanical devices are capable of.

SpeedRead+ exercises your peripheral vision, improves your eye movement and timing, and generally works with you at your pace... now and in the future.

NOTE: The Atari version of SpeedRead+ needs only 16K of RAM.

SpeedRead+ \$59.95

tiny

As a product of Tiny C Associates, tiny-c was the first structured language interpreter for microcomputers. Now OSS brings this innovative interpretive language to your home computer. While not having the speed and power a true C compiler, tiny-c is an excellent choice for the programming student who is ready to begin learning the valuable techniques of structured languages.

tiny-c provides an easy-to-use, easy-to-modify environment that encourages experimentation while promoting proper programming style. The tiny-c package includes not only a comprehensive and instructional user manual but also complete source.

tiny-c \$99.95*

C/65

NOW AVAILABLE!

The first native mode C compiler ever produced for Atari and Apple computers.

C/65 supports a very usable subset of the extremely powerful and popular C language. Just as C is used by the most sophisticated programmers from the professional and academic communities, so shall C/65 prove to be a powerful and much-needed tool for 6502 software developers.

C/65 supports integer and character types (and arrays), pointers, fully recursive functions, and much more.

NOTE: C/65 requires MAC/65 or an equivalent assembler. Two disk drives recommended but not required.

C/65 \$80.00*

BASIC A+

"From the authors of Atari BASIC..."

It's a fact! OSS gave you that first and most popular language for Atari Home Computers. But why be content with the first when you can have the finest?

BASIC A+ is the only logical upgrade available to the Atari BASIC programmer. While retaining all the features which make Atari BASIC so easy to use, we've also given BASIC A+ features that place it at the forefront of modern interpretive languages. BASIC A+ will let you explore the worlds of structured programming, superior input/output, helpful programming aids, and even a very comprehensive PRINT USING command. And, exclusively for the Atari computer, an almost unbelievable array of PLAYER/MISSILE GRAPHICS commands and functions.

BASIC A+ \$80.00*

*REMEMBER: Standard OS/A+ is included at no extra charge with BASIC A+, MAC/65, C/65, and tiny-c.

ATARI, APPLE II, and TINY C are trademarks of Atari, Inc., Apple Computer, Inc., and Tiny C Associates, respectively. SpeedRead+, MAC/65, C/65, BASIC A+ and OS/A+ are trademarks of Optimized Systems Software, Inc.

Optimized Systems Software, Inc., 10379 Lansdale Ave., Cupertino, CA 95014, (408) 446-3099

Presuming that you have read my August and September columns, you will recognize the style and conversions that I have done. Statements such as PLOT, DRAWTO, COLOR, and others have been translated into JSRs to routines in my graphics package. (Note that the listing of the package has been omitted for space considerations. Simply include lines 9000 through 9999 of the listing in my August article.) I would, however, like to discuss a few points of interest.

Notice the coding of lines 2600 and 2700, where the BASIC program had used PTRIG(x)-PTRIG(x+1) to obtain a +1, 0, or -1 value from the joystick. But that requires turning the joystick 90 degrees from normal to play the game. As long as we are coding in assembly language, let's do it right!

What we have here, then, is essentially the code that BASIC A+ uses for its HSTICK(n) function. I think the code is easy to follow if you remember that the switches in the joystick force a zero bit in locations STICKn when they are pushed. By masking to only the bits we want, and by then inverting the bits, we are able to treat an "on" bit in a more or less normal fashion.

By the way, note that here, as elsewhere in the code, we are also using one-byte numbers to hold both positive and negative values. This works only so long as the absolute value of the signed numbers does not exceed 127, so be careful when using this technique.

Note the simulation of the array YP(n). First, look at how easy it is to handle array elements with constant subscripts, as in BASIC line 1010 (listing lines 1210 to 1230). Even variable subscripts aren't too hard when the array is byte sized and byte dimensioned. Look at BASIC line 4210 (listing lines 6030 and 6040). Admittedly, a true assembly language simulation of the BASIC line would probably go more like this:

```
LDX    HITP
LDA    SCORE,X
CLC
ADC    #1
LDX    HITP
STA    SCORE,X
      ;SCORE(HITP)=SCORE(HITP)+1
```

But why not be a *little* smart when making conversions? Besides, if we were writing in some higher level languages, we could have written "INCREMENT SCORE(HITP)".

Finally, the hardest part of this conversion needs some analysis. As we noted last month, in order to provide better movement and bounce characteristics for the ball, we allowed it to have movements (and positions!) of -1, -0.5, 0, +0.5, and +1. But now we're in assembly language using

byte integers. How do we implement fractional movements? We can't really, so we must choose an equivalent scheme.

Notice the variables in the program called "Q.Yxxx". These variables all are used to hold values that represent *half* movements or positions. Example: if Q.YNEW contains 17, that means it is really representing position 8.5! Notice, then, that before plotting any point that is represented in this fashion, we must divide its value by 2 (by using a LSR instruction, c.f., listing lines 3820, 3930, etc.). Choosing this scheme has some interesting consequences: the last statement of BASIC line 3080 (listing lines 4500 through 4650) is, in some ways, the hardest part of this listing to understand, simply because of the implied "mixed-mode" arithmetic that is used. But it works!

Foibles Of The Assembler/Editor

Writing this article caused me to rediscover some of the foibles of the Atari Assembler/Editor cartridge (and EASMD, for that matter). For many of you, these quirks may seem normal, especially if you haven't used several different assemblers on various machines. But, to others, these eccentricities can be annoying or puzzling.

First, beware of the "*"=" pseudo-operator. It is *not* an origin operator ("ORG" in many assemblers), even though it is used as such! Any label associated with this pseudo-op will take on the value of the instruction counter *before* the operator is executed. This is necessary since "*"=" is *also* used to reserve storage ("DS" or "RMB" in some assemblers).

Examples:

```
LABEL1 *= *+5
      ; reserves five bytes of storage
      ; and assigns the label "LABEL1"
      ; to the five bytes
*= $4000
      ; sets the instruction counter
      ; to 4000 hex
LABEL2 *= $5000
      ; assuming this line followed one
      ; above, assigns 4000 hex to
      ; "LABEL2" and sets instruction
      ; counter to 5000 hex!
```

Second, examine any references to location "CLOCK.LSB" in the Boing listing (e.g., line 5870). Notice that, even though CLOCK.LSB is in zero page, the assembler produced a three-byte instruction for all references to it. This is because the *definition* of CLOCK.LSB did not occur until *after* the first *reference* to it! Actually, the assembler/editor is being remarkably clever here. Remember that the cartridge is, like most assemblers, a two-pass program. It reads the source once to determine where things are and will be, and then it reads the

COMPUTE!'s Second Book Of Atari

After only three years on the market, the Atari 400/800 microcomputers have become among the most popular personal computers ever made. So it was no surprise when *COMPUTE!'s First Book of Atari*, a collection of the best Atari articles published during 1980-81 in **COMPUTE!** Magazine, also became a "bestseller" with Atari enthusiasts. The first printing sold out in just a few months.

That's why we've followed up with *COMPUTE!'s Second Book of Atari*. Available immediately, the *Second Book of Atari* continues **COMPUTE!'s** tradition for personal computer users.

But the *Second Book of Atari* differs from the *First Book* in one important respect — all the articles are totally new and previously unpublished. The *Second Book of Atari* includes such interesting articles as "Page Flipping," "Fun With Scrolling," "Perfect Pitch," "Player-Missile Drawing Editor," and "TextPlot Makes a Game." Whole chapters are devoted to subjects such as "Advanced Graphics and Game Utilities," "Programming Techniques," and "Beyond BASIC." With 250 pages — more than 25 percent thicker than the *First Book* at the same price — the *Second Book of Atari* is crammed with information and ready-to-type program listings. And the book is spiral-bound to lie flat and is fully indexed for quick reference.

Best of all, *COMPUTE!'s Second Book of Atari*, like **COMPUTE!** Magazine itself, is written and edited to appeal to all computer enthusiasts — beginners and experts alike. Priced at only \$12.95.

Available at computer dealers and bookstores nationwide. To order directly call TOLL FREE 800-334-0868. In North Carolina call 919-275-9809. Or send check or money order to **COMPUTE! Books**, P.O. Box 5406, Greensboro, NC 27403.

248 Listing Conventions

249 Index

source again to produce the listing and code. But, during the first pass through the source, it can't possibly know whether CLOCK.LSB is in zero page or not, so it chooses the safe route and assumes non-zero page. Then, lo and behold, it discovers that we really wanted the label to be in zero page. What to do?

If we now assign that label to zero page, the second pass of the assembler will produce only two bytes of code here, and all references to labels past that point will be off by one byte. We will have the infamous "phase error." So the assembler has a rule that states "once non-zero page, always non-zero page," and it continues to generate three-byte references. For a simple assembler like the Atari cartridge, this is a big step. It is still possible to produce phase errors with the cartridge, but it is more difficult than with many 6502 assemblers.

Third and last, there is a problem with the assembler/editor when it comes to multiple forward references. Consider the following code fragment:

```
AAA = BBB
BBB = CCC
CCC = 5
```

There is no way for a two-pass assembler to determine what the value of AAA is! On the first pass, it says "AAA is undefined, because BBB hasn't been defined yet." And then it thinks "BBB is undefined, similarly because of CCC." On the second pass, it *should* say "ERROR!!AAA is undefined, because BBB still hasn't been defined yet." But it can then produce "BBB = equal to 5 because that's what CCC is equal to."

Unfortunately, the assembler/editor doesn't keep a separate flag meaning "label as yet undefined." The "BBB = CCC" line is sufficient, from the assembler's viewpoint, to establish the existence of "BBB." So, on the second pass, it blindly puts the value of BBB (presumably zero) into AAA. Watch out for this trap! It has snared many a good programmer! I hope you realize that there would be no problems if you had coded that sequence in this order:

```
CCC = 5
BBB = CCC
AAA = BBB
```

That's it for this month. Next month we will investigate the many languages available to the Atari programmer. We will discuss and fix the major bug in Atari's 850 interface handler (the "Rn:" drivers). And maybe, just maybe, we will try to add cassette tape verification to BASIC.

Telecommunications

TELEGAMING

Michael E. Day
Chief Engineer
Edge Technology
West Linn, OR

Telegaming brings to mind many things, from simple games played via a telephone link to interactive games such as chess, and on to multiple-participant *macrogames*. Indeed, the farther you go when thinking along these lines, the more difficult it becomes to separate gaming from real life, simulations from the events they imitate.

Actually, telegaming has been around for a long time. Probably the earliest form of telegaming was the use of couriers to carry letters between two or more individuals noting the moves of the particular game in progress. The official postal service eventually replaced the couriers. Later, with the development of the ability to communicate via electrical means, telegaming as we would normally consider it – via electrical communication devices – came about.

One game that has received notice in this regard is chess, which lends itself easily to telegaming since strategy is of greater importance than speed. There are many chess games in progress at this very moment by mail, by telephone, by radio, and yes, even by computer.

Telegaming is certainly not just for computers though. Airborne television and cable television can (in some locales do) support telegaming. In Britain, one major system is the Prestel Videotex system, which uses the television in conjunction with the telephone to provide its services. The Prestel system currently supports approximately 16,000 users. While the system normally provides the usual fare of stock reports, news, etc., it also provides for telegaming.

Even something as simple as gaming can sometimes run afoul of politics, however. Last April, during the Falkland Islands problem, Prestel added a video game called "Obliterate." The object was to sink an Argentine flagship. A good shot brought the comment, "Well done, sir! You are a national hero. Horatio would be proud of you," while a poor shot would elicit, "Your poor judgment is endangering the reputation of your country and giving the enemy a chance to retaliate." A rather loud protest from the House of Commons scotched the game after only a week.

Five Adventurers, Three Maps

Telegaming is, of course, not limited to television. In fact, gaming via a terminal to a master computer at some remote location – which allows access to complex games not normally available to the game player – is more common. These games are often provided by timeshare computer networks such as "CompuServe." While other special-purpose computer systems for public use can support gaming, they seldom make it available, largely because there is only a single phone line to the system. In order to allow high volume use of the single line, such systems necessarily limit gaming activities.

While many private systems do not restrict use, systems available for free public use are mostly privately supported. The timeshare networks, which have the multiple communications capability already installed, do not have the restriction problem of the smaller private systems. In fact, they charge for the use of their facilities and, to increase revenues, tend to provide games which are oriented to lengthy line times and, if possible, more than one user.

One of the more popular games is the multi-user adventure, which allows more than one person to play at once. This adds interest: there is now competition for the available resources of the simulation. There might be five adventurers but only three treasure maps.

One problem with the current telegaming structure is response time. In order to have the fast response time needed for interactive gaming, you must be in direct contact with the gaming computer. This means line charges are accumulated even when you're not actively communicating with the system. In games such as chess where the response time is not critical, you can avoid these charges by not staying in direct communication, but instead breaking the link and calling back at a later time after the next move has been planned.

Having a reasonable response time while not actually using the communications link would lead to increased telegaming by reducing the connect time and its associated cost. Some interactive cable systems come close to this. While many still require that the communications be done via the telephone, some provide the ability to interrogate the "black box" on the TV set which attaches the set to the cable, providing a lower cost means of returning information to the cable system. The limitation here is that the system must interrogate each set on the line to get information, and this can slow performance in interactive game uses.

An interactive telegaming system of this sort could be of immense use to the general telecommunications market. Widespread use of interactive data systems is now impeded by requirements to

get on to the system and by the charges generated once there. The usual method of operation is to plan for the activity ahead of time, call up the data base, get the desired information, and get off as quickly as possible. This means that the information is being inefficiently used since only the known information is being retrieved.

Metagames

Ideally, both a proper information retrieval system and a good interactive telegaming system should be easy to access and inexpensive.

There is one company around that could build such a system. Bell Telephone already has a communications network in place that is easy to use and relatively inexpensive to operate. One major problem is that it still can take ten to 30 seconds or more to establish a connection to another phone. This means that the information retrieval/gaming system would have to have a different means of access if it was intended to be disconnected between operations. This could be done, but would be more expensive than the current method of telephone interconnect since more equipment would be involved. If the data access/gaming computer is not located inside the local exchange, high priority lines to the computer will also have to be accounted for. All this, of course, adds to the cost.

In the end, a quick retrieval data system will be implemented one way or another, simply because there is a need for it. How it will be implemented is yet to be seen. Once the system has been implemented, telegaming will quickly follow. If, however, telegaming comes into being first, a data system will soon follow it. Both systems require the same type of telecommunications capabilities; it is simply a matter of which will be first.

It is perhaps not too far off when we will be able to join in metagames – simulations so large that they are, in effect, hard to distinguish from reality. If memory becomes very cheap and computer switching becomes very fast, games might be built which contain so many variables that nearly any decision (or move) could be accommodated by the game. Add telecommunication to this meta-game, and you have historical re-enactments or imaginary events taking place all over the world simultaneously (on videoscreens or in "environmental rooms"). An adventure game could take months or years to reach its conclusion.

You could join an army as a private and, after months of part-time "playing," you could work your way up to become a general or a spy or whatever. All the players would join or leave this network simulation as their time and interests permitted. Imagine a computer-controlled, world-wide simulation so full, so convincing that millions of players

could experience (and influence) a make-believe first contact with aliens. You might be assigned to the team which decodes their language, or you might choose to just watch the event unfold on the Simulated Evening News. Whatever happens, the coming marriage of games and telecommunications will bring about some surprises. [For additional thoughts about gaming in the coming years, see "Future Games" elsewhere in this issue.]

CIRCUIT SOLVER I

You don't have to be an engineer to make productive use of this program. A large clear manual leads you through the use of Circuit Solver using sample problems which have practical application.

Features

- Simple Circuit Entry
- Circuit Listing
- Circuit Storage & Retrieval
- Easy Circuit Editing
- Supports Op-Amps
- Many Useful Sample Circuits

Machine Language: The Beginner's Dilemma

Jim Butterfield
Associate Editor

The beginner in machine language programming is faced with a three-way task. It's not enough to learn about machine code itself; the beginner must also develop skills on the particular machine that has been chosen. These extra skills fall into two general categories: using the tools that are provided and finding your way around the architecture.

Machine Language Itself

The machine code is the easiest part. There are numerous books and reference sources that will supply this information.

The matter is confused slightly by approaches and titles. Some teach machine language, some teach assembly language, and others identify themselves as books on "programming" or "program design." There isn't really much difference; they all develop the same skills.

I tend to favor learning the machine itself first — hexadecimal codes and such — and working up to the more general assembly language level later. It seems to me that if you can retain a firm image of the instructions as they lie in memory, you will always have a strong feeling for the real nature of the machine. For a beginner, assemblers do too much; it's easy to lose touch with how the machine is really doing the job. Later, assemblers will prove to be a powerful aid to programming, but they may be too powerful for the beginner.

But the neophyte may find himself blocked at the start. It's all very well to read about these codes, but how do you get them into the machine? And how do the codes create output to screen or printer?

Machine Language Tools: Monitors And Interfaces

The user needs some understanding of the *monitor* before he can do anything useful. This is the tool

that allows him to enter code into the machine; to check code for correctness; to initiate a program test run; and to intercept a program during the run in order to investigate its performance.

The monitor for a given machine may come in many forms. It may be built in, or loaded from tape or disk, or plugged in as a ROM cartridge. A given system may have one monitor, or a choice of several, or even extensions that can be added to a built-in monitor. Variety may be the spice of life, but it makes things difficult for textbooks. It's easy to show how to add two numbers together with a 6502; the coding is the same for all systems. But an outline of how to put this addition program into the computer must vary from machine to machine, from monitor to monitor.

There's another problem that needs to be solved. Different machines call for different interfaces to input and output. As a result, a general textbook can't complete the picture, since the input and output mechanics vary from machine to machine. On Commodore products, output (print) is generated by a call to \$FFD2; but the identical activity on Apple, KIM, Atari, AIM, or OSI is coded in a manner unique to that machine. Pity the poor machine language book author: he/she can't complete the picture without either tying himself to a specific machine or attaching a long rambling list of interfaces.

Architecture

Even identifying the tools specific to your machine isn't enough. We need to know how the machine is structured: in particular, what parts of memory are used for what purposes.

Where is the screen? It's often memory-mapped, but might be one place on a PET and another place on an Apple. Machines like Atari and VIC have "mobile" screens. There are several places in memory which might reflect the screen, depending on circumstances.

More importantly: what space is available on your computer, and what is in use? It's hard to enter a program into your computer if you don't know how to find or create a safe place in RAM for the program to go.

Again, it's hard for the textbook. Either it specializes in your machine, or leaves the poor beginner without the information he needs to fit the program to his machine.

You cannot effectively learn machine language in a vacuum. Each learner must have a chance to try his hand at coding the things he learns. Yet it seems to the beginner that he's being prevented from doing this: his books don't tell him enough.

Try to gain information on your machine. It may come from various sources: manufacturer's

literature, books, magazine articles, clubs, or examination of other people's programs.

Learn how to use the tools, especially the monitor. Find the best input/output interfaces for your machine. Study the mapping to find safe places to put your programs.

You'll find that all three skills will develop together. You'll learn machine language, machine tools, and machine architecture at the same time. Later you may want to transfer your skills to another machine and may need to learn new tools and architecture. By that time, you'll know enough about the whole machine environment to pick up very quickly.

For the beginner, machine language programming often seems to be an insurmountable obstacle. No single book gives all things needed to make a decent start. But a minimum set of skills can be developed, and after that the path becomes much easier.

An old joke tells of a drunk who falls down an open elevator shaft and then calls back to his friend, "Watch that first step - it's a big one!" The first step in machine language learning is a big one, too, but it sets the stage for unlimited further development - painlessly.

**YES! We said
"SORT VISICALC"!**

versacalc™

A UNIQUE VISICALC(tm) ENHANCEMENT

NOW AVAILABLE FOR PET

If you use Visicalc(tm) but are bumping into its limitations, you need Versacalc(tm)! Versacalc runs within Visicalc but uses no extra memory; in fact, it effectively increases memory by letting you call in modules from disk as needed.

A Tutorial section makes clear such features as @LOOKUP, DIF, @NA, @ERROR, which are not well explained in the Visicalc manual.

A Utilities section makes it easy to create your own menu-driven modules which condense hundreds of commands into four keystrokes. You can build in sophisticated error checking (e.g. Is the input value between certain limits?). Now it is possible for people untrained in Visicalc to perform the weekly updating without constant instruction.

for Commodore Pet & CHM 2040 - DOS 1.0
available for 8050 on request

SORT Visicalc, and Other Useful Wonders!

NOW YOU CAN:

SORT a Visicalc screen on any column, ascending or descending, and all related formulas and labels are sorted too.

put the entire disk CATALOG on the screen at once!

easily do Year-To-Date accumulations!
"pound" formulas to expose the full formulas in place on the screen!

append two Visicalc files!

print the contents of a /SS file!

print the contents of a /PF file!

AND our EASEL BINDER is so nice that you will put your other manual in it!

With this technique, your PET/IBM (4.0 BASIC or Upgrade, 16 or 32K) can store and play digitized speech. No special hardware is required. This program lets the PET digitize, store, playback and monitor speech or other audio signals from the tape deck. It also is a beginning for the processing of the digitized audio signals and can be used for a rudimentary voice-print analysis allowing you to discriminate between different people's voices.

Digital Speech

Kenneth Finn
Bedford, NY

The machine language of the program (from \$033A to \$03BD) is called Voice-Rec. Its job is to take the information from the cassette tape and store it in memory from \$1000 to \$4000. (Note: If you change locations \$035E and \$0391 to \$30 [which is machine language BMI] the memory will be saved from \$1000 to \$8000.)

A 20K Hz Sampling Rate

This program is interesting in several ways. The first is that the sampling time for the audio signal has been reduced to about 41 microseconds. This corresponds to a sampling rate of better than 20 KHz/second. One of the ways this was accomplished was by taking the program and practically duplicating it for the high-low and low-high transitions on CA1, which is the cassette read head. The sections from \$0349-\$037B and \$037C-\$03AE are almost identical. This was done to make the sampling rate the fastest possible.

Another peculiarity of the program is that the data is packed. Each memory byte contains either a number or \$FF, which means an overflow. The number corresponds to how many 40 microsecond loops went by before the signal changed from high to low or vice versa. This packing method allowed us to store about 20 seconds of audio in the 12K of memory allocated. While this does not seem like much time, remember that about 20K samples are taken every second. Without this packing, the entire 32K PET would fill up in about one and a half seconds. This packing is made possible by the silent periods between words and the presence of other low frequency components of human voice.

A third peculiarity of this program is that the paths taken by the program for the three possible conditions – no transition, overflow, transition – have all been equalized to within four or five microseconds. This is evident by the number of NOPs or (\$EA) in the program.

The second section of the program is called Voice. It goes from \$03B0 to \$03F6. It has been previously published in the November 1981 issue of **COMPUTE!** but has been modified here so that it can be co-resident with Voice-Rec; the two programs go well together. Its job is to allow you to position a voice tape by monitoring or listening to what is on it. It is very useful when you are trying to get the tape set up to record a specific segment of it.

A couple of things about it are interesting. First of all, it shows you how the stop key, the CB2 line, the tape read line, and the cassette motor can all be used from machine language. Second, it has an even higher sampling rate than Voice-Rec. Both this program and Voice-Rec can be in the second cassette buffer without any trouble, or they can be separated easily. Both are also relocatable.

The third part of the program is called Voice-Play. It goes from \$033A to \$03B3, and it can playback the recorded speech from memory \$1000 to \$4000. (This program also can be modified by changing \$036C and \$0397 to \$30 or BMI, and then it will play from \$1000 to \$8000.)

It has been designed to work with Voice-Rec in a similar way. Its timing loops at 43 microseconds match closely the loops of Voice-Rec; the playback is at least uniform, if not good.

Now let's examine the process that we have been using and see what we can now do with our digitized voice. What we have been doing is making the PET into a one-bit analog to digital converter. Another way of describing the process is saying that we have been making a record of an infinitely clipped signal. While this method is not quite as good as using an eight-bit ADC, it at least has the benefit of allowing us to get some experience cheaply and can be improved by the use of a good amplifier with tone controls on the PET's CB2 line. Since we are not capturing the signal in a very sophisticated way, I have chosen to make the sampling rate as high as possible to make up for it. That is why the first two program sections were not merged.

Let's begin by looking at the digitized data that we made and seeing how densely it has been packed.

```
10 POKE53,13:POKE52,0:CLR
20 FORI=4096TO16384
30 S=S+PEEK(I)
40 NEXTI:PRINTS/12288
```

This little program will produce the average byte value in the program. When I ran it, I got about 32, the average number of samples packed into each byte. This is why we can compress 20 seconds of information at a 20K Hz sample rate into only 12K bytes of memory.

Voice Analysis

A second analysis of the program was to produce a histogram of the signal. Remember that each byte represents a sort of instantaneous frequency. Thus, we want to examine what amounts of each frequency were present.

```
10 POKE53,13:POKE52,0:CLR:DIMA%(256)
20 FORI=4096TO16384
30 A%(PEEK(I))=A%(PEEK(I))+1:NEXTI
40 OPEN4,4,0
50 FORI=1TO70
60 PRINTA%(I),A%(I+70),A%(I+140),A%(I+210)
70 NEXTI:CLOSE4:END
```

This little program will produce a histogram, running down the page, on the PET printer. For the sample that I used, the majority of the important information was contained in the first 50 or so numbers running down. This is not too surprising, since the average value of the sample was 32. (Note, please, that overflow samples of 256 or \$FF were not really treated correctly in this little analysis. They should have been added to the next following byte to get the correct frequency.) This data is a kind of voice-print for a person's speech. If you have different people say the same thing into a tape recorder and then analyze each voice with our system, you will get a separate voice-print. Women's voices, since they tend to be higher, will have higher amounts of lower numbers, which correspond to the higher frequency. While this system is crude, it does provide a departure point.

A third analysis of this data is to transform the signal via differentiation. Before you wring your hands in despair, remember that we are dealing with digitized information, and all we have to do is to transform the data by taking the difference between each number in our stored data base. The ease with which we can manipulate a signal once it is in memory is why we started this project in the first place.

Another thing we can do quite easily is to filter the signal any way we like. Try adding two or three numbers to each datum, and see how each modification changes the signal. While this technique is not strictly a filter, it illustrates the idea that digital processing of speech data is useful.

Remember that once the rough parts of the work have been done in machine language, the fun parts can be done in BASIC. This makes it simple to process the data.

One final point. Up to now we have been

working in the time domain. We have a representation of how the voice looks at each point in time. There are other ways we can present this signal. While the other methods cannot mathematically tell us more about the signal, they can give us other ways to look at it.

One famous method is to transform the signal into the frequency domain by using a fourier transform. This analysis gives an altogether different type of histogram of the signal.

How To Use The PET/CBM Software Voice Synthesizer

The program is a combination BASIC loader and a runtime helper. When RUN, it loads the machine language programs from the DATA statements. Type each number carefully, and save the program before you run it, in case you've made an error (remember to change the indicated lines if you have Upgrade ROMs or 16K memory).

The program presents you with three options: Monitor Tape, Record, and Play. The Monitor program simply plays the tape. Press the RUN/STOP key to stop monitoring. You must press RUN/STOP while the tape is playing something audible, or the program won't acknowledge you. If you press it quickly, without holding down, you'll be returned to the menu of options; otherwise you'll see the message: BREAK AT LINE XXX. You can type RUN to restart the program.

When you're ready to record the tape into your computer's memory, press PLAY on the tape player first, then press R for Record. The tape will run for about 20 seconds. You can then listen to the digitized voice or sound with Play. The quality is best with an external CB2 speaker (some 4032's and all 8032's have a built-in piezoelectric "bell" that can produce low volume, high pitched CB2 sound). You can attach an amplifier to pins M and N on the user port if you want to add CB2 sound.

Z-RAM™ Opens Up The World Of CP/M™ To The Commodore Computer!

Z-RAM, a circuit board that fits inside the Commodore 4000 and 8000 computers, adds a Z-80A microprocessor and 64K of Random Access Memory (RAM), tripling the current maximum user memory!

Also provided with Z-RAM is the CP/M operating system, adding a new dimension to the Commodore computer by finally making the vast world of CP/M software available to its users.

With the addition of the Z-RAM board, Commodore computers will operate with 96K RAM and use both the 6502 and Z-80 processors. Several modes of operation are possible:

- With Z-RAM installed, all earlier versions of Commodore computers [regardless of memory capacity] can function as 32K machines. All current programs will run using 32K memory and the standard 6502 processor.
- Z-RAM permits the 6502 to use the full 96K of memory to operate the new expanded versions of Wordcraft Ultra, WordPro -Plus™ and other expanded Commodore programs.
- The Z-80A processor will operate in 64K memory and will run the industry standard CP/M operating system. WordStar™, SuperCalc™, and Accounting II Plus™ are only a sample of the fantastic CP/M programs now available to run on your Commodore computer!

Programming The PET/CBM

by Raeto Collin West

The book described by Jim Butterfield as

"...unquestionably the most comprehensive and accurate reference I have seen to date..."

The Reference Encyclopedia for Commodore 2000, 3000, 4000, and 8000 series computers and peripherals.

Here's just a sample of reviewer and reader reaction:

From reviewers:

Educational Computing Review by Stephen Potts

"Of all the books I have read on the PET this book *Programming the PET/CBM* by Raeto West must rank as one of the most comprehensive and readable accounts on the PET that I have ever had the pleasure to see..."

"If you wish to get more from your PET than arcade games and simple teaching programs then this book is a must for your bookshelf. It does not matter whether you run on BASIC 1, BASIC 2, or BASIC 4 since all routines are supplied with addresses and changes to make them run on any machines wherever possible..."

"...this book, with its lucid explanations of the PET, its useful routines and programming hints, is an essential purchase."

IPUG Magazine Review (British PET User Group) by Ron Geere

"This publication represents over a year's intensive research ... and the resulting product is a valuable work of reference. A tremendous amount of useful information has been packed in this 500+ page work at which I was so over-awed that I did not know how to

start this review at first...

"This book is a must for every CBM/PET user."

From readers:

"...a book the average to advanced user cannot afford *not* to possess..."

"My copy of your *Programming the PET/CBM* has been in daily use for nearly a month and I am finding it totally addictive, suffering severe withdrawal symptoms whenever I try half-heartedly to move on to other reading matter. It is without doubt the best book on its subject available today..."

"I have recently acquired a copy of your book *Programming the PET/CBM* and must congratulate you on its concept and on packing in so much detail. It's so very much better than anything I have had up to now that it'll be my constant reference manual."

"I have received my copy of *Programming the PET/CBM* by Raeto West and I have recommended it to several of my students. This book is so valuable that I cannot now afford to be without it."

Published exclusively in North America by **COMPUTE! Books**. The book is an astonishing reference manual of useful information. Contents include this and much more:

1 Introduction and overview: Plan of the book, sources of information, features and chronology of CBM hardware.

2 BASIC and how it works: Storage of BASIC and its variables; tokens, pointers, syntax; optimising BASIC.

3 Program and system design: Capabilities of the equipment; charts, algorithms, space, timing.

4 Effective programming in BASIC: Seventeen examples, including subroutines, dates, DATA, INPUT, rounding.

5 Alphabetic reference to BASIC keywords: Full descriptions, with examples, of all keywords, with methods for adding additional commands not present in CBM BASIC, e.g. AUTO, DEL, OLD, POP, PRINT USING, SORT, VARPTR.

6 Disk drives: Descriptions of operation and workings of disk drives, with BASIC and machine-code examples; bugs.

7 Alphabetic reference to disk BASIC commands: BASIC 4 disk commands with examples and notes.

8 Other peripherals and hardware: Tape storage and handling; printers; modem; keyboard; EPROMs; reset switches.

9 Graphics and sound: Tables of CBM characters; CRT chip;

animation, bar plots, 80 by 50 etc.; user-port sound.

10 The transition to machine-code: Introductory concepts; a BASIC monitor; use of MLM, Supermon, Extramon; easy examples.

11 More 6502 machine-code: 6502 hardware features; eighteen common problems in programming; debugging.

12 Alphabetic reference to 6502 opcodes: Examples, notes, and explanations on each opcode from ADC to TYA.

13 Using ROM routines: IRQ, NMI, RESET; the Kernel; examples - modifying LIST; ordinary and relocating loaders.

14 Effective 6502 programming: Assemblers; CHRGET and wedges; PIAs, VIA, IEEE; common mistakes.

15 Index to BASIC ROMs and RAM: Memory map of RAM and ROM, detailing and comparing BASICs 1, 2, and 4.

16 Mathematical programming: Precision; equations; statistics; simulation; finance; calculus; machine-code.

17 Programming in business and education: Examples, applications and pitfalls in business and education.

Appendices: 6502 reference charts; Supermon listings; ASCII; glossary

Plus many programs, diagrams and charts. Paperback, 504 pages. ISBN 0 942386 04 3. **\$24.95.**

VIC Ringer is a utility that should be in any programmer's bag of tricks. Those who are used to wide screen computers will find it especially helpful in working with VIC's screen wraparound.

VIC Ringer

Thomas Henry, Mankato, MN

The Commodore VIC-20 computer has got to be one of the most pleasant computers to program. However, you might find the 22-column screen a little disconcerting, especially if you were brought up on other computers. Of course, the VIC-20 does have screen wraparound, meaning that your BASIC lines can be a full 88 characters wide, including the line numbers. A BASIC line can actually occupy four normal screen display lines. This is a great scheme, but if your mind is on programming you may forget to watch for the end of this four-line limit. This is especially true if you are adding a line and the screen is already full of other statements.

Let's add an end-of-the-line bell. This bell should ring when the cursor is within, say, eight spaces of the end of a BASIC line. This gives enough

warning so that you can finish up the line or make the necessary changes to start a new line. The Commodore CBM-8032 has such a bell, and so does every typewriter; why shouldn't the VIC-20?

"VIC Ringer" is written in machine language and sits at the top of memory. The top of memory pointers at \$37 and \$38 are automatically adjusted so that they point just below the Ringer. Thus the program is "locked in" and safe from BASIC program interference. It can then peacefully coexist with any other programs you may care to enter in.

The principle of operation is quite simple. On the VIC-20 every 1/60 of a second, the computer stops doing whatever it may have been doing and goes to an *Interrupt Request* service routine. This routine scans the keyboard for key closures, refreshes the display, updates the realtime clock, and so forth. The VIC Ringer program is inserted into this Interrupt Request routine. Essentially, when the computer receives the interrupt signal, it will jump to the VIC Ringer routine and check to see if the cursor is at the 80th position on a BASIC line. If it is, and if this is the first time the 80th position has been found, then the bell rings. The computer then jumps to the normal Interrupt Request routine. If the cursor is not on the 80th position, the bell ringer routine is skipped.

ATTENTION VIC-20 USERS

Put YOUR BASIC programs on a cartridge!

The **ROMPACKER CARTRIDGE SYSTEM** lets you copy programs onto an EPROM USER Cartridge as easily as copying them onto a tape.

FEATURES

- BASIC or Machine Language Programs
- Up to 24K of Programs per Cartridge
- Automatic Program Menu on Power Up
- Single Keystroke Program Selection
- Uses Popular 2532 EPROMs

Special — ROMPACKER STARTER SYSTEM

Includes: Firmware cartridge, User Cartridge (with two 2532 EPROMs), EPROM programmer and manual.
\$149.95 till 11/30/82 (Regular \$179.95)

Extra **ROMPACKER** User Cartridges — \$39.95
2532 EPROMs \$9.50 each / 4 for \$36.00

Orders: Prepaid orders shipped free — others add \$4.00

AARDVARK — THE ADVENTURE PLACE

ADVENTURES FOR OSI, TRS-80, TRS-80 COLOR, SINCLAIR, PET, VIC-20

ADVENTURES — Adventures are a unique form of computer game. They let you spend 30 to 70 hours exploring and conquering a world you have never seen before. There is little or no luck in Adventuring. The rewards are for creative thinking, courage, and wise gambling — not fast reflexes.

In Adventuring, the computer speaks and listens to plain English. No prior knowledge of computers, special controls, or games is required so everyone enjoys them—even people who do not like computers.

Except for Quest, itself unique among Adventure games, Adventures are non-graphic. Adventures are more like a novel than a comic book or arcade game. It is like reading a particular exciting book where you are the main character.

All of the Adventures in this ad are in Basic. They are full featured, fully plotted adventures that will take a minimum of thirty hours (in several sittings) to play.

Adventuring requires 16k on Sinclair, TRS-80, and TRS-80 Color. They require 8k on OSI and 13k on VIC-20. Sinclair requires extended BASIC.

TREK ADVENTURE by Bob Retelle — This one takes place aboard a familiar starship and is a must for trekkies. The problem is a familiar one — The ship is in a "decaying orbit" (the Captain never could learn to park!) and the engines are out (You would think that in all those years, they would have learned to build some that didn't die once a week). Your options are to start the engine, save the ship, get off the ship, or die. Good Luck.

Authors note to players — I wrote this one with a concordance in hand. It is very accurate — and a lot of fun. It was nice to wander around the ship instead of watching it on T.V.

CIRCLE WORLD by Bob Anderson — The Alien culture has built a huge world in the shape of a ring circling their sun. They left behind some strange creatures and a lot of advanced technology. Unfortunately, the world is headed for destruction and it is your job to save it before it plunges into the sun!

Editors note to players — In keeping with the large scale of Circle World, the author wrote a very large adventure. It has a lot of rooms and a lot of objects in them. It is a very convoluted, very complex adventure. One of our largest. Not available on OSI.

HAUNTED HOUSE by Bob Anderson — This one is for the kids. The house has ghosts, goblins, vampires and treasures — and problems designed for the 8 to 13 year old. This is a real adventure and does require some thinking and problem solving — but only for kids.

Authors note to players—This one was fun to write. The vocabulary and characters were designed for younger players and lots of things happen when they give the computer commands. This one teaches logical thought, mapping skills, and creativity while keeping their interest.

DERELICT by Rodger Olsen and Bob Anderson — For Wealth and Glory, you have to ransack a thousand year old space ship. You'll have to learn to speak their language and operate the machinery they left behind. The hardest problem of all is to live through it.

Authors note to players — This adventure is the new winner in the "Toughest Adventure at Aardvark Sweepstakes". Our most difficult problem in writing the adventure was to keep it logical and realistic. There are no irrational traps and sudden senseless deaths in Derelict. This ship was designed to be perfectly safe for its' builders. It just happens to be deadly to alien invaders like you.

NUCLEAR SUB by Bob Retelle — You start at the bottom of the ocean in a wrecked Nuclear Sub. There is literally no way to go but up. Save the ship, raise her, or get out of her before she blows or start WWII!

Editors note to players—This was actually plotted by Rodger Olsen, Bob Retelle, and someone you don't know — Three of the nastiest minds in adventure writing. It is devious, wicked, and kills you often. The TRS-80 Color version has nice sound and special effects.

EARTHQUAKE by Bob Anderson and Rodger Olsen — A second kids adventure. You are trapped in a shopping center during an earthquake. There is a way out, but you need help. To save yourself, you have to be a hero and save others first.

Authors note to players — This one feels good. Not only is it designed for the younger set (see note on Haunted House), but it also plays nicely. Instead of killing, you have to save lives to win this one. The player must help others first if he/she is to survive — I like that.

PYRAMID by Rodger Olsen — This is one of our toughest Adventures. Average time through the Pyramid is 50 to 70 hours. The old boys who built this Pyramid did not mean for it to be ransacked by people like you.

Authors note to players — This is a very entertaining and very tough adventure. I left clues everywhere but came up with some ingenious problems. This one has captivated people so much that I get calls daily from as far away as New Zealand and France from bleary eyed people who are stuck in the Pyramid and desperate for more clues.

QUEST by Bob Retelle and Rodger Olsen — THIS IS DIFFERENT FROM ALL THE OTHER GAMES OF ADVENTURE!!!! It is played on a computer generated map of Alesia. You lead a small band of adventurers on a mission to conquer the Citadel of Moorlock. You have to build an army and then arm and feed them by combat, bargaining, exploration of ruins and temples, and outright banditry. The game takes 2 to 5 hours to play and is different each time. The TRS-80 Color version has nice visual effects and sound. Not available on OSI. This is the most popular game we have ever published.

MARS by Rodger Olsen — Your ship crashed on the Red Planet and you have to get home. You will have to explore a Martian city, repair your ship and deal with possibly hostile aliens to get home again.

Authors note to players — This is highly recommended as a first adventure. It is in no way simple—playing time normally runs from 30 to 50 hours — but it is constructed in a more "open" manner to let you try out adventuring and get used to the game before you hit the really tough problems.

ADVENTURE WRITING/DEATHSHIP by Rodger Olsen — This is a data sheet showing how we do it. It is about 14 pages of detailed instructions how to write your own adventures. It contains the entire text of Deathship. Data sheet - \$3.95. NOTE: Owners of OSI, TRS-80, TRS-80 Color, and Vic 20 computers can also get Deathship on tape for an additional \$5.00.

PRICE AND AVAILABILITY:

All adventures are \$14.95 on tape except Earthquake and Haunted House which are \$9.95. Disk versions are available on OSI and TRS-80 Color for \$2.00 additional.

Please specify system on all orders

ALSO FROM AARDVARK — This is only a partial list of what we carry: We have a lot of other games (particularly for the TRS-80 Color and OSI), business programs, blank tapes and disks and hardware. Send \$1.00 for our complete catalog.

Dealer Inquiries Invited. Programmers sought
VIC-20 is a registered trademark of Commodore Business Machines

Mysterious and even disastrous effects can result from improperly CLOSED PET/CBM files. This utility provides a convenient way to avoid these problems.

Is Anyone Open?

Elizabeth Deal
Malvern, PA

It is sometimes important to know which files on the PET have not been closed. The simplest way to find the file status is by asking the PET's machine language monitor, but you have to type error-prone inquiries. I got tired of this and adopted Mike Louder's "dynamic keyboard" routine to do the typing for me. The listing in lines 2000-2070 contains the routine. Users of BASIC 4 equipment must substitute SYS 54386 in lines 2050 and 2070. Line 2070 is important - it does the job.

Enter the code and execute by GOTO2000 or RUN. The program will print the desired inquiries, will "press" RETURN several times, and will display the data on the screen. There is one extra carriage

return stuffed in to re-enable Power. [A BASIC-enhancement program sold by Professional Software.] On Power-less systems the cursor will land one line too low. If this bothers you, change J-loop index M from 5 to 4. The display looks like you are in the monitor, but you are not. When all is done, you land safely back in BASIC. If you choose to modify the monitor display, placing the cursor over the SYS command and hitting RETURN will re-enter the monitor.

The display consists of three parts:

1) On the \$00D1 line the PET recalls the file it worked with most recently. \$D1 contains length of file name, \$D2 contains file number, \$D3 contains the secondary address or, in the case of tapes, the read/write flag, and \$D4 contains the device number. You can also go after the file name in 4, but in Upgrade, PET's PRINT commands obliterate the data.

2) On the \$00AE line we see PET's count of the number of active files. If you typed RUN or CLR; if no files were open; if you modified the program; or if you did anything that makes your PET think you modified a program - this value will be zero, hence useless to us. If it is not a zero, it is meaningful.

(3) Locations \$0251-026F contain the table of files. The first ten values are logical file numbers, the middle ten are device numbers, and

the last ten are coded secondary addresses. If the secondary address is \$FF, disregard it. Otherwise, subtract \$60 (96 dec) to get the secondary address. These values usually remain in the PET. PET considers them irrelevant if \$AE contains zero. (You may change \$AE to re-enable access to the files.) Otherwise, these are our OPEN files. As you CLOSE them, \$AE decreases by one and the display shifts to the left, always leaving a set of data in memory.

A CLOSE Option

For users who prefer not to read the information in hex, BASIC lines 2100-2250 do the same job. Additionally, this routine POKES a count of "possibly" open files into 174, so that you may CLOSE them. Needless to say, if you don't plan to close anything, you make POKE location 174 with zero; otherwise, the PET will not let you open an already active file.

There is circularity built into the routine: even if you just did CLOSE5, 5 will still be displayed. Disregard it. The purpose of the routine is to provide as much information as possible; it is up to you to use it with some thought.

The key reason for this exercise is the fact that files must be closed. If they are not, the final piece of information cannot be written. In the case of tape files, it's inconvenient. In the case of floppy files, it could lead to the disaster of losing other information already on the disk (especially if you plan to use a scratch command). It's easy to have some unclosed files dangling around – a disk error, a program error, or use of the STOP key may not allow the files to be properly closed. In direct mode, of course, an aborted SAVE command leaves an asterisk behind, meaning unfinished writing, an invitation to trouble that should be corrected immediately.

Some kinds of trouble may not show up for some time. A directory can look pretty good (though blocks free may tell you something), but when you attempt to bring a program in, for instance, it may look pretty weird (the same way as when you write a disk with a non-unique ID).

In any case, the usual procedure for handling such problems is to VALIDATE (COLLECT in 4.0 BASIC) the disk. That's a time-consuming nuisance if a disk is pretty full. It must be used in case of unfinished SAVEing. But we can skip VALIDATE by using the data provided by the above routine(s). With such an amount of displayed information, you're bound to be able to recognize which files are really OPEN and which have been closed. It often makes no difference that you know it, since it is all right to CLOSE an already closed file (hence you

can close them in a jiffy in a loop). But if you don't want to touch some device, a selective CLOSE is handy.

New Product FOR COMMODORE SYSTEMS The Commander

This 4K ROM contains exclusive programmable commands. These powerful commands contain an enhanced **COMMON** function which **RETAINS ALL VARIABLES AND ARRAYS**.

A list of some of these **COMMANDS WITH COMMON**, which until now were only available on large systems, are **INSERT, DELETE, APPEND, and RE-DIMENSION**.

INSERT - Loads a program or subroutine into the beginning, middle, or between specific line numbers of a running program, without losing variables or arrays. Program execution will continue at any line number, even a new line number just inserted. Insert also allows inserting any part of a program or subroutine.

DELETE - Deletes any portion of the running program between specified line numbers, under program control, with **COMMON** function, and continues execution. All deleted memory is reclaimed, and all variables/arrays are retained.

APPEND - Appends another program or subroutine (or any part thereof) to the end of the running program, and continues execution without losing variables.

RE-DIMENSION - Allows dynamic re-dimension of arrays, while program is running, without losing variables or any array data.

Also included are: **ENHANCED GET, STRING, FRAME, PRINTUSING and IMAGE, RETURN CLEAR, WINDOW, SPEED DATA and OVERLAY** commands.

Your Commodore needs **THE COMMANDER**®. These new commands give the Commodore system powerful features, all under program control. The commands are flexible and easy to use, in either program or direct mode.

THE COMMANDER®: \$70.00

(Includes demo/subroutine diskette)
(Florida residents add 5% sales tax)
(Specify socket: \$9000 or \$A000)

CBM/PET? SEE SKYLES ... CBM/PET?

**“Should we call it Command-O
or Command-O-Pro?”**

That's a problem because this popular ROM is called the Command-O-Pro in Europe. (Maybe Command-O smacks too much of the military.)

But whatever you call it, this 4K byte ROM will provide your CBM BASIC 4.0 (4016, 4032) and 8032 computers with 20 additional commands including 10 Toolkit program editing and debugging commands and 10 additional commands for screening, formatting and disc file manipulating. (And our manual writer dug up 39 additional commands in the course of doing a 78-page manual!)

The Command-O extends Commodore's 8032 advanced screen editing features to the ultimate. You can now **SCROLL** up and down, insert or delete entire lines, delete the characters to the left or right of the cursor, select **TEXT** or **GRAPHICS** modes or ring the 8032 bell. You can even redefine the window to adjust it by size and position on your screen. And you can define any key to equal a sequence of up to 90 key strokes.

The Command-O chip resides in hexadecimal address \$9000, the rightmost empty socket in 4016 and 4032 or the rearmost in 8032. If there is a space conflict, we do have Socket-2-ME available at a very special price.

Skyles guarantees your satisfaction: if you are not absolutely happy with your new Command-O, return it to us within ten days for an immediate, full refund.

Command-O from Skyles Electric Works.....\$75.00

For Apple, PET/CBM, VIC – this ripple sort will sort records using any internal location as its key. For example, R. J. Brown can be alphabetized starting at the "B" in Brown and ignoring "R. J."

SORTING BY FIELDS

Rick Keck
Overland Park, KS

Occasionally computer users need to sort data in a special way. Several sort routines are available, however most do not allow the flexibility of sorting data by fields. The program with this article illustrates a different type of application for a sort routine. The sorting algorithm used in this example is a ripple sort. The code as shown will work on either a Commodore or an Apple computer. Specifically, this program demonstrates a sorting routine which allows sorting of a file of string records by a user-specified field.

Observe the ten data statements at the top of the program noting that each record consists of three fields of data. It is essential that these fields start at a specified column in each of the records so that the file is consistent in its construction. In this case, the following fields start at the stated columns in each record in the file.

- Field (1): Name - column 1
- Field (2): Number - column 11
- Field (3): Code - column 21

With this program the user responds to a computer request by stating which column position the file of records is to be sorted by. The important factors which contribute to the ability to sort the file by a field are as follows: First, each record consists of a large, single string of data. Second, the utilization of the MID\$ function in the sorting section of the program allows comparison of a substring of each record.

This sorting program can be made into a subroutine and inserted into an existing program by doing the following. Delete lines 10 through 230; renumber the code as desired; replace the END statement with a RETURN statement; and call the subroutine with a GOSUB statement. Note

that the variable N must be assigned the value of the number of records in the file to be sorted. The variable C\$ is a variable string array with each element holding a record. This array must be dimensioned to at least size N. The variable B specifies the length of the field which will be sorted. In this code example it is set to the value of six. Since the data consists of a file of character string records, it is suggested that the data be sorted in the form of a sequential data file on external storage devices.

This sorting program can be used in a variety of applications. For example, sorting addresses by zip code, sorting transactions by account number, or sorting records by a date field.

A Word-Based Voice Synthesizer For The Apple II

David Barron
Spring Valley, NY

Since I purchased my computer I have been interested in voice synthesis. Its applications in CAI, games, and error handling seemed extensive. I decided to apply my newly learned machine language skills to writing my own voice routines.

My routines would have to meet several requirements:

1. They would have to be word based. This would keep the amount of memory per word constant. It would also provide for block memory organization. As well as this, it would simplify the program itself.
2. The routines would have to be easy to use. They would be activated by a POKE and a call, or by similar means. This would enable beginners to use the programs with ease.
3. To eliminate any excess costs, the routines would be hardware independent. They would make use of the Apple's cassette port and built-in speaker.

Memory Organization

The memory used to store a vocabulary is divided into 2000-byte blocks. Each of these blocks will be used to store eight, distinct words. Each word will be stored in its own bit of the block of memory. In other words, bit 0 stores word 0, bit 1 stores word 1, and so on. I chose to store the words this way rather than sequentially to reduce the complexity of the program. If I chose the latter way, many rotate commands would be required. These tend to get confusing, and, if you are not careful, very sloppy.

Since a single word rarely contains periods of silence, no data compression is necessary. Again, this simplifies the program. In order to store data in the correct bit, a few things must be done:

1. Load in the old byte.
2. Get a bit from the input port.
3. Move the input bit to the right position.
4. Plug this bit into the old byte.
5. Store the old byte.

Exactly how this is done will be explained in further detail later on.

How Speech Enters And Exits

The data enters into the program through the cassette and exits through the Apple on-board speaker. First let's talk about recording. Location \$C060 is the *cassette in*. When a byte is read from this location, the seventh bit is affected according to the audio signal present. After this location has been sampled, the seventh bit is isolated. It is then plugged into the correct position as explained above.

When in the playback mode, your voice is produced by the on-board speaker. Because the case resonates at certain frequencies, I would recommend hooking up an external speaker, as I have. This greatly improves the quality of any sound produced by the computer, especially voice. One note: when wiring up the speaker, use shielded cable. If you do not, a tremendous amount of RF interference will occur.

The speaker is controlled by location \$C030. Every time this memory location is accessed, a click is produced by the speaker. Be careful here. If you use a store instruction to toggle the speaker, it will be toggled twice. This is so because the 6502 does a read before any write. This accesses the location twice, thus producing two clicks.

Getting back to the program – once the correct data byte is loaded, the correct bit is isolated. If this bit is different than the last sample obtained, a change in state has occurred. This will result in the toggling of the speaker, producing a sound. Doing this at the proper rate reproduces the recorded word.

Here's a brief explanation of the machine language "record" and "playback" routines:

Record

The Record routine is probably the most complex part of this program. The entry point is \$9000. Here is how it works:

1. All pointers are set. This includes the calculation of the position of the word and the bit that the word is located in.
2. The Y register is set to zero. This will be

the index of the indirect address of the word.

3. A delay loop is executed. This is the start of the main program loop. The delay determines the sampling rate.

4. The sample byte is taken from the cassette port. The seventh bit is then isolated via an AND instruction.

5. The X register is set to \$FF if the input bit was high, or \$00 if the bit was low.

6. This result is moved to the accumulator. There it is ANDed with the byte that contains the bit that the word is to be stored in high. This provides us with a byte that has the bit we want the word in set according to the cassette input. All other bits in the byte are zero. This value is saved.

7. The accumulator is loaded with the mask byte and then inverted. This forms a byte with all bits set, except for the bit that the word will be stored in.

8. The current byte is loaded and then ANDed with the previously obtained value. This leaves the byte undisturbed except for the bit that the word will be stored in. This is set to zero.

9. This value is logically ORed with the byte that contained the data sample in the proper place.

10. At this point we have successfully plugged the input sample into the current byte.

11. The current byte is now stored. We are almost finished.

12. The Y register is incremented. If it is zero, then a page has been completed. In this case the page is incremented.

13. If the last page has been done, the routine ends. If not, then it jumps back to the delay routine and goes one more time.

Play

The playback routine is far simpler than the recording routine. Its entry point is \$9049.

1. All pointers are set. The positions of the word and of its bit are also calculated.

2. This is the beginning of the main loop. A delay is executed. This determines the sampling rate.

3. The Y register is zeroed. It will be the index to the indirect address.

4. The current data byte is sampled.

5. This value is ANDed with the mask byte. This results in all bits being zero except for the bit containing the word data, which is unaffected.

6. This is compared to the last data bit obtained.

7. If the value is the same, then nothing happens.

8. If there is a difference, the speaker is toggled.

9. The Y register is incremented, and the program checks whether a page has been completed.

10. If a page has been completed, the current page is incremented.

11. If the last page was done, the program ends.

12. Otherwise the program loops back until done.

Entering The Program Into Memory

Type in the BASIC Loader (Program 1) and RUN it to put the machine language program into memory. Then type CALL-151 to enter the monitor. Once this has been done, SAVE the program by typing: BSAVE VOC 1:1OBJ0, A\$9000, L\$C3.

The next step is to generate the table used by the mask subroutine. To do this, type the following:

```
*310:01 02 04 08 10 20 40 80
```

To save it, type:

```
BSAVE TABLE,a$310,L$10
```

Using The Program

To use the program requires only three simple steps:

1. POKE 0 with the word number.
2. POKE 772 with the speed.
3. Call the appropriate routine.

A sample program would look something like this:

```
10 POKE 0,1: REM WORD
20 POKE 772,10 : REM SPEED
30 CALL 9*4096 + 64 + 9 : REM PLAY
40 END : REM DONE
```

I have included three sample programs:

Program 2: This is a simple routine that speaks any number put in. You must enter the vocabulary from Table 1 before using it.

Program 3: This is a CAI demo. It is an addition quiz that uses Program 1 as a subroutine. This program shares a vocabulary with Program 1.

Program 4: This is a vocabulary builder. It should be used to build the vocabulary in Table 1.

I hope you enjoy using these routines, as I have. They make your programs many times more pleasant and impressive.

Table 1.

WORD NUMBER	WORD	WORD NUMBER	WORD
0	ZERO	27	NINETY
1	ONE	28	HUNDRED
2	TWO	29	THAT
3	THREE	30	IS

C

Function VAL (X) In UCSD PASCAL For Apple II

Michael Erperstorfer
Vienna, Austria

Function VAL (X) is similar to BASIC's VAL-function:

X must be a string of an integer number;
VAL returns a true integer number;
If X is no integer number VAL returns 0;
String X may have leading or trailing spaces.

```

PROGRAM VALTEST;
VAR INPUT : STRING;

C

To check a tape using this program, rewind the tape after a SAVE (while the program is still also in the computer's memory), type CALL 768, and do not hit return until after you have started your tape.

Verify Your Applesoft Tapes

Keith Falkner
Venice, FL

Imagine this — you've written a dandy program in Applesoft, tested it, debugged it, perfected it, and of course SAVED it.

But is the program *really* saved? Can you load the tape? If the tape recorder has developed a problem, you may lose this program forever as soon as you type NEW or turn off your Apple.

Here is how to know for sure. Below is a machine language program which verifies the accuracy of a SAVED Applesoft program on tape. To make use of this program:

1. Type in Program 1 and RUN it.
2. From the machine language monitor, SAVE it to tape via 300.393W or to disk via BSAVE VERIFY,A\$300,L\$94.
3. When you need it, BLOAD VERIFY from disk or enter the monitor with CALL -151 and reload it from tape via 300.393R (this does *not* affect an Applesoft program in memory).
4. SAVE the Applesoft program as normal.
5. Operate the tape recorder just as you would to LOAD an Applesoft program, but type CALL 768 instead of LOAD. The tape will be read and compared to the Applesoft program.
6. If the comparison is successful, there will be no error message, just the two BEEPs which accompany LOAD.
7. If, alas, the tape is not a readable copy of the program, the message ERR will appear, with the address of the error and the values of the byte on tape and the byte in memory.

An error message is never good news, but it is far better to know of a problem before the program is lost than to rely on a tape which later proves unreadable.

An Applesoft program on tape is really two data records: the first record is four bytes long and indicates the size of the Applesoft program. If this header is read accurately, the computer beeps, but prints nothing. The second data record on tape is as long as the header indicates, and contains an image of the program. When this is successfully read, whether by LOAD or by the verify program below, the computer beeps again.

Load naturally shoves the incoming data into memory, but Program 1 harmlessly compares what is read with what is in memory. If those bytes differ, an error message appears: ERR 08EB-88 (8C) for example, which means that at location \$8EB, the byte in memory is \$88 (the token for GR), but the tape contains \$8C (the token for CALL). As soon as it reports such an error, the VERIFY routine quits. At this point, nothing in memory has been altered, so the SAVE can be retried, perhaps with a different tape or a different volume level.

Take the time to type this routine into your Apple and save it. Sooner or later you will want assurance that a saved Applesoft tape is the accurate program you hope it is.

Type in the Applesoft program and it will build this machine language verify routine starting at address 768 when you type RUN.

```

CAPUTE!

Modifications Or Corrections To Previous Articles

Machine Language: First Steps

There are two corrections to be made to Jim Butterfield's series of columns "Machine Language: First Steps" (May through July, 1982). In the BASIC program which appeared several times in this series, line 220 should be changed to read:

```
220 J=48:FOR K=1 TO V
```

and in Part III (July 1982, p. 150), line 120 should read:

```
120 DATA 3,144,239,169,13,32,210,255,96
```

VIC Curiosities

The correct POKE to disable the LIST command on the VIC ("VIC Curiosities," August 1982, p. 140) is POKE 775,200

Apple Chemistry Lab

There are several typos in the chemistry simulation ("Chemistry Lab," August 1982, p. 75). Line 1220 should include a second parenthesis (X0) and lines 6035, 6050, and 6120 use a colon, not a semicolon. Lines 1041 and 1047 should start with PRINT " and line 7001 should start with DATA.

COMPUTE!'s Listing Conventions

Many of the programs which are listed in **COMPUTE!** use special keys (cursor control keys, color keys, etc.). To make it easy to tell *exactly* what should be typed in when copying a program into the computer, we have established the following listing conventions.

For The Atari

In order to make special characters, inverse video, and cursor characters easy to type in, **COMPUTE!** magazine's Atari listing conventions are used in all the program listings in this magazine.

Please refer to the following tables and explanations if you come across an unusual symbol in a program listing.

Atari Conventions

Characters in inverse video will appear like: **█**. Enter these characters with the Atari logo key, {A}.

When you see	Type	See	
{CLEAR}	ESC SHIFT <	↵	Clear Screen
{UP}	ESC CTRL -	↑	Cursor Up
{DOWN}	ESC CTRL =	↓	Cursor Down
{LEFT}	ESC CTRL +	←	Cursor Left
{RIGHT}	ESC CTRL #	→	Cursor Right
{BACK S}	ESC DELETE	⌫	Backspace
{DELETE}	ESC CTRL DELETE	⌫	Delete character
{INSERT}	ESC CTRL INSERT	⌫	Insert character
{DEL LINE}	ESC SHIFT DELETE	⌫	Delete line
{INS LINE}	ESC SHIFT INSERT	⌫	Insert line
{TAB}	ESC TAB	⌫	TAB key
{CLR TAB}	ESC CTRL TAB	⌫	Clear tab
{SET TAB}	ESC SHIFT TAB	⌫	Set tab stop
{BELL}	ESC CTRL 2	⌫	Ring buzzer
{ESC}	ESC ESC	⌫	ESCAPE key

Graphics characters, such as CTRL-T, the ball character ● will appear as the "normal" letter enclosed in braces, e.g. {T}.

A series of identical control characters, such as 10 spaces, three cursor-lefts, or 20 CTRL-R's, will appear as {10 SPACES}, {3 LEFT}, {20 R}, etc. If the character in braces is in inverse video, that character or characters should be entered with the Atari logo key. For example, {█} means to enter a reverse-field heart with CTRL-comma, {5 █} means to enter five inverse-video CTRL-U's.

For PET/CBM/VIC

Generally, any PET/CBM/VIC program listings will contain bracketed words which spell out any special characters: {DOWN} would mean to press the cursor-down key; {3DOWN} would mean to press the cursor-down key three times.

To indicate that a key should be *shifted* (hold down the SHIFT key while pressing the other key), the key would be underlined in our listing. For example, S would mean to type the S key while holding the shift key. This would result in the "heart" graphics symbol appearing on your screen.

Sometimes in a program listing, especially within quoted text when a line runs over into the next line, it is difficult to tell where the first line ends. How many times should you type the SPACE bar? In our convention, when a line breaks in this way, the ~ symbol shows exactly where it broke. For example:

```
100 PRINT "TO START THE GAME ~
    YOU MAY HIT ANY OF THE KEYS
    ON YOUR KEYBOARD."
```

shows that the program's author intended for you to type two spaces after the word *GAME*.

For The Apple

Programs listed as "Microsoft" are written for the PET/CBM,

Apple, OSI, etc. Although the programs are general in nature, you may need to make a few changes for them to run correctly on your Apple. Microsoft BASIC programs written for the PET/CBM sometimes contain special cursor control characters. The following table shows equivalent Apple words. Notice that these Apple commands are *outside* quotations (and even separate from a PRINT statement). PRINT"[RVS]YOU WON" becomes INVERSE: PRINT"YOU WON":NORMAL

{CLEAR} (Clear Screen) HOME
 {DOWN} (Cursor down)
 Apple II +: Call -922
 POKE 37,PEEK(37)+(PEEK(37)<23)
 {UP} (Cursor up)
 POKE 37,PEEK(37)-(PEEK(37)>0)
 {LEFT} (Cursor left) PRINT CHR\$(8);
 {RIGHT} (Cursor right)
 PRINT CHR\$(21)

{RVS} (Inverse video on. Turns off automatically after a carriage return. To be safe, turn off inverse video after the print statement with NORMAL unless the PRINT statement ends with a semicolon.)
 INVERSE

{OFF} (Inverse video off) NORMAL

Shifted characters can represent either graphics characters or uppercase letters. If within text, just use the non-shifted character, otherwise substitute a space. Some "generalized" programs contain a POKE such as POKE 59468,14. Omit these from the program when typing it in. One final note: you will probably want to insert a question mark or colon within an INPUT prompt. PET/CBM and many other BASICs automatically print a question mark:

```
INPUT "WHAT IS YOUR NAME";N$
becomes
INPUT "WHAT IS YOUR NAME?";N$
```

All Commodore Machines

Clear Screen {CLEAR}	Cursor Left {LEFT}
Home Cursor {HOME}	Insert Character {INST}
Cursor Up {UP}	Delete Character {DEL}
Cursor Down {DOWN}	Reverse Field On {RVS}
Cursor Right {RIGHT}	Reverse Field Off {OFF}

VIC Conventions

Set Color To Black {BLK}	Function Two {F2}
Set Color To White {WHT}	Function Three {F3}
Set Color To Red {RED}	Function Four {F4}
Set Color To Cyan {CYN}	Function Five {F5}
Set Color To Purple {PUR}	Function Six {F6}
Set Color To Green {GRN}	Function Seven {F7}
Set Color To Blue {BLU}	Function Eight {F8}
Set Color To Yellow {YEL}	Any Non-implemented
Function One {F1}	Function {NIM}

8032/Fat 40 Conventions

Set Window Top {SET TOP}	Erase To Beginning {ERASE BEG}
Set Window Bottom {SET BOT}	Erase To End {ERASE END}
Scroll Up {SCR UP}	Toggle Tab {TGL TAB}
Scroll Down {SCR DOWN}	Tab {TAB}
Insert Line {INST LINE}	Escape Key {ESC}
Delete Line {DEL LINE}	

COMPUTE! Back Issues

Here are some of the applications, tutorials, and games from available back issues of **COMPUTE!**. Each issue contains much, much more than there's space here to list, but here are some highlights:

February 1981: Simulating PRINT USING, Using the Atari as a Terminal for Telecommunications, Attach a Printer to the Atari, Double Density Graphing on C1P, Commodore Disk Systems, PET Crash Prevention, A 25¢ Apple II Clock.

May 1981: Named GOSUB/GOTO in Applesoft, Generating Lower Case Text on Apple II, Copy Atari Screens to the Printer, Disk Directory Printer for Atari, Realtime Clock on Atari, PET BASIC Delete Utility, PET Calculated Bar Graphs, Running 40 Column Programs on a CBM 8032.

June 1981: Computer Using Educators (CUE) on Software Pricing, Apple II Hires Character Generator, Ever-expanding Apple Power, Color Burst for Atari, Mixing Atari Graphics Modes 0 and 8, Relocating PET BASIC Programs, An Assembler In BASIC for PET, QuadraPET: Multitasking?

July 1981: Home Heating and Cooling, Animating Integer BASIC Loops Graphics, The Apple Hires Shape Writer, Adding a Voice Track to Atari Programs, Machine Language Atari Joystick Driver, Four Screen Utilities for the PET, Saving Machine Language Programs on PET Tape Headers, Commodore ROM Systems, The Voracious Butterfly on OSI.

August 1981: Minimize Code and Maximize Speed, Apple Disk Motor Control, A Cassette Tape Monitor for the Apple, Easy Reading of the Atari Joystick, Blockade Game for the Atari, Atari Sound Utility, The CBM "Fat 40," Keyword for PET, CBM/PET Loading, Chaining, and Overlaying.

October 1981: Automatic DATA Statements for CBM and Atari, VIC News, Undeletable Lines on Apple, PET, VIC, Budgeting on the Apple, Switching Cleanly

from Text to Graphics on Apple, Atari Cassette Boot-tapes, Atari Variable Name Utility, Atari Program Library, Train your PET to Run VIC Programs, Interface a BSR Remote Control System to PET, A General Purpose BCD to Binary Routine, Converting to Fat-40 PET.

December 1981: Saving Fuel \$\$ (Multiple Computers: versions for Apple, PET, and Atari), Unscramble Game (multiple computers), Maze Generator (multiple computers), Animating Applesoft Graphics, A Simple Printer Interface for the Apple II, A Simple Atari Wordprocessor, Adding High Speed Vertical Positioning to Atari P/M Graphics, OSI Supercursor, A Look At SuperPET, Supermon for PET/CBM, PET Mine Maze Game.

January 1982: Invest (multiple computers), Developing a Business Algorithm (multiple computers), Apple Addresses, Lowercase with Unmodified Apple, Cryptogram Game for Atari, Superfont: Design Special Character Sets on Atari, PET Repairs for the Amateur, Micromon for PET, Self-modifying Programs in PET BASIC, Tiny-mon: a VIC Monitor, Vic Color Tips, VIC Memory Map, ZAP: A VIC Game.

February 1982: Insurance Inventory (multiple computers), Musical Transposition (multiple computers), Multitasking Emulator (multiple computers), Disassemble Apple Programs from BASIC, Plotting Polar Graphs on Apple, Atari P/M Graphics Made Easy, Atari PILOT, Put A Rainbow in your Atari, Marquee for PET, PET Disk Disassembler, VIC Paddles and Keyboard, VIC Timekeeping.

March 1982: Word Hunt Game (multiple computers), Infinite Precision Multiply (multiple computers), Atari Concentration Game, VIC Starfight Game, CBM BASIC 4.0 To Upgrade Conversion Kit, Apple Addresses, VIC Maps, EPROM Reliability, Atari Ghost Programming, Atari Machine Language Sort, Random Music Composition on PET, Comment Your Apple II Catalog.

April 1982: Track Down Those Memory

Bugs (multiple computers), Shooting Stars Game (multiple computers), Intelligent Input Subroutines (multiple computers), Ultracube for Atari, Customizing Apple's Copy Program, Using PET/CBM In The High School Physics Lab, Grading Exams on a Microcomputer (multiple computers), Atari Mailing List, Renumber VIC Programs The Easy Way, Browsing the VIC Chip, Disk Checkout for PET/CBM.

May 1982: VIC Meteor Maze Game, Atari Disk Drive Speed Check, Modifying Apple's Floating Point BASIC, Fast Sort For PET/CBM, Extra Atari Colors Through Artifacts, Life Insurance Estimator (multiple computers), PET Screen Input, Getting The Most Out Of VIC's 5000 Bytes.

Home and Educational COMPUTING! (Fall 1981 and Summer 1981 – count as one back issue): Exploring The Rainbow Machine, VIC As Super Calculator, Custom Characters, Alternate Screens, Automatic Line Numbers, Using The Joystick (Spacewar Game), Fast Tape Locator, Window, VIC Memory Map.

Back issues are \$3.00 each or six for \$15.00. Price includes freight in the US. Outside the US add \$1.00 per magazine ordered for surface postage. \$3.00 per magazine for air mail postage. All back issues subject to availability.

In the Continental US call
TOLL FREE 800-334-0868
 (In NC Call 919-275-9809)

Or write to **COMPUTE!** Back Issues, P.O. Box 5406, Greensboro, NC 27403 USA. Prepayment required in US funds. MasterCard, Visa and American Express accepted. North Carolina Residents add 4% sales tax.

QUICKSOFT™

CURES THE #1 TERMINAL ILLNESS:

S.D.S. (SLOW DELIVERY SYNDROME)

QUICKSOFT'S cure doesn't come in a bottle, but it does come in handy when your computer needs software delivered promptly.

24 HOUR SHIPPING: QUICKSOFT is the software-house with a difference: **SPEED!!** When you place a phone order with QUICKSOFT we guarantee that it will be shipped within twenty-four hours.*

WIDE SELECTION: QUICKSOFT carries thousands of software disks, tapes and cartridges for every purpose. We have business systems to cure those overflowing files, educational disks to relieve the worry of a D in chemistry, and adventure games to aid a case of the blues.

QUICKSOFT HAS THEM ALL, and right now we're having specials on these items from our "most wanted" list:

SPACE EGGS	\$20.95
LETTER PERFECT	119.95
TRACK ATTACK	20.95
ZORK I or II	31.95
THRESHOLD	31.95
WORD RACE	19.95
VISICALC	189.95
CROSSWORD MAGIC	39.95
DEADLINE	39.95
CROSSFIRE	20.95

OFFER EXPIRES NOVEMBER 30, 1982.

FREE DELIVERY: QUICKSOFT offers free delivery on all orders of \$50.00 or more. We not only ship within 24 hours but we also pay the freight! (For orders of less than \$50 add \$1.50 for shipping and handling.)

CALL TOLL FREE ANYTIME. QUICKSOFT'S toll free number is available anytime of the day or night. For placing an order or for requesting our FREE CATALOG simply dial:

1-800-547-8009
IN OREGON CALL 1-342-1298
Please specify for Apple or Atari
computer on your order.

* **GUARANTEE:** QUICKSOFT guarantees shipment within 24 hours on each phone order. If the item ordered is not readily available and cannot be shipped on time, you will receive an additional 5% OFF the regular QUICKSOFT price.

Christmas Music For The Atari

B.I.G. Software announces the release of the first three of a scheduled seven volumes of Christmas Music for the Atari 400/800 Computer.

Each volume contains ten Christmas favorites and requires only a BASIC cartridge for operation. Every volume contains a different set of songs such as *Silent Night*, *The First Noel*, and many other favorites. Each song features four-part harmony and smooth, accurate song reproduction.

The program is available in two formats: Version One for 8K to 24K tape drives or 16K to 32K disk drives; and Version Two for 32K tape or 40K disk. Version Two allows the user a wide variety of options for song play. Individual songs can be selected, and each song can be repeated a given number of times or allowed to play continuously. In addition, the user can play all ten songs in the order they are listed in the program, or he can select from the available songs. This sequence can then be repeated indefinitely, and each song within the sequence can also be set for multiple play.

Christmas Music Volumes 4, 5 and 6 are scheduled for release in October, and Volume 7 in early November. Volume 7 will feature the *Hallelujah Chorus* from Handel's *Messiah*, *Ave Maria*, *O Holy Night*, and several other well-known selections. Due to the memory requirements for Volume 7, it will be available only in the Version Two format.

Future releases will include Pop and Show Tunes, Country and Western, as well as a wide selection of Classical music.

Retail prices range from \$12.95 for a one-volume tape version to \$34.95 for the three-volume disk. Words to all songs are available at a small additional cost.

Expansion Chassis For VIC

Arfon Microelectronics, Ltd. has announced a new product – the Arfon Micro VIC-20 Expansion Chassis. The Micro VIC-20 Expansion Chassis enhances the VIC-20 system by fully expanding the VIC-20 memory; plugging in

interfaces for data retrieval; and controlling applications, other computer peripherals, cartridges for expanded BASIC language functions, and programming utilities.

The Arfon Micro VIC-20 Expansion Chassis has the following features: seven expansion slots; all aluminum construction; large power supply with toroidal transformer; five volt supply direct to the VIC-20 for cooler operation; 24 volt supply for the Arfon Micro VIC printer; detachable cover to protect cartridges; housing for VIC and Expansion in one portable unit; holder for RF modulator; and support for all VIC-20 cartridges from Arfon Micro, Commodore, and others.

Arfon Microelectronics, Ltd.
111 Rena Drive
Lafayette, LA 70503
(318)988-2478

Data Perfect Apple From LJK

LJK Enterprises, Incorporated announced the release of their new program Data Perfect Apple, for the Apple II and II+ computer. Written in machine language, Data Perfect requires no disk swapping and is fully interactive with LJK Word Processor, Letter Perfect. This user-friendly program allows the operator to design his own screen mask, in either 40 or 80 column. The single-load program, which is menu driven, has an incorporated utilities section, as well as a report generator and a mailing label generator. Multiple searches and sorts are allowed. Complete formula operations, as well as mathematical operations, may be performed on and between fields. The program supports one or two disk drives and requires a minimum of 32K memory. Use with any printer is allowed. The introductory cost for the program is \$99.95.

LJK Enterprises, Inc.

Computer Conference

The Mid-South Association for Educational Data Systems is calling for proposals for its 10th Annual Conference to be held February 24-26, 1983 in Jackson, MS. The theme will be "The Computer As A Universal Machine."

Papers, workshops, demonstrations, and ideas for discussion sessions are being solicited on ways computers are and can be used as universal machines in educational settings. Areas of special interest include the computer's use as a tool for administrators, for teachers, and for students — especially in inter-

disciplinary approaches.

For information on how to submit abstracts, contact Linda Wyrick Winkle, Department of Curriculum and Instruction, School of Education, University of Mississippi, University, MS 38677 (601-232-5906). Abstracts should be submitted by November 1.

Ledger System For Radio Shack Computers

The Single Entry Ledger System provides a menu-driven, easy-to-use General Ledger package for a cash basis accounting system. Written with the operator in mind, this system maintains its own data files and provides a variety of reports. The programs

New Floating Point ROM For Atari

Fastchip is designed to give you up to three and 1/2 times the speed of the original floating point routines. Atari BASIC uses these routines for most everything.

Fastchip is a pin compatible masked ROM that replaces the original ROM. It can be installed quickly and is a permanent replacement for the original ROM. There are no modifications, cuts, or wires to add. Remove the original ROM and plug in the Fastchip ROM. Installation instructions are included.

Fastchip comes with a 90 day full warranty. Return undamaged during this period for a full refund.

Fastchip is being offered for \$41.95 each, including shipping and handling. Texas residents add 5% sales tax. Overseas orders add \$2.00. Allow two to four weeks for delivery. Call or write for additional information.

Amber Screen Monitor

USI Computer Products Division has introduced the USI Pi-4, a monochromatic video monitor with a 9" amber display. Featuring the low-fatigue amber phosphor adopted as a standard by European nations, the USI Pi-4 has 1000-lines at center resolution with 20 MHz bandwidth.

The USI Pi-4 has a 44 square-inch (9" diagonal) screen, with a full 80-character by 24-line text display. Clear, crisp graphics are ensured by USI Pi-4's wide bandwidth and high resolution, adding to the monitor's comfort factor. Corner-to-corner legibility, even with lower-case descenders, assures a high-quality, easily-readable display.

USI Pi-4 monitors are supplied in computer-coordinated enclosures that feature convenient front panel display brightness/contrast controls, power switch, and LED power indicator.

The compact and stackable Pi-4 weighs only 15 pounds. RCA phone jacks and a standard SO-239 connector make possible easy connection to major small business or personal computers.

Sold with a 90-day over-the-counter warranty, all USI Pi-4 monitors receive 100-hour factory burn-in and reinspection before being shipped. Available from computer stores nationally, the Pi-4 is offered at a suggested list price of \$215.

Publications From K-12 MicroMedia

The fall 1982 edition of the K-12 MicroMedia catalog of selected books and programs for micro-computer-assisted learning is now available.

Describing over 350 items from over 75 publishers, the catalog is organized according to subject, with recommended grade levels, machine compatibility, and media format (tape or disk) all clearly indicated. All materials may be ordered directly from K-12 MicroMedia on a thirty-day approval basis.

Offering programs for the Apple, Atari, PET, and TRS-80 microcomputers, the new catalog includes 23 new releases.

Educators may obtain a free copy by writing to K-12 MicroMedia.

Getting Down to BASIC is the first book published by K-12 MicroMedia. The 64-page workbook is for students in grades 7-10 who have had no prior programming coursework.

Designed to be used while students are working at the microcomputer, *Getting Down to BASIC* clearly and concisely explains and illustrates key BASIC commands, statements, and elementary programming techniques, including loops, flowcharting, and graphics commands. Differences among Apple, PET, and TRS-80 are noted throughout. Eight labs conveniently segment the material into manageable lessons. A glossary explains over 50 common computer terms.

Getting Down to BASIC costs \$4.95 (plus 50¢ postage). School discounts are available for quantity purchases.

K-12 MicroMedia
172 Broadway
Woodcliff Lake, NJ 07675

New Product releases are selected from submissions for reasons of timeliness, available space, and general interest to our readers. We regret that we are unable to select all new product submissions for publication. Readers should be aware that we present here some edited version of material submitted by vendors and are unable to vouch for its accuracy at time of publication.

TRS-80 Color Computer Program

Micro School Programs has announced a new program, *Colortext*, for use on TRS-80, 32K Color Computers, with one disk drive. Colortext is an easy-to-use high-resolution text driver which displays a variety of character fonts and graphics on the screen simultaneously, including the use of all features of Extended BASIC. It permits the intermixing of upper and lowercase text and graphics in various sizes and colors.

Other features include non-destructive overwrite for animation, variable screen scrolling speed, a BREAK key lock-up option, and ADDCHR – a program for creating and editing all characters (including graphics, alphanumeric, etc.). ADDCHR can be used to create character

sets of up to 200 characters. The defined character sets may be used for foreign languages such as Greek, Hebrew, Russian, or for various other print types.

The TRS-80 Model III graphics character set is included in Colortext. This permits the user to enter and use programs written for Models I and III very quickly, using the same graphics character set numbers used in the other programs. This character set may be changed by the user if desired.

This program is intended for use by curriculum authors, teachers, game designers, or by anyone who wishes to prepare programs which involve the simultaneous use of text, graphics, and color. User programs (up to 16K) will run with Colortext on 32K machines.

The more than 50-page user's manual provides complete instructions on the use of the

program. Users are led through a practice program which introduces them to the various features of Colortext. A demonstration program is also included on the disk to illustrate character sets, colors, display techniques, and animation. Two reference sections are also included, one for Colortext and one for the ADDCHR program.

Colortext comes on disk with manual. Price is \$79.80.

(714) 783-0556

board teams up with Lazer's earlier units, the Lower Case + Plus and Lower Case + Plus III, to give the user a RAM based character set on the Apple II. With the Graphics + Plus, the Apple user can easily define and redefine the characters that appear on the text screen.

Although the Graphics + Plus lets you define any character you can fit in a 7x8 cell (like the hires character generators), absolutely *no* use of the hires graphics page is made! So 280x192 hires-style graphics becomes available on the Apple's 1K screen. You manipulate the 960 bytes of data on the text page instead of the 8K bytes on the hires graphics page; you therefore manipulate the graphics characters on the screen — less than one-eighth the work. Since the graphics manipulation section of a program would be running eight to ten times faster, more

time is available for performing more complex calculations, improving the sound effects, or, even better, allowing the user to write the program in BASIC instead of assembly language.

With Graphics + Plus, a whole new range of word processing, business, scientific, and game applications are possible.

Included with the Graphics + Plus are over 20 example fonts, an excellent font editor (and the fonts created by any hires character generator are compatible with the Graphics + Plus), several utility programs and example files. Both Pascal and DOS 3.3 software are provided on diskette for the Graphics + Plus user.

Complete documentation for use and installation is provided with each board. The Graphics + Plus is available from your local dealer (or direct from Lazer Microsystems) for only \$159.95. For those who do not own a Lower Case

+ Plus or a Lower Case + Plus III, Lazer offers a special package price consisting of a Lower Case + Plus III and Graphics + Plus for only \$199.95.

Contest Marks Merger

The Paper, one of the oldest independent publications supporting Commodore computers, is merging with the *Midnite Software Gazette*, beginning with the October 1982 issue.

To celebrate the merger, a contest is underway to rename the merged magazines. The person suggesting the best name will receive a free VIC computer, courtesy of Computer Country

of Springfield, Illinois. Judging will be by the editors, and in case of ties, by the readers of the combined magazine. Entries must be received by November 1 at the address below.

Midnite specializes in brief independent reviews of products for Commodore computers. Its current issue is a 300+ page \$10 book.

The Paper has traditionally been a source of articles and tutorials for users of Commodore computers, with series on such topics as first steps in machine language, as well as extended reviews of important products.

Subscriptions to the combined magazine are \$20 U.S. or \$25 CDN. in North America for six bi-monthly issues. Overseas subscriptions are \$45 U.S.

Logica Software For World Videotex Service

Logica's new Appletel Disk allows Apple computer users to plug into the Prestel World Videotex Service. The easy-to-use software turns the personal computer into a terminal to retrieve a wide range of international data including regularly updated prices of: 63 commodities from ex-

changes in the U.S., Europe, and the Far East; 64 currency exchange and IMM rates; and 713 U.K. and other stocks.

Many other useful data bases are also available, including:

- financial/management information on corporate sectors worldwide.

- economic indicators and statistics on most industrialized countries.

- locations of 22,000 deep sea ships "bound for" or "in port."
- bookings at over 400 hotels in the U.K. and elsewhere.

- airline schedules on over 50 carriers, with reservation facilities on major airlines.

- electronic messaging to other Prestel users.

- international news, sports, and weather.

In addition, a wide range of teleshopping services are available, most aimed at U.K. shoppers. Information and services are provided by over 900 companies, some based in the U.S.

With the Appletel Disk, the Apple, and a Hayes micro-modem, the user simply accesses a local telephone number, enters a password, and retrieves any of the more than 220,000 pages in the Prestel database.

VIAC: The VIC Interface To Any Cassette

Integrated Controls has announced the VIAC. This adapter allows you to connect almost any audio cassette recorder to the VIC-20, Commodore PET, CBM, and all the new Commodore computers that employ the same existing six-pin cassette interface. The VIAC has three plugs that connect directly to the microphone, earphone and remote jacks of any standard audio cassette recorder, and a six-pin edge connector cable that interfaces directly to the computer cassette slot.

In the Playback mode, the audio cassette signal is transformed to the proper polarity and level required by the computer. In the Record mode, the computer data is attenuated and

The VIC Interface to Any Cassette

fed to the Microphone input for recording on tape. The computer will control the Start and Stop of the cassette via the Remote jack input if so equipped; otherwise, the operator would have to manually Start and Stop the cassette.

Although the VIAC has three switches, only one is required during normal operation: 1. The GO/STANDBY Switch is used to communicate with the computer in response to cassette operation screen messages during

LOAD or SAVE modes.

2. The MANUAL/REMOTE Switch enables or disables the cassette Remote Control input and is set to REMOTE during normal operation.

3. The POLARITY +/- Switch allows various types of cassettes with different outputs to be interfaced with the computer. A simple procedure establishes the output polarity of the cassette. Once set, this switch need not be changed unless a different cassette is interfaced with the computer.

An Earphone Jack is provided for audio monitoring, allowing accurate program location on tape. A LED Data Indicator Provides visual indication of signal during Playback Mode. The VIAC can be interfaced as the Primary or Secondary cassette (on computers with multi-cassette ports).

Some added features available when using an audio cassette:

— Audio instructions or remarks can be recorded directly on the program tape, saving memory space.

— Makes program locating and editing on tape much easier.

— Can be used as an audio playback device under program control for Computer Aided Instruction Programs.

— Will utilize Fast Forward/Cue, Rewind/Review, and other enhanced features of cassette if so equipped.

— Can make audio tape to tape duplications with another cassette.

The VIAC is available, for \$49.95, from:

Apple And Atari Programs From Synergistic Software

Synergistic Software has released the Inventory Manager, an inventory control software package for the Apple II computer.

The Inventory Manager can deal with 2700 different inventory items on a two disk system and with 1200 inventory items on a one disk system. It can break the inventory items down to 13 different categories of stock and can list 99 vendors who supply those inventory items.

The Inventory Manager issues reports which summarize profit margins, calculate wholesale to retail mark-ups, list back order status, recommend reorder points, print purchase

orders, and more. The program can list the 75 top selling items with their profit margins or can list the profit margins of the 13 different categories.

Owners of small to medium-sized retail businesses can use the Inventory Manager to check what they have ordered, what they have received, and what is on back order. This program is fast, menu-driven, and user-friendly. Cost is \$149.95.

Synergistic Software also announces the release of Probe One, a new action adventure game for the Atari 400/800.

Probe One combines high-resolution color graphics, sound effects, arcade-like action, and adventure strategy. The Terran Confederation is fighting the domineering Drelgan Hegemony for possession of a newly de-

and home computer applications. The unit, model CT-160, features a front panel switch that changes the display from a full-color unit for color graphics or video games to a sharp black and white data display for business use.

Model CT-160 accepts a composite video input signal and incorporates a built-in audio system for use with games or speech synthesizers. It easily reproduces a 40x25 character display.

Equipped with video input/output connectors with 75 ohm/Hi Z termination switch, the new Panasonic computer display is UL listed and carries a FCC Class B computing device certification. Suggested retail is \$400.

Grades Management System For Teachers

Master Grades program, a complete grades management system for secondary teachers, is now available from Midwest Software. This program was written by teachers for teachers and took two years to develop and test. With it you can produce pages for your record book, alphabetized grade summaries of all students by grade level or subject, progress notes to parents, and weekly (or oftener) reports in alpha or percentage order for all of your classes.

Master Grades is completely menu driven, user friendly, and uses a fast machine language sort. Most possible errors have

Commodore Announces Bilingual Keyboard For Microcomputers

Commodore Business Machines Limited, Scarborough, Ontario, and Creargie Inc., Montreal, have announced their bilingual keyboard and French word pro-

cessing software.

Jacques Brun of Creargie has designed a new character generator, and modified the keyboard of the Commodore 8000 series personal computers to be compatible with recent federal regulations and with the approval of Professional Software Inc., Mississauga, Ontario.

The name of the new program is "WordPro 4-Plus ML".

The word processing software, WordPro 4-Plus, has been translated and modified so that in using it, along with certain redesignated keys, the French characters appear on the screen – including capital letters with accents – and can be printed out on any letter quality printer. The WordPro manual has been rewritten to reflect the changes and is translated into French.

The keyboard, however, is not only bilingual but multilingual. In addition to French, character generator sets for German, Spanish and Italian have been created, all available with the same program and with the proper accents and marks for each of these languages. The plan is to market the four versions

The Computer Outlet is an associate of The Computer Learning Center For Children. We are experts in educational technology and can customize educational software curriculums for school districts, individual schools, or for the child at home. Please contact us about your software and equipment requirements and feel free to stop by our school in Las Vegas.

We have one of the world's largest educational software inventories featuring our own Computer Learning Center software.

Recreational Computing Back Issues

Recreational Computing was the first and only personal computing magazine when it started in 1972 (it was called the *PCC Newspaper* back then). Bob Albrecht, David Thornburg, Isaac Asimov, Don Inman, Ramon Zamora, Robert Jastrow, Mac Oglesby, Adam Osborne – the list of authors reads like a Who's Who of microcomputing. These and many other authors contributed some of the finest articles about computers and now-classic games to the pages of *Recreational Computing*.

Last fall, *Recreational Computing* was merged into **COMPUTE!** and we are now offering available back issues. Whatever your interest, you'll find something here – from Spanish BASIC to Computers in Sports Medicine, from Future Fantasy Games to Robot Pets.

September 1974 A Practical, Low-cost Home/School Microprocessor System, The Computer Illiteracy Problem Eight Games In BASIC

March 1975 Build Your Own BASIC The Computer In Art Birthdays

March/April 1976 A TTY Game, Games With The Pocket Calculator, Dodgem, Square, Tiny BASIC To Go

July 1976 BASIC Music, Tiny Trek For Altair, 16 Bit Computer Kit, Musical Numbers Guessing Game, Programmer's Toolbox

September/October 1976 Computer Games In The Classroom, Planets Game, Dungeons And Dragons, Hals Game, Pythagoras And Rational Music

November/December 1976 Story, Snake, Packl, Frogs Games, Make Believe Computers, The First West Coast Computer Faire, Subroutines, The First Computer

January/February 1977 Robot Pets, Computers And Space, Tiny Languages, Teaching Using Conversational Programming, High School Computers, Reverse, Tiny PILOT, Mastermind

March/April 1977 Z-80 PILOT, 6502 Assembly Programming, Tiny BASIC For Beginners, Math Drills & Games Community Information Systems, Mine, Sales Simulation, Native American Board Games

July/August 1977 Do-it-yourself CAI, Pet Robots, New Capabilities, PILOT, CAI In BASIC, Programming The HP-25, Capture, Inverse Reverse, 8080 Matrix Subroutines, Women And Computers

September/October 1977 The \$595 PET, More Tiny Languages, Computer Networks, The Bead Game, Biofeedback And Microcomputers Part 1, Home Energy Management, Sandpile Game, A BASIC PILOT

January/February 1978 Pascal Vs BASIC, COMAL Structured BASIC, Video Disks Magic Lamps for Educators?, A Computer Revolution?, Pounce, The Mechanics of Robots, TRS-80: A Status Report

March/April 1978 Epic Computer Games, Micros for the Handicapped, Buckets Game, Prayer Wheel Program, Computer Contagion, Measuring Time, Frog Race, The IBM 370 Model 69

July/August 1978 Computer Whiz Kids, Public Access To Computers, Man-made Minds, Post-human Intelligence, A Modern-day Medicine Show, Live Wire Design, ASCII Graphics, Baseball, Concentration, Gambler's Paradox

September/October 1978 Kingdom Game, Computers and Museums, Sorcerer of Exidy, Snooping With Your PET, APL, Decimals in Tiny BASIC, Apple Math, TRS-80 Level II A Grow-up Field Evaluation

November/December 1978 APL Games, The Return of the Dragons, Animated Games for TRS-80, Runequest, All In The Mind, The L-5 Society, Phantasm, Some Guidelines for Microcomputer Chess, Dataman

January/February 1979 A Jules Verne Fantasy, Artificial Intelligence, The Apple Corps is With Us, TRS-80 Personal Software, Vending Machine Gets "Brain," Apple II I/O, The Memory Game, REINO Spanish Kingdom

March/April 1979 Calculator Comics, "Lord of the Rings," Chess Reconsidered, Database, Beastary, Color Your Own Graphics, Universe, Easy POKEing with Applesoft BASIC, Air Raid, TRS-80 3-D Plots, Slot, Apple Rose

May/June 1979 PILOT for Apple II, The Game of Life, Gold Handicapping, Hunt, BASIC vs. Pascal, Inspector Clew-so, Flash for SOL, Faster Jumble, Concept Sans Computer, A Beginner's Guide To FRP

July/August 1979 Summer Fun, Fooling Around With Your PET, Cryptarithms, Baseball, Newell Awi's Goat, Zork: A Computerized Fantasy Simulation Game, What Light on Yonder Panel Flashes, The Dedicated Word Processor, The FORTE Music Programming Language

September/October 1979 TRS-80: Outside Connection, The Architecture of Multi-Player Games, The Sounds of Texas Instruments, Dynamic Color Graphics on the New Atari, An Apple PILOT, Gandalf, Spanish BASIC, Designing Animal Games, APL Mastermind

November/December 1979 SHOGI: Games For You To Program, Alan Sounds, Texas Instrument Graphics and Animation, Interrupt, Match Me, Calendar, Making Music on the PET, Tower of Hanoi, Bingo, Animal Games

January/February 1980 Computing and Holistic Health, TI Graphics and Animation Part 2, Games To Program, New Directions in Numerical Computing, An Extended BASIC "IF" Facility, Beating Computer Anxiety, Capture for PET, 8080 Tic Tac Toe, Chainwalk, Programming Problems

March/April 1980 Special Games Issue: Recreation Apple II Hi-res Graphics, Delicious Functions, Galaxy II, Fairy Chess, Raging Robots, Program Instruction Builder, Data Retrieval An Introduction

May/June 1980 Introduction to Computer Music, CBBS Phone Numbers, 6502 Machine Language, The Electric Phone Book, Number Translation, Sea Search, Apple Animation, Twister Move Generator, DOZO, Shell Game, Home Video Displays, A Proposed Graphics Language

July/August 1980 Fantasy Games Issue: Write Your Own Computer Fantasy Simulation, Wizard's Castle, On Future Fantasy Games, Wonderful World of Eamon, In Defense of Hackers, Touch Panels and Interactive Graphics

September/October 1980 Probability Trees Big Business on the Micro, The Best of People's Computer Company, Computer Analysis of Athletics, Word Search, Computers in Sports Medicine, Wired, Revolution in Typography?, Textpolation

November/December 1980 Computerized Voting, Computer-Using Educators, Hot-rod Computers, House of the Future, Yote, DOZO in Pascal, What is Truth?, Sixth Order Magic Squares on a TRS-80

January/February 1981 The Education Revolution Computer Games in the Classroom, An Art-producing Turtle, Computer Literacy Resources, Musical Compositions Using Computers, Microcomputers in China, Twenty Questions, The Pirate's Life for Me, Computers and the Volcanic Fallout

March/April 1981 Space Exploration: Frontiers for You and Your Micro, Voyage To Antares, A Spaceship Simulator, The Computer as Chess Ally, Star Trek – A Dialogue Approach, Mark of Breeding (fiction), The Fifteen Puzzle

May/June 1981 Using Computers at Sesame Place, Alan PILOT and Turtle Graphics, Computer Anatomy for Beginners, The Impact of Micros, Nevada-style 8-spot Keno, Sketch Pad, Sum of the Digits, TRS-80 Property Management Program, The Pocket Corner

July/August 1981 Which Computer Should You Buy?, Commodore's New Rainbow Machine, The Wired Nation: Do We Want It?, Computers at the Humor Museum, 3-D Tic Tac Toe for PET, Number Crossword for all Computers

September/October 1981 43 Ways To Make Money With Your Micro, How To Start A Software Exchange, Who Are Computer Cnnmats?, Micros Behind Bars, Number Systems, Computer Knock-knock Jokes in BASIC and LISP, For Photographers Only, Fibonacci Nrm, Roman Numerical Conversum Program

Index To Microprocessor Literature

Survey of Microprocessor and Personal Computer Literature is a new publication that overviews literature in this field. It surveys magazines large and small. Its purpose is to help the reader locate the article he needs and make it easier for him to keep informed and up-to-date.

Articles appearing in journals, trade publications and magazines are categorized, grouped and described for easy retrieval. A one-line bold-face statement gives the thrust of the article. This is followed by its title, some highlights, the number of illustrations, and the number of pages.

Survey consists of three sections. The section on personal computers is mainly for the non-engineering personal computer user. It includes program listings and reviews of disks.

The second section is mainly for the engineering reader. It indexes articles on chips, circuits, design, construction, etc.

The third section is of general interest. It includes applications and implications of computers in general, i.e., not specific to a particular computer.

Survey is published bi-monthly. For further information send \$2 to receive a sample pre-publication issue. Send name and address with \$2 to:

THE LEADING EDGE IN PRINTERS

ONE GREAT LINE. ONE GREAT WARRANTY.

Finally, there's one full family of printers that covers every business or word processing application—all from C. Itoh, a company known for packing more product into less price, and all distributed exclusively by Leading Edge, a company known for searching out and providing that very thing. Which means that one call to one source can get you any printer, any time you need it, for any purpose. All backed by a full years' warranty from Leading Edge. (Try *that* on any other line of printers.)

THE PRO'S.

The Prowriters: business printers—and more. The “more” is a dot-matrix process with more dots. It gives you denser, correspondence quality copy (as opposed to business quality copy, which looks like a bad job of spray-painting).

Prowriter: 120 cps. 80 columns dot matrix compressable to 136. 10" carriage. Parallel or serial interface.

Prowriter 2: Same as Prowriter, except 15" carriage allows full 136 columns in normal print mode. Parallel or serial interface.

THE STAR.

The Starwriter F-10. In short (or more precisely, in a sleek 6" high, 30-pound unit), it gives you more of just about everything—except bulk and noise—than any other printer in its price range. It's a 40 cps letter-quality daisy-wheel with a bunch of built-in functions to simplify and speed up word processing. It plugs into almost any micro on the market, serial or parallel.

THE MASTER.

The Printmaster F-10. Does all the same good stuff as the Starwriter except, at 55 cps, the Master does it faster.

*Distributed Exclusively by Leading Edge Products, Inc., 225 Turnpike Street, Canton, Massachusetts 02021.
Call: toll-free 1-800-343-6833; or in Massachusetts call collect (617) 828-8150. Telex 951-624.*
