Why every kid should ha

Today, there are more Apples in schools than any other computer. Unfortunately, there are still more

kids in schools than Apples. So innocent youngsters (like your own) may have to fend off packs of bully nerds to get some time on a computer.

Which is why it makes good sense to buy them an Apple* IIc Personal Computer of their very own.

The IIc is just like the leading computer in education, the Apple IIe. Only smaller. About the size of a threering notebook, to be exact.

Of course, since the IIc is the

legitimate offspring of the Ile, it can access the world's largest library of educational software. Everything from Stickybear Shapes[™] for preschoolers to SAT test which you might be interested in yourself. For example, 3-in-1 integrated business software. Home accounting and tax programs. Diet and fitness programs.

With a llc, your kill can do something constructive after school. Like learn to urste stores. Or learn to fly. Or even learn something slightly more advanced, like multivariable calculus ion programs for college hopefuls. Not to preption fun pro-

preparation programs for college hopefuls. In fact, the IIc can run over 10,000 programs in all. More than a few of

Not to mention fun programs for the whole family. Like "Genetic Mapping" and "Enzyme Kinetics."

ve an Apple after school.

MATH MAZE

te i

And the Apple IIc comes complete with most everything you need to start computing in one box.

Geology

Including a free 4-diskette course to teach you how — when your kids get tired of your questions.

As well as a long list of built-in features that would add about \$800 to the cost of a smaller-minded computer.

128K of internal memory—twice the power of the average office computer. A built-in half-high 140K disk drive that could drive up the price of a lesssenior machine considerably.

And built-in electronics for adding accessories like a printer, a modem, an AppleMouse or an extra disk drive when the time comes.

t-in In its optional carrying case, the lic can even run away from home

So while your children's shoe sizes

and appetites continue to grow at an alarming rate, there's one thing you

know can keep up with them. Their Apple IIc. To learn more about it, visit any authorized Apple dealer. Or talk to your own computer experts. As soon as they get

Earth will be destroyed in 12 minutes to make way for a hyperspace bypass. Should you hitchhike into the next galaxy? Or stay and drink beer?

Simply slip the disk in your computer and suddenly you are Arthur Dent, the dubious hero of THE HITCHHIKER'S GUIDE TO THE GALAXY[™] a sidesplitting masterwork of interactive fiction by novelist Douglas Adams and Infocom's Steve Meretzky. And every decision you make will shape the story's outcome. Suppose for instance you decide to linger in the pub. You simply type, in plain English:

>DRINK THE BEER

And the story responds:

YOU GET DRUNK AND HAVE A TERRIFIC TIME FOR THELVE MIN-UTES, ARE THE LIFE AND SOUL OF THE PUB, TELL SOME REALLY TERRIFIC STORIES, MAKE EVERYONE LAUGH A LOT, AND THEY ALL CLAP YOU ON THE BACK AND TELL YOU WHAT A GREAT CHAP YOU ARE AND THEN THE EARTH GETS UNEXPECT-EDLY DEMOLISHED, YOU WAKE UP WITH A HANGOVER THAT LASTS FOR ALL ETERNITY, YOU HAVE DIED. Suppose, W Suppose, on the other hand, you decide to:

>EXIT THE VILLAGE PUB THEN GO NORTH In that case you'll be off on the most mindbogglingly hilarious adventure any earthling ever had.

The Hitchhiker's Guide to the Galaxy comes complete with Peril Sensitive Sunglasses, a Microscopic Space Fleet, a DON'T PANIC Button, a package of Multipurpose Fluff and orders for the destruction of your home and planet.

You communicate - and the story responds-in full sentences. Which means that at every turn, you have literally thousands of alternatives. So if you decide it might be wise, for instance, to wrap a towel around your head, you just say so:

WRAP THE TOWEL AROUND MY HEAD

And the story responds:

THE RAVENOUS BUGBLATTER BEAST OF TRAAL IS COMPLETELY BEWILDERED, IT IS SO DIM IT THINKS IF YOU CAN'T SEE IT, IT CAN'T SEE YOU.

But be careful about what you say. Or one moment you might be strapped down, forced to endure a reading of the third worst poetry in the galaxy: the next you could be hurtling through space with Marvin the Paranoid Android aboard a stolen spaceship.

And simply staying alive from one zany situation to the next will require every proton of puzzle solving prowess your mere mortal mind can muster. Even simple tasks can put you at wit's end:

>OPEN THE DOOR

And the story responds:

THE DOOR EXPLAINS, IN A HAUGHTY TONE, THAT THE ROOM IS OCCUPIED BY A SUPER-INTELLIGENT ROBOT AND THAT LESSER BEINGS (BY WHICH IT MEANS YOU) ARE NOT TO BE ADMITTED, "SHOW ME SOME TINY EXAMPLE OF YOUR INTELLIGENCE," IT SAYS, "AND MAYBE, JUST MAYBE I MIGHT RECONSIDER, "

Other interactive science fiction stories from Infocom include PLANETFALL," in which you're stranded on a mysterious deserted world. STARCROSS," a puzzling challenge issued eons ago and lightyears away. SUSPENDED," the race to stabilize an entire planet's life support systems. And A MIND FOREVER VOYAGING. a radically new work of serious science fiction in which you explore the future of mankind.

But don't panic. You'll be accompanied every light-year of the way by your trusty Hitchhiker's Guide, which you can always depend on for up-to-the-nanosecond information. Well, almost always:

>CONSULT THE HITCHHIKER'S GUIDE ABOUT THE MOLECULAR HYPERWAVE PINCER

And the story responds:

SORRY, THAT PORTION OF OUR SUB-ETHA DATABASE WAS ACCIDENTALLY DELETED LAST NIGHT DURING A WILD OFFICE PARTY.

So put down that beer, take that towel off your head, open the door, hitchhike down to your local software store today and pick up THE HITCH-HIKER'S GUIDE TO THE GALAXY. Before they put that bypass in.

Still not convinced? Try our Sampler Disk which includes portions of four different types of stories for a paltry \$7.95. If it doesn't get you hooked on the addictive pleasures of Infocom, return it for a full refund. If it does, you can apply the price toward any Infocom story. You can't lose!

WORD WRITER With Spell Checker Now with 85,000 word Spelling Checker

- An efficient, 80-column professional word processing system which includes a spelling checker and built-in calculator.
- Contains all the features you'll need for everyday word processing, plus most of the sophisticated features found in more expensive programs: document chaining, form letter printout, page separations, horizontal and vertical scrolling, and more.

With Timeworks you get more power for your dollar

You can use each program alone. Or interface this trio – one at a time if you like – into a completely integrated productivity system that delivers all the power and features most of you will ever need...at a cost that lets you enjoy their use.

Look for these and other Timeworks programs at your favorite dealer. Or contact Timeworks, 444 Lake Cook Road, Deerfield, IL 60015. Phone: (312) 948-9200.

DATA MANAGER 2 Faster, more efficient, more versatile

- A complete general information storage and retrieval system with report-writing, graphics, statistics, and label-making capabilities.
- Exclusive X-SEARCH, X-SORT, and X-CHART features allow you to crosssearch any category of information; sort items alphabetically, numerically, or by date; break down statistical information into categories; and graphically view your results.

With Timeworks you get more than software

You Get Our Customer Technical Support Team

At the other end of our toll-free hotline, you'll find our full-time Customer Technical Support Team. Free of charge to all registered users.

You Get Our Liberal Trade-Up Policy

You'll find the details inside each package.

Editor's Notes≣

This month's Editor's Notes are written by Tom R. Halfhill, Editor of COMPUTE!. —Robert C. Lock, Editor-In-Chief.

We received some interesting letters in response to our September 1985 Editor's Notes. As you may recall, it was argued that machine language (ML) will remain the dominant language for commercial software, even though many of the first programs appearing for the newest generation of personal computers-such as the Atari 520ST and Commodore Amiga—are written with compilers such as C. The argument was that ML is and always will be the computer's native language, and since higher-level languages run slower and consume more memory, they will always be superseded by ML for commercial software.

Here's a dissenting letter from reader Jeff O'Neil in Plano, Texas:

I feel there will continue to be a migration away from assembly language with more use of higher-level languages, such as C, for application programs. The driving force is programmer productivity-being able to quickly bring good products to the market and also being able to quickly port the same program from one machine to another. Languages such as C can be effectively used on the newer micros because of better compilers and because of the larger memories available. No longer do you have to spend an inordinate amount of time trying to squeeze the code into 64K. Assembly language will continue to be used for operating systems and compilers, but less and less for application programs.

While last month's Editor's Notes presented one side of the higher-level language discussion, Mr. O'Neil presents a point of view also shared by some editors.

One of the lessons of industrialization is that a machine will always take over a task from a person if it can do the work faster, better, or less expensively. A compiler, in effect, is a device that generates object code from the programmer's high-level source code. Because high-level code is easier to write, compilers make it possible for programmers to finish a program faster than if they were writing in low-level ML to begin with. Certainly, none of the highlevel compilers currently available can generate object code as good as that written by an experienced ML programmer using an assembler. But they don't have to. They need only be good enough.

For example, the vast majority of application programs announced to date for the 520ST and Amiga are written in compiled C. Potentially, they could be even better programs if written directly in ML. But it would take longer to write and debug the programs in ML, increasing development costs accordingly. To recover this larger investment in programmers' time, the software companies would be forced to charge a higher price or accept less profit. By transferring a task to a machine—in this case, using a compiler to generate the object code-they finished the job faster and still created good programs. That's the classic equation for greater productivity.

This principle has been demonstrated time and again for hundreds of years. In all probability, the clothes you wear, the car you drive, the furniture you own, the books you read, the TV set you watch, and so on were not painstakingly handmade by skilled craftsmen. Most of these things are manufactured largely by machines. Handmade versions are available, but top quality is not always the ultimate consideration. If it were, people would hire freelance programmers to write custom programs entirely in ML, no matter what the cost.

Furthermore, compilers are constantly being improved. Someday—especially if there are breakthroughs in the field of artificial intelligence—we may have compilers which generate object code that matches or even surpasses the code written by good ML programmers. At the very least, compiled languages will continue getting better, and the most time-critical routines can be rewritten in ML—just as many other products today are made partly by machine and partly by hand.

And don't forget another factor that affects programmer productivity training time. The rapid pace of computer technology means that ML programmers have to master the instruction set of an entirely new chip every few years. But high-level languages can be implemented on any chip, so programmers only have to learn the language once.

The programmer productivity factor also is closely tied to marketability. If software companies invest the programmer time in writing all-ML programs, they risk missing a window of opportunity. And in the fast-moving world of personal computing, a few months can make or break a commercial program.

Portability, too, is related to productivity. If programmers can write a major program in a high-level language and translate it for noncompatible computers with a minimum of fuss, they can double or triple the potential market and reap a higher return on their time.

For a preview of what's to come, look at the world of minicomputers and mainframes. Application programming is increasingly done in high-level languages. As personal computers keep growing more powerful, we too will see more and more application software written in high-level languages instead of ML. The extra horsepower built into the machines will make it less necessary for people to spend tedious hours building extra horsepower into the programs.

Computers are boosting productivity and reducing sweatwork in hundreds of occupations; why should computer programming be any different?

COMPUTE! is looking for utilities, games, applications, and tutorial articles. If you've created a program that you think other readers might enjoy or find useful, send it on tape or disk to:

MacOffice: Using the Macintosh for Everything

Sharon Aker Pau Selby Bateman Val Charles Brannon

Paul Freiberger Arlan Levitan Vahé Guzelimian Dan McNeill

This newest release from COMPUTE! Books shows you how to get the most out of your Macintosh and software. Practical demonstrations teach you how to fully utilize several commercially available programs, such as Microsoft's Word, Chart, File, and Multiplan, Apple's MacTerminal, and others. You'll see how to:

- · Create form letters with Word,
- · Use Multiplan for your accounting,
- Share information between offices with MacTerminal.

Here are the ins and outs, hints and tips on how to use each program most efficiently, and previously undocumented techniques.

Extensively illustrated with actual Macintosh-created documents and graphics, *MacOffice* shows you how you can integrate programs, let them share information, making it even easier to manage your business with a computer. You'll also learn about networks—where computers, printers, and other devices are connected to create an office-wide working environment—with details on how to create a network, and what to look for in network software.

\$18.95 ISBN 0-87455-006-8

Look for these new titles at your local book or computer stores or order directly from COMPUTE! Books.

COMPUTE! Books are available in the U.K., Europe, the Middle East, and Africa from Holt Saunders, Ltd., 1 St. Anne's Road, Eastbourne, East Sussex BN 21 3UN England.

COMPUTE's Second Book of Apple

Edited

With over 30 programs, this collection for Apple II+, IIe, and IIc owners contains arcade-style games, games of logic and education, applications, graphics generators, and programming utilities. Compiled from the most recent issues of *COMPUTE!* magazine and *COMPUTE's Apple Applications Issue*, these programs include dazzling graphics, high-speed game play, and valuable programming techniques. All the programs are ready to type in.

Applications calculate your financial situation and turn your computer into a remote terminal for accessing sophisticated databases. Action games put you in a jet fighter and in a bowling alley. Educational games range from a five-level chess game to a program which lets you write quizzes on any subject. Graphics and programming utilities help you design custom graphics or put a RAM disk in your IIc.

\$12.95 ISBN 0-87455-008-4

There is also a disk available which includes the programs in the book. You can order this disk directly from COMPUTE! for only \$12.95 plus \$2.00 shipping charges.

To order, call toll-free 800-334-0868 (in NC 919-275-9809) or mail your payment (including \$2.00 shipping charges) to COMPUTE! Books, P.O. Box 5058, Greensboro, NC 27403.

Readers Feedback

The Editors and Readers of COMPUTE!

If you have any questions, comments, or suggestions you would like to see addressed in this column, write to "Readers' Feedback," COMPUTE!, P.O. Box 5406, Greensboro, NC 27403. Due to the volume of mail we receive, we regret that we cannot provide personal answers to technical questions.

Flies And Programs

What is a file, and what is the difference between a program and a file? When I try to erase a program on disk, my disk drive sometimes gives me a FILE NOT FOUND message.

Kevin Cullen

A file is any collection of data (information) stored permanently on disk or tape, or temporarily in the computer's memory. In many cases, a computer file is the electronic equivalent of a manila file folder: It stores data you create with a computer. Word processing programs store words in files, spreadsheets make files containing numbers, and so on. In that sense, a file may seem very different from a program, which is a set of instructions the computer can load into memory and run. But programs are just a special kind of data—letters, numbers, and other symbols arranged in a pattern the computer understands. Thus, a program stored on disk is a file containing computer instructions rather than some other kind of data. When the disk drive signals FILE NOT FOUND, file is used in a general sense that includes programs along with other kinds of data.

Although these broad definitions apply to all computers, be alert for additional, narrower meanings that apply only to your system or in specific situations. For instance, opening a file to a printer usually means you are opening a communications channel to that device. In Commodore disk parlance, a program file is any file with a certain format (different from sequential or relative format), and so on. When in doubt, consult the user's guide for your equipment and pay close attention to the context in which the word is used.

Apple ProDOS Conversions

use the "Renumber" program on the DOS 3.3 System Master disk. However, I like ProDOS better for programming, and most of my files are on ProDOS disks. I can copy the program to Pro-DOS, but it won't run properly. How can I make this program work in **ProDOS?**

Bruce Bohm

The general rule for transporting programs between DOS 3.3 and ProDOS is that BASIC programs usually work and machine language (ML) programs usually don't. Since the "Renumber" program you mention is stored as an Applesoft BASIC file, you would expect it to work with ProDOS. The reason it doesn't is that Renumber is a hybrid program: In addition to BASIC instructions, it contains a substantial machine language routine. When you run Renumber, the BASIC portion prints instructions for using the program, then calls the ML routine to do the real work. Though the BASIC part would probably work with ProDOS, the ML section is incompatible.

In short, there's no way to make Renumber work in ProDOS without rewriting its machine language section. But you do have an alternative. On the example disk included with "BASIC Programming with ProDOS" (available from Apple dealers) is a program called "Applesoft Programmer's Assistant." One of its features is a renumber command that's very similar to the DOS 3.3 Renumber program. The instruction manual for this package is very helpful by itself—especially if you learned Applesoft BASIC with DOS 3.3 and want to learn what's different about ProDOS—and the programs on the example disk are quite useful as well.

Datassette Adapter

I have found an adapter that lets me use my old Commodore Datassette with the newer Plus/4 or 16 computers. It is available from the following company for less than \$20:

Rabbitts Software Company P.O. Box 1192 Cleveland, Ohio 44111 (216) 252-2214

Gary Sawitzke

We appreciate the information. Inciden-I have an Apple IIe and would like to | tally, the C2N Datassette designed for the VIC-20 and 64 works just fine on the Commodore 128, in 128 mode as well as 64 mode.

Saving Atari Screens

I am currently working on an Atari program that lets me create highresolution drawings in graphics mode 8. However, it lacks one important function. How do you save and reload a graphics screen? I have an 800XL and 1050 disk drive.

Albert Newball

The following program uses the computer's input/output routines to save a block of memory. To use it, put lines 1-2 at the start of your program. These lines create a short machine language routine in memory page 6. Line 10 shows how to save or load a screen. Set the variable NAME\$ equal to the name of the file you want to save or load (include D: for disk or C: for cassette). Set the variable AUX to 4 when you want to load a graphics screen, or set AUX to 8 to save a screen. Once NAME\$ and AUX are defined, GOSUB 1000 does the iob.

```
E0 1 DIM NAME$ (15) : FOR A=153
    6 TO 1542; READ B: POKE A
    , BINEXT A
C2 DATA 104,104,104,170,76
,86,228
01 10 NAME$="D:NAME":AUX=4:G
     OSUB 1000:END
CO 1000 OPEN #1, AUX, 0, NAME$
KE 1010 POKE 852, PEEK (88) : PO
       KE 853, PEEK (89) : POKE
        856,220:POKE 857,30
       POKE 850, AUX+3
PC 1015 A=USR (1536,16)
KH 1020 CLOSE #1:RETURN
```

You can use this routine in other graphics modes by changing the values POKEd into locations 856 and 857 in line 1010. Determine the total number of bytes used for the screen in that graphics mode, then break the number down into low byte/high byte format. POKE 856 with the low byte value and POKE 857 with the high byte. The following line shows how to convert the value of the variable VA into low byte (LO) and high byte (HI) values:

 $HI = INT(VA/256):LO = VA - (HI^{256})$

EASYPLEX

THE BETTER LETTER BOX

Introducing EasyPlex[™]. The new, easy-to-use electronic mail system from CompuServe.

Finally! Electronic Mail that's so easy to use you can start composing and sending messages the first time you get online.

Designed for various experience levels, EasyPlex has a menu mode with simple, easy-to-follow directions for beginners, and it lets experienced users save time by working in the prompt or command modes. With EasyPlex, you can compose, edit, send, file, and take advantage of sophisticated options previously available only with more expensive services.

CompuServe's EasyPlex lets friends and relatives, associations and club members communicate any time of the day or night. And small business owners, real estate professionals, insurance agents, lawyers, writers, etc. can communicate quickly and simply— either interoffice or interstate. "It's Easy." "Just Plex it!"

Best of all, EasyPlex is available to all CompuServe subscribers. And, along with EasyPlex, you get hundreds of valuable and entertaining computing options. Plus the assurance of belonging to the largest, fastest growing computer information service in the world and the premier supplier of business information to FORTUNE 500 companies.

Start communicating! To buy a CompuServe Subscription Kit, see your nearest computer dealer. To receive our informative brochure or to order direct, call or write:

An H&R Block Company

ANNOUNCING THE FAMILY SOFTWARE SPECTACULAR." BUY 3, GET 1 FREE.

CHOOSE FROM OVER 50 LEADING TITLES.

What do you call an offer that brings together, for the first time ever, five leading brands of home software?

The Family Software Spectacular!

And it's your opportunity to choose a *free* software program from the best titles on the market today. All you have to do is buy any combination of three titles from any participating brands during this special offer period. And we'll send you another one of your choice – *free*!

It's a one-of-a-kind value your family shouldn't miss.

FISHER-PRICE.® A NAME YOU CAN TRUST.

For years Fisher-Price has been known for helping children develop skills as they play. With Fisher-Price[™] Learning Software, your child can develop skills in five key areas: math, language, creativity, basic learning and computer literacy.

Your child will love developing and testing language skills with the help of PETER RABBIT READING, a program that uses voice to teach sound and letter recognition in words.

WINDHAM CLASSICS." CLASSIC NOVELS COME TO LIFE.

Pick up Windham Classics, graphic interactive fiction based on some of the greatest adventures of all time. They're great for kids, yet fun for all ages.

Enjoy "THE WIZARD OF OZ."" You are Dorothy, and each of your decisions determines your adventure. There's more than one adventure to be had as you meet old friends and new in the land of Oz.

WORK BETTER WITH BETTER WORKING."

Constantly erasing and retyping? Unsure of your spelling? WORD PROCESSOR WITH SPELLCHECKER is exactly what you need. This full featured word processor includes the 50,000 word AMERICAN HERITAGE DICTIONARY[™] spellchecker which detects over 99% of misspelled words.

The full line also includes FILE & REPORT and SPREADSHEET – titles that represent the best values on the market today.

THE WIZARD OF OZ BelleiWorking

Word Processor

FisherPrice

SPINNAKER.[®] THE LEADER IN FAMILY LEARNING SOFTWARE.

From pre-school counting to high-school compositions, Spinnaker offers the high quality educational programs you have come to expect. For example, there's the HOME-WORK HELPER[™] series which provides step-by-step methods for improving writing and math skills and helps kids tackle otherwise troublesome school assignments.

TELARIUM." INTERACTIVE FICTION AT ITS BEST.

Here's graphic interactive fiction by famous writers of science fiction, fantasy, and mystery like Ray Bradbury, Arthur

C. Clarke and Erle Stanley Gardner. Each story unfolds with you in the center of the action – and completely in control. In PERRY MASON: THE CASE OF THE MANDARIN MURDER,[™] you are the world famous criminal lawyer. Challenge the evidence. Cross-examine the witness. Only you can prove your client's innocence. And time is running out.

A SOFTWARE OFFER FOR ALL AGES.

Any software offer including something for everyone in the family is certainly fantastic. But combine that with a free product offer and what you have is something spectacular. Look for the specially marked boxes of The Family Software Spectacular at your retailer.

REMEMBER, TO RECEIVE A FREE PRODUCT YOU MUST PURCHASE ANY THREE TITLES FROM THE PAR-TICIPATING BRANDS (IN ANY COMBI-NATION) AND MAIL YOUR ENTRY NO LATER THAN JANUARY 31, 1987.

- Start by saving the receipt(s) from your software program purchases. (It is not necessary for software purchases to appear on one receipt. Photocopies of the receipt(s) are accepted. Receipts must be dated BETWEEN JULY 1, 1985, AND JANUARY 31, 1987.)
- Cut the proof-of-purchase tab from each of the three user manuals that come with the programs. (Photocopies not accepted.)
- Attach the purchase receipt(s) and the three original proof-of-purchase tabs to one separate sheet of paper.
- 4. Fill in the form below and place the completed form in an envelope with:
 - a. A sheet of paper with three original proof-of-purchase tabs and your purchase receipt(s)
 - b. A check or money order for \$3.50 to cover postage and handling. (Canada residents please send \$5.00 for postage and handling.)

Make check payable to THE FAMILY SOFTWARE SPECTACULAR and mail envelope to: THE FAMILY SOFTWARE SPECTACULAR DO Part 1277 Combridge MA 02228

Too Many Caesars

I own two Commodore computers and a 1541 disk drive. I would like to connect both computers to the drive at once (of course, I would only send disk commands from one computer at a time). Everything works fine when only one computer is turned on, but when I turn on the second one, the first computer does a cold start. When I try to send disk commands from either computer, the entire system seems to lock up. Is there any way to accomplish what I'm trying to do?

Charles Mitchell

Since you can connect more than one peripheral to a single computer, you might expect the reverse to be true. Why can't two computers share the same drive? The answer reveals a fundamental difference between a computer and peripheral devices such as disk drives and printers. The computer is designed to act as "absolute ruler" of the system. It not only sends and receives information (as peripherals can do), but also sends commands that control the whole system. Plugging two computers into the same disk drive is like creating a Rome with two Caesars: Each computer acts like the only commandgiver in existence, and the system becomes confused.

In the first case you describe, turning on the second computer sends a normal reset command to every device in the system-including the second computer, which responds as if it had reset itself. Sending a disk command (which goes to the other computer as well as the drive) makes things even worse. Serial communications require a complex exchange of "handshaking" signals between computer and peripheral to make sure one doesn't send data until the other is ready, and vice versa. Since the second computer isn't designed to respond as a peripheral, it can't complete the handshake and crashes the entire system.

One makeshift way to do what you want is to unplug the serial cable from one computer whenever you want to use the other. However, we definitely don't recommend this as a regular practice. The serial port connectors aren't designed for such heavy use, and you run the risk of sending garbage signals along the line. For long-term use you may want to buy a switching box which cleanly disconnects one computer from the serial bus before connecting the other.

ACCEPT On TI

I

I have a problem using ACCEPT on my TI-99/4A with Extended BASIC. When I try to enter numeric input with ACCEPT and accidentally press EN-TER before any input, the screen scrolls

and I get an error message. Is there any way I can avoid this without using the CALL KEY statement?

Jory Rannow

The following program illustrates one solution to your problem:

```
100 CALL CLEAR

110 DISPLAY AT(1,1):"ROW

#1"

120 ACCEPT AT(2,1)VALIDAT

E(NUMERIC):X$

130 IF X$="" THEN 120

140 X=VAL(X$)

150 PRINT X
```

After this program clears the screen, line 110 prints a message on line 1 so you can tell whether scrolling occurs. Line 120 takes in numeric input (numerals 0-9, period symbol, plus symbol, minus symbol, or E) and accepts the input as X\$. If at this point you hit ENTER by mistake, line 130 sends you back for another try without scrolling the screen. Once you've entered a value, line 140 converts it from a string into the numeric variable X.

Unwanted Commodore Messages

I have written a machine language routine that loads several program modules into the Commodore 64 from disk. However, the computer prints the usual SEARCHING FOR and LOADING messages during every load. How can I prevent these messages from appearing on the screen?

Allen Kotomski

These messages are generated by the 64's operating system, which controls input/ output functions. Since Commodore calls the operating system the Kernal, they're known as Kernal control messages. One easy way to mask them is to change the character color to the same color as the screen background. The messages then print invisibly on the screen. However, since they may overprint an existing display or cause the screen to scroll, it's usually better to suppress them altogether.

Location \$9D (157 decimal) holds a flag that tells the 64 what type of messages to display. When the flag contains 128 (bit 7 is set to 1), the computer prints Kernal control messages to tell you when it's searching, loading, saving, or verifying. When bit 7 is set to 0, control messages are not displayed. Though you rarely see them when using BASIC, the Kernal also has its own set of error messages. For instance, the Kernal equivalent of BASIC's FILE NOT FOUND message is I/O ERROR #4. Location \$9D controls Kernal error messages as well: They're displayed when the flag contains 64 (bit 6 is set to 1), and suppressed when bit 6 is clear.

mae A WORD PROCESSING PROGRAM! AN INFORMATION MANAGEMENT PROGRAM! A TELECOMMUNICATIONS PROGRAM

ALL THREE PROGRAMS, ON ONE DISKETTE!, FOR ONLY \$49.95*!

"Quite simply the best! The highest rating possible...the package should be part of every (computer) library." - ANALOG COMPUTING

ime ...

"Russ Wetmore has done an EXCELLENT job! The program is flexible, powerful and very easy to use. \$49.95 buys a heck of a lot of program." - REVIEW BY ARTHUR LEYENBERGER

"Performance: $\star \star \star \star (Excellent)$ Value: $\star \star \star \star (Excellent)$ This three-in-one package is a bargain ... one of the finest values on the market."

HOMETEXT WORD PROCESSOR. HOMEFIND INFORMATION MANAGER. HOMETERM TELECOMMUNICATIONS

Together they are HomePak: the three most important and most useful home computer applications in one integrated system - on one diskette!

The reviewers are unanimous: any one of these programs alone is well worth the price. So you're getting three times the computing power, with this exceptionally easy to use package:

- o all commands in simple English; no complex computer jargon, no obscure instructions
- all key commands are immediately available on the screen menu; additional commands can be called up for the more experienced user
- to help you, system status is displayed right on the screen

And it's easy to use the three programs together. For example, in the "Merge" mode, you can take data stored in HOMEFIND and print letters and labels using HOMETEXT. Or, use HOMETEXT to write reports based on information you've called up via HOMETERM.

As more and more of our daily activities become "computerized," survival of the fittest will come down to this: Those who become successful will share a common understanding-a knowledge of computers.

That's why TIME-LIFE BOOKS brings you this brand new series. UNDERSTANDING COMPUTERS does what was once thought impossible. Help us understand how computers do the impossible.

Through straightforward language (no "computerese") and easy-to-follow illustrations, UNDERSTANDING COMPUTERS tells you what computers really are.

How to think about them. And how they can make your life easier-from where you work to where you work out.

Starting with Computer Basics, you'll get a thrilling "inside view" of what happens

inside that incredible black box.

You'll discover how everything a computer does can be reduced to a simple 'ON' or 'OFF', like a switch. And you'll learn how computers can be taught everything from predicting the weather to teaching a foreign language to reducing your heating bills.

Step by step, your understanding will grow, until

you find yourself confident and at home in the Computer Age.

So end all your wondering and enjoy the wonder of it all. Examine Computer Basics FREE for 10 days. If you aren't satisfied, send it back and owe nothing. Otherwise keep it and pay just \$12.95 (\$15.95 in Canada) plus shipping and handling. Future volumes will come one about every other month. Same free trial. Keep only the books you want. Cancel anytime.

Mail the coupon today. And see how easy understanding computers can be.

Thus, the machine language statement LDA #\$00:STA \$9D suppresses all Kernal messages. This is the normal condition when a BASIC program is running. LDA #\$80:STA \$9D displays only the control messages (the normal condition when you're in BASIC direct mode), and LDA #\$40:STA \$9D displays only the special Kernal error messages. Note that Commodore computers also have a builtin routine (SETMSG, accessed at \$FF90) to set the Kernal message control flag. To use it, load the accumulator with the value you want to put in location \$9D, then JSR \$FF90.

Atari Disk RAM?

I have an Atari 600XL and 1050 disk drive. My 600XL has 16K RAM. Does my disk drive add any RAM to the computer? If so, how much does it add? Doug Howard

Strictly speaking, you lose some usable computer memory when operating an Atari (or most other computers) with a disk drive. To use the drive, you must load DOS (the Disk Operating System) into memory. DOS is a machine language program that on the Atari is roughly 6K long. Therefore, when DOS is present, you lose memory that's otherwise available.

However, in a broader sense the disk drive expands system memory tremendously. A disk drive lets you run much larger programs (and process much more data) than the computer could otherwise handle. For example, a program that's too big to fit into memory can be broken into two separate parts or modules. When the first program module is finished, it loads and runs the second module. The second module could in turn load a third, and so on. Since the program modules link themselves together as they go, this technique is often called chaining.

Though many BASIC programs store data within the program itself (usually in DATA statements), you can also store data outside the computer in a disk file. An Atari 1050 drive with DOS 2.5 or 3.0 stores about 126K of data on each disk. An 810 drive (or 1050 drive with DOS 2.0 or 2.5 formatted for single density) stores about 88K on a disk. Of course, the computer's memory can't hold that much data all at once. But it can access parts of it whenever it wants. When one disk fills up with data, you start filling another, and so on. In this sense, a disk drive extends system memory to infinity.

Multicolor Player/Missiles

I have written many simple games on my Atari 800XL using player/missile graphics and would like to start using different colors. How do I make multicolor P/M graphics?

Bob Rudis

Unfortunately, players can be only one color. However, you can simulate a multicolor player by overlapping two or more players. Define the players' shapes so that solid areas of underlying (lower priority) players show through holes (blank areas) in overlapping (higher priority) players. One player can be used for each color you need to define. Of course, to maintain the effect, you'll need to move the overlapped players in unison.

You can obtain additional colors by setting bit 5 of the player priority register (location 623 decimal). If you add 32 to the number in the priority register, then any area where two players overlap becomes a third color. The following program displays a red player and a blue player. The region where they overlap becomes green. You can find more information on multicolor players in COMPUTE!'s First Book of Atari Graphics.

- 0) 10 POKE 106, INT (PEEK (106) /B) #8-8: GRAPHICS Ø: S=P EEK(106):REM PROTECT M EMORY ON A 2 K BOUNDAR

Immortal PC Programs?

I have an IBM PC. Sometimes when I save a program and later try to erase it from my disk, the computer says "File not found." Yet when I load the program it is still there. How can I get rid of these unwanted programs?

Richard Bookal

You are evidently enclosing the filename in quotation marks when using the ERASE command from DOS. Although BASIC requires that you enclose or at least precede filenames with quotes, DOS does not-in fact it won't find an existing file when quotes are used. To delete a file from disk, use ERASE filename.ext from DOS or KILL "filename.ext" from BASIC. When you're KILLing a program, the second pair of quotes is optional.

Trackball Tricks

I purchased a trackball for my Atari 800 computer system and would like to use the device in my programs. I have looked in the hardware manual and

elsewhere, but can't find any information about how this is done. Wesley Wortman

Atari and Commodore computers (which can use the same trackball) read the device like a joystick. If you have an Atari computer, plug the trackball into joystick port 1, then type in and run the one-line program below. By moving the ball in various directions, you can see what numbers it generates.

10 PRINT STICK(0); GOTO 10

A trackball that fits an Atari joystick port will also work on a Commodore VIC-20 or 64, again returning the same values a joystick would. If you have a Commodore 64, run the following program after plugging the trackball into joystick port 2.

10 PRINT CHR\$(19):PEEK(56320)AND15: CHR\$(20):CHR\$(32):GOTO10

After running either program with the trackball, you may find it interesting to rerun it with a joystick for comparison. As you'll see, the ball is very sensitive and tends to return rapidly changing values, whereas a joystick returns the same value as long as you push it in a particular direction. Of course, in either case the device just generates numbers. It's your job to write a program that uses those numbers in some meaningful way—to animate a figure, draw a picture, or whatever. You can learn more about using joysticks in COMPUTE!'s Second Book of Atari and COMPUTE!'s First Book of Commodore 64.

ML Disk Routine

I need a machine language routine that opens, writes, and properly closes a disk file on a Commodore disk drive.

Rick Elwell

Since we're asked this type of question often, here's a short example that writes a 20-character sequential file to disk, and works with any Commodore computer and disk drive except the 128 in CP/M mode. You'll need a machine language assembler to enter this program. The explanatory comments after the semicolons are, of course, optional:

NEW FALL RELEASES

Entertainment and information from COMPUTE! Books this fall! These brand-new, top-of-the-line books offer you the latest home and business applications for your Apple, Commodore, and IBM personal computers.

100 Personal Computer Programs for Business and Professional Use Paul Garrison

\$19.95 ISBN 0-87455-017-3

Each of these 100 short programs fulfills one specific need and runs on the IBM PC, PC XT, PCjr, and all Apple II computers. Covering such topics as inventory, loan analysis, accounts payable, name and address lists, advertising cost analysis, invoice printing, and many other business and personal applications, these programs have dozens of uses in the home and at work.

A disk is available which includes the programs in the book.

Using Your Macintosh: Beginning Microsoft BASIC and Applications

Richard K. Swadley and Joseph B. Wikert \$16.95 ISBN 0-87455-021-1

Learn BASIC gently. This comprehensive book explores the Macintosh and feaches Microsoft BASIC in such a way that even the most reluctant beginner feels at ease. Information about the revolutionary Macintosh, from its desktop environment to the mouse, will get you started. Later chapters clearly explain BASIC, from the first statement to a finished program. Examples, including several complete programs, offer study tools and practical applications which demonstrate what you can do with BASIC on the Macintosh.

COMPUTE!'s First Book of IBM

\$14.95 ISBN 0-87455-010-6 Edited

The editors of COMPUTE! Books have collected all the best programs from COMPUTE!'s PC & PCjr and COMPUTE! magazines to bring outstanding games, utilities, graphics, and applications to your IBM PC or PCjr computer. Ready to type in and use, with easy-to-follow documentation, these 30 programs offer something for every IBM user. From telecommunications tutorials to a terminal program for the PCjr, you can use your computer to access hundreds of electronic bulletin boards and commercial databases. Applications for the home help calculate IRAs, energy needs, and financial plans. Games, in both machine language and BASIC, let you bop spiders, play computerized chess, and bowl a 300 game. Programming utilities examine disks, sort through hundreds of items in seconds, and assist in creating super disk directories. Tutorials demonstrate everything from 3-D graphics cre-

Tutorials demonstrate everything from 3-D graphics creation to relational operations. Graphics, an impressive feature of both the PC and PCjr, can be fully utilized with a drawing program and a shape editor. You can even make minimovies on your computer through animation of shapes. Typing these programs in is easy, since a proofreader program is included which makes it almost impossible to enter errors.

A disk is available which includes the programs in the book.

Pick out the books you need and call us today!

COMPUTE's Personal Accounting Manager for the Commodore 64

Roland Frechette \$12.95 ISBN 0-87455-014-9

Easy to use, the Personal Accounting Manager (PAM) is a complete small-business/home accounting system that satisfies every accounting need. Thirteen support routines, from income and expenses to property and investments, are managed by the menu-driven PAM. Personalizing PAM is simple. PAM calculates, projects, plans, and prints reports on financial status based on the data entered. It's the perfect financial assistant for anyone who wants to take the drudgery out of keeping track of his or her money. Ready-to-type listings for PAM are included.

A disk is available which includes the programs in the book.

MacIdeas

J. Richard McLaughlin

\$14.95 ISBN 0-87455-015-7

This idea-packed guide includes more than 100 specific ways to apply the Macintosh's powerful graphics capabilities. Readers will learn how to use *MacWrite* and *MacPaint* to create certificates, maps, newsletters, charts, flyers, and much more. *MacIdeas* shows how to enhance personal gifts and correspondence including personalized postcards, holiday greetings, and letterhead creation. Information and examples on using the newest Macintosh technology—digitizers—demonstrate how dazzling graphics can be created from photographs, portraits, even videotape. Dozens of illustrations take the reader from an idea to the finished product.

Apple II Applications: 40 Programs for Your Apple

Brian and Christopher Flynn \$14.95 ISBN 0-87455-016-5

Forty educational and strategy games, business and science applications, and home and personal organizational tools—all ready to type in and use on any Apple II-series computer. And since all programs are written entirely in BASIC, *Apple II Applications* also serves as an excellent example of good programming techniques which can be studied. All programs run under both ProDOS and DOS 3.3.

A disk is available which includes the programs in the book.

EXIT	LDA	#3	;Set file number,
	JSR	\$FFC3	;call CLOSE routine.
	JSR	\$FFCC	;Call CLRCHN routine.
	RTS		
NAME		"0:FILE,S,W	177
			TEST FILE."
CHARS	.BYT 2		IESI FILL."

Though there are other ways to get the job done, it's usually simplest and most reliable to use the computer's builtin routines. The SETLFS routine (\$FFBA) sets the logical file number, device number, and secondary address, and SETNAM (\$FFBD) sets the filename. The filename prefix 0: designates drive 0 and the suffix ,S,W designates a sequential file opened for writing. Different suffixes are used for other operations—for instance, the suffix ,S,R would prepare the program to read this file.

After OPEN (\$FFC0) opens the file, CHKOUT (\$FFC9) sets it for output (writing). CHKIN (\$FFC6) would be used here if you wanted to set the file for input (reading). The file is written one byte at a time with CHROUT (\$FFD2). Usc CHRIN (\$FFCF) or GETIN (\$FFE4) to input bytes when reading a file. After the write is complete, CLOSE (\$FFC3) closes the file and CLRCHN (\$FFCC) restores the system to normal, reenabling keyboard input and screen output. You should always CLOSE every disk file individually. Don't try to use CLALL (\$FFE7) as a shortcut: It may create a poison (unclosed) file on the disk.

To receive additional information from advertisers in this issue, use the handy reader service cards in the back of the magazine.

AMERICA **VE BUILT IT FOR YOU** THE ATARI 520ST

"We promised. We delivered. With pride, determination, and good old ATARI know how." Sam Tramiel, President. ATARI CORP.

No other computer we know of has been awaited with such anticipation, has received so much national and trade press, and has been so unanimously acclaimed as the remarkable 520ST.

And for good reason. Its development represents a bold, new standard in personal computing power.

The 520ST simply obsoletes all current personal systems - even those costing thousands of dollars

more. Beneath its full stroke 94-key keyboard is an operating environment so intelligent that it puts you in command almost at once. It's that easy.

Graphic symbols quickly identify available functions. Menus appear just by aiming

4

With a monochrome monitor your 520ST displays 640 x 400 pixels of extremely high resolution clarity. Select a color monitor and you are able to create beautiful graphs and diagrams from a palette of 512 vivid colors.

Power to grow. An array of

expansion ports allow you to easily customize your 520ST. There are standard serial and parallel interface ports for connecting printers and telecommunications equipment, MIDI connectors to interface with music synthesizers and keyboards, and 3.5 inch floppy disk, cartridge and joystick ports. There is also a hard disk port with the lightning communications speed of 1.33

Megabytes per second. ATARI 520ST systems are avail-

the mouse. Point to a specific operation, click the mouse and instantly you are able to develop full color charts, recall files from within folders, and so much more.

And when you combine 524,288 bytes of RAM with ATARI's custom circuits and the horsepower of a 68000 microprocessor, you own a powerful computer that delivers crisp, high resolution images with incredible speed.

able now. When it comes to state-of-the-art technology ...don't settle for less. And when it comes to price ...don't pay a penny more.

A ATAR1 520 ST

SYSTEM INCLUDES: 520ST Personal Computer, Monochrome Monitor, Mouse Controllier, 3.5 inch Disk Drive, TOS" - The Operating System Disk ATARI Logo" Language Disk With full color monitor: \$999.95"

A Hands-On Report

"We aren't selling home computers. We aren't selling business computers. We're selling personal computers. People can use them for whatever they want." With those words, Jack Tramiel launched the ST series and a new beginning for Atari. Here's a close look at the first computer in the ST series and the most powerful Atari ever.

The old stereotypes about home computers are being challenged. There's a new generation of personal computers emerging that combines massive memory, highspeed processing, fast floppy disk drives, hard disk interfaces, considerable expansion potential, stunning graphics, and sophisticated sound. These computers are powerful enough to run state-of-the-art business software and versatile enough to excel at running entertainment and educational programs. The Atari 520ST was the first of this new breed. Announced at the Winter Consumer Electronics Show last January, it is now becoming widely available. Here are the standard features:

 512K of Random Access Memory (RAM), half a megabyte.

• Motorola 68000 microprocessor. This 16/32-bit chip is clocked at 8 megahertz and can directly address up to 16 megabytes of memory without bank-switching. It's the

Tom R. Halfhill, Editor

same central prccessing unit found in the Apple Macintosh and Amiga from Commodore.

• One of the fastest floppy disk drive interfaces in personal computing. Although the interface bus is serial, not parallel, it transfers data at a megabit per second, faster than some hard disks. The basic 520ST system comes with one external drive that stores 400K (unformatted) on a single side of a 3¹/₂-inch microfloppy disk. Doublesided drives which store 800K per disk have also been announced.

• One of the fastest hard disk interfaces in personal computing. It transfers data at 1.33 megabytes per second, more than eight times faster than the floppy interface. Although hard disks aren't yet available for the ST, Atari plans to introduce a 10- to 15-megabyte drive by early 1986, possibly for as low as \$399. This price is feasible because the hard disk controller is already built into the computer. The hard disk interface can also be used for memory expansion or a CD-ROM (Compact Disc-Read Only Memory). Atari has shown a prototype CD-ROM that stores up to 550 megabytes of data on a single compact disc. (See "Monster Memory," August 1985.)

• Built-in Centronics-standard parallel port and RS-232 serial port for printers, modems, and other peripherals. These ports are compatible with IBM cables for printers and modems.

• Built-in Musical Instrument Digital Interface (MIDI) for attaching keyboard synthesizers, sequencers, drum boxes, and other electronic musical devices. Because the MIDI ports transfer data at a very high speed (31.25 kilobaud), they've also been considered for such future applications as extremely inexpensive local area networks (LANs).

• A slot for cartridges containing up to 128K of Read Only Memory (ROM).

• Intelligent video output port that recognizes whether a color or monochrome monitor is plugged into the computer and allows the operating system to adjust itself accordingly. This port also has pins for audio input/output.

• High-resolution monochrome monitor. With a screen refresh rate of 70 hertz—about 16 percent faster than normal monitors and TVs this monitor is capable of unusually sharp displays. An analog RGB (red-green-blue) color monitor also is available.

• Screen modes with high resolution (640 \times 400 pixels, monochrome), medium resolution (640 \times 200, four onscreen colors), and low resolution (320 \times 200, 16 onscreen colors).

• Palette of 512 possible colors. Any of the four colors in medium resolution or 16 colors in high resolution can be selected from this palette.

• Three-channel General Instruments sound chip, the same as found in the Texas Instruments TI-99/4A, IBM PCjr, and MSXstandard computers. Envelope

registers allow the chip to simulate various types of waveforms.

· A disk-based operating system called TOS (Tramiel Operating System) which combines Digital Research's CP/M-68K and GEM (Graphics Environment Manager). CP/M-68K is the 68000 version of the popular Z80-based operating system, CP/M (Control Program/ Microcomputers), similar to the MS-DOS used on the IBM PC and compatibles. CP/M-68K is vastly expanded, however, with provisions to support up to 16 disk drives with 512 megabytes per drive and 32 megabytes per file. To make this operating system easier to use, it is linked on the 520ST with GEM, a Macintosh-like user interface with icons, windows, and drop-down menus. GEM can be manipulated from the keyboard or with a mouse controller that comes with the 520ST. The two-button mouse plugs into one of the two controller ports built into the computer.

Turtle graphics in Logo: This geometric figure was created in the Atari 520ST's low-resolution mode $(320 \times 200 \text{ pixels}, 16 \text{ colors}).$

 Digital Research Logo and Atari BASIC programming languages on disk. (At this writing, BASIC wasn't finished, and the 520ST was being shipped with Logo only. Atari has said that BASIC will be added to the package when it's done and offered as an upgrade to early ST buyers as well.)

• An 84-key keyboard with cursor keypad, numeric keypad, plus ten special function keys.

The price for the complete system (520ST, disk drive, monochrome monitor, mouse, and system software) is \$799. A 520ST system with RGB monitor costs \$999.

f you've never used a Macintosh, working with the Atari 520ST for the first time will be an unfamiliar experience. When you switch on most personal computers, you find yourself either in BASIC or some type of disk operating system (DOS). But the 520ST doesn't wake up with a READY prompt, command line, or DOS menu. Instead, the first thing you see is the GEM desktop.

Icons along the edges of the desktop screen show a trash can and file drawers. The drawers represent floppy disk drives and hard disks, depending on your system configuration. Menu titles appear across the top of the screen. Floating above the desktop is an arrow that you can move by rolling the mouse or by pressing certain keys. It represents an extension of your hand on the screen.

To view a menu, you move the pointer to the desired title. Instantly, the menu drops down over the screen. (The 520ST's drop-down menus are summoned slightly differently than the Macintosh's pulldown menus: You don't have to click and hold the mouse button.) As you move the pointer up and down the menu, it highlights various options. Some options may be invalid for a particular operation, so they appear in dim print and cannot be highlighted. To select an option, you simply highlight it and click the left button on the mouse.

To call a disk directory, you move the pointer atop the appropriate file drawer icon and do what's called a *double-click*—pressing the mouse button twice in rapid succession. The disk drive hums, and a window appears on the desktop. Various types of icons inside the window denote data files, executable program files, and subdirectories on the disk. If you prefer a more conventional disk directory, you can drop down the View menu and select View As Text. The file icons change into a list of filenames which includes such information as file lengths in bytes and the dates on which the files were last updated. Other options on the View menu let you sort the directory by filename (alphabetically), file type,

This low-res picture was created with Dr Doodle, a simple drawing program written by Digital Research and included on an ST demo disk.

In high resolution (640 \times 400 pixels, monochrome), GEM closely resembles the Macintosh desktop.

Error messages on the 520ST are usually more helpful than the cryptic error codes of days past.

size, or date.

If you're working with a twodrive system, you can call the directory for drive B by double-clicking on its icon. When this window appears, it overlaps the window for drive A. But the drive A window isn't erased; by pointing to it and clicking the mouse button once, it moves atop the drive B window. A similar click on the drive B window brings it to the fore. You can flip back and forth between several windows in this manner, like shuffling papers on a real desktop. Options selected from menus, such as View As Text, affect the window which is currently on top of the pile.

A ll other functions in the GEM desktop work in similar ways: You point to a menu option or icon, then click the mouse button once or twice.

For instance, to run a program, you point to its icon or filename in the disk directory window and double-click. The desktop disappears and the program runs. When you exit the program, the desktop reappears.

Some operations, such as deleting a file, require a mouse maneuver known as dragging. First you select the icon-in this case, the file you want to delete-by pointing to it with the mouse and then clicking the mouse button. While still holding down the button, you can roll the mouse to drag an outline of the file icon along with the pointer. To delete the file, you would drag it to the trash can icon and release the mouse button. A window appears and asks "Are you sure?", warning that the file will be erased if you click on a marker labeled "OK." If you don't want to delete the file, you can click on a marker labeled "Cancel." The first choice irretrievably erases the selected file off the disk; the second choice restores everything to normal. (Unlike the Macintosh, you can't retrieve files from the trash can. As the 520ST manual points out, the 520ST trash can is more like an incinerator.)

This dragging technique is used for other operations as well. You can copy a file from one disk to another by dragging the file icon from the source disk's directory window to the destination disk's window; you can copy the contents of an entire disk by dragging its file cabinet icon atop another disk's icon; and you can organize files into subdirectories by dragging their icons into a folder icon.

You can also manipulate windows as easily as icons. The "active" window—that is, the one on top of the pile if several are displayed—has various control bars and squares along its edges. Pointing to the square in the upper-right corner and clicking the mouse button expands the active window to full-screen size. Clicking this corner again restores it as a window. Dragging the lower-right corner lets you adjust a window's size, making it larger or smaller. Dragging the top bar lets you move a window anywhere on the screen. Clicking on the small arrows displayed along the bottom and right bars will scroll the material displayed in the window, assuming some of it is hidden due to the window's size. And clicking on the upper-left corner removes the active window from the screen ("closes" the window).

ne unusual feature of the 520ST is its intelligent monitor interface. When you boot up, the operating system checks whether a monochrome or color monitor is attached to the computer and adjusts itself for one of three possible screen resolutions.

With the monochrome monitor, the operating system automatically configures the GEM desktop for high resolution—640 \times 400 pixels, black and white. The display is extremely sharp and stable because of the monitor's 70 hertz refresh rate, which means it redraws the screen image 70 times per second rather than 60 times as on standard monitors and TVs. (This is possible because the monitor uses its own 70 hertz oscillator instead of synchronizing with the 60 hertz power line.) Furthermore, the display is paper-white, not blue-white, easier on the eyes. When the monochrome monitor is hooked up, the operating system won't let you enter the medium- or low-resolution modes, which have color.

If the 520ST is booted up when plugged into its RGB monitor, it defaults to medium resolution— 640×200 with four simultaneous colors. Because this screen has the same horizontal resolution as the monochrome mode but only half the vertical resolution, the aspect ratio is slightly distorted. Icons appear tall and skinny, and characters are narrower.

The low-resolution mode— 320 \times 200 with 16 simultaneous colors—also requires the RGB monitor. (The RF modulator included in preproduction 520STs has been eliminated from production models, so it can't be attached to ordinary TVs. There's also no direct output for standard composite monitors, although one could probably be rigged from the RGB pins.)

Superstars aren't just the best in their fields. They're the best, year after year. In the wide world of sports simulations, SSI's COMPUTER OUARTERBACK[™] and COMPUTER BASEBALL[™] stand out as

true superstars. To date, tens of thousands of enthusiastic fans and dozens of magazine reviewers alike have cheered their superb display of realism and excitement. By consistently outplaying the competition, our games stand head and shoulders above the crowd.

If you're scouting for the best football and baseball strategy games around, take a good look at ours — the ones with the proven performance. You'll know these are the superstars you want to play on your computer. Sign them up at your local computer/software or game store today!

If there are no convenient stores near you, VISA & M/C holders can order these \$39.95 games direct by calling 800-227-1617, x335 (toll free). In California, 800-772-3545, x335.

Please specify computer format and add \$2.00 for shipping and handling. To order by mail, send your check to: Strategic Simulations, Inc., 883 Stierlin Road, A-200, Mountain View, CA 94043. (California residents, add 7% sales tax.) All our games carry a "14-day satisfaction or your money back" guarantee.

STRATEGIC SIMULATIONS, INC.

In low res, the GEM desktop has a 40-column screen. The Control Panel is a pop-up menu that lets you adjust various system functions.

In medium resolution (640 × 200 pixels, four colors), the GEM desktop has an 80-column screen. Note the two disk directory windows.

The 520ST is capable of displaying numerous type styles, as seen on this hi-res Logo screen.

To enter the low-res mode, you boot up in medium-res, then drop down the Options menu and select Set Preferences. A small window appears with markers for low-res, medium-res, and hi-res (the hi-res marker is dimmed to indicate it's not available with this configuration). To change modes, you click the mouse button while pointing to the appropriate marker.

If you want your 520ST to "wake up" in low-res instead of medium-res, you can drop down the Options menu and select Save Desktop. This selection saves all adjustments you've made to GEM

onto the operating system boot disk. Other preferences can be saved this way, too. By dropping down various menus, you can specify whether warning windows should appear when copying or deleting files; turn the keyboard click and error beeps on or off; adjust the keyboard's auto-repeat delay and repeat rate; set the mouse button's response speed for double-clicking; choose the desktop's foreground and background screen colors from the 512 available hues; set the realtime clock's time and date, which is automatically stamped on disk directories whenever you save a file; and configure the RS-232 and parallel ports for certain peripherals.

The 520ST doesn't have sprites or player/missile graphics, but animation is possible in any of its screen modes by a technique called bit-block transfer. Like sprite graphics, it allows you to move objects around the screen without erasing the background. The mouse pointer and the bumblebee icon that appears when the disk drive is busy are examples of bit-block animation. Unfortunately, these capabilities are not supported in Logo, the only language shipped with the 520ST at launch. The Logo is actually a translation of Digital Research's Logo for the IBM PC, and it has no commands for animation or sound. Reportedly, the BASIC being prepared for the 520ST is a translation of Digital Research's BASIC for the PC.

hen the 520ST made its first appearance at the Winter CES, it was hard to believe that anyone could design a system like the 520ST and throw together a prototype in only about six months—the time that had elapsed since ex-Commodore President Jack Tramiel had acquired Atari from its parent company, Warner Communications.

Forced to trim down from several thousand employees to several hundred, Atari accelerated development on the 520ST by taking advantage of some ready-made parts. The 520ST came along just in time for Digital Research's CP/M-68K and GEM. This is important in understanding the underlying structure of the 520ST, which has been nicknamed the "Jackintosh."

Although the Atari's desktop screens can easily be mistaken for the Macintosh's, the 520ST is actually quite different from the Mac. True, GEM has all the icons, windows, menus, and other Macintosh screen graphics. But GEM is really just a shell-a layer between the user and the real operating system, CP/M-68K. In fact, it's possible to leave GEM and enter this lower level. All the fancy graphics can be made to disappear and you see a screen prompt, A>. This prompt is familiar to users of CP/M and MS-DOS/PC-DOS (a descendant of CP/M). You can enter commands such as DIR to call a disk directory or TYPE to display a file. Like CP/M and PC-DOS, CP/M-68K allows programmers to perform various system functions by calling routines in the Basic Input/Output System, or BIOS. Digital Research even says that CP/M file structures are upwardly compatible with CP/M-68K.

GEM, too, is a module that has something in common with other systems. Digital Research sells a version of GEM for the IBM PC and compatibles, and publishes guidelines for writing application programs to work with GEM.

All this doesn't mean that the 520ST can run CP/M or PC-DOS programs, of course—the machine languages are completely incompatible. But it does mean that programs written in compiled languages such as C can be adapted for these various systems without complete rewriting. If software companies take advantage of this, it could significantly boost the amount of software available for the 520ST.

Another consequence of the 520ST's shell-like operating system structure is that the machine has not been designed around its user interface. The computer is functional without the mouse, and the keyboard includes such traditional features as cursor keys.

Combining ease of use with real power, speed, and the potential for future expansion, the Atari 520ST is an important addition to personal computing. It lends itself to users who prefer to buy their software off the shelf as well as to programmers—a versatile representative of the new generation.

COMPUTE! Books Announces

with more than 70 neverbefore-published articles and programs for the Commodore VIC-20.

COMPUTE!'s

Included in this giant collection are over 30 games, plus utilities, applications, tutorials, and much more, most of which will run on an unexpanded VIC. COMPUTEI's VIC-20 Collection contains something for every VIC-20 user. Even If you use just a fraction of the programs inside, this book will prove extremely valuable. Typing in the programs is made easy with "The Automatic Proofreader," an error-checking program that tells you right away If you've made an error.

Edited, \$12.95, ISBN 0-87455-007-6

There's also a disk available which includes all the exciting, challenging programs from the book ready to run on your VIC-20. COMPUTE!'s VIC-20 Collection Disk saves you typing time and prevents many typing errors. It's fast, convenient, and inexpensive. You can order the Disk from COMPUTE! Books for only \$12.95. NIC 2000 NIC 2000 NA giant assortment of over 70 never-before-published articles and programs for the VIC-20. Action garnes, thinking games, utilities, graphics, sound, and tutorials.

Amiga Goes IBM-Compatible

Tom R. Halfhill, Editor

ommodore sprang a few surprises when it officially announced the Amiga in late July. For one thing, there's an option to make the Amiga compatible with most programs written for the IBM PC—an option that requires no additional hardware.

Commodore has revealed the missing link.

Its new Amiga personal computer already is reaping praise from industry analysts and journalists as the most innovative machine introduced in years (see "The Amiga: An In-Depth Review," COMPUTE!, September 1985). However, as with all new computers that break with existing technology, it could take a year or more before the Amiga accumulates an extensive software library.

But Commodore appears to have solved that problem with a single stroke. On July 23, when it formally unveiled the Amiga to a crowd of several hundred people at a gala media event in New York's Lincoln Center, Commodore announced that an option will make the Amiga software-compatible with the popular IBM PC and its huge base of commercial programs. Although this had been rumored for months, the method of achieving this compatibility was the real surprise—the Amiga will emulate the IBM PC entirely in software.

In other words, it won't be necessary to add an expansion board containing an 8088 and support chips to emulate the IBM PC. Instead, Amiga users will simply load an emulation program that replaces the Amiga's proprietary operating system with PC-DOS to make the Amiga act like an IBM. This was demonstrated in New York when an engineer loaded the PC emulator from a 31/2-inch disk, then booted PC-DOS from a standard 5¹/₄-inch IBM disk on an external drive (the 51/4-inch drive is optional). The Amiga's graphics-oriented operating system disappeared, and the screen displayed the usual PC-DOS startup message:

The IBM Personal Computer DOS Version 2.10 (C)Copyright IBM Corp 1981, 1982, 1983

After inserting another 5¹/₄inch disk and typing "lotus" at the DOS prompt, the engineer demonstrated a *Lotus* 1-2-3 spreadsheet. The Amiga screen even looked like an IBM monochrome screen.

The technical feat of emulating the IBM PC entirely in software is best appreciated by advanced programmers and engineers, but can be likened to playing a record on a tape deck. It seems almost impossible, and even some people who witnessed the demonstration have doubts that the Amiga can emulate the PC at a speed comparable to a real PC.

Nevertheless, Commodore's engineers maintain it has been done, and that the PC emulator will be available within a month after the Amiga's launch in September. No price for the emulator was announced, but Commodore says it chose the software method to keep costs down. The only hardware involved is the 5¼-inch drive, and one engineer told COMPUTE! that even that accessory might be unnecessary since some PC programs can be loaded from 31/2-inch disks sold for the Data General One, a PC-compatible portable computer.

According to Commodore, the emulator isn't memory-hungry, either. It consumes about 40K of RAM, not counting video memory. Still, to run large PC programs such as *Lotus 1-2-3*, Commodore will probably advise users to expand the Amiga's standard 256K RAM to 512K (a \$200 option).

Another surprise revealed July 23 was the Amiga's memory configuration. Commodore originally planned to locate the Amiga's large operating system, called Intuition, in 192K of ROM. Then, to make it easier to fix bugs and release the computer on time, Commodore said the first Amigas would load Intuition from disk, consuming

SUMMER GAMES II." EIGHT NEW WAYS TO GO FOR THE GOLD.

Sure Summer Games was great, but why stop there? Let Summer Games II take you even farther with eight new events including cycling, fencing, kayaking, triple jump, rowing, high jump, javelin and even equestrian. They can all be played by up to eight players and some, like cycling, rowing and fencing challenge you with realistic head-to-head competition.

First, you decide which of the 18 different countries you're going to represent. Then, in true Olympic fashion, you will need the proper strategy and mental toughness, not just speed and agility to excel in each event. It's so realistic, there's even an opening and closing ceremony along with medal presentations after each event.

It's not too early to get ready for 1988. With the right diet, proper training and hours of practice you just might make it. In the meantime, put on your sweatsuit, grab that joystick and let Summer Games II give you eight new ways to **Go For The Gold**!

Strategy Games for the Action-Game Player

about half of the 256K user RAM. Now Commodore has a better solution: The standard Amiga will have 512K of RAM, but half will be dedicated to storing Intuition. Called the Writeable Control Store, this extra bank of 256K RAM is writeprotected immediately after the operating system is loaded. Commodore says even a system reset won't interfere with it. In effect, the Writeable Control Store acts like

player see several parts of the story simultaneously. (\$54.95; Mindscape, Inc., 3444 Dundee Road, Northbrook, IL 60062.) Dr. J & Larry Bird Go One-on-One: Realistic

graphics and sound highlight simulated basketball action between the two athletes. (*Electronic Arts.*) *Marble Madness:* Translation of the arcade game. (*Electronic Arts.*)

Radar Raiders: A graphics- and sound-rich flight simulator that lets the player control a highperformance jet aircraft, both in test pilot and combat game modes. (Developed by Sublogic Communications Corporation and marketed by Amiga.) Return to Atlantis: 3-D undersea adventure. (Electronic Arts.)

Sargon III: Chess game with nine levels of play and a library of 68,000 moves. (Hayden Software Company, 600 Suffolk Street, Lowell, MA 01854.)

Skyfox: Light combat simulation. (Electronic Arts.) Zork I: The Underground Empire; Zork II: The Wizard of Frobozz; Zork III: The Dungeon Masters; Enchanter; Sorcerer; Suspect; The Witness; Cutthroats; Deadline; Seastalker; Infidel; Planetfall; Suspended; Starcross; The Hitchhiker's Guide to the Galaxy. The well-known series of alltext interactive fiction adventures. (\$39.95-\$49.95. Infocom, Inc., 125 Cambridge Park Drive, Cambridge, MA 02140.)

Languages And Utilities

ABasiC: A powerful BASIC interpreter designed to take full advantage of the Amiga's capabilities. (Developed by Metacomco, the British company that wrote AmigaDOS. Marketed by Amiga.)

Amiga Assembler/Linker: A Motorola-standard 68000 macroassembler with linker. (Developed by Metacomco and marketed by Amiga.)

Amiga Tutor: A step-by-step look at the Amiga's graphics capabilities and other major features. (Mindscape.)

Cambridge LISP 68000: Programming language

256K of ROM, except that Intuition must be loaded from disk again after the computer is powered off. As a result, the entire 256K of user RAM is available for programs.

The Writeable Control Store won't be counted as system RAM; the standard \$1,295 Amiga will still be advertised as a 256K computer, even though it really contains 512K. Later, when Commodore is certain that Intuition is fully optimized (critical parts are being rewritten from compiled C into machine language), the Writeable Control Store will be eliminated and replaced with ROM. This will allow nearly instant startups, because Intuition won't have to be loaded from disk. Commodore hasn't yet said whether early Amiga owners will be able to upgrade to a ROM-based operating system later.

designed for work in artificial intelligence. (Developed by Metacomco and marketed by Amiga.) Lattice C Compiler: Allows software developed

for other PC operating systems to run on the Amiga. (Lattice, Inc., P.O. Box 3072, Glen Ellyn, IL 60138.)

Lattice C Cross Compiler / IBM MS-DOS: Allows software developed for Amiga to run on IBM personal computers. (Lattice, Inc.)

Lattice C Cross Compiler/Unix: Allows software designed for the Amiga to run on Unix-type machines. (Lattice, Inc.)

Lattice C Cross Compiler/VAX: Allows software developed for the Amiga to run on VAX minicomputers. (Lattice, Inc.)

LMK: Software development tool similar to Unix-Make. (Lattice, Inc.)

LSE: Screen editor; allows user to enter commands in several languages. (Lattice, Inc.)

MCC Pascal 68000: Single-pass compiler for software systems and utilities development. (Developed by Metacomco and marketed by Amiga.)

TMN: Software development tool for text management utilities. (Lattice, Inc.)

TLC-LOGO for the Amiga: A high-level programming language incorporating a LISP dialect. (Developed by The LISP Company and marketed by Amiga.)

Turbo PASCAL: High-speed compiler. (Borland International, 4585 Scotts Valley Drive, Scotts Valley, CA 95066.)

Business/Productivity

CalCraft: A spreadsheet for the Amiga, featuring pull-down menus and flexible formatting options. (Developed by Synapse Software and marketed by Amiga.)

Deluxe Video Construction Set: Creates animated video with sound effects; accepts data from other Electronic Arts software. (Electronic Arts.)

Enable/Calc: Spreadsheet program with over 50 math functions and up to eight simultaneously active spreadsheet files in RAM. (The Software Group/Amiga, Northway Ten Executive Park, Ballston Lake, NY 12019.)

Enable/File: Database manager capable of handling up to 256 fields per record. (The Software Group/Amiga.)

Enable/The Office Manager: Integrated business package, including word processor, database manager, telecommunications, and graphics modules. (The Software Group/Amiga.)

Enable/Write: Word processor. (The Software Group/Amiga.)

Graphicraft: Graphics/paint package using 32 medium-resolution colors. (Developed by Island Graphics Corporation and marketed by Amiga.)

Harmony: Creates musical accompaniment, either through Amiga's internal sound or MIDI (Musical Instrument Digital Interface) instruments. (Developed by Cherry Lane Technologies and marketed by Amiga.)

Moviecraft: Animation package; uses "tweening" technique to animate without reading from disk. (Developed by Island Graphics and marketed by Amiga.) Musicraft: Turns the Amiga into a four-voice synthesizer and sequencer; teaches music composition. (Developed by Everywhere, Inc. and marketed by Amiga.)

Presentationcraft: Business graphics package for creating 3-D objects, exploded and expanded bar and pie graphs. (Developed by Island Graphics Corporation and marketed by Amiga.)

RAGS to RICHES Ledger: Double-entry general ledger software for small businesses. (Developed by Chang Laboratories and marketed by Amiga.)

RAGS to RICHES Payables: Accounts payable software for small businesses. (Developed by Chang Laboratories and marketed by Amiga.)

RAGS to RICHES Receivables: Accounts receivable software for small businesses. (Developed by Chang Laboratories and marketed by Amiga.)

RAGS to RICHES Sales: A sales register program for point-of-sale income accounting; makes the Amiga function as a cash register. (Developed by Chang Laboratories and marketed by Amiga.)

Scorewriter: Enables user to score and print music. (Developed by Cherry Lane Technologies and marketed by Amiga.)

The Print Shop: Specialized graphics software, allowing user to design and print personalized greeting cards, invitations, letterheads, stationery, signs, and banners. (Brøderbund Software, Inc., 17 Paul Drive, San Rafael, CA 94903.)

Telecraft: Telecommunications software for Amiga. (Developed by Software 66.)

Textcraft: A word-processing program incorporating online tutorials and screen help for ease of use. (Developed by Arktronics and marketed by Amiga.)

Education

The Halley Project: A realtime simulation of the solar system. Teaches about concepts like gravity, orbital motion, and navigation by the stars as players "travel" around the universe. (\$49.95; Mindscape.)

Keyboard Cadet: Teaches touch typing. (\$39.95; Mindscape.)

Seven Cities of Gold: An adventure game that helps teach geography and cartography; players are sixteenth-century conquistadors exploring the new world. (Electronic Arts.)

Peripherals

Penmouse Input Device: A cordless light pen with built-in power supply that functions as both a mouse and graphics tablet. (Kurta Corporation, 4610 S. 35th Street, Phoenix, AZ 85040.)

T-Card: Multifunction expansion card with up to one megabyte of memory; includes serial port, parallel printer port, and hard disk interface. (Tecmar, 6225 Cochran Road, Solon, OH 44139.)

T-Disk: 20-megabyte 3½-inch hard disk drive. (Tecmar.)

T-Tape: 20-megabyte tape backup for hard disk; can be linked to Amiga through floppy interface port. (Tecmar.)

T-Modem: Hayes-compatible modem, switchable 300, 1200, and 2400 bits per second. (Tecmar.)

TIRED OF WAITING FOREVER FOR YOUR PROGRAMS TO LOAD?

INTRODUCING THE FAST LOAD CARTRIDGE FROM EPYX.

You're tired of waiting forever for your Commodore 64 programs to load. But it's no use glaring at your disk drive. Calling it names won't help, either. It was born slow – a lumbering hippo. You need the FAST LOAD CARTRIDGE from EPYX. FAST LOAD transforms your Commodore 64 disk drive from a lumbering hippo into a leaping gazelle. With FAST LOAD, programs that once took minutes to load are booted up in a matter of seconds.

FAST LOAD can load, save and copy your disks five times faster than normal. It plugs into the cartridge port

of your Commodore 64 and goes to work automatically, loading your disks with ease. And that's only the beginning. You can copy a single file, copy the whole disk, send disk commands, and even list directories without erasing programs stored in memory.

And unlike other products, the FAST LOAD CARTRIDGE works with most programs, even copy protected ones, including the most popular computer games.

The FAST LOAD CARTRIDGE from Epyx. Easy to insert, easy to use and five times faster. So why waste time waiting for your disks to load?

Speed them up with FAST LOAD!

The NEW Games

Selby Bateman, Features Editor Kathy Yakal Feature Writer

A game with no instructions. A program that seems to think for itself. Aircraft simulations edging closer to the real thing. And an "alternate reality" that's expandable. All this—plus the Goonies—are among the new computer game releases you'll be seeing this fall and during the holiday season.

im Levy stepped back from the computer screen, a look of embarrassment crossing his face. As the president of Activision, Levy was *supposed* to be showing a roomful of reporters his company's newest computer game. But something had apparently gone wrong, and now he apologized and explained that he was trying to get online with a computer at company headquarters to demonstrate the program.

"Logon please..." appeared on the screen. After a few unsuccessful tries, suddenly Levy's computer was online—not with Activision, but with some unknown computer system. But whose?

"That, ladies and gentlemen, is the game," said Levy, flashing a sly smile at the crowd.

It's called *Hacker*, and it's a game with no instructions, no rules, no clues—just your simulated online connection with a mysterious

computer system. Whose system have you stumbled into? What's going on? What does it take to win? What pitfalls make you lose? As the computer hacker, you must discover all these answers on your own as you play this intriguing adventure game, which will be available initially for the Commodore 64 and 128 (Apple and Atari soon after; price to be announced).

In addition to the engaging approach Activision has taken with *Hacker*, a number of companies are showing that there are plenty of fresh ideas for computer games. And these games reveal that experienced programmers are getting far more from today's computers than ever before. Several of the newest entries are sequels which equal or surpass the original hits. Here are some highlights:

A view through the periscope in Silent Service.

Acrolet, Gunship, and Silent Service (MicroProse Software)-Fans of MicroProse Software's earlier hits, Solo Flight and F-15 Strike Eagle, can look forward to more excitement from this trio of new simulations. Acrolet is an advanced flight simulator which starts where the earlier Solo Flight left off, allowing you to pilot a BD5-J jet. Gunship is a simulation of the AH-64 Apache attack helicopter, complete with electronic multiple weapons systems and realistic helicopter maneuverability. Silent Service is a World War II submarine combat simulation which lets you slowly increase the level of complexity as your skills develop. The emphasis in all three packages is on realistic simulations coupled with intriguing game scenarios. (AcroJet-Apple II. Atari, Commodore, IBM; Gunship-Apple II, Commodore, IBM; Silent Service-Apple II, Commodore; \$34.95 each.)

Alternate Reality (Datasoft, Inc.)—This is the first game in a projected series of eight fantasy role-playing programs being released by Datasoft. Called The City, the original episode of Alternate Reality finds your character abducted by aliens to another time and place. As you move around the strange city, you learn basic survival skills. But this is an adventure game with a difference. Traits like patience, compassion, and honesty are valued every bit as much as the usual strength and proficiency with weapons. Day turns to night as you learn how to earn money, obtain food, avoid dangers, and explore the city. Later programs will tie in with this first game, letting you gain access to parts of the city which are not open to you in the original program. Following The City, Datasoft plans to produce The Dungeon, The Arena, The Palace, The Wilderness, Revelation, and Destiny. (Atari and Commodore versions, \$39.95; Apple II family, \$49.95.)

Beach-Head II (Access Software)-Two earlier fast-action games from Access, Beach-Head and Raid Over Moscow, have been among the most popular computer programs on the market. Beach-Head II may well join them. The theme is unabashedly arcade-style battle, with soldiers charging a machine gun bunker, rescuing prisoners, flying a helicopter through antiaircraft fire, and throwing knives in a one-onone finale. Superb color graphics and eerily authentic speech synthesis add realism to the game's constant action. There are two options of game play: two players or one player versus the computer. (Commodore 64/128, Atari, Apple II, IBM PC/PCjr, \$39.95.)

APBA Major League Players Baseball (Random House)—It's your strategic skills, not athletic abilities, which count in APBA Major League Players Baseball. Adapted from the popular board game invented 30 years ago, it's a simulation that lets you make the decisions of a major league manager, putting a baseball team together and then pitting it against other teams. The 1985 Master Edition contains actual records and ratings for 676 players from the 1984 professional baseball season. Updated records will be available

Get the jump on the weatherman by accurately forecasting the local weather yourself!

The beautiful princess is held captive by deadly dragons. Only a knight in shining armor can save her now!

A time-saving organizer for coupons, receipts and more.

A scientifically proven way to develop an awesome memory.

Cut your energy costs by monitoring your phone, electric and gas bills.

School-age and pre-school children are rewarded for right answers, corrected on their wrong ones.

You are trapped in a fivestory, 125-room structure made entirely of ice. Find the exit before you freeze!

Computerize car maintenance to improve auto performance, economy and resale value.

A real brainflexer. Deflect random balls into targets on a constantly changing playfield.

Take control of your personal finances in less than one hour a month.

Create multi-colored bar graphs with a surprisingly small amount of memory.

A fun way to dramatically increase typing speed and accuracy.

Get up to 30 new programs and games for less than 15 cents each every month in COMPUTE!

Every month, COMPUTE! readers enjoy up to 30 brand-new, ready-to-run computer programs, even arcade-quality games.

And when you subscribe to COMPUTE!, you'll get them all for less than 15 cents each!

You'll find programs to help you conserve time, energy and money. Programs like Cash Flow Manager, Retirement Planner, Coupon Filer, Dynamic Bookkeeping.

You'll enjoy games like Air Defense, Boggler, Slalom, and High Speed Mazer.

Your children will find learning fast and fun with First Math, Guess That Animal, and Mystery Spell.

Looking for a challenge? You can write your own games. Customize BASIC programs. Even make beautiful computer music and pictures.

It's all in COMPUTE!. All ready to type in and run on your Atari, Apple, Commodore, PET/CBM, TI-99/4A, Radio Shack Color Computer, IBM PC or IBM PCjr. What's more, you get information-packed articles, product reviews, ideas and advice that add power and excitement to all your home computing.

And when it's time to shop for peripherals or hardware, check COMPUTE! first. Our product evaluations can save you money and costly mistakes. We'll even help you decide what to buy: Dot-matrix or daisy-wheel printer? Tape storage or disk drive? What about modems? Memory expansion kits? What's new in joysticks, paddles and track balls?

Order now! Mail the postpaid card attached to this ad and start receiving every issue of COMPUTE!.

COMPUTEI P.O. Box 10954, Des Moines, IA 50340

every year. You deal with everything a real manager would should a batter bunt, should your pitcher throw an intentional walk, does the infield move in for the next batter? You even face injuries, ejections, and rainouts. Create your own leagues, divisions, teams, and farm clubs. Statistics for up to 100 teams can be stored on a disk. (IBM PC/PCjr/XT/AT with color/ graphics or monochrome adapter, \$89.95.)

King Graham meets King Neptune in King's Quest II: Romancing the Throne.

King's Quest II: Romancing the Throne (Sierra)—The threedimensional, double highresolution graphics in the original King's Quest are back in this second all-graphics adventure featuring Sir Graham (now King Graham). King Graham's quest is a colorful, smoothly scrolling adventure which can be played by youngsters as well as adults. Sierra has again paid attention to all the details, making this a worthy successor to the original. (IBM PC and PC compatibles, \$49.95.)

The Fourth Protocol (Bantam Electronic Publishing)-Frederick Forsyth's bestselling novel has been turned into a graphics and text adventure which is being released simultaneously with the paperback version of the book. You play the part of a British intelligence agent racing to uncover a plot to smuggle and detonate a nuclear device in England. The game employs easyto-use Macintosh-style icons and windows to help you get around. And there are plenty of plot twists, even for those who may have read the book. (Commodore 64, \$34.95; Apple version soon.)

The Goonies (Datasoft, Inc.)—A colorful series of eight mazes, filled

with a collection of Rube Goldbergstyle devices to trip you up, comprises this action-strategy game based on Steven Spielberg's movie. Coordinating your multiple characters and learning the intricacies of the mazes make this a demanding and absorbing game. You won't find the treasure easily, but you can have fun trying. (Apple II family, \$39.95; Atari and Commodore, \$29.95.)

Jet (SubLogic)—The company that brought out the very popular Flight Simulator II has gone one better with its newest release, Jet, for IBM computers. This newest game is a very realistic simulation of two supersonic jet fighters, a land-based F-16 Fighting Falcon and a carrierbased F-18 Hornet. There is a freeflight mode, or you can try your hand at a variety of land or sea attacks or dogfight options to test your skill. (IBM PC or PC-compatible with minimum 128K memory, \$49.95.)

Simultaneous play with split screens in Spy vs. Spy: The Island Caper.

Spy vs. Spy: The Island Caper (First Star Software)-First Star scored a big success with the original Spy vs. Spy game, and now the sequel is available. The same splitscreen Simulvision/Simulplay techniques used in the original are employed here, allowing two players to see what's happening with each onscreen character and to act independently. Both games are based on Mad Magazine's longrunning comic strip. In the latest edition, the spies are after a nuclear warhead on a tropical volcanic island. (Commodore 64/128, \$29.95; Apple II, \$34.95.)

Racter (Mindscape)—One of the most novel approaches to computer gaming this year may be Racter, a program with a mind of its own.

Racter (short for raconteur) exists to converse with you. Type in a guestion, and the program not only responds from its 2,800-word vocabulary and knowledge of English grammar, but may also launch into a lengthy tale from the past, present, or future. The sentences are sophisticated-perhaps a bit schizophrenic-and all in fun. Racter is already the "author" of its own book (the first ever written by a computer), The Policeman's Beard Is Half Constructed (Warner Books). a collection of short poems, dialogues, limericks, and stories. (IBM PC, Apple IIe and IIc, Macintosh, \$44.95. The book is available separately.)

The bobsled run in Winter Games.

Winter Games (Epyx, Inc.)-Last year, Epyx brought out a popular computer re-creation of the Summer Olympics called Summer Games. The package reportedly sold more than 200,000 copies thanks to its smooth, colorful graphics and solid game play. Now the company has produced two sequels, Summer Games II, and most recently, Winter Games, in anticipation of the 1988 Winter Olympics. Ski jumping, speed and freestyle events, a ski biathlon, and even a bobsled run are part of this latest Olympic exercise. (Apple II, Commodore 64, Macintosh, from \$29-\$35.)

Wishbringer (Infocom, Inc.)—This introductory level all-text fantasy is another of Infocom's computerized text adventures. Wishbringer is suitable for the beginning adventurer, yet offers the experienced player plenty of challenges. The game can be played on two levels—with the help of magic (for beginners) and through logic and puzzle-solving without magic (for experienced players). (Apple II family, IBM PC/AT, Macintosh, others, \$39.95; Atari, Commodore, \$34.95.) © THE #1 BACKUP COPY SYSTEM IS NOW BETTER THAN EVER!

Order by phone 24 Hs /7 days or send casher's check/money order payable to BASIX Visa, MasterCard & American Express include card # and csp. date. CA residents add 6% tax. Allow 2 weeks for clourince of personal and co. checks. Add 53:50 shipping/handling for continental U.S., 55:50 for UPS air. COD's shipped to 48 states only add 54:00. AK, HJ, APO, FPO, add 57:50. CANADA aid 510:00. Other Foreign orders add 515:00, and remit certified U.S. funds only. No credit card orders from outside North America. Dealers & Distributions invited & supported.

DISKMAKER...THE ONLY COPY SYSTEM YOU'LL EVER NEED!

Expert Systems: Shortcut To Artificial Intelligence?

Kathy Yakal, Feature Writer

f an "expert" is defined as someone who knows more than most people about a given subject, then you probably seek advice from several experts every week. If you or someone in your family is ill, you probably go to a physician. After asking several questions and running some tests, the doctor arrives at a diagnosis and recommends treatment. If your car keeps stalling at intersections, you probably take it to a mechanic, who checks the car and recommends a repair. If you find yourself owing too much federal income tax on April 15, a tax consultant can offer ways to help. And if you think you've been wronged by someone, a lawyer can usually decide if it's worthwhile to bring a lawsuit.

All of these people you consult—these experts—are trusted to have a sufficient *database* of knowledge in certain areas so that their advice is worth following (and worth paying for).

You can also buy programs for your personal computer that have been designed to act as consultants in such areas as personal finance and health care. Are they replacements for real experts? Not according to their publishers, who stress that the programs are consultants only, and that you should almost always seek additional help from professionals.

But the day may not be too distant when a new type of computer program will replace experts—or at least, take over part of what experts do. These sophisticated programs, called *expert systems*, contain a database of knowledge that human experts can spend years The term expert system is rapidly becoming a new catch-phrase, like user-friendly. Some people point to "smart" computers now being used for diagnosis and trouble-shooting in medicine and industry as proof that expert systems are possible and practical. Even some personal computer software publishers claim that their products possess artificial intelligence or expert system capabilities. But others maintain that few, if any, true expert systems really exist. Here's a look at what's happening.

acquiring. More significantly, the most advanced expert systems now under development also incorporate some of the rules of logic and analysis that experts combine with their storehouse of facts to solve real-life problems. Already, there are programs in everyday use that analyze geological data to find likely spots for new reservoirs of oil—a job which was formerly the exclusive domain of geologists and engineers.

Some people even believe that expert systems will become commonplace on the next generation of home computers, bringing the advice of family doctors and other professionals into the home at the touch of a key. But others warn that the premature application of expert systems could result in serious trouble, especially if they're based on an incomplete understanding of the decision-making process.

Though still in their infancy, expert systems are opening another chapter in the debate over artificial intelligence. Several years ago, Joseph Weizenbaum, professor of computer science at the Massachusetts Institute of Technology (MIT), wrote a computer program called *Eliza*. His intention was to show how a computer could act like a psychologist. *Eliza* would ask the user questions about how he or she was feeling, then pick up on key words or phrases in the answer to guide its "therapy."

Some people are now calling Eliza an early expert system.

"I hadn't even heard that phrase used when I wrote it," says Weizenbaum today.

Part of the challenge of designing an expert system is deciding on the definition of what it's supposed to be and how it's supposed to work: Even the experts can't agree. For example, Weizenbaum thinks Eliza is being characterized as an early expert system because he consulted experts before writing it. Although Eliza may seem like it's really listening to you and responding, the program just follows a set of rules given it by Weizenbaum. If you say you're having a bad day, the program may ask you to talk about it. Then it may ask how certain events made you feel, or what you think you should do about it. Eliza is really more of an interactive diary than an expert.

Now the term expert system appears to be changing to apply to systems that perform expertly.

That's still too vague, says Weizenbaum. "If one were to characterize systems that perform expertly as expert systems, then huge libraries of scientific and business programs that have accumulated over the years—many of which are doing a perfectly expert job at whatever they do—would all be expert systems. So it's not a very precise term.

"Here is an example of something that nobody considers to be an expert system: Today, almost all landings of wide-bodied airplanes are done automatically by onboard computers. I often wonder what the world would be like if that particular work had been done at the AI (artificial intelligence) lab at MIT or Stanford. I don't think we'd ever hear the end of it. But as a matter of fact, it was done, one might say, anonymously. I have no idea who did it, and certainly it does a job that it takes a lot of years to train a human being to do, but it's not considered an expert system. That's odd."

et, defining an expert system isn't as simple as pointing to a computer which replaces the performance of a human. Computers have been doing that for years. For instance, though they may not be labeled by some academics as expert systems, process control computers perform functions previously carried out by people with extensive training. "Today, for example, one can see a very large—I mean acres and acres-petroleum processing factory, and if you look very, very hard, you might find two people in these hundreds of acres," says Weizenbaum. "The whole thing is done under computer control.

"So there's this whole world of computerized process control which has been doing this for a long, long time, and it doesn't think of itself, or hasn't, as expert control."

Instead, true expert systems seem to be defined according to their evolution and architecture such as a database of rules and inference mechanisms. Process control computers were developed by other means. "There are lots of process control applications that have been done very well that today might have been tackled differently in the light of expert systems," says Weizenbaum.

The point at which expert systems cross the border of artificial intelligence is hazier still. To some, there is a definite difference; to others, a perfectly functioning expert system *implies* artificial intelligence.

Part of the problem is that AI researchers diverge over how to approach the development of expert systems and artificial intelligence. A long time ago, says Weizenbaum, those in the field recognized two fundamentally different ways of doing business.

The first is to look at AI basically as a branch of psychology; that is, to use a computer to understand the operations of the human mind by programming it do high-level tasks as we think a human mind might do them. The other approach is to program a computer to do very clever things that ordinarily would require human intelligence, but to perform the tasks in ways that might not be considered by (or even possible for) a human being.

These two schools of thought are referred to as *theory mode* and *performance mode*. Weizenbaum gives an example of theory mode:

"Very early on, people got interested in the idea of computers playing chess. It was thought that if we could find out somehow what goes on in a chess player's mind and somehow program that into the computer, not only would we have a good chess-playing machine, but we'd also learn a lot about psychology, about human thought processes. People started trying to do that, but if nothing else, people got tempted to take shortcuts, to take advantage of some features that were built into the computer that no one thought were built into the human mind.

"So from the very beginning, the temptation couldn't be resisted, and people started designing chessplaying programs which took enormous advantage of all the peculiarities of computers but left behind any consideration of how the mind does it. And today we have powerful chess-playing computers, without the slightest claim that they teach us anything at all about human thinking.

"We've sort of drifted from theory into performance mode."

And due to a number of circumstances, including the military's

interest in and funding of performance mode AI research, says Weizenbaum, there's very little theory work going on today.

One place where theory work is being pursued is at the University of California at San Diego, in a research center called the Institute for Cognitive Science. Paul Smolensky, one of the researchers there, has been primarily involved in research on neurally inspired mathematical models of learning, memory processes, and problem solving. Using what are currently believed to be some very general characterizations of the brain, Smolensky's work is focused on one primary area: to understand people, and how to educate them and advance knowledge in scientific fields.

An outgrowth of this research is that it suggests various kinds of novel computers that could be built—such as connecting lots of processors together and letting them work in parallel the same way neurons work in the brain. Only a few prototypes of such machines exist toda.

"There's the platonic idea of what an expert system is, and then there's a whole bunch of actual systems that people have developed that they use the label for," says Smolensky. "I'm not aware of any that are actually in practice except the one that everyone in computer science is aware of, and that's the DEC [Digital Equipment Corporation] expert system for designing installations of their VAX computer systems."

This expert system, called R1/XCON, was developed by Dr. John McDermott, principal scientist and associate head of the computer science department at Carnegie-Mellon University. It configures a VAX minicomputer system to the customer's specifications, saving DEC more than \$2.5 million annually in field costs. R1/XCON takes roughly a minute to execute the work it took its human predecessors an hour to complete.

McDermott and a number of other scientists, engineers, and programmers at Carnegie-Mellon have formed a corporation called the Carnegie Group to design and market AI-based systems for commercial applications. The Carnegie

Group is looking into many areas that could benefit from expert systems, including engineering design, project management, production management, and sensor-based machine diagnosis and control.

ne of the first steps in creating an expert system is to interview the experts the program is supposed to emulate. By asking a series of highly detailed questions, the designers try to figure out the decision-making process they'll attempt to reconstruct in the program. When this thinking process is coupled with a database of facts, the ideal expert system should have a similar capacity for analyzing information and arriving at the right decision.

A potential flaw has been cited in this approach, however: the difficulty of taking into account the role of human intuition, and even emotion, in decision-making.

This is a vital point for some critics of expert systems and artificial intelligence. For instance, if you ask someone what the movie War Games was about, they'll probably say something like, "Oh, this kid

& 1541 DRIVE!

ONE

THE ULTIMATE DISK UTILITIES FOR YOUR 64

hight Taken

broke into the national defense system with his home computer and almost started a nuclear war." But the defense system wasn't exposed to this vulnerability until after the government decided that human beings could not be trusted to enter the codes and push the buttons that would launch our nuclear weapons. So the weapons were placed under computer control, because computers would not falter for emotional reasons at the crucial moment.

"There's a tremendous amount of human judgment that has to go into a decision about whether to give a computer a certain role in a decision-making system," says Smolensky.

Computers may be able to take over jobs previously done by human beings, but that does not make them intelligent, let alone experts, he says. "Expertise derives in a very significant way from intuition and intuitive processes. Experts do not have any access to that when they introspect about how they do what they do, and no amount of asking an expert questions is going to get at the information and the knowledge that allows the expert to do

what he or she does. And if we're going to understand expertise, we have to understand intuition."

Smolensky warns of the dangers of employing too much technology too fast, especially in areas that have a direct effect on human life. He points out that even when a relatively simple computer system is first installed in a business, there are inevitable last-minute bugs and problems that must be solved before it functions smoothly. "And it's only because these systems can make a lot of bad mistakes and people can go in and fix them afterward-basically putting Band-Aids on top of Band-Aids on top of Band-Aids-that we don't have a lot of permanent disaster stories.

"If you look at the problem of making decisions intelligently as something that we can only understand when we understand intuition, and if you realize that intuition is something that we're not going to understand for a long time, then you realize that we shouldn't be giving computers the power to make decisions that are important." (C)

Bundle #1 - Language Software

Super C - Complete K&R C compiler and development system. With editor, compiler, linker, I/O library and extensive handbook. Creates 6510 machine code. Regularly \$79.95

Super Pascal - Complete J&W Pascal development system. Editor, compiler, assembler, toolkit and handbook, graphics, fast DOS (3X faster than 1541). Regularly \$59.95

Basic Compiler - Full compiler turns BASIC into lightning fast 6510 machine code or compact speedcode. Overlays, variable passing integer arithmetic, more. Regularly \$39.95

For a limited time, all 3 for only \$95

Bundle #3 - Reference Books

Anatomy of C-64 - longtime bestseller \$19.95 Anatomy of 1541 - Revised 2nd edition \$19.95 Printer Book - very complete information \$19.95

For a limited time, all 3 for only \$35

Bundle #5 Machine Lang. Books

Machine Language - learn fundamentals \$14.95Advanced Mach. Lang. - in depth\$14.95Compiler Design - write your own\$19.95

For a limited time, all 3 for only \$30

Call now, for the name of your nearest participating dealer. To order by credit card call 616/241-5510. Add \$4.00 for postage and handling per bundle in U.S. Foreign orders add \$12.00 per bundle. Other software and books are also available. Call or write for free catalog. Expires October 31st. Sorry, but substitutions are not permitted on these specially priced bundles.

Bundle #2 - Productivity Software

PowerPlan - Wonderfully complete spreadsheet. Draws 2D and 3D graphs from your worksheet data. Comprehensive handbook and built-in help screens. Regularly \$49.95

Xper - The first expert system available for Commodore. Ordinary data bases can play back facts, but a *knowledge base* can help you make decisions. Regularly \$59.95

Cadpak Revised - Complete graphics design and drawing package. Use w/ or w/o lightpen. Create very detailed designs with dimensioning, scaling, text, more. Regularly \$39.95

For a limited time, all 3 for only \$95

Bundle #4 - Application Books

Graphics Book - best reference available \$19.95 Science & Engineering - excellent intro \$19.95 Computer Aided Design - and programs\$19.95

For a limited time, all 3 for only \$35

Bundle #6 - Helpful Books

Tricks & Tips - more than 70,000+ sold \$19.95 Peeks & Pokes- programming quickies \$14.95 Ideas to Use on your C-64 - new ideas \$12.95

For a limited time, all 3 for only \$30

The Witching Hour

Brian Flynn

This game of skill and foresight is ideal for a bleak, stormy October night. Originally programmed for the IBM PC with color/graphics adapter and PCjr, versions have been added for the Commodore 64, expanded VIC-20, Atari 400/800, XL, and XE, TI-99/4A, and Apple II-series computers. The Commodore 64 and Atari versions require a joystick. When autumn winds send a shiver down your spine and the witching hour draws near, there's no better entertainment than a good computer game. "The Witching Hour" is an absorbing contest of strategy based on Alquerque, a board game played in ancient Egypt and still popular in Spain today. Type in and save The Witching Hour, referring to the listing for your computer. Since every version is similar, read the general game rules below, then check the specific notes for your computer before running the program.

The Witching Hour pits broomstick-straddling witches against ethereal ghosts and is played on a board of 25 squares with 12 pieces to a side. After choosing sides, you attempt to take your opponent's players by jumping over them. You can move vertically, horizontally, or diagonally. However, certain diagonal moves are illegal (the lines between squares show where you can go) and only one square is vacant when the game begins.

Jumping an opposing player's

COMPUTEI's First Book of Commodore 64 Games

Edited, \$12.95, ISBN 0-942386-34-5 Packed with games for the 64 plus ideas and techniques for writing your own games.

Commodore 64 Games for Klds Clark and Kathy H. Kidd, \$12.95, ISBN 0-942386-37-X Games that teach as they entertain. For klds from preschool to high school.

For a limited time only, you can order all three of these fantastic game-filled books for your Commodore 64 for only \$29.00.

of America Mail Order LTD. piece removes that piece from the board. If no capture is possible, you may move any piece to an adjacent empty square. You may not pass up a capture—if it's possible to jump an opponent, you must always do so—and if the first capture puts you in position to make another, you must jump again (except in the Apple version). The computer won't let you make illegal moves.

Play ends when all the pieces from one side have been removed from the board. You can play against a friend or measure your skills against the computer (the IBM and TI versions also let you watch the computer play itself). Like other contests of strategy, The Witching Hour is simple to learn, but a challenge to master, and can be played at many different levels. Hint: It's sometimes smart to sacrifice a player to draw the opponent into a dangerous position.

IBM PC/PCjr Version

Each game square on the screen is marked with one of the letters of the alphabet. To move a piece, first type the letter for the square of the piece you want to move. Then type the letter of the square where you want to go. For instance, to move a witch from square L to square M, type L when the computer prompts you with FROM and type M when it prompts you with TO. If you press Enter without typing a letter, the computer takes that turn. Thus, to play alone against the computer, just press Enter every other turn. Press Enter on every turn to watch the computer play against itself.

Commodore 64 And VIC- 20

Both Commodore versions of The Witching Hour offer a one- or twoplayer option when the game begins. The 64 version is played with a joystick. Plug the joystick into port 1 if you are playing alone (of course, two joysticks are needed for the two-player version). The colored box indicates which square you are on. Use the joystick to position the box on the piece you wish to move, then press the fire button: The box will change color. Now move the box to the square where you want the piece to go, and press the button again. If the move is legal, the piece appears in the new square (if not, you get to try again).

The VIC-20 game requires at least 8K memory expansion and uses keyboard controls exactly like the IBM version. Each square is marked with a letter. When the computer prompts you with FROM and TO, make your move by entering the appropriate letters. Before loading the VIC version, you must enter the following two lines in direct mode (don't add a line number, and hit RETURN after each line):

POKE 43,1:POKE 44,32:POKE 8192,0:NEW POKE 36869,240:POKE 36866,150:POKE 648,30:PRINT"{CLR}"

Atari Version

The Atari game requires a joystick (a pair for the two-player game) and is played like the Commodore 64 version. The joystick controls a colored box. Move the box over the piece you want to move, then press the fire button. After the box changes color, move it to the square where you want to put the piece, then press the button again. Player/ missile graphics are used to form the witch and ghost figures, and a short machine language routine moves them quickly around the screen.

Apple Version

The Witching Hour runs on any Apple II-series computer with DOS 3.3 or ProDOS. When the program starts, you must choose between a one- or two-player game. Then the game board is drawn and play begins. The flashing box shows which square you are on, and is moved with keyboard controls. Press the I key to go up, J to go left, K for down, and L for right. Press RE-TURN when the box is on the piece you want to move, then move the box to the desired square and press RETURN again.

TI-99/4A Version

This program runs on any TI-99/4A computer with either console BASIC or TI Extended BASIC. Every game square is labeled with a letter, and the pieces are moved on the board with keyboard controls. The first letter you enter (when the computer prompts FROM:) designates the piece you wish to move. The second letter (entered when the computer prints TO:) designates the square you will move to. The computer signals with a beep when you try an illegal move. The game may be played by one or two players, or the computer can play both sides. Whenever you press ENTER without typing a letter, the computer takes that move.

"The Witching Hour" for IBM PC/PCjr forms ghost and witch shapes with PUT statements.

Program 1: The Witching Hour, PC/PCjr Version

For instructions on entering this listing, please refer to "COMPUTEI's Guide to Typing In Programs" published bimonthly in COMPUTEI.

The complete 1541 enhancement system ...

MAKES GREAT COFFEE!!

The 1541 is the slowest disk drive on planet earth. Even simple operations seem to take forever. Quickloaders and Fastloaders that software-patch the operating system are vulnerable to being knocked out of memory, rendering them totally useless. Even Flashier products that require permanent modifications to the 64 and 1541 can't compete with the blinding speed of STARDOS.

STARDOS accelerates every (yes, we said every) function of the 1541 disk drive. Other fast loaders only load PRG files faster. STARDOS also speeds up SEQ, REL, USR and DIRECT ACCESS files. Everything including FORMAT, VERIFY, SCRATCH, VALIDATE, INITIALIZE and COPY are much faster. In addition STARDOS adds a vast array of easy to use commands all at the touch of a key.

A sampling of STARDOS features:

- Accesses ALL types of files up to 1,000% faster!
- Saves up to 300% faster than normal (with extended verify)
- DOES NOT CHANGE THE SPEED AT WHICH THE DRIVE MOTOR SPINS
- Makes your 1541 MORE RELIABLE and LESS PRONE TO BREAK DOWN or OVERHEAT!
- STARDOS is fully expandable for multiple fast disk drives
- Easy (5 minute) plug in installation. User friendly manual
- 100% compatible with software and serial bus peripherals
- Adds years of life to your disks and drive in reduced wear
- Cures a number of bugs in the Commodore 64 and 1541 disk drive including :
 - The damaging 'Head Knock' that can mis-align your 1541
 - The@: Save with replace bug!!
 - The Editor lock-up bug

- Harness the full power of your disk drive with the built in DOS wedge
- Lock/unlock files and protect/unprotect disks from the keyboard
- Powerful sector editor allows direct viewing of diskette
- Upgrades computer and drive to the latest Commodore specifications
- Instant access to the built in mini-wordprocessor for short notes and memos
- Built in copier copies all file types (even relative) easily and effectively
- Built in disk duplicator copies an entire diskette in less than 3 minutes
- Fully expanded machine language monitor, always on line
- Quality hardware. Full 120 day repair or replace warranty
- Satisfaction guaranteed or money back—no questions asked
- (Oh, by the way, we lied, STARDOS makes <u>LOUSY</u> COFFEE)

Simply the best. \$74.95 [Take advantage of our introduction special at \$64.95]

Personalize your C64! for a \$10 (non-refundable) charge we will include a 21 character power-on message with your favorite screen, border and text colors. Example	Star Route 10 Gazelle, CA 96034 [916] 435-2371

A SPECIAL APPLE-SPECIFIC PUBLICATION FROM THE PUBLISHERS OF COMPUTE!, COMPUTE!'s Gazette, AND BEST-SELLING COMPUTE! BOOKS.

The second semiannual edition of *COMPUTE!'s Apple Applications Special* goes on sale October 1,1985.

> Price: \$3.95 (in Canada \$4.75)

Editorial

COMPUTEI's Apple Applications Special second issue features applications, purchasing decisions, tutorials, and in-depth feature articles for owners and users of Apple personal computers. There are exciting applications for business, school, and home. From software to hardware to the state of the industry, this special issue serves as a useful tool and a handy reference. The special issue includes:

Features

Apple at Ten, and What's Coming in the Next Decade: This in-depth look describes Apple's place in the industry and predicts what it will do in the future. Can the Macintosh Office concept succeed against IBM? How will Apple retain its position in the market when the newest round of computers—such as the Commodore Amiga and Atari ST—reaches homes and schools? This intriguing survey includes comments by computer industry analysts and software manufacturers.

Cruising MAUG: The Micronet Apple Users Group is probably the best connection any Apple owner can make. Available through CompuServe, MAUG lets Apple users communicate and exchange information and programs. This guide to MAUG describes just some of its features, and highlights programs from Macintosh desktop utilities to complete terminal software, all of which can be retrieved with a modem.

The Big Picture: Innovative hardware and software can transform the Apple II computer into a powerful graphics machine and enhance the Macintosh's already considerable abilities. Drawing programs, digitizers, and graphics tablets are featured and evaluated in this buyer's guide and tutorial.

Applications

Dr. Disk: Allows you to read from, edit, and write to any block on any disk. An excellent utility which lets you examine disk contents, manipulate catalogs, and even change machine language programs. Enhanced Applesoft INPUT: A short machine language utility which turns Applesoft INPUT into a more flexible and powerful statement. Allows entry of any valid numeric expression, as well as commas, quotes, or colons as responses to the INPUT prompt.

The Office for Everyone: A major applications feature on using Word, Chart, File, Multiplan, and MacTerminal on the Macintosh. This tutorial shows how to turn the Macintosh into a powerful business computer.

The ApWriter: This simple BASIC program turns any Apple II-series computer into an electronic-style typewriter. Set margins and tabs, underline, and print out letters, memos, and notes.

Quality editorial in the style and tradition of COMPUTEI, the leading magazine of home, educational, and recreational computing.

There's also a disk available which includes all the programs from the magazine. The $5\frac{1}{4}$ -inch floppy disk for the Apple II+, IIe, or IIc costs \$16.95 and is available only from COMPUTE! Publications. Send in the attached card with your payment today to order the *Disk*.

Look for the October issue of *COMPUTE!'s Apple Applications Special* on sale where you buy other COMPUTE! publications, or at Apple computer retailers. You can also order directly from COMPUTE! Publications.

To order, send in the attached card with your payment or call toll-free 800-334-0868 (in NC 919-275-9809.)

A ghost is about to be jumped in this game of "The Witching Hour" for Apple II computers.

"The Witching Hour" for the TI-99/4A works with console BASIC as well as TI Extended BASIC.

Program 6: The Witching Hour, TI-99/4A Version

Version by Patrick Parrish, Programming Supervisor

Now there's a way parents can help their children climb to the heights of success.

It begins with an Apple,[®] IBM,[®] Commodore[™] or Atari[®] computer. It takes off with CBS Software.

Our Success with Math[™] series has met with sales success second to none in its field. Along with our new Success with Algebra[™] series, your home computer will become a patient, private tutor—using serious drill and practice to help your children over the obstacles in their way.

Mastering the SAT has also become a best seller. With its counterpart, Mastering the ACT, it's the comprehensive test preparation program that's proven to be the first choice for thousands of students who want acceptance from their

Mastering SAT SAT Second And Back

first choice college. They are the only programs of their kind created with the National Association of Secondary School Principals. And they're designed to provide the competitive edge that can help put your

kids over the top. $\mathbf{\tilde{x}}$

LASER BEAM For Atari And Commodore 64

Mike Greenfield

This fast-paced arcade game is written entirely in machine language and challenges the quickest reflexes. Originally written for the Atari, the program has been adapted and enhanced for the Commodore 64. The Atari version runs on any 400, 800, XL, or XE with at least 16K RAM. Both versions require a joystick.

The Atari version of "Laser Beam" is a fast-action arcade-style game with a simple premise—you score by moving. The more you move, the more you score. You start off in an arena along with a bouncing ball. If you happen to run into the ball or the arena walls, the game ends.

But watch out! If you haven't collided with anything after half a minute or so, you advance to level 2 and a second bouncing ball appears. If you last a while longer, you reach level 3 and a *third* ball appears, and so on. Up to five balls can be bounc-

ing around the arena simultaneously. Your score for each move depends on which level you're on. When there's one ball on the screen, you score one point per move; when there's five balls, you score five points.

In early stages of the game, you may not feel motivated to move unless you absolutely have to. So there's one additional challenge—the laser beams. Each side of the arena is guarded by a roving laser. You'll see a red indicator when the laser beam fire sequence has been activated, but the indicator tells you only where the beam will fire, not when. As the game progresses, it becomes more difficult to dodge the laser because the countdown before firing decreases.

Before starting the game, you can select one of ten difficulty options. The program automatically selects option 5. To change this, press the OPTION button. Option 9 is the slowest, and therefore the easiest; option 0 is the fastest.

To freeze the action, press the SELECT button. To continue, press SELECT and START together. After each round, press the START button to start another game. To return to the title screen, press START, SELECT, and OPTION simultaneously.

Entering The Atari Version

Programs 1 and 2 work together to load Laser Beam from BASIC. To fit the game into 16K of RAM, a single BASIC program can't hold all the DATA statements necessary for the machine language and also POKE them into memory.

Therefore, the DATA statements in Program 1 create a machine language file on disk or tape called LASERBEM.OBJ. (If LASER-BEM.OBJ already exists on a disk, Program 1 recognizes this and won't create a new file.) After Program 1 runs, it automatically loads and runs Program 2, assuming you

Four bouncing balls fly wildly about the screen as the player runs for his life in the Atari version of "Laser Beam."

have saved Program 2 with the filename shown in line 220. Program 2 reads the file LASERBEM.OBJ, POKEs the machine language into memory, and then jumps to the starting address to automatically run the game.

Tape users need to make a few modifications to the programs. In Program 1, delete lines 10–90, replace the statements in line 220 with END, and change D: to C: in line 100. In Program 2, change D: to C: in line 100.

After these changes, Program 1 creates a file on tape which Program 2 can load. That means the file created by Program 1 should immediately follow Program 2 on the tape. As Program 2 reads this file, it is normal for the cassette recorder to stop and start and it reads each block.

Commodore 64 Version

Laser Beam on the Commodore 64 is considerably different from the original Atari version. The object is not just to avoid the bouncing balls, but also to grab them at certain times and stuff them into a basket.

Written entirely in machine language, Program 3 must be entered with COMPUTE's "MLX" utility found elsewhere in this issue. Here is the information you'll need:

Starting address: 49152 Ending address: 52699

After you've saved Laser Beam on disk or tape according to the MLX instructions, plug a joystick into port 2 and type LOAD"LASER BEAM",8,1 for disk or LOAD-"LASER BEAM",1,1 for tape (assuming you saved the program with the filename LASER BEAM, of

course). Then type SYS 49152 and press RETURN.

The Highlight Zone

Move the joystick up or down to select the difficulty level from 0 to 9. Unlike the Atari version, 0 is the slowest and 9 is the fastest (in fact, 9 is so fast that it's almost unplayable!). The game starts when you press the fire button.

Immediately you'll see seven colored balls bouncing around the screen. At the left is a highlighted "safe zone" occupied by a small stick figure—that's you. By moving the joystick, you can maneuver your figure around the screen. But if you venture out of the safe zone and bump into a bouncing ball, you're zapped. (You get three lives per game, as indicated by the figures at the bottom of the screen.)

Your goal is to render the balls harmless, grab them one by one, and drop them into the basket in the lower-right corner. To make a ball safe to touch, you have to shoot it with the laser gun. The laser is visible along the edge of the screen. To control it, first you must move your figure into the uppermost corner of the safe zone. The laser gun is under your control only when your figure is at this spot. Pushing the joystick to the right moves the laser clockwise around the edge of the screen, and pushing the joystick to the left moves the laser counterclockwise around the screen. Press the fire button to activate the beam. If you push the joystick in any other direction, you'll move your figure away from the top of the safe zone, and the laser gun will no longer be under your control.

Now, you can't shoot just *any* bouncing ball with the laser to make it safe to grab. You have to shoot the ball which matches the border color of the screen. As soon as you hit the ball, it turns white. Then you can maneuver your figure out of the safe zone, grab the white ball by touching it, carry it to the basket, and drop it in by pressing the fire button. Afterward you must scurry back to the safe zone before a collision with another ball.

For example, let's say the border color is red. First you move your figure to the top of the safe zone to take control of the laser gun. Next you push the joystick right or left to

In this Commodore 64 version of "Laser Beam," the player has rendered a bouncing ball harmless by shooting it with the laser. Now he's carrying it to the basket.

aim the laser at the red ball. When you have a clear shot, press the fire button to shoot the beam. If you score a hit, the red ball turns white. Then you can push the joystick in another direction to move your figure out of the safe zone. Grab the ball, stuff it into the basket by pressing the fire button, and make your escape—all while avoiding the other bouncing balls, of course. If you succeed, the border color changes to correspond to one of the remaining balls.

You continue with the process until all the balls are safely dropped into the basket. Then another round begins.

Bouncing Chaos

Sounds simple, right? Well, it's not. There are a few complications. Suppose you fire the laser and hit a bouncing ball that *doesn't* match the border color. It turns white, too. But it *isn't* safe to grab. If you touch it, you're zapped. This becomes a real problem when you accidentally shoot several of the balls and turn them white. Only one of them is safe, and you have to remember which one. It's not easy when three or more white balls are bopping all over the place.

There is an incentive for creating this chaos, however. The number of points you get for dropping a ball in the basket doubles for each white ball on the screen. If the only white ball is the one you're grabbing, you get only 5 points. If a second ball is white, you get 10 points; if a third ball is white, you get 20 points; and so on. If all seven balls are white when you drop the first one into the basket, you score 320 points.

STARPOINT SOFTWARE proudly presents

[say lcepick], a revolutionary new concept in software back up for the Commodore 64. ISEPIC is not a disk duplication system, but an extraordinary hardware/software combination that actually bypasses any disk protection scheme. ISEPIC captures and saves the protected program as it runs in the 64's memory, this "snapshot" becomes accessible to the user for complete inspection and alteration. From this image, ISEPIC can automatically create a compact, auto-booting, fast-loading file which is completely unprotected and self contained.

- Backs up almost ALL memory-resident software
- ISEPIC'd programs load many times faster than originals
- BEPIC is invisible to software—cannot be defeated
- Eliminates drive "knock" due to antique protection schemes
- Automatically backs up protected programs into single, auto-booting, superfast loading files
- Place multiple programs on a single diskette
- Create auto-booting, fast-loading versions of your own programs
- Back up programs are completely selfcontained and run independently of the ISEPIC adapter
- Backs up software with a flick of a switch
- ISEPIC comes complete and ready-torun, just plug into expansion port
- Programs backed up by ISEPIC may be used on MSD or 4040 drives as well as hard disks regardless of original protection schemes

Another complication is that your safe zone doesn't always stay safe for very long. After you shoot the ball that matches the border color, it begins shrinking from the bottom up. If you don't hurry out, you'll get zapped.

And there's yet another reason to move quickly: If you finish a round by dropping every ball into the basket before the horizontal bar at the bottom of the screen disappears, you get a 50-point bonus.

If all this action causes your brain to momentarily suffer a system crash, you can freeze everything by pressing and holding the SHIFT key. Press SHIFT LOCK to freeze the game for extended periods. Release SHIFT to resume play.

For instructions on entering these listings, please refer to "COMPUTE!'s Guide to Typing In Programs" published bimonthly in COMPUTE!.

# The Original Boston Computer Diet

Tony Roberts, Production Director

Requirements: IBM PC, PCjr, or XT with at least 128K RAM; Apple II-series computer with at least 64K RAM; or a Commodore 64/128. All versions also require a disk drive.

Discipline is a key ingredient in any weight-loss program, and that remains true with *The Original Boston Computer Diet*, a software package from Scarborough Systems.

While the program takes a conservative, balanced-diet approach to weight loss, its strengths are in the ways it helps dieters gather information about their eating habits and how it takes the drudgery out of counting calories. Before embarking on the diet, you choose one of three "counselors" who engages you in a question-and-answer session. Based on this information, the counselor sets up goals and procedures for the diet and assigns readings on nutrition and health.

The program requires about an hour a day for the first week or so, after which the daily meal planning and reporting routine takes only about 15 minutes. The program maintains seven days' worth of data for meals, and a series of charts are available to help you amass and assess information about your eating habits. The information includes statistics on the intake of various vitamins and minerals, as well as data about how your mood—from depression to elation—affects the number of calories consumed.

The heart of the program is the food planning and reporting section. Counting calories is practically effortless. As you plan future meals, the screen shows how each selection affects the number of calories in the scheduled meal as well as the balance of the weekly diet. With the touch of a key, you can tell the computer how much you ate during your last meal, and it adjusts the calorie count accordingly. As the program builds its database of information about how you eat, it watches for and warns you of possible problems. Should your diet fall out of balance, the program might warn that your intake of calcium has been low recently, bolstering its comment with a graph or two. Another possible problem is undereating, which is as unacceptable to your counselor as pigging out.

Reviews

The program can't guarantee you'll lose all the weight you hope to, but its

evaluation of your eating habits, its insistence on planning and setting goals, and its readings on health and nutrition in the manual do give you the tools to help you maintain interest in your diet and develop the willpower to carry it off.

It's worth noting that the program is set up to handle the data for only one dieter at a time. A second family member who plans to take the treatment would have to obtain another copy of the program or wait until dieter No. 1 has had his fill.

### The Writer's Tool For Atari

Robert L. Riggs

Requirements: Atari 400/800, XL, or XE computer with at least 48K RAM, a disk drive, and a printer.

Those of us who can't afford the superexpensive computers—and still need to do extensive computing—try to get multiple duty from our inexpensive machines. Games are nice. But we also want programming languages, spreadsheets, database managers, and quality word processors. As a high school teacher, I use my Atari 800XL for all kinds of time- and labor-saving jobs. Still, word processing is my primary concern and, until now, I've not found a program that was sophisticated enough for all my needs.

But *The Writer's Tool* is an extrapolation of all the other Atari word processors l've tried. Anything they can do, *The Writer's Tool* does better. Even the documentation is superior. The

166-page manual is clear and concise, and it includes an 89-page tutorial especially designed for those who are completely new to word processing, plus a 56-page reference section.

If you've tried other word processors for Atari computers, you'll find the transition to The Writer's Tool quite painless-and exciting. A quick onceover to note the new capabilities gets you started. Just pull out the quick reference card from the front of the manual and start typing. Then, after getting comfortable with The Writer's Tool, read the entire manual and try out each new feature. The tutorial section leads you, step by step, through each function. The reference section provides detail. Optimized Systems Software makes this word processor very easy to learn and use.

This doesn't mean that The Writer's Tool is a simplistic, third grade level word processor-not by a long shot. It starts right out with a customizer program that lets you personalize The Writer's Tool to suit your own purposes and tastes. You can preset the printing format, screen display, and sound options so your preferences load automatically each time you boot the program. It's great to be able to change the luminance of the characters and background colors for clearer visibility. Or you can vary the blinking speed of the cursorwhich, by the way, can be either a block or an underline. You can even adjust the screen width to display more or fewer characters per line.

#### **Printing Versatility**

By presetting the printer format, you can select new default values for page length, line spacing, beginning footer line, font, single sheet option, line length, left margin, justification, and all tab stops. The selectable fonts are interesting, too. I have two Centronics printers, a 737 (equivalent to the Atari 825) and a 739 (a 737 with graphics). According to their manuals, each has only three fonts plus elongated versions. But *The Writer's Tool* can print *four* fonts. Somehow it comes up with a second proportionally spaced font that Centronics doesn't even document!

The Writer's Tool, of course, supports all the major printers: Atari, the Epsons, Gemini 10X, Prowriter/NEC 8023, Okidata 82A and 92, Comriter CR-II, Mannesman Tally Spirit 80, and so on. There's also a generic printer option, or you can insert printer control codes directly into the text. Printer problems should be practically nonexistent with *The Writer's Tool*.

Among the special printing features is something called the automatic header block. SHIFT-CTRL-H puts a block of easily modifiable printer commands on the screen for creating standard page formats. The block has a reverse slash that enables what OSS calls split justification. Everything to the left of the diagonal is justified to the left margin, while everything to the right is printed at the right margin. Now, printing tables of contents is a breeze.

In fact, *The Writer's Tool* offers *four* kinds of justification: (1) justification off, but word-wrap retained; (2) right justification; (3) word-wrap off; and (4) microspaced justification (for printers that offer this feature). You can insert "soft hyphens" in long words, but hyphenation occurs only if the word can be split between two print lines. Or you can insert "hard spaces" to prevent phrases like "Figure 5" from being split between lines.

Another special printing feature is a graphics driver that, with certain printers, lets you include pictures and graphs in your documents. The images can be created with a Koalapad, Atari Touch Tablet, Atari light pen, or virtually any other drawing program that uses graphics mode 7.5 or 8.

Like Atari's popular AtariWriter word processor, The Writer's Tool has a print-preview feature. But unlike Atari-Writer, it lets you edit the previewed text as well. There's also a Print System screen that tells you, among other things, the number of words in the document. You can use the Disk I/O System screen to determine the number of characters in the document, the location of the cursor, the amount of available memory, and how much memory remains.

#### **Typeover And Insert Modes**

For entering text, The Writer's Tool offers both typeover and insert modes. Other word processors sometimes offer only one or the other (for example, AtariWriter is locked in insert mode). Even in typeover mode, you can insert characters or lines with The Writer's Tool by pressing CTRL-INSERT or SHIFT-INSERT. Pressing CTRL-1 toggles the insert mode, denoted by a flashing vertical bar. If you don't like to watch the text ahead of the cursor repositioning itself as you insert, you can press SHIFT-CTRL-INSERT to open up a large block of empty space. After inserting your text, you can remove the unused space by pressing CTRL-J.

If you prefer one-handed cursor movement, CTRL-CAPS turns on a mode that lets you manipulate the cursor keys without simultaneously pressing CTRL. A reminder at the bottom of the screen indicates when this mode is switched on, along with the CAPS LOCK and inverse video modes. A big kudo is deserved for the Merge command. Pressing M from the Print System menu activates the Merge System. This is a subprogram which handles the creation of database files and the merged printing of these files with template documents. That means that you can use the built-in database (or another, like *SynFile*) to automatically insert names and addresses, for example, into form letters. Don't worry. The tutorial section takes you through it step by step.

The Writer's Tool lets you move swiftly through your documents. You can quickly scroll forward or backward with CTRL-F (forward) or CTRL-R (reverse), though the text scrolls only 20 lines, so you have to glance up or down three lines to find where you left off. But it's fast—unlike AtariWriter.

#### A Few Criticisms

There are a few things about *The Writ*er's *Tool* that could stand improvement. CTRL-W moves the cursor by word, which is nice, but if you move to the end of the document with CTRL-W, the cursor ends up on the last letter of the last word—so if you start typing immediately, you make a typo.

Another drawback is that *The Writ*er's *Tool* uses OSS's DOS XL instead of Atari DOS. DOS XL supports single and double density but not the Atari 1050's one-and-a-half density. This isn't a severe handicap—since the disk isn't copy-protected, you can transfer the program to another disk that contains any DOS you like, including the latest DOS 2.5.

The provisions for tabs could be improved. A special feature of the old *Atari Word Processor* that came in handy was decimal *and* right-justified tabs. *The Writer's Tool* offers neither.

Still, I can live with a few relatively minor shortfalls. *The Writer's Tool* remains a superbly designed and executed word processor for serious use on Atari computers. OSS recently cut the price by \$30 and now includes a 20,000word spelling checker as well. And, for

COMMODORE 64 PET AND CBM ARE ALL TRADEMARKS OF COMMODORE BUSINESS MACHINES. ING

MANUFACTURED BY: COMSPEC COMMUNICATIONS INC. 153 BRIDGELAND AVE., UNIT 5, TORONTO, ONTARIO M6A 2Y6 (416) 787-0617 once, "user-friendly" doesn't mean "reduced to second grade simplicity." If you've been waiting for a word processor that makes serious writing a pleasure, or if you intend to use your Atari for more than occasional writing, wait no longer. The Writer's Tool can take care of your word processing needs for

#### a long time to come.

### Karateka

James V. Trunzo

Requirements: Apple II-series computer with at least 48K RAM and a disk drive; or a Commodore 64/128 with a disk drive. Joystick optional.

This superb action game is a nominee for the Most Underrated Program of the Year. It's a program that must be seen to be fully appreciated.

The theme of the game is simple. You, the hero, have been away from your village, studying karate under a master. Upon returning home, you find that the Japanese warlord Akuma has burned your village to the ground and kidnapped your betrofhed, the lovely Mariko. Akuma has imprisoned Mariko in his mountain fortress, where she is guarded by Akuma's fierce warriorsthe least of whom is a first-degree black belt. You must fight your way into Akuma's stronghold and defeat opponent after opponent until, at last, you come face to face with the powerful Akuma himself.

The Apple version of *Karateka* has by far the best animation I've seen in an Apple arcade game. The smoothness of the animation, complete with scrolling background and beautiful, full-colored details, makes the game almost as enjoyable to watch as it is to play.

Using either the keyboard or a joystick, you maneuver your persona about the screen, kicking and punching as if he were Bruce Lee. Each opponent that Akuma sends against you has a unique style. Some are better with their feet, others are better with their hands, some are balanced fighters. As the opponents become tougher (corresponding to your success), they are better able to coordinate several kicks and punches in a row. Victory comes only after you learn the best way to fight the various warriors, each easily identified by his headgear.

Warriors aren't the only obstacle between you and your beloved Mariko, however. Akuma's pet eagle attacks from time to time, and the fortress conceals deadly traps. Furthermore, even if you vanquish an opponent, you sustain injuries that accumulate as the game progresses. Of course, your opponents are always fresh!

Karateka has more to offer, too. There are delightful animated sequences showing, among other things, Mariko despairing in her call for help and Akuma sending forth his warriors. There are the sound effects that accompany a victory. There are...well, to tell you more would ruin the surprise.

Is Karateka the perfect game? No. When you're defeated, you must start the game from the very beginning. You don't have multiple "lives," each one picking up where the previous one left off. Considering the effort it takes to progress through Akuma's stronghold, this can get a bit frustrating. Also, there are times when you try to throw a kick but your character just stands there. It's not a bug in the program, but I'm not sure if it's poor joystick response, confused commands from trying to throw two punches and two kicks at once, or what. Still, these problems are relatively minor compared to the action and enjoyment that Karateka brings to the screen.

Karateka Brøderbund Software 17 Paul Drive San Rafael, CA 94903 \$34.95

# GET THE KNOW-HOW TO REPAIR EVERY COMPUTER ON THIS PAGE.

TEN

#### Learn the Basics the NRI Way—and Earn Good Money Troubleshooting Any Brand of Computer

The biggest growth in jobs between now and 1995, according to Department of Labor estimates, will occur in the computer service and repair business, where demand for trained technicians will actually *double*.

You can cash in on this opportunity-either as a fulltime corporate technician or an independent serviceperson-once you've learned all the basics of computers the NRI way, NRI's practical combination of "reason-why" theory and "hands-on" building skills starts you with the fundamentals of electronics, then guides you through advanced electronic circuitry and on into computer electronics. You also learn to program in BASIC and machine language, the essential languages for troubleshooting and repair.

#### You Build—and Keep—a 16-bit Sanyo personal computer

The vital core of your training is the step-by-step building of the 16-bit Sanyo MBC-550 series computer. Once you've mastered the details of this state-of-theart machine, you'll be qualified to service and repair virtually every major brand of computer, plus many popular peripheral and accessory devices.

With NRI training, you learn at your own convenience, in your own home. You set the pace—without classroom pressures, rigid night-school schedules, or wasted time. You build the Sanyo IBM compatible computer from the keyboard up, with your own personal NRI instructor and the complete NRI technical staff ready to answer your questions or give you guidance and special help whenever you need it.

Praised by critics as the "most intriguing" of all the IBM-PC compatible computers, the new Sanyo uses the same 8088 microprocessor as the IBM-PC and IBM is a Registered Trademark of International Business Machine Corporation. Epson is a Registered Trademark of Epson America, Inc. Apple and the Apple logo are Registered Trademarks of Apple Computer, Inc

Compaq is a Registered Trademark of COMPAQ Computer Corporation. © 1984 AT&T the 8088 microprocessor functions, using machine language. You'll also prepare the interfaces for future

peripherals such as printers and joysticks.

#### 100-Page Free Catalog Tells More

Send the coupon today for 'NRI's big 100-page color catalog on NRI's electronics training, which gives you all the facts about NRI courses in Microcomputers, Robotics, Data Communications, TV/Video/ Audio Servicing, and other growing high-tech career fields. If the coupon is missing, write to NRI Schools, 3939 Wisconsin Avenue, NW, Washington, DC 20016.

features the MS/DOS operating system. As a result, you'll have a choice of thousands of off-the-shelf software programs to run on your completed Sanyo.

Your NRI course includes installation and troubleshooting of the "intelligent" keyboard, power supply, and disk drive, plus you'll check out

### 1 Dir For IBM PC/PCjr

Arthur Leyenberger

Requirements: IBM PC/PCjr or compatible with at least 128K RAM (192K recommended), at least one disk drive, and DOS 2.0 or higher.

Whether you are a casual user or a "power user," getting the most from your IBM PC or compatible requires a thorough understanding of how to use MS-DOS. But the difference between merely understanding how to use MS-DOS and really using it effectively may be like the difference between walking around the block and competing in a marathon. With 1 Dir from Bourbaki, Inc., you can easily run circles around MS-DOS.

1 Dir (pronounced "wonder") stands for one directory. Its purpose is to simplify the use of MS-DOS for anyone, regardless of their level of expertise. It is called a shell for DOS because it sits between you and the operating system, simplifying command execution.

1 Dir eliminates the DOS A> prompt and the need to type filenames and commands on the command line. Instead, it presents a menu screen from which all operations take place (see photo). At the top left of the screen is an indicator showing which directory is being displayed; the indicator is blank for your root directory.

The rest of the screen is divided into seven columns grouped into three blocks. The first column displays the currently selected disk drive and a "file cursor"-a reverse video cursor used to select files from a directory. The next three columns list your filenames, extension names, and file sizes. The following two columns, grouped into another block, display the date and time that your files were last accessed. (If you like, 1 Dir can also display system and disk statistics in this area rather than file information.) The last column, separated from the others in its own block, contains the toggle and setup information.

#### **Sorted Directories**

Toggles such as Caps, Print, Batch, and Edit are highlighted in reverse video when turned on. You can also switch the Pause option on or off, select which drive directory is displayed by default, and choose from four ways to sort file directories (by name, extension, date, and size). Each time you specify a different sort, the filenames instantly rearrange themselves on the screen.

A horizontal block at the bottom of the screen contains a "command cursor" and nine commands: Erase, Rename, Type, Copy, Run, Compose, Execute, Date, and Time. By moving the command cursor with the left and right arrow keys to the command you want, and then moving the file cursor with the up and down arrow keys to the filename you want, you can execute DOS commands without having to remember the proper syntax. Just above the horizontal command block is a oneline area for typing commands and responding to prompts.

1 Dir makes it easier to use MS-DOS by organizing commands and file directories into menus.

Let's say you want to erase three files on a disk whose filenames are too different to permit use of a wildcard (which is a risky way to delete files, anyhow). Rather than erasing each file separately by typing ERASE A:FILE1. EXT, with 1 Dir you start by positioning the command cursor on the Erase command and then moving the file cursor to the first filename you want to delete. Press the + key to tag that file. Then move the file cursor to the second and third filenames and tag those files by pressing + each time. Although you've tagged the files, nothing yet has happened. When you press ENTER, the screen displays all three filenames and shows how many bytes will become available by erasing them. If you answer Y to the "Are you sure?" prompt, the files are deleted.

The Copy command works in much the same way. You point to either an individual file to be copied or tag several files. Then tell 1 Dir where the file(s) should be copied to and press ENTER. If you want to copy an entire disk, you can tag the whole directory with one keystroke rather than tagging each file separately. You can also run programs simply by pointing to them with the file cursor, positioning the command cursor on Run, and pressing ENTER.

#### **Batch Files, Too**

One of the most powerful features of MS-DOS is its ability to execute a group of commands with a batch file. Unfortunately, creating batch files with Edlin (the MS-DOS line editor) can be difficult, especially for novices and casual users.

With 1 Dir, creating batch files is easy. The Batch Builder feature automatically compiles a batch file as you issue the commands. In the Batch Builder mode, you can use 1 Dir to change directories, run programs, copy and erase files, or do whatever you want. When you're done, just turn off the mode and 1 Dir constructs the batch file.

1 Dir also lets you customize the command menu at the bottom of the screen. If you use the Batch Builder first to create your commands, it's easy to make menus corresponding to the batch files. You can put together customized shells in very little time.

I've been running 1 Dir for several months on a two-drive AT&T 6300 computer and have found it invaluable and easy to use. Although it's very useful on a floppy disk computer, it's even better if your computer has a hard disk. I set it up on a hard disk system accessed mostly by casual users, and there's no question that this particular computer gets more use because of 1 Dir.

A new version of 1 Dir, promised to be available by the time you read this, is supposed to be even more powerful. It will have expanded color options, password protection, a rewritten manual, the ability to rename subdirectories, and custom commands that allow abbreviations or descriptions to be displayed rather than actual command syntax.

Whether you're a beginner or an experienced user, 1 Dir can simplify your introduction to MS-DOS and make your time on the computer more productive.

## Save With Replace: Debugged At Last Part 1

#### P. A. Slaymaker

Since the early days of the Commodore PET in the late 1970s, a controversy has raged over one particular disk command—Save-with-Replace. This convenient command automatically replaces an existing disk file with a new file of the same name, combining SCRATCH and SAVE in one operation. But for years, many Commodore users have shunned Save-with-Replace like poison, swearing that it contains a mysterious bug which unpredictably scrambles disks. And just as many other users contend the bug doesn't exist at all. Now, finally, there's proof: The bug does exist in the 1541 drive, it can be demonstrated, and most importantly, it can be avoided. This two-part article is the first full explanation of why the bug happens and how you can circumvent it. The author is the president of Quantum Software, which produces the Peek a Byte disk utility for the Commodore 64.

It's time to settle something once and for all: There *is* a Save-with-Replace bug! It afflicts the Disk Operating System (DOS) built into every 1541 disk drive, potentially threatening every disk on which you use the Save-with-Replace command. In this two-part series, we'll review what the Save-with-Replace bug typically does; list a program which demonstrates the bug beyond doubt; explain *why* it happens; and finally, recommend a procedure for avoiding the bug.

The Save-with-Replace command (typed as SAVE@) has been

accused of scrambling, swapping, duplicating, or overwriting disk files and of messing up Block Allocation Maps (a BAM is a map on a disk which keeps track of which blocks are storing files and which are free). Many computer magazines and other authorities in the Commodore community have warned against using SAVE@. Yet other Commodore experts have never experienced problems with SAVE@ and swear the bug is an old hacker's tale. There are many anecdotes about when the bug strikes, which files are affected, and when the files or BAM will be garbled. The mystery has persisted for so long because usually the bug is not repeatable. But this article shows how to replicate the bug and explains why it is related primarily to the file length and the distribution of free blocks on the disk as determined by the BAM.

Recently some new evidence surfaced about SAVE@. In an article published in the July 1985 issue of The Transactor, "SAVE with Replace Exposed !!," author Charles H. Whittern showed that the bug exists under some conditions. This article made some observations on files likely to be affected and listed a program which repeatedly loaded and saved files using SAVE@. Afterward, an examination of the disk showed some files to be scrambled. Unfortunately, no details of the file configurations were given, and the editors admitted the bug had them baffled—but at least the problem was recognized, a first step.

Our investigation shows that the bug usually occurs when the drive number has not been specified on previous drive operations, such as loading a file or listing a directory. In other words, typing LOAD"filename",8 or LOAD"\$",8 instead of LOAD"0:filename",8 or LOAD"0: \$",8 sets up conditions for the bug. The drive number 0 should be specified in disk commands because, as we'll explain later, the SAVE@ bug is related to the phantom software drive 1 in the 1541. In addition, the bug tends to bite disks on which many files have been scratched and rewritten. This leaves gaps on the disk so that a file is scattered over many tracks. These gaps do not normally cause a problem if you specify the drive number in disk commands.

Therefore, the key to avoiding the SAVE@ bug is to always specify drive 0 when performing any disk drive function, or to always reset the drive before any SAVE@ operation. Resetting the drive requires either turning the drive off and then on, or sending a reset command (OPEN15, 8,15,"UJ").

#### **Demonstrating The Bug**

At this point, some of you might be skeptical that the SAVE@ bug really exists. To prove that it does, the accompanying program formats a new disk with the single file "SAVE@ DEMO" and alters the BAM to simulate a partially used disk with a gap due to scratched files. Follow these instructions carefully:

### **COMPUTE! Back Issues**

Here are some of the applications, tutorials, and games from available back issues of COMPUTE!. Each issue contains much, much more than there's space here to list, but here are some highlights:

May 1981: Named GOSUB/GOTO in Applesoft, Generating Lower Case Text on Apple II, Copy Atari Screens to the Printer, Disk Directory Printer for Atari, Realtime Clock on Atari, PET BASIC Delete Utility, PET Calculated Bar Graphs, Running 40 Column Programs on a CBM 8032, A Fast Visible Memory Dump, Cassette Filing System, Getting To A Machine Language Program, Epidemic Simulation.

June 1981: Computer Using Educators (CUE) on Software Pricing, Apple II Hires Character Generator, Ever Expanding Apple Power, Color Burst for Atari, Mixing Atari Graphics Modes 0 and 8, Relocating PET BASIC Programs, An Assembler In BASIC for PET, Quadra PET: Multitasking?, Mapping Unknown Machine Language, RAM/ROM Memory, Keeping TABs on a Printer.

July 1981: Home Heating and Cooling, Animating Integer BASIC Lores Graphics, The Apple Hires Shape Writer, Adding a Voice Track to Atari Programs, Machine Language Atari Joystick Driver, Four Screen Utilities for the PET, Saving Machine Language Programs on PET Tape Headers, Commodore ROM Systems, Using TAB, SPC, And LEN.

August 1981: Minimize Code and Maximize Speed, Apple Disk Motor Control, A Cassette Tape Monitor for the Apple, Easy Reading of the Atari Joystick, Blockade Game for the Atari, Atari Sound Utility, The CBM "Fat 40," Keyword for PET, CBM/PET Loading, Chaining, and Overlaying, Adding A Programmable Sound Generator, Converting PET BASIC Programs To ASCII Files. October 1981: Automatic DATA Statements for CBM and Atari, VIC News, Undeletable Lines on Apple, PET, and VIC; Budgeting on the Apple, Atari Cassette Boot-tapes, Atari Variable Name Utility, Atari Program Library, Train Your PET to Run VIC Programs, Interface a BSR Remote Control System to PET, A General Purpose BCD to Binary Routine, Converting to Fat-40 PET.

December 1981: Saving Fuel \$\$ (multiple computers), Unscramble Game (multiple computers), Maze Generator (multiple computers), Animating Applesoft Graphics, A Simple Atari Word Processor, Adding High Speed Vertical Positioning to Atari P/M Graphics, OSI Supercursor, A Look At SuperPET, Supermon for PET/CBM, PET Mine Maze Game, Replacing The INPUT # Command, Foreign Language Text on The Commodore Printer, File Recovery.

January 1982: Invest (multiple computers), Developing a Business Algorithm (multiple computers), Apple Addresses, Lowercase with Unmodified Apple, Cryptogram Game for Atari, Superfont: Design Special Character Sets on Atari, PET Repairs for the Amateur, Micromon for PET, Self-modifying Programs in PET BASIC, Tinymon: A VIC Monitor, VIC Color Tips, VIC Memory Map, ZAP: A VIC Game.

May 1982: VIC Meteor Maze Game, Atari Disk Drive Speed Check, Modifying Apple's Floating Point BASIC, Fast Sort For PET/CBM, Extra Atari Colors Through Artifacting, Life Insurance Estimator (multiple computers), PET Screen Input, Getting The Most Out Of VIC's 5000 Bytes.

August 1982: The New Wave Of Personal Computers, Household Budget Manager (multiple computers), Word Games (multiple computers), Color Computer Home Energy Monitor, A VIC Light Pen For Under \$10, Guess That Animal (multiple computers), PET/CBM Inner BASIC, VIC Communications, Keyprint Compendium, Animation With Atari, VIC Curiosities, Atari Substring Search, PET and VIC Electric Eraser.

September 1982: Apple and Atari and the Sounds of TRON, Commodore Automatic Disk Boot, VIC Joysticks, Three Atari GTIA Articles, Commodore Disk Fixes, The Apple PILOT Language, Sprites and Sound on the Commodore 64, Peripheral Vision Exerciser (multiple computers), Banish INPUT Statements (multiple computers), Charades (multiple computers), PET Pointer Sort, VIC Pause, Mapping Machine Language, Commodore User-defined Functions Defined, A VIC Bug.

January 1983: Sound Synthesis And The Personal Computer, Juggler And Thunderbird Games (multiple computers), Music And Sound Programs (multiple computers), Writing Transportable BASIC, Home Energy Calculator (multiple computers), All About Commodore WAIT, Supermon 64, Perfect Commodore INPUTs, VIC Sound Generator, Copy VIC Disk Files, Commodore 64 Architecture.

May 1983: The New Low-Cost Printer/Plotters, Jumping Jack (multiple computers), Deflector (multiple computers), VIC Kaleidoscope, Graphics on the Sinclair/Timex, Bootmaker For VIC, PET and 64, VICSTATION: A "Paperless Office," The Atari Musician, Puzzle Generator (multiple computers), Instant 64 Art, 64 Odds And Ends, Versatile VIC Data Acquisition, POP For Commodore.

June 1983: How To Buy The Right Printer, The New, Low-Cost Printers, Astrostorm (multiple computers), The Hawkmen Of Dindrin (multiple computers), MusicMaster For The Commodore 64, Commodore Data Searcher, Atari Player/Missile Graphics Simplified, VIC Power Spirals, UnNEW For The VIC and 64, Atari Fast Shuffle,

### **COMPUTE! Back Issues**

VIC Contractor, Commodore Supermon Q & A.

July 1983: Constructing The Ideal Computer Game, Techniques For Writing Your Own Adventure Game, SpeedSki And Time Bomb (VIC), Castle Quest And Roadblock (Atari), RATS! And Goblin (64), How To Create A Data Filing System (multiple computers), How To Back Up Disks For VIC And 64, Atari Artifacting, All About The Commodore USR Command, TI. Mailing List.

August 1983: Weather Forecaster (multiple computers), First Math And Clues (multiple computers), Converting VIC And 64 Programs To PET, Atari Verify, Apple Bytechanger, VIC And 64 Escape Key, Banish Atari INPUT Statements, Mixing Graphics Modes On The 64, VICplot, VIC/64 Translations: Reading The Keyboard, Musical Atari Keyboard, VIC Display Messages.

September 1983: Games That Teach, Caves Of, Ice, Diamond Drop, Mystery Spell, and Dots (multiple computers), VIC Pilot, Ultrasort (VIC, 64, PET), Easy Atari Page Flipping, Computer Aided Design On The TI, Relative Files On the VIC/64, Atari Fontbyter, TI Sprite Editor, All About Interrupts (multiple computers), Cracking The 64 Kernal, Making Change On The Timex/Sinclair, Build Your Own Random File Manager (multiple computers).

October 1983: Computer Games By Phone, Coupon File (multiple computers), Dragon Master And Moving Maze (multiple computers), Merging Programs From Commodore Disks, Atari Master Disk Directory, Sprites In TI Extended BASIC, Commodore EXEC, Multicolor Atari Character Editor, High Speed Commodore Mazer, Apple Sounds, Extra Instructions (multiple computers), Commodore DOS Wedges, Invisible Disk Directory For VIC And 64.

February 1984: What Makes A

Good Game, Circus (multiple computers), Quatrainment (multiple computers), Commodore 3-D Drawing Master (Apple version also included), Speedy BASIC For VIC And 64, Dr. Video 64.

March 1984: All About Adding Peripherals, Modern Memory: The Future Of Storage Devices, Roader (multiple computers), Barrier Battle (multiple computers), Programming The TI: File Processing, Sound Shaper (multiple computers), Commodore Floating Subroutines, Big Buffer For Atari.

**April 1984:** Apple's Macintosh Unveiled, Securities Analysis (multiple computers), Worm Of Bemer (multiple computers), Programming The TI: File Processing, Part 2, 1540/1541 Disk Housekeeping, Hidden Atari DOS Commands, Function Keys For The Apple, TI Tricks And Tips, Super Directory (multiple computers).

May 1984: The Digital Palette: Fundamentals Of Computer Graphics, The Inside Story: How Graphics Tablets And Light Pens Work, Picture Perfect For Atari And Commodore 64, 64 Hi-Res Graphics Editor, Snertle (multiple computers), Pentominos: A Puzzle-Solving Program (multiple computers), A BASIC Cross-Reference (PET, 64).

June 1984: Choosing The Right Printer: The Easy Way To Hard Copy, Pests (multiple computers), Olympiad (multiple computers), Programming The TI: TI Graphics, MacroDOS For Atari, Part 1, Apple Variable Save, Programming 64 Sound, Part 1, Apple Input And Menu Screens.

July 1984: Evolutionary To The Core: The Apple IIc Heads For Home, The ABC's Of Data Bases, Statistics For Nonstatisticians (multiple computers), Bunny Hop (multiple computers), Blueberries (multiple computers), Atari Artist, Applesoft Lister, Program Conversion With Sinclair BASIC And TI BASIC, Commodore 64 ROM Generations. September 1984: New Trends In Educational Computing, Choosing The Best Educational Software, Missile Math (multiple computers), Lightsaver (multiple computers), Multiple Choice Quiz Generator (multiple computers), Lightning Sort (multiple computers), Commodore Autoboot, Apple Editing Hints, Atari Paddle Fixer, Musical TI Keyboard.

January 1985: VIC/64 TurboTape: tape at disk speeds, Music In The Computer Age, Inside MSX, Paratrooper (multiple computers), Rescue Of Blondell (Commodore/ Atari), Guitar Tuner (multiple computers), Which Computer Language Is Best?, Machine Language Multiplication, Part 1, Enhanced Applesoft Input, Atari Terminal Program, IBM Pie Chart Maker.

February 1985: Special Games Issue, The New Atari, Fame Games, Birth Of A Computer Game, Acrobat (multiple computers), Terminal Program For VIC & 64, Programming The TI Without A Math Background, Adding Sound Effects To Atari, Rebound: Machine Language IBM Game, Apple Bowling Champ, 64 Sound Effects.

Back issues are \$6 each. Price includes freight in the US. Outside the US add \$1 per magazine ordered for surface postage, \$4 per magazine for air mail postage. All back issues subject to availability.

In the Continental US call TOLL FREE 800-334-0868 (919-275-9809 in NC)

Or write to: COMPUTE! Back Issues P.O. Box 5058 Greensboro, NC 27403 USA

Prepayment required in US funds. MasterCard, Visa, and American Express accepted. NC residents add 4.5% sales tax. 1. The program is for the Commodore 64. For the VIC-20, change these lines:

 10
 POKE 36879,8
 :rem 5

 100
 IF K<>39 THEN 90: REM WAIT

 FOR F1
 :rem 154

 150
 IF K=11 THEN 170: REM CONT

 INUE IF <Y>
 :rem 187

For the Plus/4 and 16, change these lines:

10 COLOR Ø,1:COLOR 4,1:rem 133 340 POKE 239,0: REM CLEAR KEYB OARD BUFFER :rem 80 5000 POKE239,0:POKE198,64: REM CLEAR KEYBOARD BUFFER :rem 31 5010 K=PEEK(198) :rem 102

Type the program *exactly* as listed—including all uppercase REM statements (the lowercase rem statements are checksums for COMPUTE!'s "Automatic Proofreader"; do not type them in). It's important to type the program as listed because it must be at least nine blocks long on the test disk to insure proper results.

- 2. Save the program on another disk before running it.
- Put a blank test disk in the drive and run the program. It will format the disk and save a file called SAVE@ DEMO on the disk. Type LOAD"\$",8 to list the directory and notice that 254 blocks are free.
- 4. Reset the drive by turning it off, then on. Load the file by typing LOAD''SAVE@ DEMO'',8.
- Save the file three times using the SAVE@ command (SAVE"@0: SAVE@ DEMO",8). Do not list the directory or perform any other operation between SAVE@ commands.
- 6. List the directory by typing LOAD"\$",8. What's this? There were 254 blocks free before, but now there are 258—a discrepancy of four blocks. (If you don't get this result, it probably means that you haven't followed the directions exactly. Start again at step 3.) If you examine the BAM with a disk utility, you'll see that the first four sectors of the file are marked as free! (Specifically, the file starts on track 17, block 0; blocks 0 through 3 are marked

as unallocated.) If you executed a fourth SAVE@ command, it would overwrite the beginning of the file, and the disk would be corrupted even worse!

7. Now rerun the program to make a new test disk. Reset the drive and run the above test again, but specify the drive number for the load (LOAD''0:SAVE@ DEMO'',8). The SAVE@ bug does not occur!

#### Always Specify Drive 0

This demonstration provides a powerful lesson: All DOS commands should include the drive number 0:

LOAD"0:filename",8 (Load file) SAVE"0:filename",8 (Save file) SAVE"@0:filename",8 (Save with Replace) LOAD"\$0",8 (Load directory) LOAD"\$0:filename",8 (Load directory entry with filename) OPEN15,8,15,"10":CLOSE15 (Initialize drive 0) OPEN15,8,15,"V0":CLOSE15 (Validate

BAM)

Similarly, all disk file commands should specify the drive number.

Most Commodore users do not specify the drive number when loading the directory or files. The 1541 User's Manual examples for the LOAD command don't specify the drive, and neither do most magazine articles. If the drive number is not specified, the 1541 is supposed to default to drive 0. What actually happens very often causes an error message such as 74,DRIVE NOT READY,00,00. For a simple example, use the DOS 5.1 Wedge that comes with the 1541. List the directory for the file "TEST" on the 1541 Test /Demo disk by using the Wedge command:

>**\$TEST** (list directory for files "TEST")

Since this file doesn't exist on the *Test/Demo* disk, the red error light begins blinking. This command should include the drive number, but is accepted without it. Now repeat the command and read the error channel with this Wedge command:

> (read error channel)

The error will be 74,DRIVE NOT READY,00,00. Repeat this test, but specify the drive number: >\$0:TEST (List directory with drive specified) No matter how many times this command is repeated, no error will occur.

#### The Missing Drive

Part 2 in next month's COMPUTE! will present a full technical explanation of the SAVE@ bug. For those who aren't so technically inclined, here's a brief summary.

The early Commodore PETs were available with dual disk drives-two drives in one unit. The drives were addressed as 0: and 1: when using disk commands. But on later Commodore computers designed to use the 1540/1541, multiple drives are addressed by changing the device number, not the drive number. The device number for a single drive is 8. That's why you type a command like LOAD "filename",8. On two-drive systems, the second drive is usually addressed as device 9, as in LOAD "filename",9. Therefore, most people stopped (or never started) specifying the drive number, which is 0: for all 1541 disk drives. Drive 1: simply doesn't exist with the 1541.

What happens when the drive number is not specified for a LOAD or SAVE? DOS first checks for a drive number. If none is specified, it assumes drive 0. Okay so far. Then DOS attempts to read the disk. If no disk is found, DOS automatically switches to the nonexistent drive 1. A DRIVE NOT READY error then results whether or not a drive number was specified. If a disk is found, DOS searches its internal directory for the specified file. If the default drive was used, DOS switches to drive 1 to continue searching. This also causes the DRIVE NOT READY error, since there is no drive 1. Furthermore, drive 1 remains the default drive as long as there are directory searches to be done. The internal drive pointers must be reset to recover from this error condition.

SAVE@ always works properly in our tests if the drive number is specified on all operations and no direct access buffers are allocated. We are not aware of anyone who has documented a failure under these conditions (assuming a closed file was specified, sufficient room was present on the disk, and no read or write errors occurred). Thus, Commodore experts who claim there is no bug are partially correct. We have also found that if the drive number is not always specified during loads and directory listings, as is common practice, the SAVE@ bug can occur even though the drive number is specified in the SAVE@ command.

Files stored on just one or two tracks—such as short files on a fresh disk—are not prone to the SAVE@ bug. Files stored over many tracks on disks on which many files have been saved and scratched are the most susceptible, as are files saved with some utilities intended to speed up the 1541 disk drive.

Next month: Part 2 examines the technical reasons for the Save-with-Replace bug in more detail. Our special thanks to Jim Gracely of Commodore and Associate Editor Jim Butterfield for very helpful discussions.

#### **SAVE@ Bug Demonstration**

## Dynamic Keyboard For Commodore Machines Part 1

Jim Butterfield, Associate Editor

Dynamic keyboard techniques let you perform tasks that would otherwise be difficult or impossible in BASIC. The first article in this two-part series covers the fundamentals. In Part 2, we'll look at more advanced uses of the dynamic keyboard.

Many BASIC commands can be used in either direct mode (typed directly on the keyboard without a line number) or program mode (as part of a program). Certain commands, however, work only in direct mode. Using them in a program requires the dynamic keyboard technique, which lets a program act like it's you-typing commands on the keyboard. This method is especially effective on Commodore machines because of their full-screen editing. The term dynamic keyboard was first used by Mike Louder in 1978, though the technique had been used previously by Larry Tessler to merge programs.

**Direct Versus Programmed** 

A direct-mode command doesn't have a line number and is executed as soon as you press RETURN. An example is PRINT "HELLO". In program mode, the command does have a line number and is executed only when you type RUN and then press RETURN. An example is 10 PRINT "HELLO". Most BASIC commands work in both direct and program mode.

A few BASIC commands cannot be used in direct mode, however; they may appear only in a program. GET, INPUT, GET#, and INPUT# are the best-known of these. Usually these commands use a segment of memory called the input buffer to store data as it arrives, and they won't work in direct mode because the same input buffer is used to hold the command itself. Thus, the incoming data might overwrite the command you typed in. An easy way to see this conflict is to use GOSUB as a direct command, calling a routine that does input. Try the following simple program:

300 INPUT "YOUR NAME";NŞ 330 RETURN

Execute this routine by typing GOSUB 300 and pressing RE-TURN. The subroutine will ask YOUR NAME?. If you reply with a one-character name, such as X, everything works fine. The RE-TURN takes you back to the keyboard, and the computer reports READY. But if you reply with a longer name such as CHARLOTTE, you may get a strange error message. Why? Your original command GOSUB 300 is still sitting in the input buffer. When the subroutine ends, the system looks beyond the GOSUB command to see what comes next. We expect it to find an end-of-command marker and quit. But the GOSUB command has been destroyed. It was overwritten by the name you typed in, which went to the same input buffer. The result is confusion.

On the other hand, some BASIC commands can be used only in direct mode—not in a program. CONT, for example, causes an indefinite pause when used in a program. LIST works in program mode, but on most Commodore computers the program ends after executing LIST. In direct mode, you can enter a program line to add to the program or change it. You can't do this while running a program. Again, there's a difference between programs and direct commands they have different powers.

A very important difference is found in the LOAD command. If typed as a direct command, LOAD fills memory with a new program from tape or disk. If there was already a program in memory, it vanishes and its variables are thrown away. But a LOAD command executed within a program is quite different. The new program comes in, but' existing variables are not scrapped—they are preserved so that the new program can use them. This is a powerful programming technique called *chaining*, which lets one program continue processing data that was generated by a previous program.

#### **Invisible Fingers**

Direct keyboard statements can perform certain tasks that programs can't (at least, not in the usual way). For example, if we want a program to invite a student to type in a formula, BASIC doesn't allow the formula to be evaluated (an INPUT statement won't evalute the formula 2 + 2 as 4).

Similarly, suppose we want one program—perhaps a main menu program-to load and run another program. That's hard to do because BASIC wants to chain the new program to the old one. Instead of starting the next program fresh, it tries to make it a continuation of the previous program. On rare occasions, there may be a real need to allow a program to change itself, although this is tricky because every time you change a program (by editing a line, etc.), its variables go away. It's hard for any program to continue running after its variable values disappear.

We can accomplish these things, however, by using a startling technique: making the computer type on its own keyboard. How can a computer do this? It doesn't even have any fingers.

Here's how it works. When you strike a key, the information always goes first to a memory area called the *keyboard buffer*. After it gets there, it is picked up and used by the computer. If we can put a character in the keyboard buffer without actually pressing any keys, it will appear to have been typed, and the computer responds exactly as if the corresponding key was pressed.

#### Self-Keying

Let's try a quick example to see how it works. The keyboard buffer is located in different places on different computers, so the commands must be tailored to the machine involved. We'll ask the machine to self-type the letter X:

For VIC-20 or Commodore 64: POKE 198,1:POKE631,88

For Plus/4 or 16: POKE 239,1:POKE 1319,88 For PET/CBM (3.0 and 4.0 BASIC): POKE 158,1:POKE 623,88

For Original ROM PETs: POKE 525,1:POKE 527,88

For Commodore B-128 (Model 700) BANK 15:POKE 209,1:POKE 939, 88

The first POKE in each line tells the computer how many characters are waiting in the keyboard buffer. The second puts the character X in the first slot of the buffer. After you type the line and press RETURN, the computer reports READY and acts as if you pressed the X key. The letter X appears on the screen and the cursor flashes to its right. It would be easier just to type the X, of course, but we've established a new capability. A program can now, in effect, type on the keyboard.

#### **Using The Screen**

With this technique alone, you're limited to pretty short commands. The keyboard buffer usually has a size limit of about nine characters. Also, it's cumbersome for a program to put characters into the buffer one at a time. But on Commodore machines we can take advantage of *screen editing* to process longer direct commands.

Whenever you press the RE-TURN key, the computer reads the screen. Whatever it finds there, it does—perform a command, enter a line, or whatever. To make a program execute a long direct-mode command, follow these steps:

1. PRINT the command on the screen in a known place.

2. Position the cursor a couple of lines above the command.

3. Put a carriage return in the keyboard buffer.

4. Terminate execution with an END command.

When the program reaches END, here's what happens. The desired command is on the screen and the RETURN is in the keyboard buffer. The program terminates, and the computer prints READY. Although the program has ended, the computer receives the RETURN as if you had just pressed that key, so it executes the line on the screen. Among other things, that line might contain a GOTO or CONT that would continue the program.

#### **A Simple Example**

Here's a simple program that uses the dynamic keyboard method to do something normally forbidden by BASIC: a computed GOTO. In most cases, a straightforward ON-GOTO command does the same job better, but let's use this example for the sake of simplicity. Type in line 100 as shown for your machine:

For VIC-20 or Commodore 64:

100 DATA 198,631

For Plus/4 or 16:

100 DATA 239,1319

For most PET/CBM:

100 DATA 158,623

Now enter the following lines:

110	READ A, B
120	PRINT "PICK A NUMBER 3 TO
	{SPACE}5"
130	INPUT "NUMBER";L
140	IF L<3 OR L>5 THEN 130
15Ø	PRINT CHR\$(147)
16Ø	PRINT
17Ø	PRINT
180	PRINT "GOTO";L*100
190	PRINT CHR\$(19)

The program isn't finished, but you might like to see what we have so far. If you run it and enter 3 in response to the prompt, you'll find the program stopped with the cursor blinking over a line that says GOTO 300. To execute that direct command, all you'd need to do is press RETURN. When we complete the program, it will press RETURN by itself. Finish the program by entering these lines:

200 POKE A,1 210 POKE B,13 220 END 300 PRINT "THIS IS LINE 300" 310 GOTO 120 400 PRINT "HERE'S 400" 410 GOTO 120 500 PRINT "LINE 500 IS THE END

It's as easy as that. Once you grasp the basic method, all sorts of interesting applications come to mind. Next time, we'll look at more advanced, useful applications of the dynamic keyboard technique.

## All About IBM Batch Files Part 2

G. Russ Davies

Part 1 of this article (COMPUTEI, September 1985) covered the fundamentals of batch programming on the IBM PC/PCjr. This month we'll look at some advanced techniques and a utility that makes batch programs interactive and easier to use.

As we saw last month, IBM batch programs can be very powerful. The batch commands FOR, IF, and GOTO permit program loops, conditional tests, and program branching. You can also chain two or more batch programs together and pass information from one to another.

But batch programs have limitations, too. Visual displays are often unexciting, consisting of singlecolor alphanumerics (no graphics characters, etc.), and user input is even more restricted. The PAUSE command allows only two options: continuing after the pause or ending the program. This virtually rules out complex, interactive programs that let you select from several different options to perform various tasks.

#### **Adding Choices**

The "CHOOSE.COM" program below provides the equivalent of a new batch command. As the name suggests, CHOOSE lets you make a choice. It can be used by itself to request a yes/no response, or with additional information to offer several different options. Since CHOOSE.COM is a machine language program, we've included a BASIC filemaker program that creates it for you. Type in and save Program 1 as listed below, then run it. Once that's done, you can try out the simpler "yes/no" form of CHOOSE.

Remember from Part 1 that any batch program named AUTO-EXEC.BAT loads and runs automatically when you boot the system. An AUTOEXEC.BAT program that doesn't include the DOS commands DATE and TIME won't prompt you to enter the date and time (as normally happens when you boot up). Though it's often valuable to have correct date and time information on new files, there are also many times when you don't need it.

The short batch program that follows lets you choose whether to add date and time settings. Enter it as listed, using the EDLIN program (on the DOS Supplemental Programs disk) or any word processor or text editor that produces standard ASCII output. Since this and the following examples are not BASIC programs, don't try to enter them with COMPUTE's "IBM Automatic Proofreader." Once you have entered this program, save it with the filename AUTOEXEC.BAT. Because the program calls CHOOSE-.COM, you must save it on a disk that contains CHOOSE.COM.

```
echo off
MODE CO80
echo Do you wish to set the
date/time?
rem press Y,y,N, or n to
answer
CHOOSE
IF ERRORLEVEL 1 GOTO :setdt
goto :next
:setdt
date
time
:next
CHKDSK
BASICA MENU
```

After saving this program, run it by rebooting the system (press Ctrl-Alt-Del or enter AUTOEXEC). When used without parameters, CHOOSE checks for a yes/no response, permitting uppercase as well as lowercase Y and N (it's not necessary to press the Enter key after typing Y or N). Other responses (except Ctrl-Break) cause the prompt message to be displayed until a valid choice is made.

#### **ERRORLEVEL IS A Variable**

After you respond with yes or no, CHOOSE passes this information to the batch program via ERROR-LEVEL. As explained in Part 1, ERRORLEVEL is a special variable you can test with IF. In this example, CHOOSE sets ERROR-LEVEL to 1 when the response is no. The GOTO command then branches appropriately. Note that GOTO branches to a destination label, which is a colon followed by a string. This program uses the labels :setdt and :next. Don't confuse the label :next with BASIC's NEXT statement (which doesn't exist in batch programming).

In this case, ERRORLEVEL can have only one of two possible values, but it can take higher values as well (see below). When testing ERRORLEVEL with IF, keep in mind that the IF ERRORLEVEL statement is true when ERROR-LEVEL is greater or equal to the number being tested. If you tested for 0 first in this program, ERROR-LEVEL would always be 0 (1 and 0 are both greater than or equal to 0). When testing ERRORLEVEL, you must always test for higher values before testing for lower ones.

#### **Multiple Options**

Most utility programs offer a variety of options. Typically, they display a menu with a list of options, and you choose the option you want by pressing a certain key. CHOOSE makes it easy to present such menus within a batch program. First display the options on the screen, then use CHOOSE followed by a list of the keys you wish to test. For instance, the statement CHOOSE ABC checks the A, B, and C keys and returns appropriate values in ERRORLEVEL. The ERROR-LEVEL value corresponds to the position of the key in the list after the CHOOSE command. Thus, after the program performs CHOOSE ABC, ERRORLEVEL equals 1 if A was pressed, 2 if B was pressed, and so on.

When using CHOOSE with several option keys, it's critical to list the keys in the right order. Since you must always test for higher ERRORLEVEL values before testing for lower ones, you'll want to put the most likely (or most speedcritical) options at the *end* of the option key list. This assigns higher ERRORLEVEL values to the more important options.

#### Entering FILES.BAT

The "FILES.BAT" program below demonstrates multiple-option selection as well as a colorful, attractively formatted menu and help panel. It sorts any disk directory by file size, date, filename extension, or alphabetical order, and can also create separate batch files for mass DOS operations. Entering the program requires several steps:

- 1. Make sure your disk contains the system file called ANSI.SYS. If necessary, copy ANSI.SYS from the DOS disk with the COPY command. This file contains the screen/keyboard driver used for graphics displays and temporary key assignments.
- Make sure your disk contains a file named CONFIG.SYS that includes the statement DEVI-CE=ANSI.SYS. If your disk already has a CONFIG.SYS file, add that statement to the file with EDLIN or another text editor. If your disk doesn't have a CONFIG.SYS file, create one by entering these lines:

COPY CON:CONFIG.SYS DEVICE=ANSI.SYS

Next press the F6 key to end the file, then press Enter. Your disk now contains the necessary CONFIG.SYS file.

- 3. Using EDLIN or some other text editor, enter Program 2 as listed below and save it on disk with the name FILES.BAT. (Since this is not a BASIC program, don't try to enter it with the IBM Automatic Proofreader.) Several lines in the listing contain the characters {CTRL-P}. The braces indicate that this is a special control character which you must enter by pressing a combination of keys. Do not type the braces. Instead, wherever you see {CTRL-P} in the listing, hold down the Ctrl key and press the P key. On the screen, you'll see the wedge-shaped control character that precedes special ANSI.SYS screen or keyboard instructions. Type everything else in Program 2 exactly as it appears.
- 4. In the same manner, enter Program 3 as listed and save it on disk with the name FILES.MNU (do not use any other filename). This file is graphics data for the menu. Whenever you see {CTRL-P} in the listing, enter CTRL-P as described in step 3. A number enclosed in braces indicates a graphics character (the number is an ASCII code) which you must enter with the Alt-keypad technique on the PC and by another method on the PCjr.

For instance, where the listing contains {218}, hold down the Alt key, then type the characters 2, 1, and 8 on the numeric keypad. When you release the Alt key, character 218 appears on the screen. On the PCjr, hold down Alt, press Function-N, then enter the numbers as on the PC. After all three numbers are entered, release the Alt key; the character will appear on the screen. When the braces enclose two numbers, several characters are needed; the first value shows how many characters to enter, and the second is the ASCII code. For instance, where you see {5 196}, use the above procedure to enter character 196 five times. Where you see the letters SP followed by a number and enclosed in braces, you should type the space bar the indicated number of times. For example, {SP 16} means to type 16 spaces.

- 5. Enter Program 4 as listed, using the technique described for step 4, and save it on disk with the filename FILES.HLP (don't use any other filename). This file contains graphics data for the Help screen.
- 6. Enter a batch program that contains nothing but a REM statement and save it on disk with the filename QUIT.BAT. This can be done with a text editor or by entering these statements from DOS:

COPY CON: QUIT.BAT REM ANYTHING

Now press the F6 key followed by Enter.

- 7. Activate BASIC and type in Program 5. Since this program is listed in BASIC, enter and save it using the IBM Automatic Proofreader published bimonthly in COMPUTE!. You must save this program with the filename FILEGRP .BAS.
- 8. Finally, before using FILES.BAT, check your disk to make sure all the necessary files are present. It must contain CHOOSE.COM, ANSI.SYS, CONFIG.SYS, FILES.BAT, FILES.HLP, FI-LES.MNU, FILEGRP.BAS, and QUIT.BAT. The program will not work correctly unless all

these files are on one disk and named as shown here. Note that the FILEGRP option (see below) also requires BASIC.

#### Using FILES.BAT

Before you run this program, reboot the system by turning the computer off and on or by pressing Ctrl-Alt-Del. This guarantees that the ANSI.SYS driver is present. To run FILES.BAT, enter FILES after the DOS prompt and press Enter. Most of the program is self-explanatory after all, that's what menus and help screens are for—so we won't describe every option.

The FILÉGRP option lets you create a separate batch file (named FILEGRP.BAT) for performing operations on a group of files. Every line in FILEGRP.BAT consists of a filename from the subject disk and four dummy parameters in this order:

#### %1 filename.extension %2 %3 %4

Dummy parameters are replaced by actual parameters you supply when running FILEGRP-.BAT. This makes it easy to perform the same operation (copy, print, delete, etc.) on a large group of files. After using the FILEGRP option, exit to DOS and use a word processor or text editor to edit FILEGRP-.BAT as needed, deleting the names of any files you don't want to include in the operation. Then run FILEGRP.BAT by entering its name followed by the needed parameters. The first parameter can be any DOS command; the rest will be parameters that are relevant to that command. For instance, you might enter FILEGRP COPY B: /V to copy the files listed in FILEGRP.BAT onto drive B. Incidentally, BASIC does not provide any way to set ERRORLEVEL.

#### Advanced Batch Programming

FILES.BAT employs several techniques you may find useful. The DOS command BREAK ON makes the system respond to Ctrl-Break in more instances than normal. The TYPE command is used to display graphics like the menu and help screen. TYPE creates such displays much faster than the DOS ECHO command (you could also use COPY).

The ANSI.SYS driver assigns the lowercase keys a, s, d, e, b, and i to their uppercase equivalents to reduce the amount of testing required. The F1 and F10 keys are assigned to keys H and X, respectively, so those function keys perform their usual HELP and EXIT roles. After CHOOSE accepts a response, the modified keys are restored to their original definitions. Pressing Ctrl-Break while CHOOSE is active (or pressing Y in response to "Terminate batch file?") leaves these keys reassigned. To avoid this effect, you should normally exit by pressing F10.

The F10 (EXIT) function uses a trick to perform a quick exit. It simply runs QUIT.BAT, a batch program that consists of a do-nothing REM statement. When any batch program ends, it ends all preceding batch programs as well. Note that since ECHO OFF is in effect when QUIT.BAT is called, the REM is not displayed.

Batch commands are not particularly fast. To optimize speed, structure the program so that the most-often used (or speed-critical) routines are closest to the place you're branching from. The fewer program lines that a GOTO has to skip over, the quicker it executes. You can also speed up batch programs by using extra disk buffers as explained in the DOS Manual. REM statements slow batch programs drastically; if you want to document the program, store your comments in a separate file.

In some cases it's useful to test for the absence of a parameter. For instance, you might want to reprompt the user with a message like "You must enter more information." This can be done with a statement such as IF .--%1. GOTO .NOPARM. This line means "if a dot equals the parameter plus a dot then go to the no-parameter routine." The IF test is true only when no parameters have been entered.

#### Program 1: CHOOSE.COM Filemaker

For instructions on entering this listing, please refer to "COMPUTEI's Guide to Typing In Programs" published bimonthly in COMPUTEI.

## Davidson is ***1, *1, *1, & *1** in Education

For math, speed reading, spelling and vocabulary, Davidson's award winning software outsells all others. Why? Because enough people choose to buy the educational software that works.

MATH BLASTER makes it more fun to add. subtract, multiply, divide, and learn fractions, decimals

and percents. First through sixth graders master 600 math facts with exciting graphics, animation, sound effects...even an arcade game. Apple™, Macintosh™, IBM™, Commodore 64/128™, Atari™, 49.95.

SPEED READER II can quadruple your reading speed and improve your comprehension. Develop

good reading habits, chart your progress, and have fun! For high school age through adult. Apple II™, Macintosh™, IBM™, Commodore 64/128**. 69.95

WORD ATTACK lets students ten through adult discover the meanings and usages of 675 new words.

Includes a fun, fast-action arcade game and add-your-own-words editor. Apple™, IBM™, Commodore 64/128™, Atari™. 49.95

SPELL IT teaches ten year olds and older how to spell a thousand and one of our most commonly

misspelled words. Vivid graphics, animation, sound effects, a lively arcade game and add-your-ownwords editor, too! Apple™, IBM™, Commodore 64/128™. Atari™. 49.95

## 64 Multicolor Graphics Made Easy

James P. Hassett

"Color Plotter 64" gives your Commodore 64 a set of 14 powerful new commands for plotting multicolor high-resolution graphics. You can even mix text and graphics on the same screen. The photos on these pages were generated by the demo program following this article.

Have you ever admired a multicolor high-resolution graphics display on the Commodore 64? Usually you have to learn machine language to create such displays yourself—but not now.

With "Color Plotter 64" those screens become easy because you'll have 14 special graphics commands added to your Commodore 64 BASIC. And because the commands are written in machine language, they work fast and efficiently. Here is a summary of the new commands:

IN, Turns on hi-res multicolor mode.

**OFF,** Turns off hi-res multicolor mode.

CL, Clears hi-res screen.

**PC,** Pen Clear. Clears everything on high-res screen drawn with current pen number.

**P0**, *n* Sets color of PEN 0, which is also the background color, where *n* is one of the 16 standard colors (0-15).

**P1**, *n* Sets color of PEN 1 (n = 0-15).

**P2**, *n* Sets color of PEN 2 (n = 0-15).

**P3**, *n* Sets color of PEN 3 (n = 0-15).

**PEN**, *n* Defines active pen number (n = 0-3).

**PL**, x, y Plots point on hi-res screen at coordinates x, y using active pen. **DR**, x, y Draws best straight line from last point plotted to coordinates x, y using active pen.

**CR**, *x*, *y* Sets hi-res screen cursor to coordinates *x*, *y*.

**PR**,A\$ Prints contents of A\$ on high-res screen using active pen.

**PR**, *"text"* Prints text between quotes on hi-res screen using active pen.

Some of these commands may look familiar to those who have plotted graphics on other computers with other languages. You might be able to jump right in and start plotting. Do note that all commands, even those without parameters (such as the IN, command), must be accompanied by the comma. There are also some special typing and loading instructions to follow with Color Plotter 64. For more details, see the sections below.

#### **Entering The Program**

Since Color Plotter is written entirely in machine language, it must be entered with the "MLX" machine language editor program, found elsewhere in this issue. To enter the Color Plotter program, load and run MLX. When MLX asks for the starting and ending addresses for the machine language data to be entered, respond with 49152 and 51353, respectively. MLX will then prompt you with the line number of the first line of data, 49152. Begin typing the data shown in Program 1 and continue until all the data is entered. If you do not type in all the data in one sitting, follow the directions in the MLX article for saving your incomplete work. When all the data is entered, you're ready to start using the Color Plotter commands.

#### Special Loading Instructions

You must issue a certain sequence of commands to load and activate Color Plotter 64. After turning on the power, enter these lines for disk, pressing RETURN each time:

#### LOAD "COLOR PLOTTER",8,1 POKE 44,64:POKE 16384,0:NEW SYS 51260

For tape, change the first line above to:

LOAD "COLOR PLOTTER",1,1

Of course, you can save Color Plotter 64 on disk or tape with any filename you like. To load a program that contains Color Plotter commands, use the normal LOAD command.

#### **Color Plotter Pen**

As described above, the first three Color Plotter 64 commands (IN, OFF, and CL,) turn the hi-res multicolor mode on or off and clear the screen. (For those interested, the hires screen is located at memory addresses 8192 to 16191—hex

#### \$2000-\$3F3F.)

PC, (Pen Clear) makes it possible to erase certain things off the screen while leaving all else intact. This is particularly useful for removing text, prompts, or messages while preserving the drawing in the background. To erase everything drawn with PEN 1, for example, execute:

PEN,1:PC,

The next five commands are very similar to each other; they all select drawing colors for the various pens. The parameter n should be a number, variable, or numeric expression in the range of 0 to 15 corresponding to standard Commodore 64 color numbers. (If you specify a number larger than 15, Color Plotter 64 does not report an error, however.) All the following statements are legal:

P0,0:REM Sets PEN 0 and background color to black.

P1,J:REM Sets color of PEN 1 to previously defined value of variable J. P2,J/2+1:REM Sets color of PEN 2 to value of expression J/2+1.

The command PEN, n defines the active pen number—in other words, which pen will be used with the drawing, printing, and penclearing commands that follow. Since there are only four pens, the parameter n should be a number, variable, or expression in the range of 0 to 3. PEN 0 is the background color, which makes it handy for erasing lines drawn with another color (simply draw over the lines with PEN 0).

As a technical aside, the pens draw in different colors by switching on different bit pairs on the hires screen. PEN 0 plots a 00 bit pair. PEN 1 plots the 01 pair, PEN 2 plots the 10 pair, and PEN 3 plots the 11 pair. PC, (Pen Clear) works by searching the screen and removing all occurrences of the bit pair that matches that of the active pen.

#### **Drawing And Printing**

The next five commands all perform the actual drawing, plotting, and printing in the colors specified by the pen commands. They use a coordinate system so you can place the pens anywhere on the screen.

PL,x,y is the plot command. Screen coordinates in the multicolor hi-res mode range from 0 to 159 horizontally (x) and 0 to 199 vertically (y). Important: The origin is the *lower-left* corner of the screen. That means the coordinates of the lower-left corner of the screen display are 0,0, the upper-left coordinates are 0,199, the upper-right coordinates are 159,199, and the lower-right coordinates are 159,0.

Again, the parameters x and y can be numbers, variables, or numeric expressions. Trying to plot a location out of range causes an ILLEGAL QUANTITY ERROR.

DR,*x*,*y* is the draw command. It works with the same coordinates as the plot command. Since the *x*,*y* parameters are the coordinates it *draws to*, at least one plot command should be executed to define the starting point before the first draw command.

CR,*x*,*y* positions the invisible hi-res cursor at the coordinates specified. This defines where a following print command will begin printing the text. Since a character is 8 bits high and 16 bits wide, the allowable range for coordinates with this command is 1 to 144 for x and 1 to 192 for y. Specifying a location out of range causes an ILLEGAL QUANTITY ERROR.

PR,A\$ and PR,''' are the hi-res printing commands. To print a message, simply put the text between the quotes with PR,''' or define it as a string variable with PR,A\$. String expressions such as PR,A\$+B\$ or PR,A\$+''ABC'' are not allowed.

#### **Nondestructive Printing**

The printing commands are specially written so they never write over a bit that is already on. This means they print nondestructively; they won't interfere with your graphics. This is handy in many instances. For example, if you create a drawing or a graph, you can label it without erasing any lines. Then you can erase the text with the PC, command without disturbing the graphics, assuming the text is printed in a different color.

The printing commands also update the invisible hi-res cursor automatically. They provide for line advances and wraparound from the bottom to the top of the screen.

There is one limitation with the

printing commands. They can print only those characters with ASCII codes 33 to 95 (this includes most punctuation symbols, numbers, and letters, but no keyboard graphics). Trying to print characters out of this range will cause an error.

You can do lots of exciting things with these 14 commands. By executing P1,1 everything drawn on the screen with PEN 1 will change to white in a flash. With a simple loop (FOR X=0 TO 15:P1, X:NEXT X) everything drawn with PEN 1 will flash through all 16 colors in an instant. Drawings or objects can be made to disappear by executing a command to match the pen color to the background color. Then they can be made to instantly reappear by executing another pen color command using a contrasting color.

#### Additional Notes

You should be aware that Color Plotter 64 affects a few normal BASIC commands. None of the new commands works with IF-THEN. For example, the following statement will cause a syntax error:

10 X = 5:IF X = 5 THEN CL,

Otherwise, IF-THEN works normally.

BASIC's pi function ( $\pi$ ) also is affected. It still operates and is evaluated as 3.1415 . . . but appears as a graphic symbol when listed. If a line containing a pi symbol is edited, the pi symbol will have to be retyped at the edited line. I have found it convenient to define the variable PI=3.14159 and use PI instead of the pi symbol.

The IN, command should never be executed when already in the hi-res mode. Otherwise, a system crash and lockup may result. This is because the IN, command saves the normal error vector (ERRVEC) and replaces it with a new vector. If it is executed again before an OFF, command, the ERRVEC will point to the address of the replacement vec--in effect, it will point to itself. tor

Anytime there's a syntax error, the normal text screen with the default colors is restored. When a program is running in the hi-res mode, you can stop it as usual by pressing the RUN/STOP key. To return to the normal text screen, deliberately cause a syntax error by typing a key in direct mode and pressing RETURN.

If you press RUN/STOP-**RESTORE**, the Color Plotter 64 commands will no longer work. That's because BASIC ROM is switched back in. (Color Plotter 64 works by copying BASIC ROM into RAM and then modifying it to patch in the new routines.) In fact, the program won't even LIST properly. The first thing to do after pressing RUN/STOP-RESTORE is to enter SYS 51343 or POKE-1,PEEK(1) AND254. Either statement will switch out BASIC ROM and resurrect Color Plotter 64.

#### Program 1: Color Plotter 64

# **Apple II** Pull-Down Menus

#### Lee Swoboda

With this program, you can add attractive, Macintosh-like pull-down menus and instruction screens to any BASIC program. For all Apple IIseries computers with DOS 3.3 or ProDOS.

Apple's Macintosh has forced programmers to reevaluate software for the venerable Apple II. Recent Apple II programs go to some lengths to emulate the Mac's pulldown menus and icons to make the software less intimidating. No amount of programming magic will turn an Apple II into a Mac, but the following programs let you add pull-down menus and instruction screens to any Applesoft BASIC program.

Two programs are needed to make this happen: a BASIC subroutine you can easily add to the end of any BASIC program, and a machine language (ML) routine that temporarily saves and later restores the text behind the pull-down menu. Although BASIC takes several seconds to move an entire text screen. machine language performs the same task in an instant. Don't worry if you're unfamiliar with machine language. We've listed a BASIC filemaker program that automatically creates the ML routine for you.

#### **Starting Out**

To get "Pull-Down Menus" running, you need to type in and save both programs listed below. Program 1 is the filemaker program that automatically saves the ML routine to disk as a binary file named MOVE. Type it in and save a copy, then run it. Program 2 is an example BASIC program that demonstrates pull-down menus. It is designed to run with either DOS 3.3 or ProDOS. If you're using DOS 3.3, type the program exactly as shown. For ProDOS, change line 150 as shown here:

#### 75 150 HIMEN: 35840

Since this program loads the MOVE file from disk, be sure to put the right disk in the drive before you run it. Once you have it running, the program simulates a crude word processor with a screenful of text. You can type on the screen and move the cursor with the arrow keys (use CTRL-J and CTRL-K for the up and down cursor keys if you don't have a IIe or IIc). When you press the ESC key, the pull-down menu appears. Then you can move the selection cursor inside the menu with the cursor keys, and choose a selection by pressing RETURN. Note that the text behind the menu is always restored correctly when you leave the menu.

#### **Create Your Own Menus**

The important part of the demonstration program is the subroutine beginning at line 63000. This routine allows you to add pull-down menus to your own programs with a minimum of work: It generates the window shape and calls MOVE at the appropriate time. All you need to do is add lines 63000-63500 to the end of any BASIC program, and follow the steps listed below:

- 1. Your program must BLOAD MOVE as shown in lines 180-190 before calling the ML routine.
- 2. Set HIMEM *immediately* (line 150) before you declare any strings or open any files. Use a value of 36914 for DOS 3.3 or 35840 for ProDOS.
- 3. Set the variable NN to equal the maximum number of items you will have in the largest menu (line 160). The menu subroutine automatically determines how many items are in each menu and adjusts the size of the menu window accordingly.
- 4. DIMension the string array MM\$ for the number of menu selection labels you need (line 170). Then fill each array element with a label string, either by READing string DATA as in lines 200–220 or by defining each string expressly (with statements like MM\$(1)="Leave menu").
- 5. Define the string variable TITLE\$ as your menu title (line 470). The menu subroutine automatically centers the title for you.

6. Provide some means of branching to the rest of your program based on the value of the variable SELECT (line 480). This may be done with ON SELECT GOTO as in this program, or with ON SELECT GOSUB or a series of IF-THEN statements.

Lines 690–850 of the program show how to use MOVE to add instructions to your programs without losing the original screen. In this case, CTRL-I is used to request instructions.

#### **Using A Mouse**

If you have an Apple mouse, you can use it to call the menu and make selections. This requires several changes in the demonstration program. First, delete lines 320, 330, and 63360–63460. Then change lines 310, 450, and 63350 as follows:

```
E9 310 PRINT "PRESS ESC KEY OR M
OUSE BUTTON FOR MENU";
98 450 GOTO 311
66 63350 HTAB 3: VTAB SELECT + 2
: INVERSE : PRINT ">" C
HR$ (8);: NORMAL
```

Now add these lines:

- 02 235 PRINT : HOME : PRINT D\$"P R#2": PRINT CHR\$ (1): PRI NT D\$"PR#0" M 311 VTAB 15: HTAB 1: PRINT CH
- R\$ (13)D\$"IN#2" 55 312 VTAB 23: HTAB 40: INPUT "
- ";X,Y,BØ # 313 IF BØ = 1 OR BØ < Ø THEN
- 316 8/314 VTAB CV: HTAB CH: FLASH : PRINT " ";: NORMAL
- A8 315 GOTO 312
- C2 316 PRINT D\$"IN#Ø"
- 57 317 IF BØ = 1 THEN IN\$ = CHR\$ (27): GOTO 319 8F 318 IN\$ = CHR\$ ( PEEK ( - 163 84) - 128)
- 34 319 POKE 16368,0 10 320 VTAB CV: HTAB CH: PRINT "
- "; 77 395 IF CH > Ø THEN HTAB CH 79 396 IF CV > Ø THEN VTAB CV

- : PRINT " "; (9 63400 SELECT = Y0: IF SELECT
- > NITEMS THEN SELECT =
- 30 63410/ IF SELECT < 1 THEN SELE CT = 1 44 63420/ GOTO 63350
- 1 83429 GUIG 83339 1 63439 PRINT D\$"IN#0"

If you're using ProDOS,

change line 311 to the following:

# 311 VTAB 15: HTAB 1: PRINT D\$ "IN#2"

The PR#2 and IN#2 in lines 235, 311, and 63360 assume the mouse interface is in slot 2. If your interface is in another slot, substitute the appropriate slot number in those lines. If you have an Apple IIc, substitute PR#4 and IN#4 for PR#2 and IN#2 in those lines. (Although the IIc doesn't have physical slots, the mouse is in *logical* slot 4.) Once you've made all the changes, install the mouse and rerun the program. It works much as described above, using the mouse button instead of RETURN for menu selections.

For instructions on entering these listings, please refer to "COMPUTEI's Guide to Typing In Programs" published bimonthly in COMPUTEI.

## Using The Atari 130XE And DOS 2.5

The Atari 130XE is the first computer 32K in Atari's XE line and by far the least expensive 128K RAM computer on the market. Here's a guide to using tion

Making good on its promise to continue supporting the 8-bit line of computers first introduced in 1979, Atari recently brought out the 130XE, its most powerful 8-bit machine yet. Atari also started distributing free copies of its new disk operating system, DOS 2.5, to solve some compatibility problems between the single-density DOS 2.0 and the enhanced-density DOS 3.

the new features of the 130XE and the

latest version of Atari DOS.

Both products are evolutionary rather than revolutionary. DOS 2.5 bears a strong resemblance to DOS 2.0 and is designed to smoothly handle both Atari disk formats. Likewise, the 130XE has much in common with the XL series and original 400/800. Because the 130XE's internal operating system is virtually identical to the 800XL's, the 130XE works with all existing Atari peripherals and nearly all the software. Nevertheless, the 130XE does incorporate some features not found on earlier Ataris:

• 128K of Random Access Memory (RAM), with the extra 64K accessible by bank-switching in 16K banks. Without bank-switching, the amount of free memory for BASIC programs remains the same as on 48K and 64K Ataris—about Tom R. Halfhill, Editor

32K or 37K, depending on whether DOS is booted.

• A high-speed RAM disk option for the extra 64K when DOS 2.5 is booted with a special startup file. (A RAM disk is a disk drive simulated in memory; you can save and load files much faster with a RAM disk than with a conventional disk drive, although the contents of the RAM disk are erased when power is shut off.) The RAM disk can be disabled if you want to use the extra 64K for other purposes.

• Revision C Atari BASIC. The 130XE's BASIC has been cured of the infamous lockup bug that plagued the revision A BASIC cartridge sold for the 400, 800, and 1200XL, and the even-worse bugs that infested revision B BASIC in the 600XL and 800XL when Atari tried to fix revision A.

• Enhanced Cartridge Interface (ECI) for future expansion. The expansion connector found on the rear of the 600XL and 800XL has been slightly redesigned for the 130XE. The new ECI is supposed to be more versatile than the rarely used XL connector, allowing you to add faster disk drives, hard disks, and other devices—none of which have been announced, however. (Don't confuse the ECI with the ROM cartridge slot, which is fully compatible with cartridges made for older Atari computers.)

• Chroma and luma video outputs for sharper screen displays. This allows you to hook up the 130XE to video monitors with separate chroma and luma inputs for a much sharper image than with normal composite video. The old Atari 800 had this feature, but it was eliminated on later models.

#### **Dual-Personality DOS**

Before examining the 130XE's new features in greater detail, let's cover the new functions of DOS 2.5, since they affect all users of 8-bit Atari computers as well as 130XE owners.

First of all, if you don't have a copy of DOS 2.5, get one soon. Atari is shipping DOS 2.5 with 1050 disk drives and distributing it free through user groups, electronic bulletin boards, and the Atari forum on CompuServe. It is quickly replacing DOS 3 because it integrates the best features of existing DOS versions, is compatible with all Atari computers, and works interchangeably with both singledensity (810 format) and enhanced-density (1050 format) disk drives. (Of course, enhanced density disks are still unreadable on 810 drives.)

The new DOS menu is identical to the DOS 2.0 menu except for one extra feature: option P, Format Single. Since DOS 2.5 is a dualdensity DOS, it must be capable of formatting disks for both single density and enhanced density. Option P formats a disk in single density, leaving 707 sectors free (about 88K of storage). Option I, Format Disk, now defaults to *en*hanced density, leaving 1010 sectors free (about 126K). Also, one existing option has been slightly changed: Option J, Duplicate Disk, now formats the target disk before copying.

Three new utility files are included with DOS 2.5. The first, SETUP.COM, lets you customize DOS in various ways without the POKEs that used to be necessary. For instance, you can significantly speed up disk accesses by turning off the write-with-verify mode. You can also set up one of three AUTORUN.SYS files: the usual RS-232 handler for the 850 Interface Module; a file which automatically boots a BASIC program; or a file which boots both the RS-232 handler and a BASIC program.

The second utility, DISKFIX-. COM, can help clean up garbled disks by closing open files and verifying that allocated sectors correspond to information in the disk directory. It can even recover deleted files, as long as new data hasn't been saved over the deleted data. The third utility, COPY-32.COM, converts DOS 3 files to 2.0/2.5 format. All three utilities guide you with screen prompts and are nearly foolproof.

#### **New Disk Commands**

DOS 2.5 also makes a few additional disk commands available in BASIC. There are now two methods of reading a disk directory:

OPEN #1,6,0,"D:*.*":FOR X=1 TO 1E9:GET #1,A:? CHR\$(A);:NEXT X OPEN #1,7,0,"D:*.*":FOR X=1 TO 1E9:GET #1,A:? CHR\$(A);:NEXT X

The first method is the same as before. But the second method identifies files in the directory which cannot be accessed from DOS 2.0 because they occupy extra sectors on an enhanced-density disk. These files are flagged by a pair of less-than/greater-than symbols, such as <FILENAME.BAS>.

Also, there are now three ways to format a disk from BASIC: XIO 253,#1,0,0,"D1:" XIO 253,#1,34,0,"D1:" XIO 254,#1,0,0,"D1:"

The first XIO statement formats a disk in single density. The second formats in enhanced density (generating an error 139 if attempted on an 810 drive). The third XIO statement attempts to format in enhanced density, then switches to single density if the drive isn't 1050-compatible.

Incidentally, if you select option J (Duplicate Disk) with DOS 2.5 when using a 1050 drive, the disk is automatically formatted in the DOS command in BASIC. Usually this takes 10 to 20 seconds or more. But with DUP.SYS stored in the RAM disk, the DOS 2.5 menu comes up almost instantly when you type DOS.

Memory Location 54017 (130XE Only)

#### **Bit Position** Function

0	If 1, enable OS ROM, disable RAM from \$C000-\$FFFF (default)
	If 0, disable OS ROM, enable RAM from \$C000-\$FFFF
1	If 0, enable BASIC ROM at \$A000-\$BFFF (default)*
	If 1, disable BASIC ROM, enable RAM at \$A000-\$BFFF
2-3	If 00 (decimal 0), switch first 16K bank of extra 64K into \$4000-\$7FFF
	If 01 (decimal 4), switch second 16K bank of extra 64K into \$4000-\$7FFF
	If 10 (decimal 8), switch third 16K bank of extra 64K into \$4000-\$7FFF
	If 11 (decimal 12), switch fourth 16K bank of extra 64K into \$4000-\$7FFF
4	If 1, deny 6502 access to extra bank (default)
	If 0, allow 6502 access to extra bank
5	If 1, deny ANTIC access to extra bank (default)
	If 0, allow ANTIC access to extra bank
6	Not presently used. Default $= 1$ .
7	If 1, disable self-test ROM, enable RAM at \$5000-\$57FF (default after powerup)
	If 0, enable self-test ROM, disable RAM at \$5000-\$57FF
	ilar chart on page 122 of the 130XE Owner's Manual indicates uld always be set. However, bit 1 should not be set unless you

enhanced density before copying starts. Keep this in mind if you're duplicating a disk for someone who doesn't have an enhanced-density drive. Instead, you'll have to format the destination disk for single density (option P) and then copy the source disk one file at a time.

#### **Instant DOS**

want to disable BASIC.

The 130XE's extra 64K RAM can be used as either a superfast RAM disk with DOS 2.5 or as additional memory for programming. Of these two options, the RAM disk is by far the easiest to use, especially for those who aren't too familiar with bankswitching or bit manipulations.

The only accessory you need to set up a RAM disk with the 130XE is a free DOS 2.5 file called RAM-DISK.COM. When you boot DOS 2.5 on a 130XE, RAMDISK.COM automatically initializes the RAM disk and loads two DOS files: DUP.SYS and MEM.SAV DUP.SYS is the DOS utility package—the part that normally must be loaded from disk when you type The second DOS file stored in the RAM disk, MEM.SAV, temporarily saves the portion of BASIC memory that would be overwritten when you enter DOS. That means you can enter DOS and return to BASIC without losing your BASIC program.

DUP.SYS and MEM.SAV take up 87 sectors total, leaving the RAM disk with 412 free "sectors"—51.5K of high-speed (though temporary) storage. If you don't mind waiting for the DOS menu to load from disk as usual, you can delete DUP.SYS and MEM.SAV from the RAM disk to create 499 free sectors (62.3K).

You access the RAM disk by addressing it as drive 8 (D8:). For example, LOAD''D8:FILE-NAME.EXT'' or SAVE''D8:FILE-NAME.EXT'' Almost all DOS commands work, too: Disk Directory, Delete File, Rename File, Copy File, Lock File, Unlock File, Binary Load, Binary Save, and Run At Address.

Duplicate File doesn't work because there's no way to swap disks with a RAM disk (use the two-drive Copy File command instead). Also, the Format Disk and Duplicate Disk commands sometimes cause strange results and should be avoided. For instance, if you erase DUP.SYS by deleting it or formatting the RAM disk, then replace it by duplicating a floppy disk that contains DUP.SYS, you might not be able to enter DOS from BASIC afterward.

Aside from these exceptions, the 130XE RAM disk seems to be very transparent; it's worked with everything we've tried. Although a RAM disk is no substitute for a floppy—it's at the mercy of power interruptions and system crashes it can make a world of difference when running disk-intensive applications, such as assemblers, compilers, database managers, mailing list programs, and word processors with linked files.

#### Like Memory In The Bank

Using the 130XE's extra memory for programming is a lot more difficult than using it as a RAM disk. For one thing, the 6502 microprocessor which is the central brain of 8-bit Atari computers was not designed to access more than 64K memory at a time. So even though the 130XE has 128K RAM, the 6502 is "blind" to the extra 64K.

Making the extra memory visible requires a technique known as *bank-switching*. A block, or bank, of memory in the regular 64K is temporarily switched off and replaced with a bank from the "hidden" memory. Under program control, banks can be switched in and out at will. It's sort of like reading a book and flipping between the page you're on and a footnote section in the back.

The 130XE organizes its extra 64K RAM into four 16K banks. Only one of these banks can be switched in at a time. When you're using the RAM disk, the RAM-DISK.COM file and DOS 2.5 handle these details for you automatically. But using this memory for other purposes means writing your own bank-switching routine in BASIC or machine language.

Bank-switching on the 130XE is controlled by memory location

54017 (\$D301 hexadecimal). This byte was previously reserved for port B of the Peripheral Interface Adapter (PIA), an input/output control chip. On the Atari 400 and 800, it's used for controller jacks 3 and 4, which have been eliminated on the XL and XE series. On the 1200XL, part of this byte controls the keyboard LEDs, which were dropped from the 600XL, 800XL, and XE series. On all XLs and XEs, location 54017 also lets you switch off the operating system and BASIC ROM to reveal the full 64K RAM underneath. On the 130XE, you can now flip other bits at this location to switch on any 16K bank of the extra 64K RAM into the address space from 16384 to 32767 (\$4000 to \$7FFF). See the accompanying table for a guide to this important address.

Notice that bits 4 and 5 control whether the 6502 and ANTIC chips can access the extra banks of memory. Some special applications may blind either chip from seeing the banks. Also note that the 130XE *Owner's Manual* contains errors on page 122 when explaining how location 54017 works. The location normally contains 241 when the RAM disk is booted and 253 otherwise, not 193; and all bits *except* bit 1 should be set for normal operations.

If you're an experienced machine language programmer, you shouldn't have any trouble manipulating the bits at location 54017. BASIC programmers won't have it so easy, because bit-flipping is rarely required in BASIC and Atari BASIC lacks bitwise operators. So try this formula:

POKE 54017,193+4*bank+16*mode

where bank is the 16K bank you want to select (0 = bank 1, 1 = bank 2, 2 = bank 3, 3 = bank 4) and mode chooses which chip has access to the extra banks (0 = 6502/ANTIC, 1 = ANTIC, 2 = 6502, 3 = neither).

A word of caution: One wrong POKE into this critical memory location could instantly disable the operating system or BASIC or both, triggering a hopeless system crash. The only recovery might be to switch the machine off and then on again, wiping out your program. So be careful when experimenting. ©

## Atari Animation With P/M Graphics Part 2

Robert J. Powell

Part 1 of this series introduced the basic concepts of Atari player/missile graphics and showed how to display all four player strips on the screen. This month, Part 2 demonstrates how to redefine players into any shapes you want and how to move them horizontally.

If you ran last month's example program, you saw the Atari's players as they really appear: four colored strips which are eight bits wide and taller than the screen. To really make use of player/missile graphics, your program must transform these featureless strips into shapes of your own design. It isn't a difficult task, though it helps if you have a grasp of binary numbering. But even if you know nothing about binary, we'll provide plenty of stepby-step examples so you can learn by experimentation.

First, run last month's program again. (For those who missed it, it's listed below as Program 1.) When the program finishes, you should see four colored strips at the right side of the screen and the READY prompt at the left. Don't press SYS-TEM RESET or any other keys for now; we'll illustrate how shapes are defined by changing one of these players in direct mode so you can see the effects immediately.

If you refer to the P/M memory map in Part 1, you'll notice that the memory area for the four players extends from PMBASE+1024 to PMBASE+2048. That's a total of 1,024 bytes, or 1K. (Remember, this program is using *single-line resolution* P/M graphics, so each of the four players is 256 bytes tall. If it were using *double-line resolution*, each player would be only 128 bytes tall, and player memory would extend from PMBASE+512 to PMBASE+1024.)

The numbers stored in this memory area determine the shape of each player. Right now, the memory area for all four players is filled with the number 255, POKEd there by line 90 of Program 1. The players appear as solid strips because 255 is the largest number which can be stored in a single byte. The key to defining a shape is to selectively display only parts of the player strip by POKEing numbers between 0 and 255 into the player's memory area.

#### **Building A Box**

Let's start by redefining the shape of player 0 (by custom, the four players are numbered 0 to 3). Referring again to the P/M memory map in Part 1, notice that player 0's memory extends from PMBASE+ 1024 to PMBASE+1280 (256 bytes). This is the target for our POKEs. In direct mode—that is, without a line number—type this line and press RETURN:

#### FOR X=PMBASE+1024 TO PM BASE+1280:POKE X,0:NEXT X

You should see the player 0 strip disappear. Why? Because this line POKEs 256 zeros into the memory area for player 0, erasing the 255s previously stored there. Notice that players 1, 2, and 3 remain unaffected.

Now let's restore part of the player 0 strip to make a simple shape. One by one, enter the following lines, pressing RETURN each time: POKE PMBASE+1152,255 POKE PMBASE+1153,129 POKE PMBASE+1154,129 POKE PMBASE+1155,129 POKE PMBASE+1156,255

Each time you press RETURN, you should see a hollow box taking shape where the player 0 strip used to be. If you examine the POKE statements, you'll notice that the first number in each statement is a memory address in the middle of the player 0 memory area. These addresses determine the shape's vertical position within the strip and therefore its vertical position on the screen.

The second number in each statement actually defines part of the box. Experiment by POKEing other numbers between 0 and 255 into these addresses (as well as other addresses in the player 0 memory area). Once you learn how these numbers are arrived at, you can create almost any shape you want. When a certain bit position in a player/missile strip is turned "on," it appears onscreen as a tiny dot. Bits which are turned "off" do not appear onscreen. To define a shape, then, you have to figure out which bits to turn on, add up the bit values of their positions, and POKE the resulting number into the appropriate memory address.

The accompanying figure makes this explanation more clear. It shows the bit pattern for a player defined as a happy face. The bit values are the numbers running across the top of the figure; notice now the values double for each bit position running from right to left.

The numbers running down the side of the figure are the *byte values*, or the sums of the bit values for each byte. To arrive at the byte values, you add up all the bit values for "on" bits in each row. For instance, the top row, or byte, has two bit positions turned "on": bits 8 and

#### Calculating byte values for a player shape.

#### **Patterns Of Bits**

The numbers between 0 and 255, when POKEd into a byte, represent *bit values* in the binary number system. These bit values translate directly into player shapes.

A byte contains eight bits, or positions. Each position has a different value ranging from 1 to 128. 16. Therefore, the byte value for that row is 8 + 16, or 24. The next byte has four bit positions turned "on": bits 4, 8, 16, and 32. Therefore, the byte value is 4 + 8 + 16 + 32, or 60. All the other byte values are determined in a similar fashion. These are the numbers you POKE into the player memory area

to make the shape appear.

To see this in action, press SYSTEM RESET and run Program 1 again. When it stops, fill the player 0 memory area with zeros using the FOR-NEXT loop as we did before. Then enter these lines, pressing RE-TURN after each one:

POKE PMBASE+1152,24 POKE PMBASE+1153,60 POKE PMBASE+1154,126 POKE PMBASE+1155,90 POKE PMBASE+1156,219 POKE PMBASE+1157,255 POKE PMBASE+1158,219 POKE PMBASE+1159,1195 POKE PMBASE+1160,102 POKE PMBASE+1160,102 POKE PMBASE+1162,24

Each time you press RETURN, another byte of the player shape should appear.

Try designing your own shape using a blank version of the grid in the figure. After coloring in each square to make the shape, add up the bit values to arrive at the numbers for your POKE statements. Remember that your shape can be only eight bits wide, but can be as tall as the screen.

#### **Storing Player Shapes**

When you're writing a program that defines player shapes, it's inconvenient to POKE the byte values into memory in direct mode, of course. Usually the byte values are stored in a DATA statement, retrieved by a READ statement within a FOR-NEXT loop, and then POKEd into memory.

To see an example, add these lines to Program 1:

```
XT X
100 FOR X=1 TO 11
110 READ A
120 POKE PMBASE+1152+X,A
130 NEXT X
140 DATA 24,60,126,90,219
,255,219,195,102,60,2
```

Line 90 clears out the player memory area with zeros. Lines 100–130 are the loop which READs the DATA in line 140. Notice that line 120 POKEs the byte values into the middle of the player 0 memory area. To define this shape as player 1, you could simply add 256 to this address; to define it as player 2, add 512; and to define it as player 3, add 768.

Missiles are defined in a similar way, with one important difference: Because each missile is only two bits wide, all four missiles share the same amount of memory as a single player. That means the bit patterns are two-bit slices of the grid in the figure. By referring to this figure and the P/M memory map in Part 1, you can see that missile 0 is defined by adding the bit values 1 and 2; missile 1 is defined by the bit values 4 and 8; missile 2 is defined by the bit values 16 and 32; and missile 3 is defined by the bit values 64 and 128.

Of course, with only two bits to work with, missile shapes are pretty limited. That's why they're used mostly in games as "bullets" fired by player shapes.

#### **Horizontal Animation**

By now you're probably wondering how to animate the shapes you've created. We'll tackle horizontal movement first because it's the easiest; we'll save vertical animation for Part 3 next month.

In Part 1 we mentioned that each player has a horizontal position register, a memory location which determines the horizontal placement of the player on the screen. These memory locations are 52348 for player 0, 53249 for player 1, 53250 for player 2, and 53251 for player 3. Line 80 of Program 1 POKEs these registers to group all four players together near the right edge of the screen. Any number from 0-255 can be POKEd into the registers, but the range of numbers which position the player on the visible part of the screen is only about 45 to 205.

Moving a player horizontally is as simple as POKEing different numbers into the appropriate position register. Add these lines to Program 1:

#### 100 FOR X=45 TO 205 110 POKE 53248,X 120 NEXT X

When you type RUN, this loop moves player 0 across the screen from left to right. By changing the register address in line 110, you can move any of the four players.

Missiles are moved horizontally like players; the four horizontal position registers for the missiles are at memory locations 53252 to 53255. To see the missiles onscreen, add these lines to Program 1:

- 85 POKE 53252,140:POKE 53 253,144:POKE 53254,148 :POKE 53255,152 96 FOR Y=PMPAGE1748 TO PM
- 90 FOR X=PMBASÉ+768 TO PM BASE+2048:POKE X,235:N EXT X

#### **One-Way Registers**

There's only one tricky detail to keep in mind when manipulating the horizontal registers-they are write-only memory locations, which means they can be POKEd but do not return useful values when PEEKed. This makes your programming more complicated, because you can't keep track of a player or missile's horizontal screen position merely by PEEKing its horizontal register. Instead, you have to set aside a variable for each object to store its horizontal position. Every time the object moves, your program must update the corresponding variable.

This technique is demonstrated in Program 2. It's a modified version of Program 1 that lets you move player 1 left or right with a joystick plugged into port 1. Notice how the variable P1 keeps track of the player's horizontal position. Also notice how player 1 moves over players 2 and 3, but beneath player 0. These different display priorities let your programs simulate 3-D graphics effects.

Try modifying Program 2 yourself to move the other three players. Be careful about moving the player too far off the edges of the screen, though—if the program tries to POKE a value smaller than 0 or greater than 255 into the horizontal register, it will crash with an error.

In Part 3, we'll cover a method of vertical animation and a few other details about player/missile graphics as well.

# Lightning Renumber For Atari

Raymond Citak

This fast, convenient utility renumbers any BASIC program. It runs on any Atari 400, 800, XL, or XE with at least 48K RAM.

If you write BASIC programs, you know how frustrating it can be to run out of space to insert program lines, especially when the program is nearly finished. Since Atari BASIC has no RENUMBER command, you may be forced to renumber dozens of lines manually, creating the risk that you'll inadvertently delete or misnumber a line. "Lightning Renumber" removes that worry and saves a lot of time, too. It can handle any Atari BASIC program, and it renumbers internal line references as well as the lines themselves. Because it uses a machine language (ML) routine, it does the job in only a few seconds. But it's easy enough for anyone to use, even if you don't know anything about machine language.

Type in and save Lightning Renumber as listed below, then run it. The program offers two options. You can either write the ML routine as a binary (machine language) file to disk, or POKE it directly into memory. The binary file option is straightforward: After you designate the drive number, the program creates and locks a binary file named RENUMBER.OBJ on your disk. The binary file can then be loaded into memory and called with a USR statement (see below) whenever you like. If you don't have a disk drive, select the second option to POKE the ML into memory.

#### Call It With USR

Once the ML routine is in memory, enter NEW and load the BASIC program you want to renumber. Now you can call the ML routine by typing in a USR statement and pressing RETURN. The USR statement must include three numbers: the address of the routine (always 38900), the starting line number, and the line increment value. For example, the statement U=USR(38900,10,10) renumbers a program so the first line is 10 and the rest are numbered in increments of 10 (20, 30, and so on). To start with line 1000 and renumber in increments of 100, use the statement U=USR(38900,1000,100), and so on. When the message **RENUM-BERED** appears, the job is complete. At this point, you should resave the renumbered program.

The routine checks for several errors. First, it makes sure the renumbered program will not have line numbers above 32767. If the values you specify in the USR statement would create a line number greater than 32767, you'll get the

message ERROR — CHANGE YOUR USR ARGUMENTS. Enter a new USR statement with appropriate values.

Incorrect line references are detected as well. For instance, your program may contain the statement GOTO 300 when no line 300 exists. When such an error occurs, you'll see the message ERROR — LINE # MISMATCH. Mismatched line references (300 in this example) are replaced by 55555, and the rest of the program is renumbered as usual. When this error message appears, you must LIST the program and change any 55555 line references to the correct line numbers before resaving the program.

TRAP statements (except for TRAP 40000) are also renumbered by this routine. However, it cannot change *computed* line references (GOTOs or GOSUBs that use a variable to refer to a line number). If your program uses computed line references, LIST the program and change them yourself after the rest of the program is renumbered.

#### **Possible Memory Conflicts**

Although Lightning Renumber is designed to be reliable, it's possible to disrupt it by running BASIC programs. The ML normally resides in high memory just beneath the display list in GRAPHICS 0. Running a BASIC program that's very long or that uses the same memory area for other graphics modes, playermissile data, etc., may overwrite and destroy the ML. When that occurs, trying to call the routine may crash the computer (and destroy your program). When in doubt, save your BASIC program and reload the binary file (RENUMBER-.OBJ) trom disk; then reload the BASIC program and call the routine with USR.

If you use this routine frequently, you may want to include the USR call within the BASIC program itself. Since line 32767 will never be renumbered, place the USR statement in that line. Then you can renumber the program at any time by entering GOTO 32767.

You could also create an AUTORUN.SYS file that loads Lightning Renumber into memory automatically when the disk is booted. If you already have an AUTORUN.SYS file on the disk, you can append the renumber file to it from the DOS menu. Choose the Binary Save option, then type in AUTORUN.SYS/A,97F4,9BFF. Lightning Renumber will be appended to the existing AUTO-RUN.SYS file and will load automatically when you boot that disk.

If you want to save typing, send a blank disk or tape, a selfaddressed postage-paid mailer, and \$3 to:

Raymond Citak 1514 Park Avenue Laramie, WY 82070

Special thanks to W. A. Bell for his useful line dump routine which appears in COMPUTE!'s First Book of Atari.

The World Inside the Computer

Fred D'Ignazio, Associate Editor

### More Adventures Of Junior, The Robot

Last month I described the trials of traveling across the country with a personal robot ("A Robot Toddler," September 1985). Among other things, my Heath HEROjr—nicknamed Junior—had panicked in the coat closet of a jetliner and started screaming for help, alarming some of the passengers.

We finally got Junior quieted down again, but more incidents were to follow. When we reached Chicago's giant O'Hare Airport, I suddenly realized that our connecting flight was at the opposite end of the terminal. Would I have to walk Junior clear across the airport? Luckily, two porters came to my rescue and pointed out a luggage cart I could rent for only a dollar. A moment later Junior and I were sailing along the corridors of O'Hare. Junior was perched high on the front of the cart singing "Summer-time! Summertime! Sum-sumsummertime!" Meanwhile, I was pushing the cart like a good rickshaw boy and warning people, "Watch out for the robot! Please clear the way! The robot's trying to catch a plane!"

#### **Drinks For Junior**

I always tried to keep Junior quiet when loading him on a jet. I felt the best strategy was to keep a low profile so nobody would have second thoughts about flying with a robot. But it was no use. It's like accompanying Michael Jackson and expecting no one to notice. Everyone on board always seems to be aware of Junior. And everyone seems to delight in teasing me about him.

For instance, after stowing Junior in the closet and collapsing in my seat, a man came up and said, "Your robot just woke up and left the plane!" I leaped to my feet, alarmed, and he pushed me gently back down. "Just kidding," he said. Another time, a flight attendant brought me a soda and a glass of champagne. I had ordered the soda, but not the champagne. "The champagne's for Junior," she explained, "compliments of the captain."

After one long flight, I headed for the men's room as soon as we landed. Naturally, I carried Junior along. Behind me, a number of men who were on the same flight saw us enter the men's room. They began laughing and followed us. "This I've gotta see," said one. I turned around and gave him a look of disapproval, then disappeared into one of the stalls. After all, even a robot deserves his privacy.

#### Is He Alive Or Isn't He?

Often, while waiting around to board a plane, I would set Junior on the floor, wake him up, then step back and quietly observe people's reactions.

It was fascinating. I loved to see the childlike curiosity and playfulness Junior would evoke in adults. And it was amazing to see the paradox Junior created in the adults' minds. I could almost see them wondering, "Is he alive, or isn't he?" And, "If he isn't alive, why does he seem to be alive?" This ambiguity seemed to create a tension in many people's minds that found its outlet in jokes about Junior being my son.

I observed another paradox as well. They seemed to ask themselves, "Is this machine a friend or an enemy? Is he here to help us do our jobs, or will he take our jobs away?"

The person who asked these questions the most simply and eloquently was the elderly cabbie in Roanoke, Virginia, who drove Junior and me back to my house at the end of our journey. The cabbie was fascinated by Junior and drawn to him, but his fascination was mixed with a pinch of fear. He began speculating about robots like Junior becoming humanlike and driving taxicabs. "If robots can do everything a man can," he said as he spat out the window, "we ought to hang it up." However, after some more thought, he decided: "There are just too many complications for a robot to be a good cab driver." And, referring to the possibility of robots getting out of control and taking over, he remarked, "There's more than one way to shut them off!"

The cabbie's fascination and affection for the robot ultimately won out over his fear. He pulled up in front of my house and turned around to face me and Junior. "You know something?" he said. "I sort of like that old box."

#### **Time For A Recharge**

When the cabbie dropped us off at the end of our trip, we were happy to be home and totally exhausted. We had traveled almost 7,000 miles together, and we had remained the best of friends in spite of crowded airports, grilling from customs officials, and Junior's tendency to wander off when I wasn't looking.

But now our trip was over, and boy, were we tired! The suitcases, computers, and Junior were sprawled across the front yard, and I was so groggy that I reclined on the grass for a little catnap.

I had just closed my eyes when, in a weak little voice, Junior pleaded, "Please charge my battery." Then he began mumbling a song: "All good robots sing this song: Doo Dah! Doooooo...."

"Okay, Junior," I said, getting up. "You win." I hefted the little robot on my shoulder and carried him into the house.

Five minutes later the two of us were fast asleep.

Computers and Society

### Of Babbages And Things

Computer jargon and concepts have permeated our language in strange ways. This came home to me one night when I heard a caller on a talk show say that she had trouble "interfacing" with her partner. I guess this is just a reflection of the pervasiveness of computer technology. Every new technology spawns its own vocabulary, and computers are no exception.

In fact, the computer industry has provided us with both a rich assortment of words and a rich collection of concepts that alter how we think about our world. While the words of technology wax and wane in popularity, the concepts are longer-lived. This gives us the chance to misjudge the newness of a concept we have just learned. When this happens, a brief look at history often shows that what we thought was new was known a long time ago. I got caught in one of these historical time warps last spring. I was teaching a graduatelevel computer course at Stanford University and had introduced a model of program design that I called a *microworld*.

To my way of thinking, microworlds are made of two kinds of things—objects and operators. The objects have certain attributes, and the operators work on these objects to create new instances of them. These new instances may inherit some or all of the attributes of the old objects. Sound like gobbledygook? Read on.

For example, the microworld of arithmetic contains objects we call numbers. These numbers have attributes (they may be integers, decimals, imaginary, etc.). The operators for arithmetic include addition, subtraction, multiplication, and so on. These operators combine the number objects to produce new numbers. Notice that this way of thinking about arithmetic has nothing to do with computers.

#### **Computer Microworlds**

Because we have devised ways to represent both numbers and their operations inside computers, the microworld of arithmetic is a suitable domain for implementation in a computer. Of course, the arithmetic microworld is not the only one we have. For example, word processing is a microworld which contains letters as objects and insert and delete as operators.

What I like about this concept is that it provides a framework for creating flexible computer programs in nearly any domain. To build a microworld, one has to identify the objects and operators, and then build representations of these in the computer using a suitable programming language.

I thought this way of looking at programming was fairly new, but I soon received the shock of my life while reading a collection of papers about Charles Babbage and the Analytical Engine—a nineteenthcentury predecessor to the digital computer. At the end of one article translated into English by Ada Augusta, Countess of Lovelace, were some notes added by the Countess:

In studying the action of the Analytical Engine, we find that the peculiar and independent nature of the considerations which in all mathematical analysis belong to operations, as distinguished from the objects operated upon and from the results of the operations performed upon those objects, is very strikingly defined and separated. It is well to draw attention to this point, not only because its full appreciation is essential to the attainment of any very just and adequate general comprehension of the powers and mode of action of the Analytical Engine, but also because it is one which is perhaps too little kept in view in the study of mathematical science in general.

Here was my microworld model, described by Ada Augusta in 1842!

#### So Much For Arithmetic

Lest you think she had only mathematics on her mind, she went on to say:

By the word operation, we mean any process which alters the mutual relation of two or more things, be this relation of what kind it may. This is the most general definition, and would include all subjects in the universe.

In fact, she went on to point out that the Analytical Engine was capable of symbolic computation and was not restricted to numerical analysis. This capability came from the fact that the programs in the Analytical Engine (coded on punch cards) not only contained the values of variables, but also the sequence of commands and operations to be performed. The Analytical Engine had what we call today an instruction set. These primitive instructions allowed values to be read and saved to memory (which Babbage called the store), and a series of basic operations, such as addition, which were carried out in the central processing unit (which Babbage called the mill). The punch cards contained what we would call machine language programs.

The Analytical Engine embodied the basic concepts of today's computers, but nineteenth-century craftsmen lacked the technology to build it. Though it was not constructed in Babbage's lifetime, his dreams and Ada's ideas finally came to light a century later.

So the next time you toss computer jargon into your conversation to be trendy, remember that you might be reflecting on the trends of some British inventors in the 1800s! Telecomputing Today

Arlan R. Levitan

## The Latest Developments

AT&T Technologies and Bell Atlantic have been testing a new modem that works at 2400 bits per second (bps) since July of this year. The CTS-1620 will debut some time in 1986 and be pegged between \$1,600 and \$2,600. Why the relatively steep price tag? The CTS-1620 will be the communications giant's first *cellular* modem.

The testing is being conducted in the Baltimore-Washington, D.C. area and includes users in several government agencies, banks, insurance companies, and real estate agencies. The cellular modem requires a cellular telephone and transmitter, as well as an input/display device. While the majority of initial buyers are expected to be lap computer owners, reliable sources within Ford Motor Company report that prototypes of a builtin dash terminal are being readied for trials late next year.

Although the CTS-1620 will be AT&T's first cellular modem, two lower-speed cellular units are already available from other companies. Motorola offers a 300 bps modem for \$195, and Spectrum Cellular has a 1200 bps modem that goes for \$695. Few details are available on the free-wheeling AT&T modem, but you can bet your seatbelt that by definition it will have "auto-answer" and "auto-dial."

#### **Better Than Gorillas**

The Source information service added 2400 bps access in August, with surcharges far lower than had been anticipated by industry watchers. Subscribers with 2400 bps modems pay \$1.80 and \$1.20 premiums for prime and nonprime time, respectively. With 1200 bps service priced at \$25.80 and \$10.80 for the same time periods, users are said to be moving to the higherspeed modems in droves.

Prices for 1200 bps modems continue to plummet. Cermetek of

Sunnyvale, California has announced the Infomate 1200-TPC, an internal "bare minimum" Hayes-compatible modem for the IBM PC priced at \$198. Cermetek isn't alone in the under-\$200 market. A recent issue of a popular electronic hobbyist publication contained several advertisements for stand-alone Hayes compatibles, with prices as low as a \$129 kit version for those bold enough to wield a soldering iron.

And 300 bps modems for under \$50—including software—are springing up like mushrooms after three days of rain. I fully expect them to be given out as party favors at upscale kids' birthday parties. Tacky? It's a definite improvement over singing gorillas with balloons.

The 2400 bps market is heating up as well. With industry leader Hayes at \$895 and the bulk of its competitors at \$795, U.S. Robotics (the manufacturer of Apple's 300 and 1200 bps modems) raised more than a few eyebrows when it dropped the list price of its Courier 2400 to \$695. Hats off to U.S. Robotics not only for lowering prices, but also for a number of "now why hasn't somebody else done that before" features of the Courier.

#### The Speed Of Choice

Here are some examples. Ever lose the "handy" reference card of commands that comes with most modems? The bottom of the Courier is imprinted with a complete command and register summary as well as an RS-232 pin assignment cheat sheet. If you're too lazy to turn the modem over, there are three separate full-screen help displays that can be called up while online. Also directly accessible on the bottom of the unit are DIP switches for changing the default settings, and a sliding volume control that (unlike those on some modems) can actually be manipulated by human beings to control the internal speaker.

U.S. Robotics is working closely with system operators of computer-based bulletin boards to encourage 2400 bps. A special acquisition deal available to operators of heavily trafficked systems is rapidly making 2400 bps the speed of choice for serious telecomputerists. (If you're a system operator who'd like more information on the U.S. Robotics program, contact the company at 8100 North McCormick Boulevard, Skokie, IL 60076.)

The rapid move to 2400 bps seems to have caught some people unawares, however. During a recent visit to Atari Corp. in Sunnyvale, I was pleasantly surprised to find that the new ST series of computers includes a terminal emulator as a standard desktop accessory. But I was even more surprised when I opened its configuration menu and was presented with choices of 300, 1200, 4800, or 9600 bps. Something was missing—apparently an oversight.

"What happened to 2400?" I asked. The person showing me the ST managed to minimize his look of distress to a few nanoseconds. "Hmmmm...I'll have to write that one down," he said. "Hey, look at this graphics demo...."

Atari's 4800 and 9600 bps options indicate that some companies are looking far beyond 2400 bps, though. If 2400 bps isn't fast enough for you, how about 10,000 bps—over regular phone lines? Digital Communications Associates of Alpharetta, Georgia has unleashed both internal (\$1,995) and external (\$2,395) modems, dubbed DCA Fastlinks. Even more of a mouthful than the Fastlink's speed is the proprietary DCA protocol it uses, called Dynamically Adaptive Multicarrier Quadrature Amplitude Modulation, or DAMQAM for short. And I thought that was an engine problem.

# Games People Play

In February I wrote about a new adventure game called King's Quest—and about a million of you wrote back asking me for the dwarf's name. Now the sequel is out. Sierra On-Line has just published King's Quest II: Romancing the Throne, and it is every bit (sorry) as challenging as the original game.

Playing the role of Sir Graham—now King Graham in the sequel—you can move through 93 three-dimensional animated screens looking for your true love, the fair maiden Valanice. But before you can find and rescue her, you must swim with a mermaid, bargain with an antique dealer, pray with a monk, and defy the curse of Dracula. Yes, there's even a mushy kissing scene at the end. To accumulate points, you have to solve such problems as crossing the poison lake surrounding Dracula's castle—although the points are secondary to rescuing Valanice. Like the original King's Quest, the game is full of hidden goodies: If you visit the entrance to the Hag's cave often enough, occasionally a Batmobile comes roaring out. (If you keep falling through the bridge, write and I'll tell you why.)

Ken and Roberta Williams, the husband-and-wife founders of Sierra On-Line, live in the foothills of the Sierra mountains in a real stone castle—complete with spiral stairs, three hot tubs, and a racquetball court. (Incidentally, the most technically difficult part of Kings Quest II was to program King Graham realistically winding his way up the castle's spiral stairs.) Roberta writes and draws the storyline on a giant sheet of paper, and Ken works with a group of programmers to turn her ideas into computer language and a finished game. Then Ken's brother John helps promote the product he's the director of public relations (and he lives in a conventional house).

If you've never played an adventure game, and are reluctant to part with \$49.95 to try King's Quest II, check around for a free demonstration disk. Instead of spending a lot of money running advertisements, Sierra On-Line has produced 15,000 incomplete versions of KQII and shipped them to dealers and computer clubs across the country. If you like the demo, you'll love the game.

King's Quest II runs on all IBM PCs, PCirs, and most compatibles with 128K RAM, one disk drive, and a color monitor. (An Apple II version is under construction.) This is one game that no PCjr owner will want to be without; the color and sound are excellent.

#### Climbing The Money Tree

If galloping around 93 screens in search of a maiden isn't your idea of fun, then how about slogging through 77 weeks' worth of financial data in an attempt to make a million dollars?

Blue Chip Software creates games for the Walter Mitty in us. Millionaire is for wheelers and dealers on the New York Stock Exchange; Tycoon, for the commodity speculators; and Baron, for those who believe that the only sure way to millions is real estate. These games are available for the IBM PC family of computers, most compatibles, the Apple II series, Macintosh, and Commodore 64/128. The IBM version costs \$49.95; the others a little less.

Which of these games you'll want to play depends on your perspective and experience. I bought my first stock when I was 12 years old. The company promptly went bankrupt and my three-share certificate now graces my wall. How to invest in real estate has become the biggest TV-ad fad since how to grow hair on a bald head-and about as successful, I imagine. The only thing I know about cominodity speculation is that I shouldn't. Therefore, Tycoon was the game I chose to test my financial acumen.

Before you can begin Tycoon, the computer takes about four minutes to generate a unique trading environment from 300,000 possibilities. Once the environment is set, you are given \$10,000 and a list of 15 commodities to buy and sell.

Although I've never seen a soybean, and can't stand soy sauce, I selected them as a likely vehicle for my fortune. Somewhere I read that the way to play commodities is to pick one and stick with it-not to jump from wheat to pork bellies (yuck!) to heating oil. Apparently that is sound advice. By ignoring all other commodities and concentrating on soybeans, I parlayed my \$10,000 into \$1,082,598 in just 60 weeks. (If only I were so lucky in real life!)

But Tycoon is more than a game for those of us too chicken to buy real soybeans. Like Millionaire and Baron, it is an educational game which closely simulates actual economic situations and the workings of real markets. Blue Chip Software says these programs are used at all levels of instruction-from fifthgrade economics classes in the Chicago Public Schools to college courses at Penn State and Southern Illinois University.

It's true, you will learn about interest, commissions, taxes, margins, short-selling, and options, but these games may not make you a more successful investor. They may have just the opposite effect. Once you see how easy it is to make money, once you think you've mastered the technique, you may be tempted to mortgage the house and play in the real world. But before you do, give me a call. I've got a tonic guaranteed to grow hair .... @

# Atari Disk Drive Compatibility

Way back in 1978, when Atari announced the double-density 815 disk drive, Percom Data Corporation saw the prototypes displayed at several shows and decided it could easily build a better drive which would sell for less.

Because Percom produced both single- and double-sided disk drives using both single and double density, and because it wanted to maintain compatibility with both the single-density 810 and doubledensity 815 drives, Percom invented the configuration block (more on this below). With some cooperation from a small, brand-new software company (wonder who that could be) which had inherited the source code rights to Atari's File Management System (FMS), Percom succeeded in establishing standards which have been adhered to by all other Atari-compatible drive manufacturers. All Atari-compatible drive manufacturers except one, that is: Atari. Before the 815 even hit the market, Atari dropped it from the product line. Years later, in 1984, Atari introduced the "enhanced density" 1050, which is actually somewhere between singleand double-density. Sigh.

As of this writing, the following drives and/or modification kits are known to be capable of understanding the Percom-standard double-density mode and configuration table: Percom, Indus, Amdek, Astra, Trak, Rana, SWP (ATR-8000), Happy Doubler, and ICD's US Doubler.

#### The Percom Config Block

As defined by the Percom standard, a config block is a set of 12 bytes within the memory of the disk control microprocessor—which is inside your disk drive(s). You read a drive's config block by passing "N" to it as an SIO command. You can write a new config block to a drive via an "O" command. The "N" and "O" commands closely parallel the "R" and "W" sector input/output commands, except the data length is always 12 bytes and no sector number is needed. The 12 bytes in the block are shown in the table.

#### Byte # # of Description

	Bytes	
0	1	Number of Tracks
1	1	Step Rate
2-3	2	Sectors per Track
4	1	Number of Sides or Heads
5	1	Density (0=Single, 4=Double)
6-7	2	Bytes per Sector
8	1	Drive Selected?
9	1	Serial Rate Control
10-11	2	Miscellaneous (reserved)

This table requires some explanation. First, all the double-byte values are in high-byte/low-byte order, the opposite of normal 6502 practice (because that's how the microprocessor Percom used in their drives worked). Also, not all these values have meaning to all manufacturers. In fact, some don't allow you to change more than two or three of the values listed here.

The Step Rate controls the speed of a drive's head stepping motor, and the values used here have no universal meaning. A step rate of 2 may mean 6 milliseconds per track to one drive, 20 milliseconds per track to another, or be illegal to yet another.

Number of Sides is actually one less than the actual number. So most drives use a zero here, meaning one head.

Changing the value of Drive Selected may turn the drive off as far as the computer is concerned. Percom must have had its reasons for this, but I don't know what they were.

#### Changing The Config Block

For the Density byte of the config block, I don't know of any drives which use values other than 0 (FM mode, single density) or 4 (MFM mode, double density). If you find a drive that actually *uses* some other value (not just ignores it), let me know.

The Serial Rate Control value and Miscellaneous bytes have no universal meanings. Some drives will remember these values if you change them; other drives ignore your values.

So that leaves Number of Tracks, Sectors per Track, and Bytes per Sector, all of which should be self-explanatory. Again, though, many drives ignore values outside certain legal ranges. Indus drives, for example, reject any changes to the number of tracks or sectors. In fact, Indus pays attention only to the Bytes per Sector and the Density bytes. Experiment with your own drive(s). See what they will and will not allow. And even if they seem to allow a change, do they execute it or ignore it? (Fun, if you're a masochist, right?)

And just how do you read and/or change the config block? Have a look at the BASIC program following this column. It should be pretty much self-explanatory. You can use the subroutines at 8010, 8210, and 9010 in your own programs. Remember what we said at the beginning, however: Atari drives do not follow the Percom config block standard. As a result, this program works only on Ataricompatible disk drives, not on the Atari 810 or 1050.

#### **Configuration Block Modifier**

For instructions on entering this listing, please refer to "COMPUTEI's Guide to Typing In Programs" published bimonthly in COMPUTEI.

Tom R. Halfhill Editor

# **Clearing Up Variable Cloudiness**

If you're just learning to program, variables can be confusing at first especially because there are so many varieties of variables. Last month's column introduced the concept of numeric variables. But, depending on your computer's BASIC, there are also integer variables, double-precision variables, string variables, numeric array variables, and string array variables. This month we'll cover integer variables and tackle the rest later.

Numeric variables, you'll recall, represent ordinary numbers. For instance, you can store the number 10 in the variable X with the BASIC statement X = 10. Numeric variables can represent fractions just as easily, as in X = 98.6. An integer variable is similar, but with one important difference. As the term implies, integer variables can only represent *integers*—whole numbers. Fractions like 98.6 aren't allowed. There's one other limitation, too. In most BASICs which allow integer variables, the value cannot range beyond a maximum of 32,767 or a minimum of -32,768.

At first, these restrictions may seem odd. What's the advantage of limiting a variable to a whole number, and especially a whole number within a relatively narrow range?

The answer has to do with the way computers manipulate numbers. Internally, they use the binary numbering system instead of our everyday decimal system. Translating decimal numbers into binary gets tricky when the decimal number is a fraction, or *floating point* number (so-called because the decimal point can "float" to the left or right, as in 98.6 or 9.86). The conversion process requires a few valuable microseconds, and it takes several bytes of memory just to store a single floating point number.

#### Are Integers Faster?

Integer variables can greatly simpli-

fy matters for a computer. Because fractions aren't allowed, the operating system doesn't have to spin its wheels performing lengthy floating point conversions. And when the integers are limited to a range of -32,768 to 32,767, each number can be stored in only two bytes of memory.

Saving a few bytes of memory isn't a terribly important consideration anymore, now that nearly all personal computers come with at least 64K of RAM. But on certain computers, integer variables *can* help your programs run faster often significantly faster.

In Commodore BASIC, Applesoft, and IBM BASIC, you declare an integer variable by appending a percent symbol (%) to the variable name, as in X% = 10. (Integer variables are not available in TI BASIC or Atari BASIC, but are supported in Atari Microsoft BASIC.) A common mistake is to accidentally omit the % symbol in a statement somewhere, often leading to a mysterious error or unexpected result. Keep in mind that two variable names such as X and X% are treated by the computer as completely separate variables-they can store independent values and are as different as A and Z.

To test the performance of integer variables versus regular variables on your computer, enter this simple program:

- 10 FOR X=1 TO 32000
- 20 Y = Y + 1
- 30 NEXT X
- 40 PRINT Y

Use a watch to measure how long this program takes to execute. Jot down the result, then change all three occurrences of Y to integer variables by adding the % symbol. Now run the program and time it again.

#### **Surprising Results**

What happened? If you have an

IBM PC or PCjr, the program should run measurably faster. But if you have a Commodore or Apple, the program actually runs *slower*. What's going on?

Integer variables are indeed faster and more memory-efficient on IBM computers. But on Commodore and Apple computers, integer variables actually execute slower and consume just as much memory as regular variables. This is true even though all three computers have versions of Microsoft BASIC. The reason is that the math routines in the Commodore and Apple are designed to handle floating-point numbers only. Therefore, the computer must convert integer variables into floating-point values, perform the math requested by the program, and then convert the results back into integers. All this conversion takes so long (in computer terms) that integer variables really aren't any faster than regular variables on Commodore or Apple computers.

It would seem, then, that integer variables are useless if you have a Commodore or Apple. But in fact, they can speed up your programs and save memory when used to construct *arrays*—a future column topic.

In the meantime, let's clear up another mystery raised by the above program. If you examine it closely, you might wonder why converting Y to Y% makes it run faster even on the IBM. Since the FOR-NEXT loop is incrementing Y by steps of one, Y is never a fraction, anyway—it's always a whole number. But computers handle all numeric variables as floating point numbers, even when the value is a whole number and not a fraction. Defining a variable as an integer variable forces the IBM to treat it as an integer. (Ô

Modifications or Corrections To Previous Articles

#### **Commodore Disk 64** Commander

A character was smudged in the listing for this disk utility program from the September issue. Line 3315 (p. 82) should read as follows:

3315 :168,160,000,177,098,153,231

Also, the DOPEN command example for relative files (p. 81) is incorrect. The record length must be specified outside the quotes surrounding the filename, not within the quotes as shown. Thus, the example for opening a relative file named TEST with a record length of 20 characters should read:

DOPEN#1,"TEST",L20

#### **Commodore 64 Headliner**

The large characters displayed by this program from the August issue | routine to your own programs, you

(p. 72) do not have the desired color on newer 64s, and are invisible on older 64s which do not fill color memory. This is because the variable G, which is defined in line 100 as the address of the start of color memory and intended for use in line 530 to color the large characters, is redefined when it is used for another purpose in lines 200 and 220. There are several possible solutions to this problem, the simplest of which is to change the G in lines 200 and 220 to some other variable:

200 PRINTCHR\$(147)TAB(125)"DOW NLOADING THE CHARACTER SET ':C=53248:GN=12288:rem 114 220 POKE 56333,127:POKE1,51:FO R Q=ØTO1023:POKEGN+Q,PEEK( C+Q):NEXT :rem 85

When adding the "Headliner"

should make sure that your program does not use any of the variables in the main subroutine (lines 500–550) for any other purpose. The variables are P, L, X\$, G, CC, and SL.

# Machine Language Entry Program For Commodore 64 Charles Brannon, Program Editor

MLX is a labor-saving utility that allows almost fail-safe entry of machine language programs published in COM-PUTE!. You need to know nothing about machine language to use MLX—it was designed for everyone. At least 8K expansion memory is required.

MLX is a new way to enter long machine language (ML) programs with a minimum of fuss. MLX lets you enter the numbers from a special list that looks similar to BASIC DATA statements. It checks your typing on a line-by-line basis. It won't let you enter illegal characters when you should be typing numbers. It won't let you enter numbers greater than 255 (forbidden in ML). It won't let you enter the wrong numbers on the wrong line. In addition, MLX creates a ready-to-use tape or disk file.

#### **Using MLX**

Type in and save the appropriate version of MLX (you'll want to use it in the future). When you're ready to type in an ML program, run MLX. MLX for the 64 asks you for two numbers: the starting address and the ending address. These numbers are given in the article accompanying the ML program.

When you run MLX, you'll see a prompt corresponding to the starting address. The prompt is the current line you are entering from the listing. It increases by six each time you enter a line. That's because each line has seven numbers—six actual data numbers plus a *checksum number*. The checksum verifies that you typed the previous six numbers correctly. If you enter any of the six numbers wrong, or enter the checksum wrong, the computer rings a buzzer and prompts you to reenter the line. If you enter it correctly, a bell tone sounds and you continue to the next line.

MLX accepts only numbers as input. If you make a typing error, press the INST/DEL key; the entire number is deleted. You can press it as many times as necessary back to the start of the line. If you enter three-digit numbers as listed, the computer automatically prints the comma and goes on to accept the next number. If you enter less than three digits, you can press either the space bar or RETURN key to advance to the next number. The checksum automatically appears in inverse video for emphasis.

To simplify your typing, MLX redefines part of the keyboard as a numeric keypad (lines 581–584):

-	I	-				8	
			become	0	4	5	6
Μ	,				1	2	3

#### **64 MLX Commands**

When you finish typing an ML listing (assuming you type it all in one session), you can then save the completed program on tape or disk. Follow the screen instructions. If you get any errors while saving, you probably have a bad disk, or the disk is full, or you've made a typo when entering the MLX program itself.

You don't have to enter the whole ML program in one sitting. MLX lets you enter as much as you want, save it, and then reload the file from tape or disk later. MLX recognizes these commands:

SHIFT-S: Save SHIFT-L: Load SHIFT-N: New Address SHIFT-D: Display

When you enter a command, MLX jumps out of the line you've been typing, so we recommend you do it at a new prompt. Use the Save command to save what you've been working on. It will save on tape or disk, as if you've finished, but the tape or disk won't work, of course, until you finish the typing. Remember what address you stop at. The next time you run MLX, answer all the prompts as you did before, then insert the disk or tape. When you get to the entry prompt, press SHIFT-L to reload the partly completed file into memory. Then use the New Address command to resume typing.

To use the New Address command, press SHIFT-N and enter the address where you previously stopped. The prompt will change, and you can then continue typing. Always enter a New Address that matches up with one of the line numbers in the special listing, or else the checksum won't work. The Display command lets you display a section of your typing. After you press SHIFT-D, enter two addresses within the line number range of the listing. You can abort the listing by pressing any key.

# Sprites In TI Extended BASIC

Since this month's COMPUTE! is a game issue, let me remind you that COMPUTE!'s First Book of TI Games is still available. It offers a variety of games that do not require TI Extended BASIC.

Eventually, however, game programmers usually want the Extended BASIC command module because it adds several programming features, including up to 28 *sprites* (smoothly moving screen objects). With one statement you can define a sprite and set it in continuous motion. For example, try this short program:

```
100 REM TI EXTENDED BASIC

110 REM SPRITE DEMO

120 DEF R(X)=INT(X*RND)

130 CALL CLEAR

140 FOR S=1 TO 28 :: RAND

OMIZE

150 CALL SPRITE(#S,64+S,R

(15)+2,90,128,R(255)-

127,R(255)-127)

160 NEXT S

170 GOTO 170
```

```
180 END
```

This month's main program, "Sprite Tester," offers a way to test your sprites before putting them into a program of your own. After it displays a sprite on the screen, it lets you change various characteristics of the sprite by entering different numbers. You may experiment as much as you wish. When you have the sprite moving as you want, simply jot down the CALL SPRITE statement shown at the bottom of the screen.

#### **Designing The Sprite**

To get started, type in and run Sprite Tester. Choose a magnification factor from 1 to 4. (A regularsize character is magnification 1 and a four-times size is magnification 2. Magnification 3 is made up of four regular-size characters, and magnification 4 is four large characters.)

Next choose a character number from 33 to 95—one of the char-

acters from the regular ASCII character set. If you prefer to use your own graphic character, insert a CALL CHAR statement to redefine a character.

You may then choose a sprite color. Since 1 is transparent (the screen color), you must choose a color number from 2 to 16. If you choose color 8, the screen changes so you'll be able to see the sprite. All other colors use the cyan background screen.

Next choose a dot row and dot column position from which the sprite should start moving. Then, to move the sprite, select a row velocity and column velocity. Since these may be positive or negative numbers, first choose + or -, press ENTER, then pick the number and press ENTER again. If you want to experiment with the position of the sprite, keep the row velocity and column velocity at +0. Otherwise, the sprite will be in motion, and you may not be able to see the dot row and dot column changes.

As you enter parameters, the CALL MAGNIFY and CALL SPRITE statements at the lower part of the screen show the sprite's present conditions. The program continues until you press FCTN-CLEAR.

#### Extended BASIC Features

Extended BASIC contains a number of statements which make programs such as Sprite Tester easier to write. The DISPLAY AT statements, for instance, allow you to print at a specified row and column. USING helps to format output, right-justifying numbers in this case.

The ACCEPT statement is quite versatile for accepting input. BEEP sounds a tone when the computer is waiting for the input. AT() lets you receive the input starting at a certain row and column on the screen, and SIZE limits the input to a specified number of characters. VALIDATE allows you to specify what characters are acceptable as input. To erase or change before you press ENTER, you can press FCTN-ERASE. Unfortunately, if you enter something wrong, an error message appears and the printing on the screen starts to scroll. Afterward, the cursor may not be lined up with the original question.

Unlike Console BASIC, Extended BASIC lets you follow THEN and ELSE in IF statements with either a line number or a command.

The CALL SPRITE statement specifies the sprite number, the character number for the sprite, the foreground color, the beginning dot row and dot column positions, and the row velocity and column velocity.

CÁLL MAGNIFY sets the magnification factor. You can change characteristics of the sprite either by using another CALL SPRITE statement or CALL PAT-TERN for the character number, CALL COLOR for color, and CALL MOTION for the velocities.

If you prefer to save typing effort, you can obtain a copy of this program by sending a blank cassette or disk, a stamped, selfaddressed mailer, and \$3 to:

C. Regena P.O. Box 1502

Cedar City, UT 84720

Please be sure to specify that you want Sprite Tester.

# What the world really needs is a 99 cent **Double Sided, Double Density Diskette** with a LIFETIME WARBANTY!

# And DISK WORLD! has it.

#### **Introducing Super Star Diskettes:** the high quality diskette with the lowest price and the best LIFETIME WARRANTY!

In the course of selling more than a million diskettes every month, we've learned something: higher prices don't necessarily mean higher quality.

In fact, we've found that a good diskette manufacturer simply manufactures a good diskette...no matter what they charge for it. (By way of example, consider that none of the brands that we carry has a return rate of greater than 1/1,000th of 1 percent!)

In other words, when people buy a more expensive diskette, they aren't necessarily buying higher quality. The extra money might be going toward flashier adver-

tising, snazzier packaging or simply higher profits But the extra money in a higher price isn't buying better quality

All of the good manufacturers put out a good diskette. Period

#### How to cut diskette prices ...without cutting quality.

Now this discovery posed a dilemma: how to cut the price of diskettes without lowering the quality. There are about 85 companies claiming to be "diskette"

manufacturers.

Trouble is, most of them aren't manufacturers

Rather they are fabricators or marketers, taking other company's components, possibly doing one or more steps of the processing themselves and pasting their labels on

The finished product. The new Eastman Kodak diskettes, for example, are one of these. So are IBM 5%" diskettes. Same for DYSAN, Polaroid and many, many other familiar diskette brand names. Each of these diskettes is manufactured in whole or in part by another company! So, we decided to act just like the big guys. That's how

we would cut diskette prices...without lowering the quality.

We would go out and find smaller companies to manu-facture a diskette to our specifications...specifications which are higher than most...and simply create our own "name brand" diskette.

Name brand diskettes that offered high quality at low prices

DISKETTE STORAGE

Super Star diskettes are sold in multiples of 50 only. Diskettes are shipped with white Tyvec sleeves, reinforced hubs, user ID labels and write-protect tabs

#### Boy, did we get lucky. Our Super Star Diskettes are the same ones you've been using for years...without knowing it.

In our search for the low priced, high quality diskette of

our dreams, we found something even more interesting. We found that there are several manufacturers who don't give a hoot about the consumer market for their diskettes. They don't spend millions of dollars in advertising trying to get you, the computer user, to use their diskettes

Instead, they concentrate their efforts on turning out the highest quality diskettes they can...because they sell them to the software publishers, computer manufacturers and other folks who (in turn) put their name on them...and sell them for much higher prices to you!

After all, when a software publisher or computer manufacturer or diskette marketer puts their name on a diskette, they want it to work time after time, everytime, (Especially software publishers who have the nasty habit of copyprotecting their originals!)

> ORDERS ONLY: 1-800-621-6827 (In Illinois: 1-312-256-7140) INQUIRIES: 1-312-256-7140

> HOW TO ORDER:

FOR FASTEST SERVICE, USE NO-COST MCI MAIL: Our address is DISKWORLD. It's a FREE MCI MAIL letter. No charge to you. (Situation permitting, we'll ship these orders in 24 hours or less.)

ship these orders in 24 hours or less.) SHIPPING: 5¹⁴ & 3¹⁴; DISKETTES—Add \$3 00 per each 100 or lewer diskettes OTHER ITEME: Add shipping charges as shown in addition to other shipping charges PAYMENT: VISA. MASTERCARD and Prepad orders accepted COD OR-DERS: Add additional \$3 00 special handling charge. APO, FPO, AK, HI & PR ORDERS: Include shipping charges as shown and additional \$% of total order amount to cover PAL and insurance. We ship only to United States addresses, except for those listed above TAXES: Illinois residents, add 8% sales tax sales tax

MINIMUM ORDER: \$35 00 or 20 diskettes

#### Super Star Diskettes. You already know how good they are. Now you can buy them...cheap.

Well, that's the story Super Star diskettes don't roll off the boat from Pago-Pago or emerge from a basement plant just east of Nowhere

Super Star diskettes have been around for years...and you've used them for years as copy-protected software originals, unprotected originals. Sometimes, depending on which computer you own, the system master may have been on a Super Star diskette. And maybe more than once. you've bought a box or two or more of Super Star diskettes without knowing it They just had some "big" company's name on them

Super Star Diskettes are good. So good that a lot of major software publishers, computer manufacturers and other diskette marketers buy them in the tens or hundreds of thousands.

We buy them in the millions.

And than we sell them to you. Cheap.

#### When every little bit counts, it's Super Star Diskettes.

You've used them a hundred times...under different names

Now, you can buy the real McCoy, the same diskette that major software publishers, computer manufacturers and diskette marketers buy...and call their own. We simply charge less.

### Super Special! Order 50 Super Star Diskettes and we'll be happy to sell you an Amaray Media-Mate 50 for only \$8.75, shipping included...a lot

less than the suggested retail price of \$15.95

Regular DISK WORLD! price: \$9.69 ea. + \$2.00 Shpng.

Super Star Diskettes are unconditionally warranted against defects in original material and workmanship so long as owned by the original purchaser. Returns are simple: just send the defective diskettes with proof of purchase, postage-paid by you with a short expla-nation of the problem, and we'll send you the replacements. (Incidentally, coffee stained diskettes and diskettes with staples driven through them don't quality as "defective".)

WE WILL MEET OR BEAT ANY NATIONALLY ADVERTISED PRICE ON THE SAME PRODUCTS AND QUANTITIES SUBJECT TO THE SAME TERMS AND CONDITIONS.

# **DISK WORLD!** is proud to introduce the lowest-priced, LIFETIME-WARRANT diskettes ever And they're BRAND NAME PRODUCT to boot! 5.25'' SSDD $\rightarrow$ .79 ea. 5.25'' DSDD $\rightarrow$ .89 ea. 5.25'' DSDD-HD $\rightarrow$ \$2.35 ea. $3.50^{\prime\prime}$ SSDD $\rightarrow$ \$2.25 ea. $3.50^{\prime\prime}$ DSDD $\rightarrow$ \$2.65 ea.

Based on multiples of 100 each. Boxed in 10's with heavy-duty cardboard sleeves, user ID labels, reinforced hubs (where appropriate) and write-protect tabs.

Introducing Wabash Pinnacle Series Diskettes. Two years ago, if you'd told me I'd be writing this ad, I would

have laughed. At that time, Wabash diskettes were synonymous with

"s--t" Just saying that quality control was poor would be charitable

So much was wrong that DISK WORLD wouldn't sell them. That was yesterday.

Kearney-National Inc., a \$202-million division of a much larger company, came into Wabash. Out went the old management, the old methods, the old production techniques...and in went a lot of new people, ideas, production lines and some really imaginative thinking

#### The end result.

Today, I'm proud to offer you the Wabash Pinnacle Series of diskettes at the prices shown.

This isn't evolution in diskette manufacturing: it's revolution. Here's what you get.

Wabash Pinnacle diskettes are

- ...certhied 100% Error Free ...are coverd by a LIFETIME WARRANTY ...meet or exceed all industry specifications (by quite some distance)

and are simply the best value in diskettes available today.

#### The torture test.

Considering Wabash's earlier dubious reputation. I wasn't exactly a true believer when their Director of Marketing came into my office with samples.

So I took a box at random, selected a disk, bent the thing every which way and slipped it into my IBM-PC. It formatted. It booted. It stored and retrieved data.

#### That wasn't enough.

I gave samples of the diskettes to Curt Rostenbach and, in turn, to Tom Streit, both hackers of long experience and members of the Waukegan (Illinois) Apple Users Group Tom really went at it

He took a quartz-halogen lamp, aimed it at the diskette until it started to smoke (and melt) ...and then formatted, booted

The same terribly (and intentionally) mutilated diskette ran on an ITT, Corona and IBM. Curt was nicer.

He simply bent the diskette every which way ... and it still formatted, booted and ran on his Apple

#### The best buy I've ever seen.

DISK WORLD!, Inc. sells more flexible magnetic media by

DISK WORLD!, Inc. sells more flexible magnetic media by mail-order than anyone else in the world I, as President of the corporation, won't tolerate a product with a failure rate of more than 1/1000th of 1 percent. I also don't like companies who try to milk a "quality" or "premium" image for a higher price like Dysan and Verbatim did ...until they failed. As President of DISK WORLD! Inc., my moto is simple: "the best disket for the least amount of money."

best diskette for the least amount of money

#### Wabash is it.

Right now, there is no better value than the Wabash Pinnacle Series of diskettes

Granted, you have to buy a hundred at a time, but so what? Split the order with friends, relatives, co-workers or even your worst enemies

The key thing is to get the most diskette for the money And this is it

(Incidentally, as a corporation, we put our money where our

WORLD!

1.5-million units.

But, then again, I have the diskette that Tom Streit literally

#### The truth about \$1.00 or less diskettes.

More and more ads are popping up offering diskettes for

By the same token, more and more people who were selling

used cars a few months ago are now selling diskettes by mail. We did a little survey of current ads for diskettes advertised for a dollar or less and did some analysis of the market and here's what we found as it applies to 5.25" DSDD diskettes "Supposedly" selling for a dollar or less

#### The real truth about \$1.00 or less diskettes.

It costs all diskette manufacturers about the same to pro-A costs all otsette manuacturers about the same to pro-duce a diskette. Some may charge more because they want to project a "premium quality" image, ala the late, lamented Dysan who bought their basic media from 3M. Some charge less because they sell a sub-standard prod-uct...and we're not foolish enough to name names here But here's the truth about the \$1.00 or less diskette market It falls into four categories.

But here is the truth addit the S1.00 of test dispetite manual. It falls into four categories: 1. The DISK WORLD's of the universe who simply are so big that they can buy first quality product in massive quantities and choose to pass on the savings to you. (Precision Data and Diskette Connection on **BRAND NAME** products also fall into this category.)

2. The people who buy "cosmos"...stuff from major manu-facturers that usually hits quality control standards, but is

cosmetically blemished and thus can't be packaged and sold under the manufacturer's own name 3. "Duplicator Quality". Uncertified media, usually below manufacturer's own standards and frequently below ANSI and IBM standards. Sold on an "as-is" basis with the understand-ion that the manufacture access understanding that the manufacturer's name will never be divulged. Usual-ly about a 20% reject rate...as compared to DISK WORLD's standard of less than 1/1000th of 1% reject/return rate. Next to garbage, this is the source of most diskettes advertised at a dollar or less.

They may work... and then again they may not. (Frankly, the odds at the Blackjack table in Las Vegas are more in your favor.) 4. Garbage. Stuff that shouldn't be sold at all. But some manufacturers are hurting for cash, so they sell it anyway.

(After all, they want to meet their payroll. Look what happens when you don't: you become a Dysan or Verbatim. Lots of history, but no money.) More and more gatarian to the distribution of the market as manufacturers become pressed for cash and are motivated into selling anything and everything they can manufacture. (Read the article in FORBES about Verbatim and its "Bonus" brand).

Finally, the Taiwanese counterfeiters are moving into the act Perfect duplicates of the packaging of major manufacturers. with one exception: the quality isn't there.

#### The Critical Factor.

Only DISK WORLD!, Inc. offers fully brand-identified. LIFETIME-WARRANTY product for less than a dollar Every one else offering 5.25° product for less than a buck doesn't tell you who makes it.

We do

And that ought to tell you a lot right there.

# Ordering & Shipping Instructions

SHIPPING: Wabash Pinnacle Diskettes are sold in multiples of 100 only. Shipping charges are \$3.00 per 100, regardless of type or size. PAYMENT: VISA, MASTERCARD and PREPAID orders

accepted. Corporations rated 3A2 or better and government and quasi-government open accounts are accepted on a NET 15 basis.

C O D orders are subject to a \$5.00 special handling charge (Sorry for the increase, but too many people have been refusing C 0.D. orders or using bad checks. It's a classic example of a few "bad eggs" making life more expensive for everyone else.)

APO, FPO, AK, HI & PR ORDERS: Include shipping as shown and an additional 5% of the total amount of the order to cover PAL and insurance

No other non-continental U.S. orders are accepted. TAXES: Illinois residents only, add 7%.

All orders subject to acceptance. Not responsible for typographical errors.

ORDERS ONLY: 1-800-621-6827 (In Illinois: 1-312-256-7140)

INQUIRIES & INFORMATION 1-312-256-7140

FOR FASTEST SERVICE. USE MCI MAIL: Just address "DISKWORLD"

(24-hour shipping on any item in stock if you order via MCI MAIL.)

That's an awful lot of faith and confidence melted .. and kept on running. \$1.00 or less.

WORLD!

stay the same...but there's no free Flip n' File. The last time we ran an offer like this, everything was sold out in about

six weeks.

So don't wait. Order now.

# presenting ... CAPTURETH A NEW WAY TO UNLOCK THE POWER OF YOUR C64 OR C128*

- CAPTURE IS A CARTRIDGE THAT PLUGS INTO YOUR COMPUTER'S EXPANSION PORT.
- CAPTURE DOES NOTHING UNTIL YOU PRESS ITS CAPTURE BUTTON. UNTIL THEN, A RUNNING PROGRAM CANNOT DETECT ITS PRESENCE.
- CAPTURE THEN TAKES CONTROL NO IFS, ANDS OR BUTS AND PRESENTS A MENU.
- CAPTURE WILL NEATLY SAVE EVERYTHING IN YOUR COMPUTER TO YOUR 1541 OR COMPATIBLE DISK DRIVE — ALL 64K OF RAM, CPU, VIC AND SID CHIP REGISTERS — EVERYTHING. IN EASY TO VIEW CHUNKS.
- CAPTURE WILL, IF YOU WANT, PRE-CONFIGURE YOUR COMPUTER'S RAM SO THAT ONLY MEMORY ALTERED BY YOUR PROGRAM NEED BE SAVED.
- CAPTURE WILL WRITE A BOOT ON YOUR DISK SO YOU CAN RELOAD AND BEGIN EXECUTION RIGHT WHERE YOU LEFT OFF.
- CAPTURE DOES ALL THIS AT A COST OF JUST \$39.95

# **BUT HERE'S THE BEST PART**

• CAPTURE WILL MAKE AN AUTO-START CARTRIDGE OF YOUR PROGRAM. IT'S EASY! JUST FOLLOW THE DIRECTIONS ON THE SCREEN. NOW PLUG IN YOUR CARTRIDGE AND TURN ON YOUR COMPUTER. IN LESS THAN TWO SECONDS YOUR PROGRAM BEGINS AGAIN AT PRECISELY THE POINT WHERE YOU CAPTURE'D IT. MAGIC!

BESIDES **CAPTURE**, YOU NEED A *promenade* C1 AND A SUPPLY OF CPR3 CARTRIDGE KITS.

14605 28TH AVENUE NORTH MINNEAPOLIS, MINNESOTA 55441-3397

#### COMPUTER

64K RAM. 20K ROM standard (includes operating systems and BASIC interpreter). Text characters. High resolution graphics. 320 x 200 pixels. Music synthesizer produces 3 independent voices, each with a range of 9 octaves.

Typewriter keyboard with 66 keys for upper and lower case letters, numerals, symbols, reverse characters. 2 cursor control keys. 4 function keys, programmable to 8. Input/output ports for user, serial, ROM cartridge, 2 joystick/paddles, video, cassette drive interface. 16 background, border, character colors.

#### **DISK DRIVE**

Intelligent, high-speed. External 5%" floppy diskette recorder. 2K RAM, 16K ROM. Maximum storage of 170K formatted data; 35 tracks. Uses single sided, single density disk. Serial interface. Second serial port for chaining second drive or printer. Data transfer rate of 400 bytes per second.

#### DOT MATRIX PRINTER

Bi-directional 6x7 dot matrix impact printer. 60 characters per second. Has upper and lower case letters, numerals and symbols. All PET graphic characters. Standard friction feed. Maximum of 80 columns width, dot addressable. CBM ASCII character codes. Original plus maximum of two copies. Paper width: 4.5" to 8.5". Size: 13"W x 8"D x 3'4"H. Weight: 6'4 lbs. Power requirements: 120 volts AC: 60 Hz

# **Classified**

# COMPUTE! Classified is a low-cost way to tell over 350,000 microcomputer owners about your product or service.

- **Rates:** \$25 per line, minimum of four lines. Any or all of the first line set in capital letters at no charge. Add \$15 per line for boldface words, or \$50 for the entire ad set in boldface (any number of lines.)
- Terms: Prepayment is required. Check, money order, American Express, Visa, or MasterCard is accepted. Make checks payable to COMPUTE! Publications.
- **Form:** Ads are subject to publisher's approval and must be either typed or legibly printed. One line equals 40 letters and spaces between words. Please underline words to be set in boldface.
- **General Information:** Advertisers using post office box numbers in their ads must supply permanent address and telephone numbers. Orders will not be acknowledged. Ad will appear in next available issue after receipt.
- **Closing:** 10th of the third month preceding cover date (e.g., June issue closes March 10th). Send order and remittance to: Harry Blair, Classified Manager, COMPUTE!, P.O. Box 5406, Greensboro, NC 27403. To place an ad by phone, call Harry Blair at (919) 275-9809.
- Notice: COMPUTE! Publications cannot be responsible for offers or claims of advertisers, but will attempt to screen out misleading or questionable copy.

#### SOFTWARE

61,183 delicious bytes for your Commodore 64

### S'MORE Memory, S'MORE Power, S'MORE Fun!

**Now, 61K available memory** S'MORE frees up 61,183 bytes of C-64 RAM memory for un-restricted Basic programming (57% more than the standard C-64).

#### A bridge to C-128

The S'MORE command structure is similar to the C-128's new Basic 7.0, providing C-64 users advanced programming techniques.

#### S'MORE features

for programming power

- Over 60 new and enhanced basic commands & functions
- No peeks or pokes (direct access to normally peeked/poked items)
- Full error trapping and automatic error helps
- Full up/down scrolling through program listings
- Structured programming
- Relative files
- · Print using
- Formatted inputs
- Print at...and much, much more.

The Wizards from the Land of Oz Have done it Again!

CARDCO, Inc./300 S. Topeka/Wichita, KS 67202

# "Thanks for," the memory."

# INTRODUCING THE COMMODORE 128.

It's here. And it's going to make a lot of Commodore 64th owners very happy. A personal computer with a 128K memory and 80-column capability that's still compatible with all the peripherals and over 3,000 programs designed for the Commodore 64.

amp

In fact, the new 128 is almost like getting three computers in one. That's because it can run as a 64, a 128 and in a CP/M® mode. Or it can even be expanded to a full 512K memory. And that's about as "personalized" as a personal computer can get. It's intelligence that can match your own versatility. And then, even take it to a higher level.

#### There's more than a bigger memory.

There are a lot of extra features we didn't forget. Like a handy numeric keypad for data-entry efficiency and accuracy.

An expanded keyboard that puts more commands at your fingertips for easier programming. So you can be a whiz at using more varied graphics and text. Or a musical genius playing full three-part melody in any tempo – you set. And there's even a thelp" key that comes to your rescue, listing programming errors on-screen with the error in reverse field.

There's also a new faster disk drive. With a separate "Burst" mode that can transfer up to 3,000 characters per second. Just in case you're a speed demon.

"Thanks for the memory!" You're welcome. And for the expandability. And compatibility. And versatility. And for making it all very affordable. After all, one of the other things that should go into a more intelligent computer is a price that makes sense.

### COMMODORE 128 PERSONAL COMPUTER A Higher Intelligence
