## THE SECRETS OF PERFECT MEMORY: ONE AND ONE HALF EARTH DOLLARS

AT LAST: THE WHOLE  
TRUTH ABOUT FLOPPIES.

Amazing book reveals  
all!

How to keep from  
brainwashing your disk  
so it never loses its  
memory.

How fingerprints can  
actually damage disks.  
Unretouched Kirlian  
photographs of UFO's  
(Unidentified Floppy  
Objects)! The incredible  
importance of making  
copies: the Department  
of Redundancy Depart-  
ment — and what goes on  
when it goes on! Power-  
ful secret methods that  
scientists claim can ac-  
tually prevent computer  
amnesia! All this, and  
much more . . .

In short, it's an 80-  
page plain-English,  
graphically stunning,  
pocket-sized definitive  
guide to the care and  
feeding of flexible disks.

For The Book, ask your  
nearest computer store  
that sells Elephant™  
disks, and bring along  
one and one half earth  
dollars.

For the name of the  
store, ask us.

# ColorMate™

## The Color Computer's better half.

COLORMATE unleashes the power of the Color Computer! It expands any standard CoCo with 16K and floppy disk to allow operation of SDOS, a fast, time proven operating system, and powerful program development tools like the BASIC Compiler. SDOS handles floppies and optional Winchester disk transparently. BASIC provides very fast code, long names, true subroutines and powerful disk file I/O.

Screen above is unretouched photograph of ColorMate display. Disk Extended BASIC is not required.

COLORMATE is \$495.00. Includes 400+ pages of documentation. Radio Shack floppy controller and floppy disk drive not included. Word processing, accounting, and Winchester disk drives are available. Write or call for details. Dealer inquiries invited.

# DIGRESSIONS

## WHAT DO YOU DO ABOUT SOFTWARE PIRACY?

One of the hottest (no pun intended) topics in the computer press of the past year is software piracy. This plague is just as prevalent in the Color Computer circle as in the rest of the industry. It costs you, the reader, money because it cuts into vendors' sales, and it discourages those vendors from investing in new, more exciting software for your CoCo.

Software piracy takes many forms. The most extreme case is when someone copies software while intending to resell at a lower price. Yet this is not the most damaging kind of piracy to the CoCo software industry. What hurts most is the guy who buys a piece of software and does a "favor" for a friend by giving him a copy.

Well intentioned or not, this "favor" is theft. True, most people cannot afford all the software they'd like to own and much software is overpriced, but using these facts as justification for "freebies" doesn't wash. And some people would like to make it harder for users to get these freebies by restricting promotion of the numerous copy utilities.

Vendors protect software to keep honest people honest; any dedicated pirate can break any protection scheme without the aid of a back-up utility. But while protection schemes might keep most novices from backing up software, they also create real problems for the legitimate user.

How does a user put his favorite utility on all his system disks if it's protected? How does a user transfer all his copy-protected tapes to disk when he upgrades his system? How does a user preserve his software investment by making back-ups if that software is protected? Copy utilities were written for the legitimate software owner with the above problems, not for the software pirate.

It's easy to sympathize with those who oppose copy software, because that software has the potential to be abused; it's just as easy to make an illegal copy of a program with this software as it is to make a legal copy.

So, should all copy utilities be censored? Will censoring all software with the potential to be abused in this way solve the problem of software piracy? No and no. The root of the problem lies with the user who thinks nothing of copying a program and giving it away. You don't see Radio Shack pulling its tape recorders off the shelves because too many Rolling Stones albums have been pirated. You don't outlaw technology to solve a problem in human attitude.

What must be done is to educate the Color Computer public about how software piracy damages their hobby. The trend in many computer clubs to write antipiracy rules into their bylaws is a commendable step in this direction.

*HOT CoCo* will publish ads that promote copy utilities as long as those ads emphasize only the legitimate uses of that software. We have published programs that copy protected software, and we might well do so in the future, but only in conjunction with a legitimate application.

We strongly urge that all computer clubs discourage members from unethical copying. If your club has a software library, encourage your members to use it rather than accept illegitimate copies. If your club has a statement of policy against piracy, let us know when you submit your listing for publication in *HOT CoCo*. If you have no such statement of policy, you owe it to your members and the CoCo software industry to adopt one.

Software companies should do all they can, within reason, to make illegal copying as unappealing as possible. If they protect their software, they should provide quick, inexpensive replacements for blown media. They

should offer documentation and software upgrade service for those programs that require it, so the buyer feels he is getting more than just a piece of software.

But you bear the ultimate responsibility. You are an honest lot, by and large, and very enthusiastic about your computer hobby. Software piracy is like the "Death of 1,000 Cuts"; one "cut" won't kill the individual, but enough of those little cuts drains the life-blood. Don't fool yourself if you accept illegitimate software by rationalizing that your one transgression can't hurt. There are perhaps hundreds of other users in the Color Computer public with the same thought.

## The Color Computer Means Business

This month *HOT CoCo* shows you ways to make your Color Computer pay its keep. This issue focuses on ways to manage and make money with your CoCo.

Computers are good at doing "what if" projections, and the Color Computer is no exception. And what better topic with which to do "what if" projections than the stock market? Howard DePol and Jim Barbarello wrote "Stock Transactions Tracker," p. 58, to not only keep accurate records of stocks the user owns, but to predict the outcome of potential transactions.

Are you a salesman? If you are, you probably have to juggle a lot of information about accounts, orders, and prices. "Active Negotiations," by Charles Levinski, p. 66, has proven itself in the field. You can adapt it to a number of other applications, as well.

Need some help managing your personal money matters? We have two articles that will help you. Richard Tucker has a simple, yet effective program that figures interest, principal, and term of any personal loan (p. 110). Carl Christensen's "Computing Your Future," p. 52, tells you how to plan for retirement.

We've got some work savers this month, too. Gerald Sprouse has a good mailing-list program for disk users that's suitable for a club, church, or small business (p. 88). Mike Charlton's "CoCo Payroll" takes the drudgery out of figuring the payroll for a small business. Glen Tapanila's "Show as You Go," p. 80, demonstrates a clever technique for making more effective graphic presentations.

Thinking about buying a data-base manager? Read James Perotti's "Data-Base Managers and the Small Business," p. 46, first. It will give you insight as to how a data-base manager can help you and what to look for when shopping for one.

## But Wait, There's More . . .

Re:FLEX, p. 138, returns this month with its new author, Scott Norman. Scott takes a look at two Basics available only with the FLEX operating system. Scott's column will be the one to read if you are going to invest in either FLEX or the new OS-9 operating systems.

Due to space limitations last month, we were unable to publish Part III of "Journey to the Center of the ROM," by Mark Goodwin. It appears this month on p. 114. Again due to space limitations, Reader's Forum was sacrificed this month for other material and will return next month.

Mark Silverblatt's "Colormania" series begins this month, and it will concentrate on Assembly and advanced Basic programming. Mark starts off the series slowly with an introduction to number systems. Here's your chance to get started programming in Assembly.

## Let's Hear from You!

What's your favorite column in *HOT CoCo*? What's your least favorite? Why? What are the individual articles that you've liked or disliked? What should we be doing that we are not?

We have a lot of questions that only you can answer. We are serious about making *HOT CoCo* your magazine, so please tell us your impressions by dropping us a note at Pine St., Peterborough, NH 03458. We'll thank you for your input.—M.N. ■

## Subscriptions:

*Problems with Subscriptions:* Send a description of the problem and your current and/or most recent address to: *HOT CoCo*, Subscription Department, P.O. Box 975, Farmingdale, NY 11737.

*Change of Address:* Send old label or copy of old address and new address to: *HOT CoCo*, P.O. Box 975, Farmingdale, NY 11737. Please give eight weeks advance notice.

*Dealers:* Contact Ginnie Boudrieau, Bulk Sales Manager, *HOT CoCo*, Pine St., Peterborough, NH 03458. (800) 343-0728.

The left bracket, [, replaces the up arrow used by Radio Shack to indicate exponentiation on our printouts. When entering programs published in *HOT CoCo*, you should make this change.

*HOT CoCo* formats its program listings to run 64 characters wide. This accounts for the occasional wrap-around you will notice in our program listings. Don't let it throw you, particularly when entering Assembly listings.

Article submissions from our readers are welcomed and encouraged. Inquiries should be addressed to: *HOT CoCo* Submissions Editor, 80 Pine Street, Peterborough, NH 03458. Include an SASE for a copy of our writer's guidelines. Payment for accepted articles is made at a rate of approximately \$50 per printed page; all rights are purchased. Authors of reviews should contact the *HOT CoCo* Review Editor, 80 Pine Street, Peterborough, NH 03458.

*HOT CoCo* is a member of the CW Communications/Inc. group, the world's largest publisher of computer-related information. The group publishes 42 computer publications in 18 major countries. Nine million people read one or more of the group's publications each month. Members of the publication group include: Australia: *Australasian Computerworld*, *Micro Magazine*; Argentina: *Computerworld/Argentina*; Brazil: *Data-News*, *MicroMundo*; Denmark: *Computerworld/Danmark*, *MikroData*; France: *Le Monde Informatique*; Germany: *ComputerWoche*, *MicroComputerWelt*, *PC Welt*; Italy: *Computerworld Italia*; Japan: *Computerworld Japan*; Mexico: *Computerworld/Mexico*; Norway: *Computerworld Norge*, *MikroData*; People's Republic of China: *China Computerworld*; Saudi Arabia: *Saudi Computerworld*; Spain: *Computerworld/Espana*, *MicroSistemas*; Sweden: *ComputerSweden*, *MikroData*, *Min Hemdator*; United Kingdom: *Computer Management*, *Computer Business Europe*; United States: *Computerworld*, *Desktop Computing*, *HOT CoCo*, *inCider*, *InfoWorld*, *ISO World*, *Microcomputing*, *PC World*, *80 Micro*, *RUN*.

# Feedback

## No Junk In Elmer's Arcade

As a computer science major who works at the college computer center, redoing code in several languages, I hate to come home and begin typing in a published program listing, only to find several lines of unneeded code that could be replaced by one GOSUB.

On the other hand, Richard Ramella should be commended for an outstanding display of structured programming in "Elmer's Arcade." That's efficient programming.

I noticed one odd thing about the game, "Sprinks." On my computer, the dot stops when I release the key pressed, but on my dad's computer the dot continues to move.

I found that the rollover table on his machine does not reset itself. If anyone else has this problem, they can make the following change:

```
505 FOR Z=1 TO 4 : POKE 340+Z, 255
   : NEXT
```

This change slows the program, but it's almost unnoticeable.

*Douglas James III  
Baconton, GA*

## Literacy Plus + Call for Participation

The Arizona State University College of Education is hosting the fourth annual Microcomputers in Education Conference, "Literacy Plus +," March 15 and 16, 1984.

The two-day conference emphasizes practical, creative ideas for successfully using computers in all aspects of education. There will be introductory presentations for those with little computer knowledge.

On the 13th and 14th there will also be a preconference on Microcomputers and the Writing Process. The preconference will feature symposiums, research presentation, reports of ongoing studies, discussion of actual classroom experiences, and hands-on

word processing workshops.

The 14th is also scheduled for sharing experiences and research findings on other topics concerning microcomputers in education.

We are soliciting papers for the conference and preconferences. Contact Ruth Camuse at the address below for speaker-proposal forms.

Vendors interested in securing a booth should contact Donna Craighead, conference codirector.

## Modified "Doculist/C"

James Barbarello's article, "Docu-

list/C" (*HOT CoCo*, June 1983, p. 58), was worth the whole year's subscription price, not only because it has been a great aid in developing and debugging programs, but also for what it taught me about the workings of my CoCo. The "Galaxy Trek" adventures of later issues have also been popular with my whole family.

Readers should note that Doculist/C will spot the kinds of problems (leaving out required spaces in Basic) that Howard Culbreth discussed in "Reader's Forum" in the September issue (*HOT CoCo*, p. 44). If Doculist/C doesn't add a space between a variable and a Basic expression, you might get a syntax error.

If you examine the numbers in memory, you'll find the ASCII codes instead of a token. For example, if you enter IF X=YTHEN..., you'll find 133 88 179 89 84 72 69 78... in memory.

# The HJL-57 Keyboard

## Compare it with the rest. Then, buy the best.

If you've been thinking about spending good money on a new keyboard for your Color Computer, why not get a good keyboard for your money?

Designed from scratch, the HJL-57 Professional Keyboard is built to unlock ALL the potential performance of your Color Computer. Now, you can do real word processing and sail through lengthy listings...with maximum speed; minimum errors.

At \$79.95, the HJL-57 is reasonably priced, but you can find other CoCo keyboards for a few dollars less. So, before you buy we suggest that you compare.

### Compare Design.

The ergonomically-superior HJL-57 has sculptured, low-profile keycaps; and the three-color layout is identical to the original CoCo keyboard.

### Compare Construction.

The HJL-57 has a rigidized aluminum baseplate for solid, no-flex mounting. Switch contacts are rated for 100 million cycles minimum, and covered by a spill-proof membrane.

### Compare Performance.

Offering more than full-travel, bounce-proof keyswitches, the HJL-57 has RFI/EMI shielding that eliminates irritating noise on displays; and four user-definable function keys (one latching), specially-positioned to avoid inadvertent actuation.

### Free Function Key Program

Your HJL-57 kit includes usage instructions and decimal codes produced by the function keys, plus a free sample program that defines the function keys as follows: F1 = Screen dump to printer. F2 = Repeat key (latching). F3 = Lower case upper case flip (if you have lower case capability). F4 = Control key; subtracts 64 from the ASCII value of any key pressed. Runs on disc or tape; extended or standard Basic.

### Compare Installation.

Carefully engineered for easy installation, the HJL-57 requires no soldering, drilling or gluing. Simply plug it in and drop it right on the original CoCo

mounting posts. Kit includes a new bezel for a totally finished conversion.

### Compare Warranties.

The HJL-57 is built so well, it carries a full, one-year warranty. And, it is sold with an exclusive 15-day money-back guarantee.

### Compare Value.

You know that a bargain is a bargain only as long as it lasts. If you shop carefully, we think you will agree...the HJL-57 is the last keyboard your CoCo will ever need. And that's real value.

### Order Today.

Only \$79.95, the HJL-57 is available for immediate shipment for either the original Color Computer (sold prior to October, 1982) or the F-version and TDP-100 (introduced in October, 1982).

### Order by Phone Anytime

**716-235-8358**

**24 hours, 7 days a week**

**PRODUCTS INC.**

955 Buffalo Road • P.O. Box 24954  
Rochester, New York 14624

Ordering Information: Specify model (Original or F-version). Payment by C.O.D., check, MasterCard or Visa. Credit card customers include complete card number and expiration date. Add \$2.00 for shipping. New York state residents add 7% sales tax. Dealer inquiries invited.

## Feedback

The Program Listing is a modified version of Doculist/C. I used it with my Epson MX-80 printer with tractor feed. I've made two changes. First, adding line 63005 and deleting all of 63270 except RETURN lets you print the complete program and doesn't require your continuous attention.

Line 63005 sets up the Epson printer to count lines, skip the last six, and go to the top of the next sheet automatically. Another printer might require a different code.

Also, adding lines 63015, 63022, and 63024 causes the listing to begin with the specified line number. Entering a zero starts the listing from the first line of the program. Used with the break key, this allows you to print out any segment of the program.

Alan Derkacs  
Fountain Hill, PA

### Changes in the CMI and BioBox

I've found a problem that will affect a number of readers who attempt

to use my CMI ("Real-World Applications—Part I, the CMI," *HOT CoCo*, September 1983, p. 82) and BioBox ("Real-World Applications—Part II," *HOT CoCo*, October 1983, p. 38).

Both projects use the CoCo's cassette port for input and output interface. The problem occurs in sensing the output of the interface (input to the CoCo).

The CoCo uses a zero crossing detector circuit to sense when a change in input level has occurred. With no input to the CoCo, the input to the comparator portion of the detector is supposed to be at a positive level.

Thus, when a negative signal is applied, it combines with the reference and the resultant level crosses zero and goes negative. This triggers the comparator, whose output changes from low (0) to high (1). When the signal changes and goes positive, the comparator switches again, producing a low (0) output.

However, in my CoCo, the no-input condition has the comparator input negatively biased. I've con-

cluded this is due to tolerance variations in the resistors that bias the comparator. When either the CMI or BioBox produces a positive trigger pulse, the CoCo senses it because it changes the state of the comparator.

If, however, the theoretical condition of initial-positive biasing exists, a positive pulse does nothing (since the comparator input must go negative to do something). The result is that the BioBox produces immediate faults, and the CMI indicates "out of range."

Now I've developed (and verified on both CoCo versions) easy fixes. They are not as elegant as the original designs, since they require the construction and use of a cable to connect to the joystick port. They are simple, however, and require only removal of some components and a very minor change to the programs.

The information here tells if you need the change and exactly what to do.

### CMI Changes

Color Computer variations can affect proper operation of the CMI. Technically, the output of the CMI is provided to the CoCo's cassette input circuitry. This circuitry contains a comparator (U14) in which the input should be biased low when no input is present. The CMI output can then signal the CoCo by providing a high level to U14. Due to component variations within the CoCo, the no-input bias might already be high; then the CMI cannot signal the CoCo.

Check your CoCo by entering PRINT PEEK(65312). It will return either a 2 or 3. If your CoCo returns a 2, you must modify the CMI and Capmeter program as follows:

- Locate, remove, and discard capacitors C1 and C2 and resistors R5 and R6. Obtain two 2.2K (2200 ohm), 1/4-watt resistors.

- Locate and remove jumper J and reinstall in the two holes C1 vacates. Install a 2.2K resistor in the holes J vacates (the holes that C2, R5, and R6 vacate remain unoccupied). Note the two pads to which J2 (black) is connected. Tack solder one end of a 2.2K resistor to one of these pads. Tack solder the other end to the other pad (this places the 2.2K resistor in parallel with J2).

- Obtain a six-pin (stereo) DIN plug

## Computer Technology will Enhance your Chess Playing Skills

High technology comes to the aid of chess players! Chess-007 was designed to help you and not a computer! This unique program, developed for use on the Radio Shack TRS-80 color computer, allows you to record any game with multiple variations for rapid retrieval. Imagine reviewing your favorite openings or

Chess-007 Displayed on Radio Shack TRS-80 Color Computer

grandmaster games prior to competition!

- Easy to operate, menu driven, user friendly program requires no programming skills.
- Tournament clock, skittles clock and accumulative blitz clock also incorporated for two player usage. (Incorporates two joysticks).
- Input moves by joystick manual controls.
- Records games and chess problems with multiple sideline variations.
- Build a low cost video library of your tournament games or your study games. Instructions provided to utilize blank computer cassette tapes for data storage.

- Record comments for play by play review.
- Variable speed replay for review.
- No need to set up two boards for analysis -you can return to any position during the recorded game!
- Error-free - our computer program checks for illegal or ambiguous moves before recording entry moves.

- Time saving - imagine reviewing your pre-recorded grandmaster games with extensive analysis in less than 4 minutes per game!
- Definitely not another "me-too" chess playing program. The highest levels of chess are played by people, not computers!
- Requires Radio Shack TRS-80 32k extended color computer (approx. cost \$399.00), two joysticks and cassette recorder. Uses any color or b/w TV for video playback.
- Reasonably priced program cassette is only \$59.95. Nothing on the market like it!

\*Rep. T.M. Tandy Corp.

Use Your CitiLine Card

As Low As \$25 Per Month  
On CitiLine Credit

**A Smart Investment.** Give your family a colorful Christmas this year with our TRS-80 Color Computer 2. It's the perfect way to join the computer revolution. And, at \$80 off, it's the affordable way, too!

**Easy to Use.** Just connect your TV, plug in a ready-to-run Program Pak™ and you're all set. Prepare a household budget, monitor your investments, teach your kids or play thrilling outer space and sports games.

**Deluxe Features.** Both models feature a typewriter-quality keyboard in an attractive white case. Use the built-in Color BASIC language and our entertaining 308-page manual to start writing your own programs with color and sound. Want to create stunning high-resolution graphics and write advanced programs?

Then select our sale-priced 16K Extended BASIC Color Computer 2. Create incredible drawings and designs, business and engineering charts, even animation with simple one-line commands.

**Expandable.** Best of all, Color Computer 2 can expand easily as your computing skills grow. Add a cassette recorder to store and load your own programs, a telephone modem to access tomorrow's news and stock reports, a printer, joysticks or a color mouse for more exciting game action, disk drives and more.

**The Perfect Gift to Give . . . Or Get!** Come into a Radio Shack Computer Center, participating store or dealer near you and get a demonstration of our spectacular Color Computer 2.

## Feedback

(Philmore EA-9 or equivalent), a 1/8-inch phono plug, and 2 feet of two-conductor wire. Call one conductor A and the other B.

Attach one end of conductor A to pin 4 of the DIN plug (refer to the numbers on the DIN plug). Attach the other end of conductor A to the tip (shortest) lug of the phono plug. Attach one end of conductor B to pin 3 of the DIN plug. Attach the other end to the ring (remaining) lug of the phono plug. You have just constructed a CMI cable.

- Load the CMI program and list line 30. Note that the last three DATA values are 254,186,255. Change these values to 1,180,255. Similarly, the first three DATA values of line 40 are 32,129,254. Change these values to 0,129,1. Save the modified program.

- If you have a 32K CoCo and you experience an out-of-memory (OM?) error when you run the program, re-type lines 10 and 50 as follows:

```
10 CLS 5: CLEAR 200,32127: DEFUSR =
32128: R(1) = 10: R(2) = 0.1: C(1) = 9
50 FOR I = 32128 TO 32170: READ M: POKE
I, M: NEXT I
```

To use your modified CMI, load and run the modified program. Insert your cassette cable's large grey plug into the BioBox jack marked "grey" as before. Insert the CMI cable's DIN plug into the CoCo's right joystick jack. Insert the CMI cable's phono plug into the BioBox's black jack. All other operations remain unchanged.

### BioBox Changes

The BioBox operates the same as does the CMI. Perform the same check, and if your CoCo returns a 2, make the following BioBox and Bio program modifications:

- Locate and remove capacitor C2. Form a jumper from a short length of wire and install in the two holes C2 has vacated.

- Locate and remove transistor Q3. Form a jumper from a short length of wire and install in the two vacated holes closest to J3 (black). The third vacated hole remains unoccupied.

- Perform the same modifications as given in the third step for the CMI. You've just constructed a bio cable.

- Load the Bio program and list line 50. The last three DATA values are 254,186,255. Change these values to

TRS-80  
COLOR  
COMPUTER

# STEAL

The best out of our library of over 200 published programs, packaged and priced so low that it seems like robbery:

**Games #1** - Action-packed, logical, and colorful ones! Flyby, Blackjack, Motorcycle, Germ, Blockade, Life, Diggem, Robot Run, Stellar Empire, and Zero G for your fun and pleasure!

**Adventures #1** - Trips to far-off and dangerous places. On the agenda are Jerusalem Adventure, Ultimate Adventure, Williamsburg Adventure, House Adventure, Andrea Doria Adventure, Blackard's Castle, and Realm of Naugal

**Practicals #1** - Programs for text editing, maillists, budgeting, filing, etc. including Keypext, Keep Address, Keypist, Keepcheck, Keep Budget, Files, and Tape Inventory.

**Graphs & Charts #1** - For data manipulation and display! Do it with Pie Chart, Bar Chart, XY Graph, Curve Fit, and Two Dates.

Choose any one of the four packages for just \$12.00 (\$17.00 on disk)!

**SILVERWARE**

- a lot of software for a little silver

Santa Barbara CA 93121 (805) 966-1449

## Feedback

1,180,255. Similarly, the first three DATA values of line 60 are 32,129,254. Change these values to 0,129,1. Save the modified program.

● If you have a 32K CoCo and you experience an OM? error when you run the Bio program, retype lines 10 and 70 as follows:

```
10 CLEAR 1000,32127:DIM T(50,3):
DEFUSR = 32128:DEFUSR1 = 32173
70 FOR I = 32128 TO 32197:READ M:
POKE I,M:NEXT I
```

Use this modified BioBox just as you do the modified CMI. All other operations remain unchanged.

*James Barbarello  
Englishtown, NJ*

### Looks Like We (Err...)

Goofed

*Ed. note—There were two errors in our November 1983 issue that we'd like to correct.*

*The System Requirements box for "Smashout" should include an SDS80C Editor/Assembler (Micro Works).*

*The lines referred to in the last full paragraph on page 77 of "Colorful Cryptology—Part III" should be 100-130, and not 130-170.*

*Sorry.*

### "Give Your Computer Some Character" Change

Line 02550 on page 112 of "Give Your Computer Some Character" (*HOT CoCo*, September 1983, p. 104) contains an error. Change it to 00.

Also, when I upgrade my 16K CoCo to 64K, will all my old programs and those designed for 32K run on it?

*Christopher Waters  
Harvey, LA*

*They should.—eds.*

### Joysticks And the CMI

Anyone building the capacitance meter interface described in "Real-World Applications—Part I, the CMI" (*HOT CoCo*, September 1983, p. 82) should know that the CMI might not work if your joysticks are plugged in.

The CMI uses the cassette port, which shares some circuitry with the joystick inputs, and these can interfere with each other. As far as I can tell, the joysticks prevent the cassette input from falling to zero volts. If a call to USR(0) immediately returns a zero no matter what you do, this is probably why.

I'm looking forward to more "Real-World Applications."

*Robert L. Hawkins  
Columbus, OH*

### Where's the Bug?

I was very pleased to find Ken Knecht's article, "CoCo Word Processor" (*HOT CoCo*, June 1983, p. 36).

However, I've found a problem in Program Listing 2, and I haven't been able to solve it. The program prints at least one line of a block or indented form letter one character to the left of the margin.

I've spent several hours reviewing the program and can't find the reason for the problem. I'd appreciate any help anyone can give.

*David B. Newell  
Sedalia, MO*

*You're the third person to tell me about this problem. One reader even tried having the computer print the value of the variable LM before printing each line. This variable, as TAB(LM), positions the start of each line. Even when the line started one character to the left, the value of LM did not change. Thus, a change in LM was not the problem.*

*Next, he tried replacing the TAB(LM) with a string of X's the same length as the TAB(LM). This time the computer dropped one of the X's. This indicated to me that there must be a bug in Basic's print routine.*

*The problem does not appear to be in the program, at least according to the tests and the fact that only three readers have mentioned it. But a bug in Basic doesn't sound right either, because I've never heard of a similar problem in any other program. I'm stumped and would welcome any help.*

*Incidentally, the TAB(LM) appears*

*in lines 163, 165, 220, 230, 710, 810, and 1010 of Listing 2 (p. 37). Only line 710 should be able to cause the problem. Also, the problem only occurs in the first line of a document, or in the first line after a blank line. Perhaps this is a clue.*

*Since the length of the justified line is correct, the computer does not appear to be tacking a CHR\$(8) on the beginning of the affected line.*

*Ken Knecht  
Yuma, AZ*

### Space Race

I must disagree with Beth Norman's evaluation of Space Race from Spectral Associates.

As a home version of the arcade game, Omega Race, Space Race is a good duplication, although the controls are a bit touchier and the action slightly faster than in the arcade version. But I've found Space Race one of the most challenging CoCo games I've played.

Rotate/thrust-type keyboard controls, as used in Space Race, are always difficult to learn at first. I had problems getting the ship to do what I wanted, and it did take a long time, but now I can zoom it around just fine. But once you learn to use the keyboard controls, they give much more control than do joysticks.

In my opinion, Space Race deserves a challenging rating, and not the poor one you gave it.

*Alexander Beneson  
New York, NY*

*It is perfectly possible for a game to be challenging, even maddening, and still be good. I am not reluctant to give high ratings to a game I find difficult.*

*The problem with Space Race, in my opinion, is that there is nothing about the game that draws me into it—nothing that makes me want to get better. Its internal reward structure, whatever it may be, is lacking.*

*Beth Norman*

### Classifying the Colors In Multicolor Graphics

In Kenneth Anderson's article, "Introduction to Multicolor Graphics—Part II" (*HOT CoCo*, September 1983, p. 62), he states that there is a

logical method to find colors in his program.

The numbering system he described is essentially counting in base five, and it is a simple matter to let the computer do the work. Enter the following lines to make the task of classifying colors much easier:

```
145 FOR CP=1 TO I-1: C(CP)=1: NEXT
180 LOGICAL ORDER OF SELECTION
190 CP=I
200 C(CP)=C(CP)+1: IF C(CP)=5 THEN
C(CP)=1: CP=CP-1: IF CP=0 THEN
END ELSE 200
```

Gary Teter  
Paradise, CA

## "Give Your Color Computer Some Character" With Disk Basic

In my article, "Give Your Color Computer Some Character" (*HOT CoCo*, September 1983, p. 104), I mentioned that you could modify the program to run on Disk Basic. Enough readers have written to ask how it's done, so I thought I might share the information with everyone.

Modify the original program as follows:

- Change line 440 to DSET EQU \$BC.
- Change line 450 to SBEG EQU \$BC.
- Delete the SEND reference.
- Change line 710 from \$8CF1 to \$C58F.
- Change line 1040 from RTS to JMP \$CB4A.
- Change line 1340 from PSHS B to CMPB #24 and delete lines 1350-1370.
- Insert these lines:

```
1421 TFR X,D
1422 ADDA #24
1423 PSHS D
1561 PULS D
```

- Replace the two <SENDS in lines 1500 and 1550 with ,S.

This patch does, however, eliminate the possibility of the Apple mixed-mode emulation and all other non-four-line formats. To this end, I've revised my program entirely, so that all the original modes are supported under both Disk and Extended Color Basic.

I've also written a new version that

allows 51 characters per line, although this is slightly less legible. In addition, the clear key now clears the screen.

I'm offering cassettes with these programs in object code for \$5. One side has the 42-character version, while the other has the 51-character version. Specify Disk Basic or Extended Color Basic when ordering.

Thomas Rokicki  
Box 258  
College Station, TX 77841

## Copy That Screen

"Print That Trace" (*HOT CoCo*, June 1983, p. 64) was very helpful in debugging my programs, and I thought there might be some interest in the following routine to copy the text screen to the printer:

```
15 FOR P=1024 TO 1535
20 C=C+1: IF C=33 THEN C=1: PRINT #2,""
25 X=PEEK(P)
30 IF X>127 THEN X=42
35 IF X<=31 THEN X=X+96: GOTO 45
40 IF X>=96 THEN X=X-64
45 PRINT #2,CHR$(X);
50 NEXT P
55 PRINT #2,""
```

It will not copy a graphic character, so I changed my graphics to an asterisk in line 30.

Jim Burridge  
Thomaston, ME

## Correct "Inverted Video Modification"

There was some incorrect information in my article, "Inverted Video Modification" (*HOT CoCo*, September 1983, p. 94).

For the quick modification, lift pin 32 of IC U7 (a 6847) from the socket. If leaving this pin up doesn't invert the video, just tie it to ground.

For the complete modification, lift pin 32 of IC U7, and pins 1 and 2 of IC U29 (a 74LS02). Then connect pin 32 of U7 to pin 1 of IC U2, and connect pin 2 of U29 to pin 2 of U7 (note—don't lift pin 2 of U7).

That's all you need for the modifications. Pin 16 of IC U29 doesn't exist, and you don't lift pin 3 of U29.

As far as the new F board is concerned, I've received conflicting information about the correct IC numbers.

Just look for the 6847 and the 74LS02 on the PC board.

John G. Skora  
Shoreham, NY

## "Submarine Simulation" Fix

I noticed that the printer dropped a few bytes in line 1420 of my "Submarine Simulation" article (*HOT CoCo*, November 1983, p. 109). The line should read as follows:

```
1420 OCS="": IF R(2)>0 THEN SW=1
```

Also, if you want to use the program with a disk system, make these changes: Change line 10 to GOTO 9905, and remove POKE 65495,1: in line 9905.

This removes the break-key disable function and high-speed operation that is not compatible with some disk systems.

William S. Bonnell  
Rochester, NY

## "Galaxy Trek Adventure 2," Change 2

Please make the following line changes in "Galaxy Trek Adventure 2" (*HOT CoCo*, September 1983, p. 72):

```
1000 A$=A$+"":V$=LEFT$(A$,3):
N$="":FOR I=3TOLEN(A$):IFMID$(
A$,I,1)=" "THENN$=MID$(A$,I+1,4):
NQ$=MID$(A$,I+1,LEN(A$)-4-I):
I=255:NEXTI:ELSENEXT I
1007 IFVN=7THEN2100
2100 IFN$="ENER"ANDCL=28THEN
2115
2110 B=300:GOSUB2050:PRINTNQ$:
GOSUB2050:GOTO850
```

I've included these changes in an errata sheet and sent it to all who have purchased the tape of Adventure 2. My apologies for any frustration!

Howard F. Batie  
12002 Chevoit Drive  
Herndon, VA 22070

# TEN MOST-ASKED QUESTIONS about **DYNACALC**<sup>TM</sup>

## THE ELECTRONIC SPREAD-SHEET FOR 6809 COMPUTERS

---

**1. What is an electronic spread-sheet, anyway?**

Business people use spread-sheets to organize columns and rows of figures. DYNACALC simulates the operation of a spread-sheet without the mess of paper and pencil. Of course, corrections and changes are a snap. Changing any entered value causes the whole spread-sheet to be re-calculated based on the new constants. This means that you can play, 'what if?' to your heart's content.

**2. Is DYNACALC just for accountants, then?**

Not at all. DYNACALC can be used for just about any type of job. Not only numbers, but alphanumeric messages can be handled. Engineers and other technical users will love DYNACALC's sixteen-digit math and built-in scientific functions. You can build worksheets as large as 256 columns or 256 rows. There's even a built-in sort command, so you can use DYNACALC to manage small data bases — up to 256 records.

**3. What will DYNACALC do for ME?**

That's a good question. Basically the answer is that DYNACALC will let your computer do just about anything you can imagine. Ask your friends who have VisiCalc<sup>TM</sup>, or a similar program, just how useful an electronic spread-sheet program can be for all types of household, business, engineering, and scientific applications. Typical uses include financial planning and budgeting, sales records, bills of material, depreciation schedules, student grade records, job costing, income tax preparation, checkbook balancing, parts inventories, and payroll. But there is no limit to what YOU can do with DYNACALC.

**4. Do I have to learn computer programming?**

NO! DYNACALC is designed to be used by non-programmers, but even a Ph.D. in Computer Science can understand it. Even experienced programmers can get jobs done many times faster with DYNACALC, compared to conventional programming. Built-in HELP messages are provided for quick reference to operating instructions.

**5. Do I have to modify my system to use DYNACALC?**

Nope. DYNACALC uses any standard 6809 configuration, so you don't have to spend money on another CPU board or waste time learning another operating system.

**6. Will DYNACALC read my existing data files?**

You bet! DYNACALC has a beautifully simple method of reading and writing data files, so you can communicate both ways with other programs on your system, such as the Text Editor, Text Processor, Sort/Merge, STYLOGRAPH<sup>TM</sup> word processor, RMS<sup>TM</sup> data base system, or other programs written in BASIC, C, PASCAL, FORTRAN, and so on.

**7. How fast is DYNACALC?**

Very. Except for a few seldom-used commands, DYNACALC is memory-resident, so there is little disk I/O to slow things down. The whole data array (worksheet) is in memory, so access to any point is instantaneous. DYNACALC is 100% 6809 machine code for blistering speed.

**8. Is there a version of DYNACALC for MY system?**

Probably. You need a 6809 computer (32k minimum) with FLEX<sup>TM</sup>, UniFLEX<sup>TM</sup>, or OS-9<sup>TM</sup> operating system. You also need a decent crt terminal, one with at least 80 characters per line, and direct cursor addressing. If your terminal isn't smart enough for DYNACALC, you probably need a new one anyway. The UniFLEX and OS-9 versions of DYNACALC allow you to mix different brands of terminal on the same system. There's also a special version of DYNACALC for Color Computers equipped with FLEX (Frank Hogg or Data-Comp versions).

**9. How much does DYNACALC cost?**

The FLEX versions are just \$200 per copy; UniFLEX version \$395; OS-9 version (works with LEVEL ONE or LEVEL TWO) \$250. Orders outside North America add \$7 per copy for postage. We encourage dealers to handle DYNACALC, since it's a product that sells instantly upon demonstration. Call or write on your company letterhead for more information.

**10. Where do I order DYNACALC?**

See your local DYNACALC dealer, or order directly from CSC at the address below. We accept telephone orders from 10 am to 6 pm, Monday through Friday. Call us at 314-576-5020. Your VISA or MasterCard is welcome. Please specify diskette size for FLEX or OS-9 versions. Software serial number is required for the UniFLEX version.

**CERTIFIED****GOOD  
STUFF****MACRO-80C**

This is a **disk-based editor, macro assembler and monitor**, written for Color Computer by Andy Phelps. **THIS IS IT** — The ultimate programming tool!

The powerful 2-pass macro assembler features conditional assembly, local labels, include files and cross referenced symbol tables. MACRO-80C supports the complete Motorola 6809 instruction set in standard source format. There are no changes, constraints or shortcuts in the source language definition. Incorporating all of the features of our Rompack-based assembler (SDS80C), MACRO-80C contains many more useful instructions and pseudo-ops which aid the programmer and add power and flexibility. The screen-oriented text editor is designed for efficient and easy editing of assembly language programs. The "Help Key" feature makes it simple and fun to learn to use the editor. As the editor requires no line numbers, you can use the arrow keys to position the cursor anywhere in the file. MACRO-80C allows global changes and moving/copying blocks of text. You can edit lines of assembly source which are longer than 32 characters.

DCBUG is a machine language monitor which allows examining and altering of memory, setting break points, etc.

The editor, assembler and monitor — as well as sample programs — come on one Radio Shack compatible disk. Extensive documentation included. **MACRO-80C Price: \$99.95**

**SOFTWARE DEVELOPMENT SYSTEM**

The Micro Works Software Development System (SDS80C) is a complete 6809 editor, assembler and monitor package contained in one Color Computer program pack! Vastly superior to RAM-based assemblers/editors, the SDS80C is non-volatile, meaning that if your application program bombs, it can't destroy your editor/assembler. Plus it leaves almost all of 16K or 32K RAM free for your program. Since all three programs, editor, assembler and monitor are co-resident, we eliminate tedious program loading when going back and forth from editing to assembly and debugging!

The powerful screen-oriented Editor features finds, changes, moves, copies and much more. All keys have convenient auto repeat (typematic), and since no line numbers are required, the full width of the screen may be used to generate well commented code.

The Assembler features all of the following: complete 6809 instruction set; conditional assembly; local labels; assembly to cassette tape or to memory; listing to screen or printer; and mnemonic error codes instead of numbers.

The versatile monitor is tailored for debugging programs generated by the Assembler and Editor. It features examine/change of memory or registers, cassette load and save, breakpoints and more. **SDS80C Price: \$89.95**

**MICRO WORKS COLOR FORTH**

• Forth is faster to program in than Basic. • Forth is easier to learn than Assembly Language. • Forth executes in less time than Basic.

Forth is a highly interactive language like Basic, with structure like Pascal and execution speed close to that of Assembly Language. The Micro Works Color Forth is a Rompack containing everything you need to run Forth on your Color Computer.

Color Forth consists of the standard FORTH Interest Group (FIG) implementation of the language plus most of FORTH-79. It has a super

**Star Blaster** — Blast your way through an asteroid field in this action-packed Hi-Res graphics game. In ROMPACK; requires 16K. **\$39.95**

**Pac Attack** — Try your hand at this challenging game by Computerware, with graphics, sound and action! Cassette requires 16K. **\$24.95**

**Haywire** — Have fun zapping robots with this Hi-Res game by Mark Data Products. Cassette requires 16K. **\$24.95**

**Dunkey Monkey** — Arcade excitement awaits those who dare to conquer the monkey! Joystick and 32K required, by Intellectronics. Cassette: **\$24.95**

**Colorpede** — Great graphics, two-player option, and pause control in this exciting game by Intracolor Communication. Cassette requires 16K. **\$29.95**

**Adventure** — *Black Sanctum* and *Calixto Island* by Mark Data Products. Each cassette requires 16K. **\$19.95 each**

*6809 Assembly Language Programming*, by Lance Leventhal, **\$16.95**

*TRS-80 Color Computer Graphics*, by Don Inman, **\$14.95**

*Assembly Language Graphics for the TRS-80 Color Computer*, by Don Inman, **\$14.95**

*Starting Forth*, by L. Brodie, **\$17.95**

**NEW! MAGIGRAPH** will turn your Color Computer into a graphic design center with the ease of a keystroke! This utility makes it simple to draw highly detailed graphic figures, up to and including an entire graphic screen. Nine animation buffers are provided for you to test and revise the movements of animated figures. To see your creations, just toggle between the design screen and graphic display screen. A full set of logical operation and pixel manipulation functions simplify the development of a figure in all its different possible color and position combinations. Save the graphic screen to cassette or disk for later recall, or send the pixel codes of a graphic image to a printer. If you are an experienced basic or assembly language programmer, you won't want to be without this program! Demonstration programs are included in the comprehensive documentation package. Comes on cassette (16K required) for **\$34.95**; disk (32K Extended Color Basic required) for **\$39.95** and Amdisk cartridge for **\$44.95**.

screen editor with split screen display. Mass storage is on cassette. Color Forth also contains a decompiler and other aids for learning the inner workings of this fascinating language. It will run on 4K, 16K, and 32K computers. Color Forth contains 10K of ROM, leaving your RAM for your programs! There are simple words to effectively use the Hi-Res Color Computer graphics, joysticks, and sound. The 112-page manual includes a glossary of the system-specific words, a full standard FIG glossary and complete source listing. **COLOR FORTH... THE BEST!** From the leader in Forth, Talbot Microsystems. **Price \$109.95.**

**MICROTEXT: COMMUNICATIONS VIA YOUR MODEM!**

Make your Color Computer an intelligent printing terminal with off-line storage! The Microtext module is just what you'll need for:

- Talking to a timeshare system or information service
- Printing out what is received as it is received
- Saving received text to cassette tape
- Re-displaying the received text even while on-line
- Communications with other computers
- Using your computer as a general-purpose 300-baud terminal
- Downloading programs from other computers

The Microtext module is a program pack containing not only firmware but a second serial port so that both your printer and modem can be connected at the same time. Microtext can be configured for any serial printer that will work with the Color Computer, even if it requires line feeds! But even if you don't have a printer, you can keep a permanent copy of your data by storing to cassette tape. Also, any Radio Shack/Centronics-compatible parallel printer may be used by adding the Micro Works' PI80C parallel interface.

For those of you with special terminal applications, Microtext has selectable parity; it sends odd, even, mark or space. With mark parity (which is default) you can send to computers requiring either seven or eight bits. All 128 ASCII codes can be sent. Exchange programs with other Color Computer users! Basic programs may be downloaded from other computers or timesharing systems.

You'll find many uses for this versatile module! Available in ROMPACK, ready-to-use, for **\$59.95.**

**MACHINE LANGUAGE**

**MONITOR TAPE:** A cassette tape which allows you to directly access memory, I/O and registers with a formatted hex display. Great for machine language programming, debugging and learning. It can also send/receive RS232 at up to 9600 baud, including host system download/upload. 19 commands in all. Relocatable and reentrant. **CBUG Tape Price: \$29.95**

**MONITOR ROM:** The same program as above, supplied in 2716 EPROM. This allows you to use the entire RAM space. And you don't need to re-load the monitor each time you use it. The EPROM plugs into the Extended Basic ROM Socket or the Romless Pack I. **CBUG ROM Price: \$39.95**

**SOURCE GENERATOR:** This package is a disassembler which runs on the Color Computer and generates your own source listing of the BASIC interpreter ROM. Also included is a documentation package which gives useful ROM entry points, complete memory map, I/O hardware details and more. A 16K system is required for the use of this cassette. **80C Disassembler Price: \$49.95**

**Cave Hunter** — Experience vivid colors, bizarre sounds and eerie creatures in hot pursuit as you wind your way through a cave maze in search of gold treasures. This exciting Hi-Res game by Mark Data Products requires 16K for cassette version. **\$24.95**

**Starfire** — Fly around the planet defending Earthlings from being snatched up by aliens in this challenging game from Intellectronics. Cassette requires 16K: **\$21.95**

**Doodle Bug** — Joystick-controlled Doodle Bugs must move quickly through mazes while being chased by enemy bugs in Hi-Res game by Computerware. Cassette requires 16K: **\$24.95**

**Astro Blast** — You'll need to act fast as you protect Earth from wave after wave of alien invaders in this Hi-Res game by Mark Data. Cassette requires 16K: **\$24.95**

**PARALLEL PRINTER INTERFACE** — Serial to parallel converter allows use of all standard parallel printers. PI80C plugs into the serial output port, leaving your Rompack slot free. You supply the printer cable. **PI80C Price: \$59.95**

**MEMORY UPGRADE KITS:** For Rev. level E., ET, NC and TDP-100s, we carry 64K chips; upgrading is easy! Eight prime **64K chips** and instructions: **\$64.95**

**Romless Packs** for your custom EPROMs — call or write for information. **SUPER-PRO KEYBOARD** — **\$69.95.** (For computers manufactured after Oct. 1982, add \$4.95)

# ELMER'S ARCADE

DANG IT!

by Richard Ramella

Elisa the Puzzle Lady was at Elmer's joint last week. I was glad to see her. I like puzzles as much as I like arcade games.

"Talk some sense into this man," she said, pointing at Elmer. "Look at this puzzle and tell me that it's not a winner."

"I still have puzzles left over from your last visit that I haven't sold," Elmer complained.

"So, we'll put it on consignment," said Elisa, pressing the puzzle into my hand.

It was a little plastic gizmo with a window in the front.

"What do you do with it?" I asked.

"Try to put the little BBs in the slots at the top."

"Whoa! These things run uphill." With a distinct sense of vertigo I tilted

the puzzle box slightly and every BB in the box climbed toward the top in contravention of the law of gravity.

"Let me see that!" Elmer grabbed for the puzzle.

"Wow!" I said, keeping it out of his reach.

"I'll take a dozen," he said to Elisa.

While Elisa wrote up the order, I figured out why the BBs ran uphill (or seemed to). "Look," I said, "there's a mirror at a 45-degree angle in this thing. You work the puzzle sideways and backwards to move the BBs to the top. The BBs roll around on a plane parallel to the ground, and the mirror makes it appear that they're frolicking around the far wall."

"It's a trick then," said a disappointed Elmer.

"All life is a puzzle, my friend, but

the trick is only in your mind," said Elisa, whisking Elmer's money out of sight. He had apparently forgotten the part about consignment.

Elmer tried the puzzle. "I like it," he said unsurely. "It's kind of like a miniature arcade game."

"Now you know why I come here," said Elisa as I gently took the gadget

# Some Like It HOT

## HOT CoCo<sup>®</sup>

Guaranteed to make your TRS-80 Color Computer\* sizzle with color, **HOT CoCo** magazine is informative, interesting, and *best of all* just for the Color Computer. You'll look forward to **HOT CoCo** month after month because it has something for everyone, from the novice right on up to the expert. **HOT CoCo** gives you:

- **PROGRAMMING TECHNIQUES & TUTORIALS**—that promise to make you a superior programmer.
- **UTILITIES**—to save you time and effort on all your routine tasks.
- **EXPERTLY WRITTEN COLUMNS**—including *BASIC, GRAPHICS, FLEX and GAMES*.
- **HARDWARE & CONSTRUCTION**—ideas on interfacing and enhancing to make building projects a breeze.
- **EDUCATIONAL APPLICATIONS**—will stimulate and encourage imaginative thinking in your child.

**PLUS**

- **BUSINESS PROGRAMS**—sure to make you a star at the office.
- **FEATURES ON COLOR APPLICATIONS**—make your computer reach its full potential and get your money's worth from your machine.
- **BUYER'S GUIDES & PRODUCT REVIEWS**—now you can stop running around comparing prices and products and start running your computer.
- **HOME & HOBBY APPLICATIONS**—exciting ways to help your computer add enjoyment to your leisure time.
- **ANSWERS TO SPECIFIC QUESTIONS**—it's like having your own private consultant—free!

Join in the color explosion with **HOT CoCo** today! Take advantage of our money saving offer, 12 issues for \$24.97. A 13th issue is yours **FREE** with pre-payment (check or credit card). Use the attached order form, the coupon below, or call toll free 1-800-258-5473. (In NH. call 1-924-9471)

**YES!** I want my Color Computer to sizzle with color. I understand that with payment enclosed or credit card order I will receive a free issue making a total of 13 issues for \$24.97.

from Elmer's hands.

"Hey, give me that," he told me.

I drew back the puzzle. "I want it. I'm going to write a computer game."

"Sure," said Elmer. And to Elisa: "How much do you get for these wholesale?"

"A half-dollar each."

"That'll be a buck," said Elmer.

"But it's shopworn," I protested. "And it will wipe me out as far as play time goes."

"We'll put it on the tab," said my good and trusting friend.

The little puzzle box inspired me to write Dang It!, a moving strategy game of colors that climb a wall. If I did my job right, you'll also be climbing the wall and saying "Dang It" as Elmer does when he fumbles around with the little puzzle.

Also, this game can teach you something useful about graphic PEEK and POKE commands on your CoCo or Micro CoCo—the MC-10.

Dang It! begins with a white playing square drawn on the screen. Randomly, blocks of color sweep from the left or right at the bottom of the field. To release a color to climb the wall, press any key except break or shift. The color will go and stick to whatever it hits.

If the released color sticks in a position where the color is the same above it or to either side, the game ends. It's simple at the start, but becomes more complex when the playing field becomes increasingly crowded, and the colors crossing the bottom of the screen begin to speed up.

The highest possible score seems to be 324 (27 across by 12 down). You get one point for every color that goes up and doesn't come in contact with the same color. You lose one point if you allow the color choice to run all the way across the bottom of the screen without sending it up. The top-left of the screen displays your current game's score while the top right displays the high score for the series.

When the game ends a game-over message appears at the bottom left of the screen, and a tone sounds. To start the next game, press any key except break or shift.

One final playing tip. If a white playing piece is the first to cross the bottom, there's no place to put it because the frame is white. So take the lost point and stay viable.

I think you have to become somewhat monomaniacal about this game

to score higher than 50. That throws down the gauntlet rather forcefully, doesn't it?

### More on PEEKs and POKEs

PEEK and POKE graphics are what make this program work.

First thing to do is write down the RAM location for the text display number. If you have an MC-10, this magic number is 16384. On my 16K Extended Color Basic machine, the number is 1024. In both program listings for this game, R is given the respective values for POKE and PEEK graphics in line 240. Both numbers are the zero position on the screen display.

This short program explains POKE and PEEK:

```
100 REM * POKE-PEEK LECTURE *
110 CLS
120 R = 1024
130 INPUT "NUMBER 1 TO 255";X
140 CLS 0
150 POKE R + 232,X
160 PRINT PEEK(R + 240);
170 FOR T = 1 TO 1000
180 NEXT T
190 CLS
200 GOTO 130
210 END
```

MC-10 users, change line 120 to:  
120 R = 16384

Run the program and enter a number 1-255 when prompted. The program POKES the graphic to the middle of the screen. The POKE is achieved by adding the value of R to the screen position 240 (just like the PRINT@ 240 screen position). The

numbers 1-255 are the ASCII decimal codes for the characters POKEd to the screen.

CoCo owners, see pages 280, 281, and 276 of *Getting Started with Color Basic*. MC-10 owners, see pages 115, 116, and 118 of *TRS-80 MC-10 Micro Color Computer Operation and Language Reference Manual*. These manuals provide text and graphics characters.

### Back to "Dang It!"

Now back to the little program. Line 160 prints the ASCII value of the character. The command to PRINT PEEK(R + 240) displays the ASCII number of the character you just POKEd. It doesn't parrot the number you entered. It examines the screen position R + 240 and finds the value of the character printed there. Then it tells you that value.

It also works for PRINT@ graphics, but you have to add in the magic number for the PEEK test. Example: PRINT@ 32,CHR\$(255) can be tested in Extended Color Basic with the command PRINT PEEK(1024 + 32). It returns the ASCII decimal code for what's at screen position 32 (in this case, an orange block).

Now that you see what it does, let's look at Dang It! to see how you can use it. The line numbers I refer to are the same in both listings.

In lines 270-290, I POKE in the top and sides of the white playing square.

I've found PRINT@ graphics faster than POKE graphics on the

## Subscription Problem?

*Hot CoCo* does not keep subscription records on the premises, therefore calling us only adds time and doesn't solve the problem.

```

Listing continued

Color Computers, so I use PRINT@ in line 440, which is part of a loop that takes the player graphics in either direction.

The next important thing that happens is in line 560, a PEEK test. This line reads, "If the position north of

the current position of the upward flying color piece is not blank, then it must be some color, so go to line 590 to see what happens."

In line 590, first look at the previous lines. Back in lines 390-400 the color of the fly-up playing piece is made rec-

ognizable by the value of A, which added to 143—CHR\$(143+A)—yields the block of color that crosses the screen. In line 590, L is made to equal whatever 143+A totals.

The important PEEK test is in line 610. It says, "If the position above the flying graphic is its same color (its ASCII number equal to L), or if the position to left or right is the same color, go to line 650 for a loser routine." If these tests for failure aren't met, SC, which stands for score, has a point added, and the game goes back to line 330 to continue.

Unless you know what you're doing, don't POKE around with values other than those indicated, i.e., Extended Color Basic—1024 to 1535, and Micro Color Basic—16384 to 16895.

There are other ways of using the commands and you will see examples in other programs, but these numbers are the extent of my POKE/PEEK responsibility to you. Strange things could happen if you fail to heed my advice. You could lock up the system and lose the resident program. ■

*I'll help if you have trouble making Dang It! work. I cannot help if you've modified it in any way. If you can, send a line printer listing for comparison or state where you get error messages. Include a stamped, self-addressed envelope or, from other countries, a self-addressed envelope with coin equal to the stamps on your outgoing letter. Write Richard Ramella, 1493 Mt. View Ave., Chico, CA 95926.*

# HI-RESOLUTION SCREEN UTILITY

**HI-RES SCREEN UTILITY**  
 Features: Double Height Characters, On-Screen Underlining, Bell Character Tone Generator, Switchable Full Screen Reverse Video, Inverse Upper & Lower Case Character Set, Reverse Screen Highlighting, Programmable Line Lengths from 28 to 255 characters.

28 Characters per Line  
 36 Characters per Line  
 42 Characters per Line  
 53 Characters per Line  
 64 Characters per Line

Line Lengths of 87, 128 & 255 are unreadable but can be very useful for seeing display layouts.

All Functions are easily programmable thru BASIC. Fully BASIC COMPATIBLE (including CLS & PRINT).

- FULLY BASIC COMPATIBLE
- DISPLAY FORMATS OF 28 to 255 CHARACTERS PER LINE
- FULL 96 UPPER LOWER CASE CHARACTERS
- MIXED GRAPHICS & TEXT OR SEPARATE GRAPHIC & TEXT SCREENS
- INDIVIDUAL CHARACTER HIGHLIGHTING
- REVERSE CHARACTER HIGHLIGHT MODE
- WRITTEN IN FAST MACHINE LANGUAGE
- AUTOMATIC RELOCATES TO TOP OF 16.32K
- AUTOMATICALLY SUPPORTS 64K OF RAM WITH RESET CONTROL
- REVERSE SCREEN
- ON SCREEN UNDERLINE

- DOUBLE SIZE CHARACTERS
- ERASE TO END OF LINE
- ERASE TO END OF SCREEN
- HOME CURSOR
- BELL TONE CHARACTER
- HOME CURSOR & CLEAR SCREEN
- REQUIRES ONLY 2K OF RAM
- COMPATIBLE WITH ALL TAPE & DISK SYSTEMS

**\$19.95**

## Editor/Assembler CO-RES9

CO-RES9 is a Co-resident Editor/Assembler that will allow you to create, edit and assemble machine language programs for the color computer. It will quickly and efficiently convert assembly language programs into machine code files. It will output machine object code to either cassette tape in a 'CLOADM' compatible format or directly to memory for direct execution.

  - Three Programmable Headers
  - Ten Programmable Tab Stops
  - Margin Justification Left & Right
  - Decimal Align, Center, Left & Right Justify on Tab Column
  - Display & Input from Keyboard
  - Change Formatting During Processing
  - 64K Version Has a 52K Text Buffer
- TEXT EDITOR FEATURES**
- Single Keystroke Edit Command
  - Append Files from Tape or Disk
  - Fully Integrated Disk File Handler
  - Edit or Process Files Larger Than Memory
  - (NO Conversion Required) Fully ASCII Compatible
  - Full Featured Line Oriented Screen Editor
  - Search and Replace Any Character Pattern
  - Copy, Move or Delete Lines or Blocks of Text
  - Edit Basic, Text or Assembler Files

## TERMINAL PACKAGE

- Full Text Buffering • Printer Baud Rates 110-4800
- Terminal Baud Rates 300 to 9600 Baud
- Automatic Word Wrap Eliminates Split Words
- Full/Half Duplex
- Full Disk Support For Disk Version
- Send Control Codes From Keyboard
- ASCII Compatible File Format
- Automatic File Capture

- Display On Screen Or Output Contents Of Buffer To Printer
- Save & Load Text Buffer To Tape Or Disk
- Send Files Directly From Buffer Or Disk
- Programmable Word Length, Parity & Stop Bits
- Automatic Buffer Size At Memory Limit

Datapack on tape w/manual ..... \$24.95

Diskpack for R.S. disk w/manual **\$49.95**

# Telewriter-64™

## the Color Computer Word Processor

- 3 display formats: 51/64/85 columns × 24 lines
- True lower case characters
- User-friendly full-screen editor
- Right justification
- Easy hyphenation
- Drives any printer
- Embedded format and control codes
- Runs in 16K, 32K, or 64K
- Menu-driven disk and cassette I/O
- No hardware modifications required

### THE ORIGINAL

Simply stated, Telewriter is the most powerful word processor you can buy for the TRS-80 Color Computer. The original Telewriter has received rave reviews in every major Color Computer and TRS-80 magazine, as well as enthusiastic praise from thousands of satisfied owners. And rightly so.

The standard Color Computer display of 32 characters by 16 lines without lower case is simply inadequate for serious word processing. The checkerboard letters and tiny lines give you no feel for how your writing looks or reads. Telewriter gives the Color Computer a 51 column by 24 line screen display with *true lower case characters*. So a Telewriter screen looks like a printed page, with a good chunk of text on screen at one time. In fact, more on screen text than you'd get with Apple II, Atari, TI, Vic or TRS-80 Model III.

On top of that, the sophisticated Telewriter full-screen editor is so simple to use, it makes writing fun. With single-letter mnemonic commands, and menu-driven I/O and formatting, Telewriter surpasses all others for user friendliness and pure power.

Telewriter's chain printing feature means that the size of your text is never limited by the amount of memory you have, and Telewriter's advanced cassette handler gives you a powerful word processor without the major additional cost of a disk.

*...one of the best programs for the Color Computer I have seen...*

— Color Computer News, Jan. 1982

### TELEWRITER-64

But now we've added more power to Telewriter. Not just bells and whistles, but major features that give you total control over your writing. We call this new supercharged version Telewriter-64. For two reasons.

### 64K COMPATIBLE

Telewriter-64 runs fully in any Color Computer — 16K, 32K, or 64K, with or without Extended Basic, with disk or cassette or both. It automatically configures itself to take optimum advantage of all available memory. That means that when you upgrade your memory, the Telewriter-64 text buffer grows accordingly. In a 64K cassette based system, for example, you get about 40K of memory to store text. So you don't need disk or FLEX to put all your 64K to work immediately.

### 64 COLUMNS (AND 85!)

Besides the original 51 column screen, Telewriter-64 now gives you 2 additional high-density displays: 64 × 24 and 85 × 24!! Both high density modes provide all the standard Telewriter editing capabilities, and you can switch instantly to any of the 3 formats with a single control key command.

The 51 × 24 display is clear and crisp on the screen. The two high density modes are more crowded and less easily readable, but they are perfect for showing you the exact layout of your printed page, *all on the screen at one time*. Compare this with cumbersome "windows" that show you only fragments at a time and don't even allow editing.

### RIGHT JUSTIFICATION & HYPHENATION

One outstanding advantage of the full-width screen display is that you can now set the screen width to match the width of your printed page, so that "what you see is what you get." This makes exact alignment of columns possible and it makes hyphenation simple.

Since short lines are the reason for the large spaces often found in standard right justified text, and since hyphenation is the most effective way to eliminate short lines, Telewriter-64 can now promise you some of the best looking right justification you can get on the Color Computer.

### FEATURES & SPECIFICATIONS:

**Printing and formatting:** Drives any printer (LPV7/VIII, DMP-100/200, Epson, Okidata, Centronics, NEC, C. Itoh, Smith-Corona, Terminate, etc).

Embedded control codes give full dynamic access to intelligent printer features like: underlining, subscript, superscript, variable font and type size, dot-graphics, etc.

Dynamic (embedded) format controls for: top, bottom, and left margins; line length, lines per page, line spacing, new page, change page numbering, conditional new page, enable/disable justification.

Menu-driven control of these parameters, as well as: pause at page bottom, page numbering, baud rate (so you can run your printer at top speed), and Epson font. "Typewriter" feature sends typed lines directly to your printer, and Direct mode sends control codes right from the keyboard. Special Epson driver simplifies use with MX-80.

Supports single and multi-line headers and automatic centering. Print or save all or any section of the text buffer. Chain print any number of files from cassette or disk.

**File and I/O Features:** ASCII format files — create and edit BASIC, Assembly, Pascal, and C programs, Smart Terminal files (for uploading or downloading), even text files from other word processors. Compatible with spelling checkers (like Spell 'n Fix).

Cassette verify command for sure saves. Cassette auto-retry means you type a load command only once no matter where you are in the tape.

Read in, save, partial save, and append files with disk and/or cassette. For disk: print directory with free space to screen or printer, kill and rename files, set default drive. Easily customized to the number of drives in the system.

**Editing features:** Fast, full-screen editor with wordwrap, block copy, block move, block delete, line delete, global search and replace (or delete), wild card search, fast auto-repeat cursor, fast scrolling, cursor up, down, right, left, begin line, end line, top of text, bottom of text; page forward, page backward, align text, tabs, choice of buff or green background, complete error protection, line counter, word counter, space left, current file name, default drive in effect, set line length on screen.

Insert or delete text anywhere on the screen without changing "modes." This fast "free-form" editor provides maximum ease of use. Everything you do appears immediately on the screen in front of you. Commands require only a single key or a single key plus CLEAR.

*...truly a state of the art word processor...  
outstanding in every respect.*

— The RAINBOW, Jan. 1982

### PROFESSIONAL WORD PROCESSING

You can no longer afford to be without the power and efficiency word processing brings to everything you write. The TRS-80 Color Computer is the lowest priced micro with the capability for serious word processing. And only Telewriter-64 fully unleashes that capability.

Telewriter-64 costs \$49.95 on cassette, \$59.95 on disk, and comes complete with over 70 pages of well-written documentation. (The step-by-step tutorial will have your writing with Telewriter-64 in a matter of minutes.)

### DEMON'S DEFIANCE

The inhabitants of the distant planet of Mestopholus live their daily lives in constant fear of the winged demon Beleshar. Beleshar is an oppressive guardian over the planet's surface. In order to maintain control over the frightened population, he has encircled the planet with a colorful but deadly force field. The Mestopholan forces are too weak to overpower the winged demon. Instead they offer token defiance by shooting at the force field or the demon himself. By scoring precious power points against the enemy, they hope to be able to free themselves.

Your job, as a Mestopholan gunner, is to blast away at the Demon's force field in the sky. The higher the section in the power field, the more points you score. Hitting the demon will disorient him and score you extra points. Avoid the underground Neutralizer which will vaporize your gun station if you fire while one is underneath you.

### TRI-PLANETARY HANGMENOIDS

HA! So you think you are safe in your earthly homes! Little do you know, but the evil settlers from the Tri-Planet system of Hangmainia have been planning an assault on Earth for decades! At this very moment, they are planning to launch their invasion craft once they receive word from their confederates on Earth. You can foil their scheme by intercepting their messages which closely resemble English terms. If you decode the words, the interceptor craft will destroy the invader ship. If not, the invader ship will launch for the destruction of earth.

You have fifteen tries to decode the word on the screen. Each time you miss a letter a new section is added to the alien. There are two levels of play, hard and easy. Sometimes a code word will be repeated. See how many alien craft you can destroy before they are able to launch!

## the CoCo Professional TAX PREPARER

### FOR THE INDIVIDUAL, IT ELIMINATES ANXIETY

File your taxes in confidence. The CoCo Professional Tax Preparer is accurate, thorough, and easy to use. Just answer the questions.

The CoCo Tax Preparer interviews you the way professionals in the large walk-in tax firms do. It takes you through each tax form in an organized manner. It knows which forms you need based on how you answer the questions it asks. And you can change data and make corrections - no hassle.

When you're done, the program prints your completed tax return on government-approved forms.

### FOR THE PROFESSIONAL TAX PREPARER, IT SAVES TIME

Spend your time doing what you're supposed to do. You make the important business decisions, the CoCo Tax Preparer will do the rest. And you can simplify your filing - one diskette per client.

Interview your clients in a time-saving manner and get rid of your check-off sheets.

Produce complete tax returns on government-approved forms. The CoCo Tax Preparer lets you run continuous multicopy forms in the order you need, when you need them.

Mass. residents add 5% sales tax. Shipped post paid. Delivery starts during the third week of December. Yearly update available.

### PROGRAM FEATURES

Designed by a 15-year tax consultant, the program has built-in tax tables and tax rate schedules and supports the following forms:

- 1040
- Schedules A, B, C, D, E, G, SE, W
- Forms 2106, 2119, 3903, 4797
- Office-at-Home
- Installment Gain
- Dependency Support
- Credits and Other Taxes

\$ **99**

For a limited time only.  
A \$400 value

### MORE FEATURES

- Over 170 full-screen menus displayed on command. Fully menu-driven screens - each appears only when required.
- Full reverse-screen scrolling and forward-screen block scroll.
- Calculator mode supports +, -, \*, /, = on numeric data.
- Edit capability: any line at any time. Supports change, delete, hack, search, and insert commands. Eliminates the need for check-off sheets
- Runs on 32K extended Basic (one disk drive with change of diskette during program execution) or two disk drives. (A special-order version runs on 64K RAM units with one or two disk drives.) Comes with diskettes and operating manual that describes each screen presentation. Additional forms are available by special order.
- Full disk drive storage for all data and computations.
- Printed output on pin-fed or tractor-fed printers, for government-approved forms.
- Its combination of machine language and Basic is fast and it minimizes memory use.

# The Basic Beat

You are only a few months from finals and the graduation ceremony, as this column nears its end.

You've already learned how to PEEK into high memory to check information POKEd into those locations. This month you'll learn to use PEEK so a program can tell what key you have pressed.

Isn't that the same as INKEY\$? Yes, and no—when you run Program Listings 1 and 2 you'll see the difference.

You can save some work by first typing and running Listing 1. To change to Listing 2, simply delete lines 20–60 and add lines 20–50 of Listing 2.

Both programs let you draw on the screen by pressing the U, D, L, and R keys (up, down, left, and right). To move a line with Listing 1, you must press a key each time you want the line to move one space. To move 15 spaces, you must press the key 15 times.

Listing 2, using the PEEK command, allows the line to move as long as the key is pressed. You can move the line 15 spaces simply by holding the key down for the proper length of time. You don't have to release and press it 15 times.

PEEK has another advantage, too. When you use INKEY\$, it is easier to use the four arrow keys. Program Listing 3 prints the word "FIRE" when you press the up arrow. The mark between the quotes in line 20 is an up arrow as printed by most printers. Try to change the program to

## THE FIRST STEPS TO BASIC PROGRAMMING LESSON 8

by James W. Wood

```
10 CLS0:X=32:Y=15
20 AS=INKEY$
30 IFAS="U"THEN Y=Y-1
40 IFAS="D"THEN Y=Y+1
50 IFAS="L"THEN X=X-1
60 IFAS="R"THEN X=X+1
70 IF X<0 THEN X=0
80 IF X>63 THEN X=63
90 IF Y<0 THEN Y=0
100 IF Y>31 THEN Y=31
110 SET(X,Y,1)
120 GOTO20
```

Program Listing 1

```
10 CLS0:X=32:Y=15
20 IF PEEK(343)=251 THEN Y=Y-1
30 IF PEEK(342)=254 THEN Y=Y+1
40 IF PEEK(342)=253 THEN X=X-1
50 IF PEEK(340)=251 THEN X=X+1
70 IF X<0 THEN X=0
80 IF X>63 THEN X=63
90 IF Y<0 THEN Y=0
100 IF Y>31 THEN Y=31
110 SET(X,Y,1)
120 GOTO20
```

Program Listing 2

use the down-arrow key.

The down arrow, left arrow, and right arrow are difficult, if not impossible, to use with INKEY\$. Too bad—it would be easier to play a game with the arrow keys than with the U, D, L, and R keys.

Fortunately, you can program the arrow keys fairly easily using PEEK. Change Listing 2 to use the arrow keys. Figure 1 is the guide for determining keyboard PEEKs.

In line 20 of Listing 2, the program checks to see if you've pressed the U key. To change it to check for the up-arrow key, locate the up arrow in Fig. 1. Up arrow is across from memory address 341 and above the number 247, so change line 20 of Listing 2 to read IF PEEK(341)=247 THEN Y=Y-1. Change lines 30, 40, and 50 to use the proper arrow keys instead of the present D, L, and R. The drawing will be much easier to control.

You can also use PEEK to make the program require you to press more than one key at a time. Near the bottom of Fig. 1 is a row titled "Change of contents." What command would make memory location 338 contain the value 234? With no keys pressed, the locations are equal to 255; 234 is 21 less than 255.

The only combination of the "Change of contents" row that add up to 21 (-21, actually) is -16, -4, and -1. These numbers are under the @, P, and 0 keys. Run Program Listing 4 to see if this is the correct

Address	Keys						
338	@	H	P	X	0	8	ENTER
339	A	I	Q	Y	1	9	CLEAR
340	B	J	R	Z	2	:	
341	C	K	S	↑	3	;	
342	D	L	T	↓	4	,	
343	E	M	U	←	5	-	
344	F	N	V	→	6	.	
345	G	O	W	SPACE	7	/	
	-1	-2	-4	-8	-16	-32	-64 Change of contents
	254	253	251	247	239	223	191 Contents if pressed

No key pressed, contents = 255

combination of keys. Remember, you must hold all three down.

I'll give you one more keyboard PEEK example, this time to create laser fire. Program Listing 5 requires that you press the space bar as a fire button. The laser keeps firing as long as you hold the bar down.

Thus far, you have used SET, CHR\$, and POKE graphics. SET was the slowest. POKE increased the speed of displays, and CHR\$ is fast enough for simple animation. Now I'll take you a small step beyond CHR\$ graphics to the realm of "string packing," a very fast way to print a large area of graphics on the screen. String packing isn't the quickest way to program, but it should be worth the effort.

First, I'll show you a small graphic design. In the upper left corner of Fig. 2, I'll produce a yellow space ship with red lights on each end.

Program Listings 6, 7, and 8 help explain how to pack strings. Listing 6 requires Extended Color Basic. The numbers in line 80 are the graphics codes for the space ship. Use Fig. 3 to design other graphic patterns.

Line 10 of Listing 6 must have as many characters between the quotes as there are items in the data line. Line 10

```

10 A$="<LLISTMOTORCLOADTROFF"
20 CLS0
30 PRINT@64,A$;
40 GOTO40

```

Program Listing 8

could be A\$="ABCDE". A\$ is called a dummy string. In line 40, the number added to B must be one less than the number of items in the data line.

When you run Listing 6 on an Extended Color Basic computer, Listing 7 results. The computer rewrites line 10. You cannot type Listing 7 and expect it to work unless you remove lines 20-80 and add lines 30-40 from Listing 8. Then you can save the resulting program on tape and CLOAD it into a Color Basic computer.

If you don't have an Extended Color Basic machine, then take your issue of *HOT CoCo* to your local Radio Shack. Use their Extended Color Basic computer to produce Listing 8 and save it to tape. After saving the program, rush home and run it on your computer.

Listing 8 prints a small area, and it's difficult to tell that string packing prints graphics faster than CHR\$ graphics do. I'll show you how to make a large title. I'll simply use the word "TITLE," but it should teach you how to design your own favorite.

Figure 2 contains the large block work, "TITLE." Notice how line 10 grew from Listing 6 to Listing 7.

Be careful to not let the dummy string start too long. It can only grow to 255 characters. For this reason, I

# Save 75 to 100 Hours of Typing Time with ...

## instant CoCo T.M.

Don't miss another great program because you didn't have the time to type it in. **instant CoCo**, the monthly cassette loader from **HOT CoCo**, will save you hours of keyboarding time. Just load **instant CoCo** into your Color Computer\* and within seconds you get to use:

- new applications—reliable programs for education, business, home and hobby help the whole family grow in computer knowledge.
- time saving utilities—will make your routine tasks a breeze to perform, while expanding the capabilities of your Color Computer.
- action-packed games—save your quarters and get hours of video fun without leaving home.

The Best of '83 cassette contains more than 33 of the best programs from all the 1983 issues of **HOT CoCo Magazine**. And it's yours for the astonishingly low price of \$14.97! That means you get quality programs entered automatically for less than 45¢ each.

Coming in January of 1984 will be a monthly cassette of all the major programs from each issue of **HOT CoCo Magazine**. Every month you'll be able to load great programs in seconds and follow right along with your issue of **HOT CoCo Magazine**.

So don't delay! Mail the attached card or the coupon below **NOW!** You don't want to miss one more great program because you didn't have the time to type it in.

**Or call toll-free—1-800-258-5473—and use your MasterCard, Visa, or American Express card. Foreign customers, please call 603-924-9471.**

100 GOTO100

```

Program Listing 10

used two strings in Program Listing 9. A\$ will represent the top three rows of TITLE. B\$ will represent the bottom two rows. Lines 10-70 and 150-170 create A\$. Lines 80-140 and 180-190 create B\$. Each data line represents a 32-character row on the screen.

After running Listing 9 on an Extended Color Basic machine, remove

lines 20-70 and 90-190. Add lines 90 and 100 of Listing 10 and you will have a working version of Listing 10.

Try to create a graphic that uses less memory than that required by string packing. Listing 10 uses only 231 bytes of memory. I determined this by typing PRINT MEM before the program was loaded into the computer, writing

down the results, loading Listing 10, typing PRINT MEM again, and subtracting this reading from the first reading.

Now you're ready to add the rest of your program to your title. ■

Write James Wood c/o HOT CoCo, Pine St., Peterborough, NH 03458.

## QUALITY SOFTWARE FOR AGES 3-6

EARLY LETTER RECOGNITION and KIDS' CHOICE (number recognition) have been developed specifically for preschoolers. Our "activity center" approach, along with outstanding animated graphics, introduces the young child to the keyboard, software-usage skills, and to the realization that the TV can be much more than merely an electronic pacifier.

At Software Specialists, we are excited about the idea that this will be the first generation to grow up relating to computers as an integral part of everyday life. We offer programs that foster early familiarity and pleasure with Cocco, laying the foundation for effective and enthusiastic utilization of computers in grade school and beyond.

EARLY LETTER RECOGNITION . . . \$12.95  
KIDS' CHOICE . . . . . \$12.95

\*\* Order both programs for \$19.95 \*\*

(System: 16K minimum, cassette-based)

# ANNOUNCING The VIP Library™ With a Terrific Sale!

Nelson Software Systems is now Softlaw Corporation, under new management. Our Super "Color" Library programs have also undergone a name change. All programs are the same unbeatable Super "Color" Library programs you've heard so much about, but with new VIP names. To introduce our **VIP Library** we are having a special sale on the following pages. Our low prices for such high quality can't be beat so get started today!

'Diamonds in the mud puddle of Color Computer software!'

## The Library Concept

State of the Art, Quality, Integrity, Compatibility and Affordability. Five things good software must possess. Five things that epitomize the **VIP Library™**. Each program is the diamond of its class, true excellence. These programs are first in features, first in power, first in memory, and all are affordably priced.

## State Of The Art

All **Library** programs are written in machine code specifically for the Color Computer, to work without the interference of a separate operating system such as FLEX. From this comes speed and more workspace for you. **Library** programs work perfectly with every Color Computer, from 16 to 64K. The most advanced hardware and software techniques are used to place programs in rompak cartridges for instant loading and total workspace with any Color Computer.

## Perfection With 16, 32 or 64K

The programs do not depend on BASIC, and so allow total compatibility and workspace with any size Color Computer, even 64K. Unlike other programs for the Color Computer which are said to be 64K compatible, **VIP Library™** programs are not limited to between 24 and 30K of workspace in 64K. **Library** programs have Memory Sense with BANK SWITCHING to fully use all 64K, thus giving an astounding 61K of workspace with the rompak cartridge, and up to 51K with a disk version!

## Lowercase Displays

State-of-the-Art graphics allow instant use of four display colors, and eight lowercase displays featuring descending lowercase letters. You can select from 51, 64 or 85 columns by 21 or 24 lines per screen, with wide or narrow characters in the 64 display. These screens provide a pleasant and relaxing way to perform your tasks, with as much text on the

---

*"... PICTURE getting your instantaneous investment report over the phone, using it in your spreadsheet calculation, generating a report, and writing a memo including that report and data from your database with your word processor, and all this with VIP Library™ programs..."*

---

screen as is possible. Each program is easy to learn and a joy to use. We take pride in the stringent testing done to make these programs perform flawlessly. Every feature, every convenience, sleek, simple and elegant.

## Total Compatibility

All **Library** programs are compatible. Transfer and use of files between programs is easy and carefree. What's better, when you have learned one program the others will come easy. And every program is the best of its kind available.

## The Library Programs

For your writing needs is the **VIP Writer™**, and its spelling checker, the **VIP Speller™**. For financial planning and mathematical calculations you can use the **VIP Calc™**. To manage your information and send multiple mailings there is the **VIP Database™**. For sending all these files to and from home or the office and for talking to your friends you can have the **VIP Terminal™**. Finally, to fix disks to keep all your **Library** files in good repair we offer the **VIP Disk-ZAP™**.

## Mini Disk Operating System

The Disk versions each have a Mini Disk Operating System which will masterfully handle from 1 to 4 drives. It offers smooth operation for such features as the ability to read a directory, display free space on the disk, kill files, save and automatically verify files, and load, rename and append files. **Library** programs simply do not have the limitations of BASIC.

## Professionalism

The **Library** comes handsomely bound in gold-embossed, padded leatherette binders to grace your work area with the professionalism it deserves. Welcome the **VIP Library™** into your home and office.

A description of each of the **Library** programs, with the special sale price, is contained in the following pages. Please indulge!

©1983 by Softlaw Corporation

# VIP Writer™

(Formerly Super "Color" Writer II)

By Tim Nelson

**RATED TOPS IN RAINBOW, HOT COCO,  
COLOR COMPUTER MAGAZINE AND BASIC COMPUTING  
The Official Dragon Microcomputer Word Processor†**

The most powerful and easy-to-use word processor is available in the showpiece and workhorse of the Library: The VIP Writer™. Because of its undisputed superiority over all Color Computer word processors, it was selected by Dragon Data Ltd. of England to be the Official Word Processor for its line of Dragon microcomputers.

The result of two years of research, the VIP Writer™ offers every feature you could desire from a word processor. It is the most powerful, fastest, most dependable and most versatile. With the display, workspace and compatibility features built into the Library the Writer is also the most usable.

*"... Nearly every feature and option possible to implement on the Color Computer. The design of the program is excellent; the programming is flawless... Features for the professional, yet it is easy enough for newcomers to master... Certainly one of the best word processors available for any computer..." October 1983 "Rainbow"*

The Writer will work with you and your printer to do things you always wanted to do. Every feature of your printer can be put to use, every character set, every graphics capability at any baud rate, EVEN PROPORTIONAL SPACING. All this with simplicity and elegance.

Although all versions feature tape save and load, the disk version provides the Mini Disk Operating System common to the whole Library, plus disk file linking for continuous printing.

## Professional features of particular note:

- Memory-Sense with **BANK SWITCHING** to fully utilize 64K, giving not just 24 or 30K, but up to 61K of workspace with the rompak version and 50K with the disk version.
- **TRUE FORMAT WINDOW** to EXACTLY replicate the printed page ON THE SCREEN BEFORE PRINTING, showing centered line headers, FOOTNOTES, page breaks, page numbers, & margins in line lengths of up to 240 characters. It makes HYPHENATION a snap.
- A **TRUE EDITING WINDOW** in all 9 display modes for those extra wide reports and graphs (up to 240 columns!).
- **FREEDOM** to imbed any number of **PRINTER CONTROL CODES** anywhere, **EVEN WITHIN JUSTIFIED TEXT**.
- Full 4-way cursor control, sophisticated edit commands, the ability to edit any **BASIC** program or **ASCII** textfile, **SEVEN DELETE FUNCTIONS**, **LINE INSERT**, **LOCATE AND CHANGE**, wild card locate, up to **TEN SIMULTANEOUS** block manipulations, word wrap around, programmable tabs, display memory used and left, non-breakable space, and headers, footers and FOOTNOTES.
- The ability to control **ANY PRINTER**, using dynamic text formatting with 27 comprehensive format parameters.
- Automatic justification, automatic pagination, automatic centering, automatic flush right, underlining, superscripts, subscripts, pause print, single-sheet pause, and print comments.
- Type-ahead, typamatic key repeat and key beep for the pros, **ERROR DETECTION** and **UNDO MISTAKE** features, 3 **PROGRAMMABLE** functions, auto phrase insert, column creation, an instant **HELP TABLE**, and a 110 page, fully indexed tutorial.

**16K ROMPAK \$59.95**

**32K DISK \$59.95**

†Sold as the Dragon Writer™ ONLY by Dragon Data Ltd. and its distributors.

# VIP Speller™

(Formerly Super "Color" Speller)

**THE WRITER'S ESSENTIAL COMPANION**

Spelling checkers are an invaluable aid to every writer. Habitual misspellings and typos can be found without the eyestrain, boredom and fatigue associated with endless proofreading. The **VIP Speller™** is a fast, machine-code proofreading program to correct any **VIP Library™** or other **ASCII** file. It automatically proofreads your documents against a 20,000 word stock dictionary, plus your own customized dictionary and corrects typos or marks them for special attention.

**DISK ONLY \$49.95**

Lowercase displays not available with this program.

# VIP™

# Library

# VIP Calc™

(Formerly Super "Color" Calc)

**TRUE VISICALC™ POWER!**

By Kevin Herrboldt

- \* **UP TO 5 TIMES THE SCREEN DISPLAY AREA OF OTHER SPREADSHEETS!**
- \* **STATE OF THE ART LOWERCASE DISPLAYS**
- \* **MEMORY SENSE WITH BANK SWITCHING FOR UP TO 61K in 64K!**
- \* **ROMPAK CARTRIDGE FOR TOTAL WORKSPACE**
- \* **EXCLUSIVE VIDEO DISPLAY WINDOWS — EVEN UP TO 16!**
- \* **USER-DEFINABLE WORKSHEET — UP TO 512 COLUMNS BY 1024 ROWS**
- \* **WORKS WITH ANY PRINTER, EVEN LETTER QUALITY!**
- \* **LOCATE COMMAND TO FIND SPECIFIC NUMBERS, LABELS OR FORMULAS**
- \* **16 DIGIT PRECISION FOR THOSE SPECIAL SCIENTIFIC USES**
- \* **ALMOST UNLIMITED PROGRAMMABLE FUNCTIONS**

**VIP Calc™** is truly the finest and easily the most powerful electronic worksheet and financial modeling program available for the Color Computer, from 16 to 64K. Now every Color Computer owner has access to a calculating and planning tool better than **VisiCalc™**, containing all its features and commands and then some, **WITH USABLE DISPLAYS**. Use **Visicalc** templates with **VIP Calc™**!

There's nothing left out of **VIP Calc™**. Every feature you've come to rely on with **VisiCalc™** is there, and then some. You get up to **5 TIMES** the screen display area of other spreadsheets for the Color Computer and **Memory-Sense** with **BANK SWITCHING** to give not just 24, or 30, but **UP TO 61K OF WORKSPACE IN 64K!!!** This display and memory allow you the **FULL SIZE, USABLE WORK-SHEETS** you require. You also get: **User definable worksheet size, up to 512 columns by 1024 rows!** \* **Up to SIXTEEN VIDEO DISPLAY WINDOWS** to compare and contrast results of changes \* **16 DIGIT PRECISION** \* **Sine, Cosine** and other trigonometric functions, **Averaging, Exponents, Algebraic functions,** and **BASE 2, 8, 10 or 16** entry \* **Multi-layered Column and Row, Ascending and Descending SORTS** for comparison of results \* **LOCATE FORMULAS OR TITLES IN CELLS** \* **Easy entry, replication** and **block moving of frames** \* **Global or Local column width control** up to 81 characters width per cell \* **Create titles of up to 255 characters per cell** \* **Limitless programmable functions** \* **Typamatic Key Repeat** \* **Key Beep** \* **Typeahead** \* **Print up to 255 column worksheet** \* **Prints at any baud rate from 110 to 9600** \* **Print formats savable along with worksheet** \* **Enter PRINTER CONTROL CODES** for customized printing with letter quality or dot matrix printer \* **Combine spreadsheet tables with VIP Writer™** documents to create ledgers, projections, statistical and financial reports and budgets.

Both versions feature **Tape save** and **load**, but the disk version also has the **Mini Disk Operating System** of the entire **Library**.

**16K ROMPAK \$59.95**

**32K DISK \$59.95**

# NEW SALE PRICES!

# VIP Database™

(Formerly Super "Color" Database)

**INCLUDES MAIL MERGE CAPABILITIES TOO!**

By Tim Nelson

- **Nine Display Formats: 32 by 16**  
**51, 64, 85 by 21 or 24**
- **True Lowercase & Descenders**
- **Four Different Display Colors**
- **16, 32 & 64K Compatible**
- **Memory Sense - Bank Switching**
- **Up to 51K Disk, 61K Rompak**
- **Mini Disk Operating System**
- **Compatible With All Printers**

This high speed MACHINE LANGUAGE program fills all your information management needs, be they for your business or home. And it does so better than any other database program for the Color Computer, featuring machine code, lowercase screens and mailmerge capabilities. Inventory, accounts, mailing lists, family histories, you name it, the **VIP Database™** will keep track of all your data, and it will sort and merge **VIP Writer™** files.

The **VIP Database™** features the **Library** Memory Sense with **BANK SWITCHING** and selectable lowercase displays for maximum utility. It will handle as many records as fit on your disk or disks. It is structured in a simple and easy to understand menu system with full prompting for easy operation. Your data is stored in records of your own design, each divided into up to 255 fields. Each field will hold up to 255 characters. All files are fully indexed for speed and efficiency. Full sort of records is provided for easy listing of names, figures, addresses, etc., in ascending or descending alphabetic or numeric order. You may also combine files, sort and print mailing lists, print "boiler plate" documents, automatically insert text in standardized forms, address envelopes - the list is endless. The math package even performs arithmetic operations and updates other fields. Create files compatible with the **VIP Writer™** and **VIP Terminal™**. Up to five different print formats are available, and control codes may be imbedded for use with all printers.

As with all other **Library** programs, the **Database** features the powerful Mini Disk Operating System.

**32K DISK \$59.95**

## A SPECIAL OFFER ON THE WHOLE LIBRARY —

The entire Library, all six great disk programs, can be purchased for only **\$300!**

## VIP Terminal™

(Formerly Super "Color" Terminal)

**THE FINEST TERMINAL PROGRAM ANYWHERE!**

By Dan Nelson

From your home or office you can join the communication revolution. The **VIP Terminal™** opens the world to you. You can monitor your investments with the Dow Jones Information Service, or broaden your horizons with The Source or CompuServe, bulletin boards, other computers, even the mainframe at work.

Picture getting your instantaneous investment report, incorporating it in your spreadsheet calculation, generating a report, and writing a memo incorporating that report and data from your database; all with **Library** programs. Then you can transmit the report to work, or wherever, long distance. The **VIP Terminal™** will become the hub of your **Library**.

**FEATURES:** Memory-Sense with **BANK SWITCHING** for full use of workspace, from 16 to 64K \* Selectively print data at baud rates from 110 to 9600 \* Full 128 character ASCII keyboard \* Automatic graphic mode \* Word mode (word wrap) for unbroken words \* Send and receive **Library** files, Machine Language & BASIC programs \* Set communications baud rate from 110 to 9600, Duplex: Half/ Full/Echo, Word length: 7 or 8, Parity: Odd/Even or None, Stop Bits: 1-9 \* Local linefeeds to screen \* Save and load ASCII files, Machine Code & BASIC programs \* Lowercase masking \* 10 Keystroke Multiplier (MACRO) buffers to perform repetitive pre-entry log-on tasks and send short messages \* Programmable prompt or delay for send next line \* Selectable character trapping \* Send up to ten short messages (KSMs), each up to 255 characters long, automatically, to save money when calling long distance.

All versions allow tape load and save of files and KSMs, but the disk version also has the Mini Disk Operating System common to the **Library**.

**16K ROMPAK \$49.95**

**16K DISK \$49.95**

Disk version requires 32K for lowercase displays.

## VIP Disk-ZAP™

(Formerly Super "Color" Disk-ZAP)

**RAVED ABOUT IN THE APRIL 1983 "RAINBOW!"**

By Tim Nelson

Your database file disk, form letter disk, or BASIC program disk goes bad. An I/O error stops loading, or even backing up of the disk. Weeks, even months of work sit on the disk, irretrievable. Now catastrophic disk errors are repairable, quickly and with confidence, using the **VIP Disk-ZAP™**. It is the ultimate repair utility for simple and quick repair of all disk errors. Designed with the non-programmer in mind, the **VIP Disk-ZAP™** will let you retrieve all types of bashed files, BASIC and Machine Code programs.

This high-speed machine code disk utility has a special dual cursor screen display to look at the data on your disk. You are able to: Verify or modify disk sectors at will \* Type right onto the disk to change unwanted program names or prompts \* Send sector contents to the printer \* Search the entire disk for any grouping of characters \* Copy sectors \* Backup tracks or entire disks \* Repair directory tracks and smashed disks \* Full prompting to help you every step of the way \* 50-plus page Operators Manual which teaches disk structure and repair.

**16K DISK \$49.95**

Lowercase displays not available with this program.

by Doug Swank

Basic Technology's five-slot expansion interface not only expands the CoCo system bus, but your horizons as well.

After working with my evaluation unit for the past few weeks, I have a long list of gadgets I'd like to build, several of which are probably under development by BT or other hardware makers. The BT clock/calendar and parallel printer port are only a start; I am sure more goodies will appear soon.

Who needs an expansion interface? To paraphrase Commodore Vanderbilt's comment about owning a yacht, if you have to ask what it does, you probably don't need one. Users who just want to select one of several game packs would be better off with Basic Technology's BT-2000, a much simpler slot-selector unit.

The BT-1000 permits splitting the

upper memory area into several independent blocks, and with a bit of planning you can talk to or control many peripherals. This flexibility enhances its power and opens the door to a host of real-world applications.

Having worked with microprocessor-based control systems for the past five years or so, I can imagine a low-cost development system for 6809 applications. A 32K CoCo with disk drives plus a BT-1000 would cost one-tenth as much as the development systems I've been using, and could blow most of them out of the water in terms of performance.

I feel the small-system commercial users—and the experienced hardware experimenters—will appreciate the BT-1000 features most, so I'll aim this review at them. All references to the CoCo memory map are in hexadecimal, with the usual (\$) prefix.

### The BT-1000 Interface Unit

The BT-1000 demands 7-by-14 inches of table space, about one-third of which is devoted to a sturdy-looking power supply. The ratings on the transformer and regulator ICs make it plain it can handle a full deck of plug-ins without much effort.

Heat dissipation was obviously considered in its design since internal temperature after 48 hours of exercis-

ing the two modules supplied was barely above ambient. I would have full confidence about putting the BT-1000 into 24-hour service.

The open pack slots would collect dirt in an industrial area, but a snap-on cover is an easy remedy. Gray duct tape is an even easier remedy if appearance isn't important. I made my temperature test with all open slots covered with tape.

The one-piece case is molded of dark gray fiberglass with an aluminum bottom plate. The shape, plus the two-foot ribbon cable on the pack that plugs into the CoCo, permit it to sit on top of or behind the computer.

My evaluation unit was from an early production run with no markings on the slots or switches. Nevertheless, it had gold-plated edge connectors and epoxy-glass boards, with none of the hand-wired patches common to first-run units.

The operating manual is adequate for experienced users, but puzzling for newcomers. I believe later production runs will include case markings and an expanded manual.

Memory mapping is where all the fun begins with the BT-1000. In the ordinary 32K CoCo, addresses from \$0000-\$7FFF are system stacks, displays, and user RAM. Memory \$8000-\$BFFF are Extended Color and regular Basic. \$C000-\$DFFF is the realm of ordinary games, and \$E000-\$FEFF is left undefined. (Users running disks and FLEX have \$E000-\$FEFF as a deliberately defined user area.)

The five slots in the BT-1000 are split into two groups: the CTSLO area, \$C000-\$DFFF; and the CTSHI area, \$E000-\$FEFF. Slots 1, 2, and 3 are in CTSLO, while slots 4 and 5 are in CTSHI.

Slot 1 has special privileges since it has the CART line connected. The

CPU checks this one at powerup, and if the CART line is jumpered the system does an EXEC &HC000. This is the place for a disk controller or block of ROM that you wish to take control at startup.

Four 24-pin sockets inside the BT-1000 case permit installation of RAM or EPROM to populate some or all of the CTSHI area without a plug-in pack—a neat touch for dedicated systems. Plug-ins make addresses not used by internal memory available, so you could have a block of ROM as well as an external interface in this memory area.

The Radio Shack disk controller almost completely occupies the CTSLO area, and incomplete decoding by the controller wastes most of the remaining addresses. Therefore, with the disk operating, I was frustrated in my attempt to use slots 2 and 3 for anything else. Non-disk systems could use it, with blocks of \$1000 (4096 decimal) per slot being most convenient.

Jumpers and DIP switches inside the unit can do all of the above partitioning. If you want to decode into blocks smaller than \$1000, you'll have to do the job externally.

So much for the technical details. The unit does its job exactly as advertised, but a box with five empty slots isn't very exciting, even though the pilot lamp in the power switch is quite pretty. But plug a few things into the slots and see what happens. . . .

### The BT-1020 Real Time Clock/Calendar

The clock/calendar occupies addresses \$FEC0-\$FEFF. You can move it to other blocks down to \$FE00 with internal jumpers. It has all the usual features you might find on a modern digital watch, plus several others in keeping with its status as a computer peripheral. One time-keeping feature not usually found on watches is compensation for Daylight Savings Time.

A tape program supplied with the unit permits initial setup and on-screen display. You can easily splice it to your own program, or rewrite it if necessary since a source listing is included.

Features of interest for computer systems are a periodic alarm and maskable interrupts at times of day, end of clock update cycle, or specific

rates such as once per second. The clock normally takes power from the 5-volt interface supply, but a nickel/cadmium battery keeps the timer portion operating for up to two weeks after an eight-hour charge. (Charging is automatic when you turn on the interface.)

A 64-byte internal RAM has 14 bytes devoted to time, control, and data. The other 50 bytes are available to you. The battery will keep them alive if system power fails.

Fifty bytes of data don't sound like much, but remember that they stay alive. In a data-logging application, you can store the time every minute, the last data logged, and perhaps even a jump address to an emergency routine. When the power comes back on, the program can figure out how long the power has been off and how much data has been lost.

By the way—the TIMER function is sometimes said to count 60 times per second, but since the color TV frame rate controls it, it actually counts 59.98 times per second. Any clock run by the CPU's timer would need elaborate correction to be accurate for long term use, but who wants to convert their computer into a clock?

### The BT-1010 Parallel Printer Interface

This one is my favorite. Like the clock module, it comes with a tape and source listing for a relocatable printer driver. The data going to the printer is simply written to the designated RAM address, and the module does all the handshaking with the printer. Since the operation only takes a few machine cycles, it is now possible to feed a printer while on-line with a modem.

All printers are at their best when fed in parallel, and the serial interface add-on for some brands costs more than this module, so the BT-1010 is a good value even if you just plug it into the computer itself.

Calling it a printer interface hides many of its functions, since the heart of the unit is a chip that contains two 8-bit, two-way ports configurable from software, two 16-bit timers, and a startling array of programmable options. You can install another header for the times when you get bored with just feeding a printer.

Basic Technology includes complete data on the interface chip for those

who want to do custom applications. A pair of 8-bit, D-to-A converters would permit elaborate music, for instance.

Again, the BT-1010 parallel module would be useful even without the expander, and with the BT-1000 expander, you could operate a pair of them without memory conflict. The BT-1020 clock would be less useful alone than in the expander.

The BT-1000 transforms the CoCo into a serious micro system. I haven't looked at the simpler BT-2000, but it would be a better choice for the user who doesn't need the partitioning but merely wishes to select one of five slots. Recent price reductions on both units make them even more attractive. ■

by Scott L. Norman

Recently, a number of companies have introduced products that add speech-synthesis capability to the Color Computer. These products fall into two categories: software that simulates speech by feeding the computer's digital-to-analog (D/A) converter synthesized renditions of a speech waveform, or hardware/firmware products that use specialized integrated circuits to generate phonemes, the elementary units of spoken language.

Despite the vendor's name, Bumblebee Software's Colorspeak falls in the latter category. It is a rather flexible, easy-to-use product, and can generate fairly acceptable speech.

Like several other voice-output

## REVIEWS

products, Colorspeak is based on the Votrax SC-01 speech-synthesis circuit. This is a complex, low-power-drain IC, capable of generating 64 different phonemes in response to a 6-bit input code.

Stringing phonemes together produces continuous speech, much as putting one letter after another produces written language. You can use an additional 2 bits of input data to specify one of four levels of inflection, making the speech a little less mechanical.

It takes more than the SC-01 to build a speech synthesizer, though, and that's where products differ. At the very least, a manufacturer must supply a control program and interface circuitry before the product is complete.

Colorspeak fulfills the requirements for a stand-alone product quite nicely. The ROM pack includes 4K of ROM containing the machine-language program that lets your Basic code drive the speech-synthesis chip. There is also 2K of RAM intended for use as a text buffer, although late-model Color Computers do not permit writing data to RAM addresses in the cartridge-address space. Putting a CLEAR statement in your program rectifies this, as I'll describe below.

Colorspeak fully uses the CoCo bus lines available at the cartridge port; audio output comes through the TV receiver, for example, rather than through an auxiliary amplifier.

There are actually four methods of specifying spoken output, although all are similar in that they require the construction of a text string in a particular format. The four modes are as follows:

- The spelling mode: Here the names of the letters, numerals, and some punctuation marks are pronounced as the program encounters them in the text string. The allowed punctuation marks are \$, %, -, +, <, >, ?, !. A blank space is pronounced as "space."

- The phoneme mode: Here you must break the desired speech into phonemes and specify hexadecimal codes for each, according to a table in the manual. This is the most flexible mode in that it permits you to specify the inflection of each phoneme, but the conversion process can be tedious and the text strings might bear no relation to written English.

- The text-to-speech mode: Now the text string looks like English (assuming that's what you want to hear), although you must follow Colorspeak's own rules of phonetic spelling.

- The inflection mode: This is another version of text-to-speech, the difference being that now it uses a few built-in rules of inflection to make the speech a little more natural. In general, the result is a little more pleasing than the text-to-speech mode's output, but not nearly as good as the phoneme mode can produce.

Colorspeak can be extremely simple to employ. The ROM pack has no apparent effect on normal nondisk computer operation—there is no new power-up message, and PRINT MEM returns the usual value.

There are only three requirements for adding speech to a Basic program: You must set aside string space for a text buffer at the top of RAM (because of the write-inhibit restriction I mentioned earlier), you must specify the start address of Colorspeak, and you must set up the text string in the appropriate format. Then passing control to Colorspeak with A=USR0(0) in Extended Color Basic, or A=USR(0) in the Color Basic dialect, produces speech.

The documentation gives details of the CLEAR statements that reserve buffer space in 16K–64K machines, as well as the DEFUSR0 (Extended) and POKE (Color Basic) commands that define the transfer address. I have included the accompanying Program Listing to show how simple a demonstration program can be, as well.

English is far from a phonetic language, of course, and so phonetic spellings often differ from the correct

ones. Colorspeak, like other synthesizers, has its own conventions for the pronunciation of single letters and letter combinations in the Text and Inflection modes.

For example, in most vowel/consonant/vowel combinations, the first vowel will be given its long form. An additional consonant is then required to shorten such a leading vowel. A silent H is a good choice; thus my wife's name, Sharon, becomes SHAHRON. The O is short because no vowel follows the N.

"Right" provides another example of Colorspeak syntax. It turns out that the IGH combination is the only way to generate a long "i" sound. Consonants are also affected. The "g" sound in "message" requires a "DJ" combination: MESSUDJ.

Working these things out is part of the fun of using a speech synthesizer, I expect. In any event, the text-to-speech and inflection modes are very useful. The final text is still likely to be pretty readable, too.

Here are the first few lines of the Gettysburg Address, in fairly accurate Colorspeak dialect:

```
FOUR SCORE AND SEVEN YIHR5 AGO
OUR FOHTHER5 BRAUT FORTH UHPON
THIS COHNTIHNT A NEW
NATION CUHNSEEVD IN LIHBERTY
AND DIHDIHKATED TO THE
PROHPOSIHTION THAT ALL MEN ARE
CREATED EEQUUHL
```

The first "E" in SEVEN isn't pronounced as a long vowel; the ROM program includes the names of the numerals. The extra spaces between NATION and CUHNSEEVD are the only way of inserting pauses in either of the text modes; the phoneme mode has a separate code to do this job.

Even though the Votrax chip is programmed with English phonemes, it is possible to make Colorspeak do a fair job with some foreign languages. BAUHNZHOHR is a decent French greeting, while an approximation to the German version of "I think, therefore I am" comes out ISH DAINGKT ALZO ISH BIN.

Working with the phoneme mode is a little more complex. The documentation gives a listing of the 64 possible phonemes in two forms: a letter/number shorthand (the "a" in "father" is AH1, for instance) and the hexadecimal codes that are actually used in the string TA\$.

```
10 CLEAR 1000,32000: ' Clears st
ring space in a 32K computer
20 DEFUSR0=49152
30 CLS: PRINT@6, "TEXT-TO-SPEECH
DEMO"
40 PRINT: INPUT " What would
you like me to say";T1$
50 TALK$="/T "+T1$+" ."
60 A=USR0(0)
70 PRINT: PRINT TAB(2) "(1) Repe
at this string"
80 PRINT TAB(2) "(2) Keep old st
ring on screen"
90 PRINT TAB(2) "(3) Enter new s
tring"
100 INPUT S
110 ON S GOTO 60, 40, 30
120 END
```

*Program Listing. Colorspeak Demonstration Program*

# REVIEWS

Four codes can represent each phoneme, depending on the inflection desired. Thus the word "equals" pronounced in a monotone is encoded as follows:

3C596D76585F

To add a little emphasis, the pitch of the "e" could be raised by changing the 3C to 7C. That's the general pattern. Adding 64 (hexadecimal 40) to a particular phoneme's code gives a step up in pitch.

Once again, this mode is powerful but tedious to use. It might be preferred for incorporating speech into an educational program or into software designed for people unaccustomed to synthesized speech. For more routine applications, the two modes that permit the use of English-like text strings are far simpler to use.

Colorspeak deserves a good rating. The speech output is quite mechanical under the best of circumstances, but it's still much easier to understand than that produced by the software synthesizers I've seen.

The documentation could stand some expansion, both figuratively and literally. I would welcome more examples of phonetic spelling, and the condensed type font used in the manual can get awfully tiresome to read. The people at Bumblebee Software, who are obviously sympathetic to vision problems, should do better. ■

## Junior's Revenge

Computerware

P.O. Box 668

Encinitas, CA 92024

32K, Extended Color Basic, joystick

\$28.95, cassette

\$31.95, disk

by Peter Paplaskas

HOT CoCo staff

For all you Donkey Kong Junior fans, here's a spinoff called Junior's Revenge, a machine-language

program with superb arcade graphics.

This game reverses the roles of Donkey Kong to have you, as a young gorilla, working to overcome many obstacles to rescue your father from Luigi, the protagonist of Donkey Kong.

Luigi has your gorilla father locked in a cage. You must successfully jump, swing, climb, and dodge across seven screens, grab the key from Luigi, and open the cage.

When you begin play, you use the right joystick and have 50 seconds to make your way through each screen. The display shows the time in the upper right corner, and the screen number you are in.

In screens one, three, and six you climb and jump from vine to vine to the top of the screen. You must avoid the Vinegators, or you can earn extra points by picking fruit and dropping it on them, knocking them off the vines.

If you successfully complete a screen, you receive a bonus timer that is added to your score. You get another Junior for every 10,000 points.

In screens two, five, and eight you must climb chains, avoid Vinegators and ZuZu birds, and push several keys into place. Finishing this task temporarily frees your father.

In the fourth screen, you must jump on a trampoline and grab one of the moving chains or land on a moving platform. Jump on the trampoline and hold the fire button down to get a super jump.

If you make it to the seventh screen, you're in Luigi's hideout and must climb onto each conveyor belt and walk across it, avoiding the sparks that are all around. Finally, you grab the key from Luigi and open the cage to set your father free.

The only flaw I could find in the entire game is a very minor one: Although the documentation states that you can only get killed in the practice mode by falling, you also lose Junior if the 50-second timer runs out.

Junior's Revenge can be pretty frustrating until you get the knack of controlling Junior's movements. Winning requires some dexterity. It's one of the best Color Computer games, though, and offers an entertaining challenge. ■

## Buzzard Bait

Tom Mix Software

3424 College N.E.

Grand Rapids, MI 49505

32K, Extended Color Basic, joystick

\$27.95, cassette

\$30.95, disk

by Peter Paplaskas

HOT CoCo staff

If you're familiar with the arcade game Joust, then you're in for a surprise with Buzzard Bait, a one- or two-player, 32K machine-language program that plays exactly like its arcade counterpart. It offers excellent color and detailed graphics.

You control a rider astride a large bird, and your objective is to unseat several enemy riders from their birds. In the first wave, you face only four enemies, but their number, and other hazards, increase as you enter each new wave.

In the single-player game, you use the left joystick to control your rider. Pushing the stick left or right commands his direction, and pushing the fire button flaps the bird's wings, causing it to fly. One push equals one flap.

You first appear at the bottom of the wrap-around screen and have a few seconds to position yourself before the enemy riders materialize on

certain of the spots on each of four floating islands.

You defeat your opponents by lancing them from a higher position. If both contestants are at equal heights, they bounce off. If the enemy is higher than you, your riderless bird flies away from the contest.

If you defeat an opponent, his "life force" falls to the ground as an egg. If you don't lance the egg, it will hatch into a more aggressive rider who will soon receive a new mount.

As you successfully complete each wave, things get more difficult. You have to face greater numbers of riders. A pterodactyl flies across the screen, and you can only defeat him by lancing him directly in the mouth—an extremely difficult task.

Part of the base at the bottom of the screen becomes a lava pit that destroys whatever enters it—and sometimes a fiery hand reaches out to pull low-flying birds to their doom. Beginning with the highest, the floating islands, which you can use in your battle strategy, begin to disappear in the more difficult waves.

The two-player game provides some of the best coordinated arcade action you can find.

You both have the same task, and you can work together or as adver-

saries. You can collect points for killing the other player, but the program awards bonus points for player cooperation. This mode also offers a gladiator wave in which you can face each other for bonus points, but I prefer a team effort.

This is one game that continues to challenge me to beat my best score. It's also one that's going to blow many a fire button on the Radio Shack joysticks. ■

by **Martin Goodman**

Two of the more powerful, flexible, and economical EPROM programmers for the Color Computer are the 1248-EP and the Intronics EPROM Programmer.

EPROMs are chips on which data can be impressed with electrical pulses. Once programmed, these chips retain the information until that information is erased. The most commonly used varieties of EPROMs are UV

erasable EPROMs. These chips are erased by exposure to short-wave ultra violet light. They differ from ROMs and PROMs in that EPROMs can be programmed and reprogrammed up to several hundred times.

There are two 8K-by-8-bit ROMs in the Color Computer and a third one in the disk controller pack. These contain the Basic, Extended Basic, and Disk Basic operating systems. Unfortunately, this system is flawed by several outright bugs and other permanently fixed features (like the default RS-232 baud rate) that a CoCo owner might wish to alter. But with an EPROM programmer and some 2764 or MC68766 EPROMs, you can make some of these desirable alterations.

You can dump ROMs into RAM, alter them, and then dump them onto an EPROM. By substituting EPROMs for ROMs, you get a customized version of Basic. This is particularly useful because Tandy's new set of ROMs for the CoCo (Basic 1.2, Extended Basic 1.1, and Disk Basic 1.1) won't correct several annoying bugs found in the old ROMs.

Creating custom EPROMs lets you burn a set of utilities into the disk ROM. Certain CoCo functions, such as the location of the interrupt and reset vectors and the reset service routine, can only be altered by changing the ROM. The right modification of ROMs lets you break out of any program.

Since all three CoCo ROMs are 8K by 8, any 8K-by-8 EPROM should work. However, the Motorola MC68766 and the MC68764 EPROMs are especially good because their pin-outs are identical to that of the 24-pin ROMs in the CoCo. As a result, they can be substituted directly into the CoCo's ROM sockets with no other modifications.

The other 8K-by-8 EPROMs (2764, 2564, and MK2764) are generally less expensive, and they come in faster versions, but all of these are 28-pin EPROMs that require you to construct an adapter socket/header for use in the CoCo. This is particularly inconvenient in the case of the disk controller card, in which there is simply not enough room inside the plastic shell for such an adapter socket.

The 2564 is a 28 pin 8K-by-8 EPROM that, after it is programmed, can be wired to fit in the 24 pin CoCo

ROM socket. You must connect pins 1 and 28 to pin 26, pins 2 and 27 to pin 14, then insert it in the CoCo ROM socket with pins 3 and 26 of the EPROM in the number 1 and 24 holes of the ROM socket.

I should also note here that "dynamic ROMs" are used in the CoCo. These cannot be read by the EPROM programmer if you merely insert the ROM in the EPROM-programmer socket. They can, however, be replaced by EPROMs.

The cost of a CoCo plus one of the two EPROM programmers reviewed below is considerably less than the cost of most dedicated EPROM programmers of equal or lesser flexibility.

## The EPROM Programmers

Both the 1248-EP and the Intronic EPROM Programmer are extremely flexible. They can program a wide variety of EPROMs (1K-by-8 to 8K-by-8 for the Computer Accessories device and from 1K-by-8 to 16K-by-8 (27128 chip) for the Intronic device).

Both units are easy to use, and the documentation for each is well written. Both devices read or program the 2508, 2516, 2532, 2716, 2732, 68764, and 68766 EPROMs. These represent the majority of 24-pin, 25-volt-requiring EPROMs on the market.

The software of both units checks an EPROM for erasure, for dumping the contents of an EPROM to memory, for programming an entire EPROM, and for verifying the contents of an entire EPROM against memory.

Neither unit requires Extended Basic. As supplied, both work only with a cassette-based system, although you can modify either to work in parallel with a disk system. The 1248-EP, however, is better suited for modification.

Such a modification requires a bit of decoding the Disk Basic ROM, the input/output (I/O) ports, and, in the case of the Intronic device, a minor modification of the software. Neither unit comes with explicit instructions to make all the needed modifications, although some helpful instructions do come with the 1248-EP.

Both units plug into the CoCo's system port, and both use tinned (rather than gold-plated) lands on their edge card connector. Both units derive their programming voltages of 25 and 21

volts from a DC-to-DC inverter circuit. This eliminates the need for an external power supply although it can introduce some "hash" onto the DC voltage to the board. Each uses two 6821 chips for its input/output function.

The 1248-EP now comes with a Textool brand zero-insertion-force (ZIF) socket, which is much more expensive but far more durable than the Aires socket that comes with Intronic's EPROM programmer. However, Intronic will, on request, sell their programmer without a ZIF socket so you can install your own.

Although the 1248-EP has its software present in an on-board ROM, the software for both EPROM programmers is written in position-independent code. Thus, you can load in the operating software of both from tape to any position in memory. However, it's convenient to use the 1248-EP software where it resides on the on-board ROM.

## The 1248-EP

Because its software is in an on-board EPROM, the 1248-EP is somewhat easier to use, but it's more difficult to alter the software.

The 1248-EP also does all of its selection of different EPROMs from the keyboard. This is also a very nice convenience, and reflects good engineering and attention to detail. Along the same lines, the device comes with legs that support it by the side of the computer. I added similar legs to the Intronic device, as I liked this idea so much.

When it arrives, the software on the ROM is located at address \$C000. However, you can add an address decoder chip (74LS138) to the board and readdress the program anywhere from \$C000-\$F000 at \$800 intervals. Additionally, as the code is position independent, you can choose to read it in from tape to any location in low RAM and dispense with the on-board EPROM.

During all EPROM operations, the 1248-EP displays the EPROM type you have selected—a useful convenience. The software uses a new EPROM programming approach that is about seven times faster than the Intronic device. When programming a number of 8K-by-8 EPROMs, this can mean the difference between a

seven-minute program time versus one minute.

The 1248-EP also has the more flexible software of the two units, allowing you to directly program from and dump to any place in memory. You can also dump or program any fraction of the EPROM to memory. Similarly, any fraction of an EPROM can be verified against memory.

Hardware hackers interested in running this EPROM programmer in conjunction with their disk systems will appreciate the 1248-EP's capability of addressing the on-board EPROM to an area above the Disk Basic ROM. Additionally, the I/O addresses reside in the FF50-FF5F area, so they won't conflict with the I/O ports of the disk controller.

Having the 1248-EP coresident with the disk-controller card does involve decoding the addressing of the disk ROM and the disk I/O ports to prevent ghosting. You must decode the Disk Basic ROM by ORing the CART line with A13 before it connects to the enable on the ROM. You create the enable line for the Western Digital disk-controller chip by ORing the SCS line with the A4 line in order to eliminate ghosting of the disk I/O ports up into the area used by the 1248-EP. These problems arise due to sloppy, inadequate address decoding within the Color Computer and its associated disk-controller card.

Computer Accessories provides hints on how to use one of the unused ports on one of their PIAs to make a parallel I/O port for the CoCo.

The most serious shortcoming of the 1248-EP is its inability to handle either the 28-pin EPROMs (2564s, 2764s, and 27128s) or any EPROM that requires a programming voltage of 21 volts (2732As and 2764s). As the 28-pin EPROMs become more popular, this criticism will become important. The 1248-EP has a 24-pin EPROM socket and has no convenient means of producing a 21-volt programming voltage.

Although the 1248-EP worked according to specifications when I received it, careful oscilloscope analysis of the power supply showed that the +5V line had a lot of hash generated by the DC-to-DC inverter on board. I cured this by adding three pass capacitors between the +5V line and ground. I recommend that you add a

# REVIEWS

few .1µf pass capacitors between the +5V and ground around the power supply pins of the chips on the board and a 10µf electrolytic as well from +5 volts to ground at some convenient point on the board.

Using the +12V line as the input to the DC-to-DC inverter was a poor choice. It required the manufacturer to place a +12V trace on board, which increases the risk of damage to the computer if you jiggle the 1248-EP while it is in use.

## The Intronics EPROM Programmer

The Intronics device was designed for maximum economy and a range of EPROM types. It has a 28-pin ZIF socket and a power supply designed to provide both 25- and 21-volt programming voltages. A combination of software and plug-in personality modules selects the EPROM type.

Five modules come with the programmer, allowing you to program 2508, 2708, 2516, 2716, 2532, 2732, 2564, 2764, and MK2764 EPROMs. Additional modules let you program 2732A, 68764, 68766, and 27128 EPROMs and are available for \$5 each (the 27128 requires a minor change in the software as well). With its extended set of modules, the Intronics device can program essentially every variety of UV EPROM on the market.

The use of personality modules, the inclusion of the schematic, and the availability of source code all make it easy to modify this device to accommodate future EPROMs.

The software that drives the Intronics EPROM Programmer is less flexible than that of the 1248-EP and must be loaded from cassette. Unlike the 1248-EP, the Intronics device can only program an entire EPROM, or dump it to memory. Both of these functions are also targeted to a fixed spot (beginning at address \$2000) in RAM. However, it can slide blocks of data of any size around in memory.

The 6821s are socketed, and schematics come with the documentation. The source code is available, on request, for an additional \$5.

The device derives its programming voltages from the +5-volt line, making it less likely that careless jarring will damage your computer. This also makes it compatible with Tandy's CoCo II, unlike the 1248-EP. Unfortunately,

it has no support legs like the 1248-EP.

To program 28-pin EPROMs or those requiring 21-volt programming voltages (2732As, 2764s, and 2564s), the Intronics device is the best choice. It is sufficient for virtually all varieties of EPROMs and is the most economical unit for those who wish to program an entire EPROM.

If you restrict your work to the Color Computer and the smaller-size EPROMs, the 1248-EP is more desirable. It's quicker and more flexible for small production runs. The 1248-EP can handle the 68764- and 68766-type EPROMs, which are the most suitable for modification of the CoCo's ROMs.

If you buy an EPROM programmer, you must also purchase an EPROM eraser. This consists of a box that contains a short-wave UV light bulb. It costs from \$49 on up depending on capacity and speed.

As a final note, both Intronics and Computer Accessories of Arizona are promising significantly improved versions of these products. Intronics will be introducing a version with an improved ZIF and software only (no need for personality modules) selection of EPROM type. They might be ready by the time this review hits the stands. Contact either company for more recent information on their EPROM programmers. ■

Hardware

## Multi-Pak Interface

**Radio Shack**  
**1400 One Tandy Center**  
**Fort Worth, TX 76102**  
**\$179.95**

by **Rusty Le Blang**

**R**adio Shack has just introduced its Multi-Pak Interface. It plugs into the cartridge port on the right side of the Color Computer and offers four expansion slots for plugging in pro-

gram packs, disk controllers, and other hardware devices. The interface will eliminate all that unnecessary wear and tear on the cartridge slot, and the hassle of plugging and unplugging ROM packs and peripherals.

The unit comes with its own power supply, an on/off switch in back, and a slot-selector switch in front. You use the selector switch to choose the slot you want at startup, and you can change to another slot at any time during operation simply by moving the switch. However, the manual tells you to press the reset switch when doing this, because the computer sometimes hangs up when you switch slots in the middle of program execution.

The interface can select a slot via software as well as hardware, and takes no RAM away from Basic. If you are in Basic (by starting up the computer with the selector set to an empty slot or to the disk controller) and wish to start up a ROM pack, simply POKE a value corresponding to the desired slot into memory address 65439. The following table shows the required values:

Slot Number	Value
1	POKE 65439,0
2	POKE 65439,17
3	POKE 65439,34
4	POKE 65439,51

The values are in increments of 17, so you don't need the manual by the computer everytime you want to change slots.

One of the nice things about the interface is that it lets you use the disk controller and the Graphics Input Tablet at the same time. You can edit your own pictures with the graphics tablet and save them right to disk. An addendum sheet included with the operations manual instructs you to plug the Graphics Input Tablet interface into any slot other than that for the disk controller (slot four).

Read the three values from the tablet (either by PEEK in Basic, or LDA in machine language), and load the display. When you are finished, simply use the SAVEM command to save your picture to disk. When you do this, the start address of the first graphics screen will be moved from \$600 to \$E00 with the disk installed. Remember this offset when you are saving any of the eight graphics pages.

# REVIEWS

Another interesting feature of the Multi-Pak Interface lets you examine the contents of a ROM pack without the danger of shorting out the computer. Place your ROM pack into a slot in the interface, and enter Basic by selecting an empty slot before you turn on the computer. Then disable the cartridge interrupt by typing POKE 65315,54.

Next, POKE the value corresponding to the slot with the ROM pack into 65439. Then, if you examine the contents of memory from 49152-57343, you'll find the ROM pack program there.

You can now move the program down into low memory, and save a copy to cassette. If you have disk, you can bypass the cassette and save it right to disk. To do this, once you have moved the ROM pack to RAM, POKE the value for the slot with the disk interface into 65439 and then execute 49152. You'll turn on the computer in Disk Basic, and the program will still be intact.

Make sure you move the slot-selector switch to the same slot; since you used a POKE for slot selection, the selector switch will no longer work, but if you press reset, the switch will be active again and boot the computer up back in the slot it selected.

The interface lets the computer select the slot being used at a particular time. However, there is always power in all four slots; when you select a slot, the interface activates the cartridge-select signal and the spare-chip-select signal on that slot so that if the device has ROM in it, it will use memory from \$C000-\$FEFF. If it contains a spare controller chip, it will use memory from \$FF40-\$FFBF.

Data lines are open to all four slots, so the interface is capable of handling several pieces of memory-decoded hardware at the same time—such as a real-time clock, a parallel printer port, a voice synthesizer, or even an 80-by-24 video display. These devices usually use memory from \$FF40-\$FFBF (the disk controller uses address \$FF40-\$FF5F), so there is no memory-conflict problem. This alone makes the interface worth having.

You can also use software to program which slot will have the cartridge-select signal, and which will have the spare-chip signal. For example, the spare chip in the disk interface

is the disk-controller chip, and it's programmed by four addresses in memory from \$FF40-\$FF5F:

Address	Function
\$FF40	Drive Select
\$FF48	Disk Status and Command
\$FF49	Track Number
\$FF4A	Sector Number
\$FF4B	Data Transfer Byte

The rest of the addresses in that area repeat these four. When the cartridge select and spare-chip select are on the disk slot, the disk ROM will be placed in memory from \$C000-\$FEFF, and the controller chip will be from \$FF40-\$FF5F.

If you look at the binary equivalent of the values you POKE into the slot select, you will see that the high-order nibble (bits 4-7) echoes the low-order nibble (bits 0-3): 0=0000-0000, 17=0001-0001, 34=0010-0010, and 51=0011-0011, because the high-order nibble programs the cartridge signal, and the low-order programs the spare-chip signal.

What can you do then if you have a voice synthesizer that uses the same memory as the disk-controller chip, but you wish to use the synthesizer with a program on disk? You can change the spare-chip select signal to the slot with the synthesizer, and when that's finished, switch it back to the disk controller.

To do this in your Basic or machine-language program, take the slot number you want for the cartridge-select signal, AND it with the value 240 to clear the low-order nibble, and OR it with the slot number (values 0, 1, 2, or 3) that you want to have use the spare-chip-select signal. Then just POKE it (or STA it) into 65439.

This feature brings up some interesting possibilities. For example, it could be possible to run up to 16 disk drives off the interface, using four disks in each of the four slots. When you want to use a drive in another slot, just POKE the spare-chip select to that slot, and Disk Basic will program the controller for that slot. You'll remain in Basic, and be able to save and load programs normally. The possibilities are endless!

I do object to the size of the Multi-Pak Interface, but that's about my only criticism. The unit is almost as big as the original interface for the Model I, and it takes up a lot of valuable desk

space. At least the Model I interface acted as a base for the video display.

The Multi-Pak Interface is a welcome addition to the Color Computer family. With four hardware- and software-selectable slots, the ability to use the disk drive with other hardware devices, and the relief of no longer having to destroy the cartridge slot by plugging and unplugging ROM packs, it is the best expansion interface on the market for the Color Computer. If you are serious about your computer and want to expand it to its full potential, the Multi-Pak Interface is the only way to go. ■

## Superscreen

Mark Data Products

24001 Alicia Parkway No. 207

Mission Viejo, CA 92691

16K, Extended Color Basic

or Disk Basic

\$29.95, cassette

\$32.95, disk

by Steve Brown

Superscreen is a machine-language utility program that replaces the familiar 32-character-by-16-line screen display with a 51-character-by-24-line display using a full upper- and lower-case character set.

In addition, Superscreen incorporates an easily mastered command set that allows you to mix graphics and text on the new wide screen. Further, screen customizing features include reverse-video display and selection of cursor type.

For the programmer in all of us, Superscreen offers a real boon: auto-key repeat to allow repetitive entry of a character, or fast-forward cursor movement while editing.

These display and programming benefits make the program worth owning, but Superscreen also fixes one

# SORTC\*\* for OS9\* THE ONE AND ONLY

**BOLDLY GOING WHERE NO SORT  
HAS GONE BEFORE**

SORTC is a high speed, full-record compounding disk sort, which gives microcomputer users mainframe capabilities. It has been specifically designed to sort data efficiently while offering the user great flexibility in designing sort programs. It is written in BASIC09\* for use under OS9.

#### COMPOUNDING FUNCTION

SORTC has the capability of summing user-specified numeric fields on equality of keys. This allows significant savings in memory, disk space, and program development time. A reduction in the number of disk accesses required when compared to other sorts is inherent in the design of SORTC.

#### DISK BASED

Specifically designed to sort large volumes of data, SORTC imposes no size restrictions on the amount of data to be sorted. It also places no limits on the number of sort keys which can be used or the order in which the keys are sorted. Furthermore, the sort procedure can be performed as many times as necessary within the same program. This feature allows the programmer to take advantage of any existing data bias, and possibly even reduce the size of the sort key.

**JBM'S MIDDLEWARE**

\*OS9, BASIC09 are registered trademarks of Microware Corporation.

\*\*Uses the same algorithm as JBM's SORTC for Digital Equipment Corp. RSTS Systems.

#### ADVANCED DESIGN

While most disk sorts are partially based upon the Fibonacci series, SORTC is not. SORTC is a generation ahead of the normal sorts based upon the "Fib series". Its unique algorithm is automatically optimized at run time for a reduction in workspace, reduced # of disk accesses and shorter run times. Designed to be as "crash proof" as possible, the sort procedure will not abort if it is accidentally asked to sort zero items.

#### EASY TO USE

It is not difficult to design a program which will use JBM's SORTC. Since SORTC is a subroutine, the user may write any procedure he or she wants to format the data for sorting and then to process the sorted data. The sorted data need not be written back to disk, but instead is immediately available. The sort code is automatically inserted into the source procedure by a simple Sort Generator.

#### ORDERING INFORMATION

SORTC, from JBM's MIDWARE line of quality software, is available on either five and one-quarter or eight inch diskettes for a price of \$150.00. All of JBM's software packages come complete with comprehensive user's manuals.

190

of the most frustrating glitches in the CoCo ROM by supporting full implementation of an "ON ERROR GOTO" statement, which lets you build error-trapping routines into programs to avoid crashes and loss of data.

Superscreen requires only 16K Extended Color Basic, but accommodates itself to 16K, 32K, or 64K machines and supports Disk Basic. You don't need any POKEs to fit the program to your machine, as the program automatically adjusts itself to available memory, relocating itself from the top of the first 16K of memory to the top of the next 16K, modifying the appropriate registers along the way.

The actual screen displays are done on the graphics pages. Mark Data warns you not to reserve fewer than four pages (PCLEAR4) before running Superscreen.

### Control Codes

Superscreen controls the screen environment through nine control codes, invoked by the Basic statement PRINT CHR\$(N), where N is the code.

To use these control codes, you can call the PRINT CHR\$(N) statement from the command mode or implant it in a Basic program. For example, to clear the screen, use the command PRINT CHR\$(28); CHR\$(31). Code CHR\$(28) homes the cursor and code CHR\$(31) erases from the cursor position to the end of the screen.

Superscreen gives you a new vista—a whopping 1,223 PRINT@ locations. Superscreen fully supports the Basic PRINT@ command. Plus, the CoCo is no longer limited to 511

print positions.

I use my CoCo for quite a few data-entry and file-processing applications. Formatting menu screens and data-entry prompt screens is frustrating when limited to only 32 characters and 16 lines. Superscreen's 51-by-24 format allows me to put most of the data-entry prompts for a single record on one screen.

The PRINT@ function also allows other uses of the control codes. The command PRINT@ 0, CHR\$(31) clears the screen, just as the PRINT CHR\$(28); CHR\$(31) command above does. The effect is that of the CLS command.

The PRINT@ statement also allows some nifty effects in overwriting screen messages. The command, PRINT@ 0, "THIS IS FIRST" will place that message at the upper left of the screen. The command, PRINT@ 0, "AND SECOND"; CHR\$(30) will print the new message at position 0 and will wipe out the remaining characters left over from the first PRINT statement.

### Auto-Key Repeat

Pressing any alphanumeric key and holding it down for a moment engages the auto-key-repeat feature. After about a half-second, Superscreen recognizes that you want to repeat the depressed key and begins printing that character until you've had enough, or the keyboard input buffer is full.

This feature is particularly useful when you're editing long Basic program lines: just hold down the space bar until the cursor is under the offending character. Auto repeat is slick and efficient.

### Error Trapping

Anyone who has spent precious time entering lots of separate data inputs into their latest program, only to have all that typing wiped out of memory when the whole thing crashes due to a syntax error, will find Superscreen worth the price for this feature alone.

The CoCo's Extended Color Basic is designed to come to a screeching halt when it encounters an error in a set of instructions. Despite all pleas, Basic resolutely closes all files and resets several memory registers, usually resulting in a program crash, lost time and data, and some new scatological phrases on your part.

The ON ERROR GOTO statement, a part of the Basic on other computers, doesn't allow the program to crash. Rather, when the machine encounters an error, the ON ERROR GOTO statement branches the program to a designated routine that brings the program to a gentle halt while retaining all registers. The error-trapping routine also uses two new commands, ERR and ERL.

ERR is represented by a numeric code that you must look up on a table provided in Superscreen's documentation. For example, an SN error is code number 2. The program then stops until you tell it where to resume.

You can also use the ERR/ERL commands in an IF...THEN statement to send program control back to a specified line. Unfortunately, Basic doesn't allow you to edit the offending line and continue as though there were no error, but careful structuring of an error-trapping routine will save many lost hours.

Since laziness and fear contribute equally to my computing efforts, I make ample use of write-protect tape on disks. More than once a program has crashed because the disk I was writing to had a write-protect tab in place. With ON ERROR GOTO I can keep some of the laziness and alleviate the fear of losing a full buffer because the program returns the WP ERROR code and waits while I remove the write-protect tab.

### Documentation

The preproduction sample of Superscreen that I received had six pages of very complete documentation,

# REVIEWS

with plenty of examples to illustrate Superscreen's versatility. I hope the production version will be as complete and will contain a demo program or two, which is the best way to learn exactly how to use the program.

## Summary

Superscreen does what it sets out to do so well that it is hard to find any major faults. The only bothersome aspect is not in the program, but in the CoCo. Superscreen uses the PMODE 4 graphics screen; the expanded "text" screen is green with black letters. However, the CoCo phenomenon of "artifact" colors creates colored halos around the smaller letters required to squeeze 51 characters on a line. Turning the TV color controls to black and white eliminates the problem, however.

Mark Data Products is known for quality games and hardware. Superscreen represents a quality utility program that fills a definite need for the serious CoCo user. The program offers flexibility in screen formatting and text handling that the CoCo doesn't offer. Plus, no other programs on the market so far have offered the error-trapping utility of Superscreen. ■

**\$21.95, cassette**  
**\$24.95, disk**

by Steve E. Williams

**L**ancer is the best version of Joust that I have seen for any home computer. Using the Color Computer's graphics to the maximum, it is a near duplicate of the original coin-operated game.

In Lancer, you control a rider astride a giant stork. Your objective is to unseat opposing riders from their storks.

You can play solo, but it's especially enjoyable to work cooperatively with a friend in the two-player mode. The resulting team spirit enhances the action and is quite different from the boredom of other games in which each player must await his turn.

The arena consists of an open area with five islands suspended in midair over treacherous lava pits. A bird can land safely upon the islands, two of which wrap around the screen borders. Islands disappear at the higher skill levels to augment the challenge.

In order to score a kill, a knight must glide downward into an opposing rider, or otherwise come in contact at a higher position.

When you kill an enemy rider, his life force plummets to a nearby island in the form of an egg. You must lance these eggs, or they will hatch into new, more dangerous riders in a few seconds.

You will lose one of your five riders if he's lanced from above or falls into the lava pits. If you have another rider left, he will appear on one of the island materialization pads.

A dragon appears randomly at the higher skill levels. Its touch is deadly, and you can kill it only by spearing it directly in its mouth.

You direct your mount with the joystick and flap its wings with the fire button. Control is exceptionally smooth and realistic. For example, in normal movement, a bird might take a running start, leap into the air, glide upward with its momentum, hover a while, flap, and turn before finally landing upon an island or attempting to lance an opponent.

Lancer features detailed, colorful graphics. The arena, knights, birds, and dragons are displayed in beautiful, high-resolution graphics. You can actually see the enemy birds' long brown necks and the spotted designs upon their beating blue wings. Your mount is a two-tone red and green stork with yellow markings.

This game offers a challenge that similar microcomputer programs do not. Enemy knights fight intelligently, often surprising their victim by flying off one edge of the screen and returning through the other. In addition, they fly artfully in defense and are tough to attack.

Lancer ranks with the finest arcade games for all home computers. ■

# DATA-BASE MANAGERS AND THE SMALL BUSINESS

Many people have naive ideas about information; they believe that having more information available improves decision making. But you've seen the ads with a hallway full of paper advancing towards the poor manager.

Too much information often has a paralyzing effect on people trying to make a decision. As Naisbett says in *Megatrends*, "We are drowning in information but starved for knowledge."

Using the XDMS Data Management System (Westchester Applied Business Systems, Box 187, Briarcliff Manor, NY 10510; disk, \$179.95; with DBMS utilities, \$249.95), I'll explain how such a program can help you store and retrieve information efficiently.

Bill Adams wrote XDMS for the FLEX operating system; it runs with no

difficulty on the 64K Color Computer. I chose this program because it is a state-of-the-art, data-base management system (DBMS) that supplements typical data-base processing techniques with the ability to calculate the data. That feature expands the usefulness of this system considerably.

---

**What Is a DBMS?**

"Look at this, we got three separate mailings from the Credit Union: One is for the checking account, another for

the savings, and the third is for the car loan." The Credit Union has a problem with data duplication because it stores the customer's name, address, and other data in a file for each account.

Why is this a problem? If a customer moves or changes names, *all* the files containing this personal information must be changed. Normally this isn't a big deal, since the Credit Union realizes that the customer has three separate accounts. On occasion, however, someone slips up and the customer's accounts are sent to the wrong address.

A DBMS is a means to organize and manipulate data files in an *integrated* manner. It organizes all the files into one data base, represents the relationships among their records, and uses these relationships to process the data.

Suppose a company wants to use information about employees' job classification, department, and sex; a DBMS would integrate these records into a single data base. Thus it is possible to retrieve all the employees (by name) who work in the budget department, or all employees with job class 4, or all females in job class 2 who work in the production department.

A file is a collection of records. A payroll file, for example, has a record for each person on the payroll. A record consists of several fields of stored information such as name, address, zip code, sex, age, marital status, credit rating, and current balance.

Each part of the information in a record is called a field. Thus a record is made up of fields, and a file is made up of records. A DBMS can process (i.e., access or update) files, records, or fields.

### Selection

Our organization has a room full of filing cabinets containing the personnel files of everyone in the company. The files are organized in alphabetical order, and any authorized person could easily examine someone's file.

But the filing system makes it extremely difficult to answer questions such as "How many people earn more than \$50,000?" "How many women make more than \$25,000?" "How many people were hired in 1980?"

The managers who have to make decisions based on answers to those questions are stymied by their inability to *select* the information they need from the sheer bulk of irrelevant information.

Finding needed information easily is the major strength of a DBMS.

DBMSes use English-like phrases to simplify the selection process. Here is an example that will list the names and salaries of females:

```
LIST NAMES, SALARY IF SEX = F.
```

And this one will print the names and salaries of people earning over \$50,000:

```
PRINT NAMES, SALARY IF SALARY > $50,000.
```

### DBMS Transaction Processing

Small businesses are finding that a microcomputer running a good DBMS can effectively handle most of their information; small business people, in fact, buy most of the DBMSes.

DBMSes are general-purpose programs; they can do what you want them to do; they substitute for a program-

ming language. Many management theorists predict that DBMS commands will become the replacement in business for most computer languages (even Cobol).

Because DBMSes can process numerical and textual information and write reports, a good DBMS can substitute for all kinds of expensive business packages in a small business. The Color Computer with 64K of RAM can handle large data bases because XDMS employs a *virtual memory* process, which uses the disks as memory, switching files in and out of RAM as needed. The disk I/O slows processing down, but processing speed is expensive. Price a hard disk with tape back-up or a mini-computer.

Computers proved themselves to businesses by doing *transaction processing* accurately and efficiently. Data was stored sequentially on a master file, which was updated by a transaction file.

But what happens if you want to expand the records to include another field? Without a DBMS, inserting and deleting another field is time-consuming and complex. Since the files are sequential, they must be rewritten.

Good DBMSes are written to facilitate transaction processing. Updating and altering records is designed to be done by data-entry clerks who input data in response to prompts. For example:

```
Name: _____
                (last)           (first)
Purchases: $ _____
Payments:  $ _____
```

The credit processing for a retail store is an example of transaction processing. Each month a master file that maintains each customer's balance is updated with a transaction file that contains the payments and purchases from last month. The computer calculates a new balance and creates a file from which bills are sent to customers.

Updating a customer's record is a transaction; updating all the records is an example of transaction processing. See Fig. 1 for an abbreviated version of a master file.

Altering the record structures by adding fields is also no problem for a good DBMS. XDMS requires only that you define the new field and then insert data into it. You can pull the data from another file. This is nice because you can also pull additional data from a mainframe file and add it to the data base on the Color Computer.

To be effective at transaction processing, a DBMS must be able to work

with multiple files simultaneously (e.g., a file with this month's transactions, the master file, and a file from which bills will be printed).

### Computation

File-management systems and most data-base programs for micros have limited or nonexistent capabilities to calculate numerical data. Even though the calculations below are simple, most DBMSes would have trouble with them.

- Interest: Old Balance × 18 percent
- New Balance: Interest + Purchases - Payments

Without this ability to compute numerical data, the small-business person using a data base must write a program to access the data in the file, do the calculations, and put the results back into the file—not impossible, but certainly a pain.

Processing such as billing, inventory, and payroll requires computation. XDMS handles the calculations straightforwardly with its CALC function:

```
CALC OLD BALANCE * .18 = INTEREST
CALC INTEREST + PURCHASES - PAYMENTS = NEW BALANCE
```

### Mid-Managers and DBMS

The micro revolution is sweeping through big business. Dun and Bradstreet recently reported that 70 percent of the companies with more than 5,000 employees had purchased microcomputers for their managers and professionals.

What's the appeal? Why do managers need a micro when these organizations have multimillion-dollar computer facilities?

Software sells hardware. These managers are buying machines to run SuperCalc and VisiCalc; the sales figures on these packages are the clue to what is going on.

Lotus 1-2-3 is now the hottest selling software in the country; it is a combination data base and spreadsheet program. XDMS is a data base expanded to perform calculations on the columns (fields) of the data base. It will probably become a big success on the 64K Color Computer as managers discover the power of the software and the value of the hardware.

Spreadsheets have limited abilities to deal with textual material. DynaCalc and SuperCalc can sort text fields, but none of the spreadsheets can really *process* information (select, find, extract, exclude, format, combine, and so on).

Managers find that the spreadsheets extend their abilities to do numerical

Table 3. Sorted by Job and Hire Date

analyses on budgets and financial records. They are now discovering that DBMSes extend their abilities to analyze records that include both tex-

tual and numerical data.

A typical managerial process goes something like this:

- A problem forces the manager to analyze information to better understand the problem.
- The information is ambiguous; the data suggests no clear decision.
- The manager then formulates a hypothesis based on shaping and interpreting the data that explains the information.
- This knowledge based on the information becomes the basis for a decision.

Let's try an example to illustrate the decision-making process and the usefulness of XDMS. Pretend that you are a manager with responsibility for three departments and 1,000 employees (I'll only use 20 records in this illustration).

Ms. Ziegler, who is a member of your administrative staff, informs you that she has filed a formal grievance with the company alleging that the company practices salary discrimination based on sex. She claims that all the women's salaries in your departments are substandard and that this pattern of discrimination will be the basis for an EEOC grievance if you do not rectify the salary inequities.

You are shocked and perplexed. You have tried hard to hire and advance women. Ziegler is an example; you have seen to it that she is relatively high priced. Salaries are based on company policy; job classification, and seniority

## GOOD NEWS FOR EPSON MX-80 and RX-80 OWNERS

### MICRO-GRIP FRICTION FEED

Add inexpensive friction feed to your MX-80 or RX-80. Easily installed with screwdriver, no soldering. Does not disturb tractor feed. Also fits printers based on Epson design such as IBM PC, Commodore and H-P Dot Matrix printers.

Wt. 1 lb. ONLY \$39.95/ea.

### CARTRIDGE RIBBONS FOR...

EPSON MX 70/80	\$5.00/ea.	RS LP III, V	\$5.85/ea.
EPSON MX 100	9.75/ea.	RS LP VI, VIII	7.00/ea.

## FIVE HOT GAMES FOR YOUR HOT CoCo

ARCADE

WARGAME

SCIENCE FICTION

SPORTS

WARGAME

Shootout Screen

### SHOOTOUT (at the OK Galaxy)

30 ALIEN WARSHIPS HAVE ENTERED YOUR PATROL ZONE. OK, shields up?, energy level . . . check, azimuth set? Yup. This may sound like the latest summer space movie thriller but in fact it's the preparations YOU will make when playing Avalon Hill's new arcade strategy game SHOOTOUT AT THE OK GALAXY. Over 2 years in the making, SHOOTOUT is purely graphical combining arcade excitement with just the right touch of strategy.

Cassette for TRS-80® Color (16K): \$20.00

### VOYAGER

A solitaire science fiction game that challenges you to explore the four levels of an alien spacecraft's maze-like corridors and rooms in 3-D simulated graphics; all the while avoiding robots programmed to blast any intruders. In order to win, you must destroy all power generators and escape or hunt out and annihilate all of the killer robots. VOYAGER comes with color-animated graphics and sound capabilities for computers so equipped.

Cassette for TRS-80® Color (16K): \$20.00

### MIDWAY CAMPAIGN

Your computer controls a huge force of Japanese ships whose objective is to invade and capture Midway Island in this tense wargame. In the actual engagement, the Japanese made several tactical errors which cost them the battle. Your computer probably won't make the same mistakes! You command the badly out-numbered and outranged U.S. Naval Forces. Your only advantage is surprise.

Cassette for TRS-80® Color (16K): \$16.00

Whether your interest is in quick-reflex arcade games, sport simulations, science fiction adventures or war games, you're sure to find many challenging contests from Avalon Hill's Microcomputer Games. Your only problem will be deciding which one to pick!

VC Screen

### BREAKTHRU (in 3-D)

Don't take our word for it! Here's what *Color Computer* magazine has to say: "This is truly a good game". Short and sweet as this description may be, BREAKTHRU is really much more than just a truly good game! It's a combination of racquet and WALLBALL. The object is to knockout five consecutive walls at the opposite end of the court using a joystick paddle to strike or deflect the lively ball. BREAKTHRU is written in pure machine language to give you a fast-action, three-dimensional, high-resolution sports experience for hundreds, maybe even thousands of hours of entertainment.

Cassette for TRS-80® Color (16K): \$20.00

### V.C.

V.C. (short for Viet Cong) is Avalon Hill's first wargame on the controversial Viet Nam War. Under your command is the chopper based air-mobile and heavily armed 1/509th Air Cavalry and 9/15th Field Artillery for fire support. It is an unconventional conflict. You have the task of bringing the civilian population under your protection where the enemy can hide amongst the people, and where the politics of terrorism and friendship can turn the people you want to save against you. V.C. faithfully re-creates this struggle in which you can lose without ever being defeated.

Cassette for TRS-80® Color (16K): \$20.00

\*Trademark of Tandy Corporation

*Table 4. Salaries Arranged by Sex*

do this with XDMS is: "Sort by dept, by salary."

Good DBMSes also have report-writing capabilities. They permit you to specify titles, headings, margins, tabs, and so on. For Table 2 I used "Title Table 2, Sorted by Dept and by Salary", and "Margins 10, Tabet 7".

Table 2 clearly shows that there are no women in the production department. It also shows that women are lowest paid in the maintenance department, but you just hired Iseman and Koda. They have the least seniority.

That's probably true of the administration department, too. Salaries are based on job classification and seniority; a sort by job class and hire date (HDATE) will verify this.

XDMS and other good DBMs can work with strange data structures like a 01-01-81 date or a social-security number. XDMS permits you to calculate with dates, to compute years employed (i.e., by subtracting HDATE from today's date:  $CALC\ 01-01-84 - HDATE = YEARS$ ).

HDATE also illustrates the need to add a new field to the records. XDMS easily handles the addition by asking that you define a new field (DEFINE HDATE,S,8), and update the data file by inserting the dates in the HDATE field.

You could also pull the dates from another file. You could fill in the HDATE field by output from another file, but the names in both files must

*Table 5. Sorted by Job Classification and Salary*

match. XDMS provides a way to merge two files.

If your hypothesis is correct, the salaries in each job class should go from highest to lowest based on seniority. But look at Table 3. Note Ziegler's salary.

determine people's pay. Better analyze the situation. Here is a job for XDMS.

Look at Table 1. The data is all jumbled. You need to sort the records in order to focus patterns in the data. At this point you don't know what you are looking for.

What if you looked at the salaries in each department? In DBMS terms, what if you sorted the data by department and by salary? The command to

**IT'S SIMPLE. . .CALL AND SAVE MONEY!**

---	---	--	---

But there is a problem with the fact that people in production (job class 3) are paid more than people in other departments. The people in job class 4 are your top managers; their salaries are set on the basis of merit. You realize that many factors affect the salaries. It's time to focus on a comparison of salaries for men and women.

You construct a simple sort by salary, but find it hard to read. XDMS permits you to sort the salaries and present them in two columns, male and female. You can array data with XDMS using any field; in this case you could array by department, job, or sex. The command to array the salaries under the M or F columns is: Array Salary for Sex = M,F.

The results as shown in Table 4 appear pretty damning. Maybe Ziegler is right.

The array shown in Table 4 shakes you; you immediately rip it to shreds. An administrative assistant cannot be compared to the head of a department! You must consider the fact that the women are mostly in job class 1. quickly sort by job class and by salary. (Table 5.) Again, the results do not please you.

The conclusion is inescapable; your

legal office calls it *Prima facie* evidence of salary discrimination based on sex. You decide to go to the company president and ask for funds to increase the women's salaries. You seek advice from your department heads about appropriate salaries and use XDMS to compare the women's salaries to the men's.

### Summary

DBMSes offer small businesses an efficient way to handle their information resources. Midmanagers in large organizations find that a DBMS helps them select the information relevant to their immediate problem, sort and analyze the information, and reach decisions based on their interpretation of the information.

These applications were illustrated with commands and output from XDMS. XDMS is a tremendously powerful programming language and report writer—one that works with files, records, and fields. This short article only touched on a few of its capabilities; *HOT CoCo* and other magazines will probably begin to publish how-to articles for using DynaCalc and XDMS in the future.

Like any language, XDMS is hard to

learn. Knowing which commands do what takes time. Pulling an HDATE field from one file and inserting it into another requires some thought.

The operations are complex; hence, the commands to perform the processes are difficult to master. Even after spending hours experimenting with certain of XDMS's commands, I could not get the output correct.

This is a fault of the manual; it needs to be clearer and filled with less jargon and more examples.

Bill Adams wrote a terrific program, but the manual is barely adequate. It's a major flaw in what is an otherwise remarkably powerful data-management system for the Color Computer, one designed for managers of small and large businesses. ■

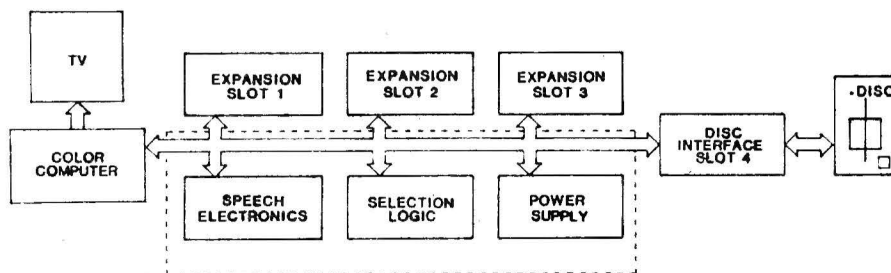

### Ed. Note:

As *HOT CoCo* went to press, a new version (1.1) of XDMS and an upgraded XDMS+ were announced. Both manuals have been revised, which should alleviate the difficulty of learning the data-base commands.

You can write to James Perotti, c/o HOT CoCo, Pine St., Peterborough, NH 03458.

# COMPUTING YOUR FUTURE

Many books on personal money matters state that only a small percentage of people who reach retirement age are financially able to enjoy a

If you haven't thought about providing for your retirement, maybe your CoCo can get you started.

comfortable, secure retirement. These books illustrate how a little planning, regular saving, and prudent investing can help almost anyone achieve the goal of a secure retirement.

The planning process involves deciding how much income you would need to retire today. You must then adjust this amount for inflation up to your proposed retirement date and calculate the size of the nest egg needed to produce the adjusted retirement income. Finally, you calculate how much you will have to invest every year to achieve that goal.

My program (see Listing) lets you try an infinite number of possibilities and see what difference a few extra dollars saved or a few extra percentage points

500	Title
1000	Input the numbers
1500	Choose retirement option
2000	Calculations
2100	Retirement benefits (adjusted for inflation)
2200	Calculate size of nest egg needed according to retirement option
2300	Calculate size of current savings at retirement
2400	Calculate amount of additional savings needed
2500	Calculate annual savings necessary
3000	Display solution on the screen
4000	Options
	Print? (5600)
	Choose different retirement option? (1500)
	Start again? (1000)
	Quit? (6000)
5000	Subroutines
5100-5500	Formulas
5600	Dump screen to printer
5700	INKEYS
5800	Printer on?
5900	Input instructions
6000	End

Table 1. Line Descriptions

### System Requirements

16K RAM  
Extended Color Basic  
Printer Optional

in net investment yield could make.

### Nuts and Bolts

Table 1 describes the program line by line, while Table 2 defines the variables. The only POKEs in the program are to increase or decrease the processing speed of the CoCo. You can modify or eliminate these on other machines.

The program uses no graphics, and you can convert it to Color Basic by eliminating the PRINT USING commands and using subroutines to raise numbers to a power.

The subroutine at 5600 is a simple screen dump to a Radio Shack Line Printer VII. You would have to modify it to allow it to function with a different printer.

One of the fancier features of the program is its three retirement options.

● **Interest Only**—You live on the interest produced by your nest egg and leave

the principal undisturbed.

● **Fixed Annuity**—You live on principal and interest and exhaust the whole thing at the end of a fixed period.

● **Inflation Adjusted Annuity**—You live as in option 2, but increase the benefits each year.

Obviously each of these plans requires a different sized nest egg. That's what the program calculates.

Notice that you invest your savings at the end of each year while you are working and that you receive the benefits at the beginning of each year during your retirement. Note also that the program applies the same inflation rate for your whole life and that the return on investment is average net yield after taxes.

### Inflation Adjusted Annuity

Standard annuity formulas calculate the cost of a fixed flow of income for a fixed period when you invest the principal at a given interest rate. This is the formula used in retirement option two. Given the rate of inflation over the last few decades, however, it doesn't seem

wise to plan a 20- or 30-year retirement on a fixed income.

The code in lines 2260-2282 calculates the savings needed to provide an annuity with increased benefits each year. First it calculates the cost of an annuity to pay a fixed benefit at the level of the first year of retirement (2266). Then it calculates the increase in benefits (IB) for the next year (2276) and a second small annuity (2266).

Since this small annuity will not start paying until the second year, it can earn interest the first year, so it needs to be discounted to its value at the moment of retirement (2270). Finally, the program adds the cost of this smaller annuity to the cost of the primary annuity (2272). It repeats this process for each year in the life of the annuity to give you the size of the nest egg (SN) you will need at retirement to provide this flow of increasing benefits. ■

<b>Input Variables</b>	
AA	Value of INKEY\$ inputs
IR	Inflation rate
WY	Working years
RY	Retired years
CS	Currently desired salary
SP	Savings at present time
WI	Investment yield while working
RI	Investment yield during retirement
O	Retirement option
<b>Subroutine Calculations</b>	
PV	Present value
FV	Future value
I	Interest rate/period
P	Number of periods
PMT	Payment
<b>Calculations of Variable Annuity</b>	
OB	Old benefit level
NB	New benefit level
IB	Increase in benefit
SI	Savings increase needed
Y	Year of retirement
<b>Output Variables</b>	
SN	Total savings needed at retirement
SR	From current savings
SA	From annual savings
RB	Yearly retirement benefits
FB	Benefit in final year of variable annuity
SY	Yearly savings required until retirement
<b>Screen Dump to Printer</b>	
L	Screen location
C	ASCII code of character at L
CN	Character counter

*Table 2. Variables*

<b>Data</b>					
● Inflation: 10%					
● Retiring in three years for three years					
● Salary desired: \$1,000 per year					
● Savings at the present time: \$100					
● Yields on investments: 10%					
● Option #3—Inflation Adjusted Annuity					
The program calculates that \$1,166 must be invested each year. Here is the verification:					
<b>Working</b>			<b>Retired</b>		
<b>1st Year</b>	<b>2nd Year</b>	<b>3rd Year</b>	<b>1st Year</b>	<b>2nd Year</b>	<b>3rd Year</b>
<b>Present Savings</b>	\$100 + 10% = 110	+ 10% = 121			
<b>Annual Savings</b>	\$1166	+ 10% = 1283 + 1166 2449			
		+ 10% = 2693 + 1166 3859 + 133			
<b>Benefits Begin</b>		<u>3992</u>	3992		
			- 1331		
			2661 + 10% =	2928	
				- 1464	
				1463 + 10% =	1610
					- 1611
					(1)
<b>Salary</b>	1000 + 10% =	1100 + 10% =	1210 + 10% =	1331 + 10% =	1464 + 10% = 1611

## Fembots' Revenge

NEW

### 3-D GRAPHIC ADVENTURE

Shooting aliens on a flat screen is nothing like BEING THERE. In machine-code 3-D excitement, highest resolution graphics and sound, you are face to face with the Guardians: the ubiquitous Fembots, the powerful Arthroks and the omnipotent Optikon. Your lasgun blasting, you hear the explosion and the crunching metal; you feel the tension as you stalk your enemy, searching for the Destruct Button on your way to the Master Bay of the Mother Ship. Can you find the means to teleport to safety?

32K Tape \$24.95 32K Disk \$29.95

## KOMET-KAZE

Another arcade hit! The Asteroid Belt is crashing down on Earth. You are the first-line defense. You must destroy the blazing asteroids and the homing orbs with your disruptor. Machine-code speed, multi-colors on a black background - the crash and explosions of the asteroids rain on your senses!

16K Tape \$19.95 32K Disk \$24.95

## INTERCEPTOR

Ever increasing Waves of Landers, Fighters, Air mines and Smartbombs help the enemy capture the Earthlings on the planet surface. Your phaser and photon bombs will be a solid defense. In multi-colored surroundings you do battle to maintain control of your homebase!

32K Tape \$19.95

32K Disk \$24.95

## THE SENTINEL

3-D GRAPHIC ADVENTURE

A dark, awful secret is hidden in the cavernous labyrinth. Beyond the chasms, the poisonous gasses, Tunnels of No Return and the relentless minions, the Sentinel hungrily awaits! Sorcerous magick and saintly swordplay are your best friends and worst enemies. You are no ordinary warrior in this ultra hi-res, 3-D medieval adventure! Can you survive to discover the secret - or is there a seat in the netherworld for you too?

32K Tape \$24.95 32K Disk \$29.95

## Xygoïd NEW

Your ship is being enshrouded by the Xygoïd Web. Certain death is minutes away! You must blast through the enveloping Web and destroy the Xygoïd vessel before you are crushed. This is a multi-colored machine-code game in the highest resolution mode on a black background. Xygoïd, from the galactic beginning! It will ensnare your mind!

16K Tape \$19.95 32K Disk \$24.95

## VEGAS GAMEPAK

Why fly to VEGAS when you can have a casino at home! The VEGAS GAMEPAK is five action packed games with great graphics & sound. SLOT MACHINE - BLACKJACK - UP AND DOWN THE RIVER - CRAPS & KENO.

16K Tape \$19.95 16K Disk \$24.95

## MS. NIBBLER

Ms. Nibbler is not just another pretty face with glossy red lips. She's a feisty lady, who moodily prowls her black maze. This game has the real arcade action and the real arcade look too! Your joystick will almost burn out as you try to keep up!

16K Tape \$19.95 16K Disk \$24.95

## Fyr-Draca

NEW ARCADE GAME

Fyr-Draca (Fire Dragons), from egg to the daemonic behemoth, greet you in five waves with nine colors on the screen at one time! This machine code game is going to sweep the Color Computer market. It is by far, the best game to come out for a long, long time. The real arcade look is here at last!

Fire Dragons uses the nine color mode to create a screen of dazzling color with a black background and a black border. Dragons swoop from their stellar watch, singly, in groups and in squadron formation. First you face the single wyrms, then the squadron, next the twin giants, followed by the Battle Drake and its minions. Even with four star vessels and shields you will be hard put to survive their spitting fire and diving attacks!

32K Tape \$24.95 32K Disk \$29.95

## BEYOND THE CIMEEON MOON

3-D GRAPHIC ADVENTURE

A dead star... A derlict vessel... or is it? Trapped within you must venture the corridors; defend yourself against the merciless gauntlet of agents of the machine mind. A real-time, high-res, 3-D science fiction adventure game of mind-blowing magnitude.

16K Tape \$24.95 32K Disk \$29.95

## Adventure Trilogy

3-D GRAPHIC ADVENTURE

Clash steel with thy foe in the arena of gore. Proved worthy, go in quest of the elusive Eye of Dazmor. If ye findest the orb, hast ye the might to ward off skem and the fortitude to restore the Eye? The ultimate high-res, 3-D quest for even the most experienced adventurer!

16K Tape \$24.95 32K Disk \$29.95

## THE NIBBLER

The King of Pac games is here. This fast-paced maze-chase game will challenge the most skilled. You guide The Nibbler through the maze, the portals, onward to the Energy Pills. Then the Ghouls, constantly at your heels, will end up in your belly! The better you get the better you have to become to master the blazing speed. You haven't pushed your skill until you've tried this one!

# MITRONIX

## MORSE CODE from MITRONIX

Turn your Radio Shack Color Computer into a complete Morse Code terminal.

MITRONIX MODEM—Interfaces the computer to your transceiver via the ROM PAC slot.

Cartridge: \$54.95

—You have your choice of 5 CW programs to pick from including:

### —MITRONIX TRANSLATOR

This Machine Language program allows you to transmit & receive from 5-60 WPM. Features split-screen with reverse video receive, a 1024 character TX buffer, auto CQ, & 4 message memories.

Cassette: \$26.95

### KA9FSQ PERSONAL CW MAILBOX—

Written in COLOR BASIC, this program allows you to transmit to 50 WPM, & receive to 30 WPM. In the MAILBOX mode, it will answer a CW call, get other station's call letters, message, data & time, and store it in memory for instant recall when you return. Also hard copy.

Cassette: \$21.95

New and Improved!

Dealer inquiries invited.

PRICE \$29.95 (Tape) \$39.95 (Disk) 16k or 32k Req.

## 364,000 BYTES!

That's right! Using your 64K Color Computer, and an 80 track drive, you too can have more than TWICE as much storage on your disk drive system. DOUBLE DOS BASIC allows you to use 35, 40 or 80 track (double or single sided) drives all on one system, all at the same time! Your system could consist of a 35 track drive, a two drive AMDEK system, and an 80 track drive, all working, and hooked up to your system! (The AMDEK drives are 40 track drives.) ALL commands are supported in DOUBLE DOS BASIC. The DOS is totally transparent to your BASIC programs! If your system selection is 80 tracks, a PRINT FREE command will return 158 granules! Compare this to the 68 granules your system now returns! The 40 track drives would return 78 granules, 10 more than the 35 track system. EVERY command in BASIC is supported by DOUBLE DOS BASIC. If you haven't already upgraded to 64K, now is the time! Use your system to its FULLEST! DOUBLE DOS BASIC also gives you RESET PROTECTION, unlike most of the other 64K programs. AND, used with our ROM MOVE program, you can also get another 8000 bytes of BASIC addressable memory! DOUBLE DOS BASIC — \$24.95  
ROM MOVE — \$12.95  
DOUBLE DOS & ROM MOVE — \$29.95

\$2.00 shipping and handling on all orders. No extra charge on COD orders, Mastercard and VISA accepted. Texas residents add 5% sales tax. Allow two weeks for personal checks.

# MULTIPOINT

FOR THE Color Computer  
The **multiport** expansion board allows up to four COLOR COMPUTER peripherals to be attached to the computer at once. Any of the four ports can be selected with a single POKE command. A LED indicates the port currently selected.

Disks and absolutely anything designed for the COLOR COMPUTER expansion port can be used with the MULTIPOINT. Imagine having a DISC, PRINTER, MODEM, VIDEOTEX and a CLOCK CARTRIDGE all on-line with your computer. Or how about four ROM-CARTRIDGES for up to 64 K of extra software. The combinations are limitless! The MULTIPOINT comes assembled and tested for \$99.50

The optional AC adapter is \$14.95; shipping-\$5.00

**The choice is yours — and you can get your first issue free if you subscribe now**

If you want to make the most of your new Dragon computer, then you need **Dragon User**. This independent, international magazine for all Dragon owners is packed with software and hardware advice.

Regular features:

- Pages of program listings
- Chance to win \$300 prizes
- Advice on which software to buy
- In-depth hardware evaluations
- Technical advisory service
- All the latest news

If you've ever been killed by the evil goblin, flamed by a dragon or turned to stone by a wizard, then you need **Micro Adventurer** — the new magazine devoted to all microcomputer adventures, war games and simulations.

Each issue features:

- Helpline and Contact columns
- Reviews of the latest adventures
- Competitions with exciting prizes
- Adventures to type in and play
- Advice on how to write your own adventures
- Profiles of famous adventurers

### Subscription form

Fill in this form and send it to the appropriate magazine's subscription department, c/o Business Press International, 205 East 42nd Street, New York, NY 10017.

Please send me 13 issues of  
 **Micro Adventurer** at US\$33.95  
 **Dragon User** at US\$29.95

This is the usual rate for a year's subscription (12 issues).

# STOCK TRANSACTIONS TRACKER

Record keeping and financial management were probably among the suggestions you gave when asked "What can you do with a home computer?" But did you follow your own advice? Here's your chance to live up to your best intentions and better manage your personal finances.

This is a program called Stock Transactions Tracker (STT). Even if you don't have any stock investments now, don't stop reading because, if you follow a plan, you can begin today. STT allows you to use your 16K cassette-based CoCo to create individual portfolio files of up to 75 stocks each. It lets you quickly load, review, update, and save the file on tape, and provides a printed record on any 80-column printer.

Investing in the stock market is as simple as walking into the nearest brokerage house and turning over your

Enter the stock market fully prepared and with fool-proof organization. STT can help you manage.

money. Any broker will be glad to help you to spend it and provide abundant advice on what he thinks is best for you. This is *not* the best way to begin. You worked hard for your money and deserve to know exactly what is happening to it when you invest. Getting started in the market requires a well-thought-out plan.

First, put aside a nest egg (at least three month's salary) into savings. Then you can begin a systematic investment in a mutual fund. Mutual funds provide you with a professionally managed portfolio and can be a good IRA (Individual Retirement Account) investment opportunity. You must, however, choose from the many funds available such as cash, bond, income, and growth. A good stock broker can help you choose based on your investment goals, and give you an education in the process. Mutual funds have many advantages for the beginning investor, but you eventually want to invest in stocks of your own choosing. This is when you need a good management tool.

STT is a way to keep track of your portfolio and update certain critical information. With STT, you can enter the latest stock quotations and your CoCo calculates profit or loss, gives you a running portfolio value, and sums your dividend income. But that's only the beginning: STT makes much more information readily available. It is helpful to know why STT was devel-

oped to understand what it does.

### Transaction Tracking Requirements

First, it was necessary to decide what was important to me, the investor, and to the IRS. The rise and fall of the stock market is neatly shown in every financial publication throughout the country in the form of the Dow Jones Industrial Average (DJIA), but it didn't help manage my personal stock portfolio.

If you're like me, you skim through the New York Stock Exchange listings daily, making mental notes on how your particular stocks are doing. A typical day might sound like this. "Okay, this stock is up a half, but that one is down three quarters. Let's see, I have 400 shares of the first, but only 250 of the second, which I only bought 10 months ago. If I sell now, will it be a short- or long-term profit? That makes a big difference at tax time! Wait a minute, what did I pay for those stocks in the first place? How big a gain is it anyhow? Should I sacrifice a good dividend income and look for a more speculative issue with a greater price increase potential? That 400 shares was before the three-for-two stock split. Or was it?" This endless questioning and uncertainty goes on and on. The only sure way to get your personal investments in order is to organize them.

Even if you have a good system for managing your portfolio, you might want to perform projections (what ifs) on certain stocks and see how that affects your profits. You might also have separate portfolios for children, or your spouse, that you wish to manage separately. You need a tool that allows you to organize individual investment portfolios and make updates easily and quickly, and provides the option of making "what if" projections.

### Using the STT Program

The program begins with two options: Create New File or Use Existing File. When you wish to use a file previously saved on tape, you select the second option. You are then told to prepare a cassette and press enter when ready. When you press enter, the message "Searching" appears. When the computer finds a valid STT file the message "Loading File" appears. With either option, STT must initialize an array that holds the data. You see a message "Initializing" that remains for some time based on the maximum number of records the program allows.

After initialization, you are advised of the portfolio's owner and the file's last update. If you are creating a new file, the owner will be "Noname" and the last update will be 99/99/99. You have the option of changing both. When you press N (No) in response to the "Change" question, you are asked to enter the date. If you make any changes to the file, the date is recorded as the date of last update.

At this point a screen presentation appears. On the first line you see the owner's name and last-update date: Under this is the command line, where all prompts appear. Next is the identification of the file (record) columns. The leftmost column identifies the data in each row: number of shares (#SHRS), stock name (NAME), dividend rate (DIV.R), date of initial purchase (DATE), total cost of purchase (COST), current selling price (PRICE), total gain (GAIN), and dividend total (DIV.T). Finally, the bottom two lines of the screen present the totals (TTLS) for gain, portfolio, and dividends.

### Data Definitions

It is always important to know the

number of shares you own of any given company. Also, share quantity can change, as with stock splits. When you receive such good news, you'll want to record it immediately, so the first row allows you to enter the number of shares. Less volatile is the company's name. The second row holds this information, or the company's ticker symbol (i.e., T for American Telephone and Telegraph). Company names occasionally change, but the ticker symbol does not. Even so, STT allows you to change any of the data entries at any time. Next is dividend data, which is entered in terms of rate-per-share. If there is no dividend, you can either leave it blank or enter a zero.

The stock purchase date is always useful since it determines whether you are in a short or long term position (useful when filling out your Federal income taxes). The date is entered in free form; there is no valid date checking.

Next on our list is the original cost data which should be entered as the sum of the cost-per-share times number of shares purchased plus any commissions, tax, or so on. This data rarely changes, but requires modification with circumstances such as taking advantage of a rights offering, selling off part of your holdings, or buying additional stock in the same company.

Many utilities offer rights to purchase shares on a limited basis and at a reduced price. For example, you originally bought 100 shares of XYZ company at a total cost of \$2,000 and you now take advantage of a rights offering of one share at \$15 per share, for every 10 shares you already own. You spend \$150 to purchase 10 additional shares.

After this transaction, you update the file as follows: number of shares

STOCK TRANSACTIONS STATUS AS OF 06/22/83 FOR HOWARD DEPOL								
FILE	# SHARES	NAME	DIV RATE	DATE	COST	PRICE	GAIN	DIV TTL

Fig. 2. Sample Data Printout

from 100 to 110, and cost from \$2,000 to \$2,150. The advantage of entering cost data this way is in the more frequent occurrences of stock splits and stock dividends, where you only have to modify the share information since cost basis remains unchanged.

The last piece of data you can enter is the current price-per-share. The CoCo calculates the gain, dividend total, and adjusts the gain, portfolio, and

dividend totals automatically. Now that you know what the data is, you must know how to enter it. Note the command line; you have three options. You select the first, Modify, by pressing the M key. Modify allows you to either add new data or change existing data in the leftmost numbered column.

When you press M, the command line states "Move cursor, Press C, Enter Data," the totals on the bottom of the screen are replaced with the message "Press Clear to End Modify" and a left bracket (the cursor) appears immediately to the right of #SHRS. Pressing the up or down arrow moves the cursor to the allowable data entry positions. When the cursor is at the position you wish to modify, press C and the normal CoCo cursor appears in the column. Type in the new data and press the enter key. The CoCo cursor disappears, the new entry is right-justified and the Modify cursor reappears.

When you are finished with all modifications, press the clear key. The message "Calculating" appears in the command line. After a short time, the totals return at the bottom of the screen and the "(M)odify, (F)ile, (E)nd," message reappears. Before proceeding, note that the last update date in the upper right corner of the screen has been changed to "today's" date, and is preceded by an asterisk. The first time you complete a Modify, the date changes. The asterisk reminds you of that fact.

Now, how do you modify file 2 or 22? Consider each file in numerical order next to each other, and your CoCo screen as a 3-file-wide window. (Fig. 1.) To modify a particular file, you must move the window so the file is in the leftmost column. The simplest way to move the window is to use the right- or left-arrow keys.

Press the right-arrow key and you see files 2, 3, and 4. Press again and see files 3, 4, and 5. Press the left-arrow key and see files 2, 3, and 4 again. If you want to move the window a long distance (from files 1, 2, and 3 to files 23, 24, and 25), you can use the Files option. Simply press F and the command line asks "Leftmost File (1-25)?"

Type in a valid number and press the enter key. The window immediately moves to show that file and the two following it (e.g., files 22, 23, and 24 if you enter the number 22). If you enter an invalid number (less than 1 or greater than 25), it is ignored and the Three Option Command line reappears.

The last option is End. Press E and you are provided with a new menu of

options. You can select option 1, Continue Session, which returns you to the point where you selected End. You can obtain a printout of your file by selecting option 2, Print Report (To Printer). As a matter of fact, at any time during the session you can end, print a report, and return by selecting Continue Session. You can also save your modified (or new) file to tape by selecting option 3, Save Updated File. After this is done, you can select option 4, End, that truly ends the program. If you wish to perform projections on your file, you can modify it, print out the results, and then end without saving the what-if changes to tape.

When you select option 2, you are prompted to "Prepare Printer. Press Enter When Ready." When your 80-column printer is ready, press enter. A printout similar to Fig. 2 is printed. If there is no data on file the printer prints "No Records on File" below the headings. When printing is completed, you are returned to the option menu. When you select option 3, you are prompted to "Prepare Cassette. Press Enter to Continue."

Place your cassette in the recorder and move it to where you wish the new file to be located (in most cases you'll want the new file to overwrite the old). Then press the record button on the cassette deck and press the enter key. The message "Saving File" appears. When the file has been saved, you are returned to the option menu.

When you select option 4, you see the message "Program Ended." If you ever select this by mistake or, for any reason, wish to return to the program without losing data, simply enter GOTO 500 at the OK prompt. This safely returns you to the option menu.

### How STT Works

To understand how the program works, refer to the Program Listing. The PCLEAR and PMODE statements in line 10 make maximum memory available for the program. Line 10 also reserves 5,000 bytes for string storage, reserves space above memory address 16205 for machine-language use, defines the machine-language USR entry point as 16206, and sets the variable FILES to 25. FILES defines the maximum number of files that the program allows. Line 10 defines it as 25, but it can be changed to 50 or even 75. Doing this, however, creates a larger cassette file that takes longer to save and load, and extends the time the computer needs to recalculate after a Modify ac-

# WE'VE DONE IT! (DONE WHAT?)

We brought you an outstanding game for your enjoyment  
(see the reviews on **GUARDIAN**)

We brought the price of hard-working software down to everyone's reach  
(see the **PRICE** of **SUPERFORTH**!)

## GUARDIAN

Here are some excerpts from two of the reviews:

### From "RAINBOW" 11-83 Issue:

"...Alas, I have found THE game that puts me in seventh heaven. ...or somewhere in a galaxy far, far away, called **GUARDIAN**, by **QUASAR ANIMATIONS**. I was very impressed the first time I played **GUARDIAN**, not only because of its similarity to **DEFENDER**, one of my favorite arcade games, but because it provides more action than its counterpart!..."

### From "HOT COCO" 11-83 Issue:

"...Of all the **DEFENDER** clones, **GUARDIAN** has them all beat. The sound effects are of superb quality — sometimes I'd swear that I was at an arcade playing **DEFENDER**. ...I have played two other **DEFENDER** clones that received good reviews, but they cannot come close to **GUARDIAN**'s standards..."

**\$27.95** (tape)  
**\$29.95** (disk)

## SUPERFORTH

Now you can get that speed and quality in your programming you're missing when you use **BASIC**. And you don't have to learn assembly language to do it!

The **SUPERFORTH** programming environment is not a unique language but conforms to fig-FORTH standards and provides 34 additional words and commands that are similar to **COLOR & EXTENDED COLOR BASIC** making this worthy of the name **SUPERFORTH**.

Imagine 20 to 50 times the speed in your programs! We've provided two free programs written in **SUPERFORTH** to show examples of the speed and quality as well as examples of the structure to get you started. One is a **BREAKOUT** type of game and the other is a **SCREEN EDITOR**. You can use the **EDITOR** to "list" the **BREAKOUT** game to see its structure.

You can use any word processor that write our **ASC** files (We use **TELEWRITER** to write our **SUPERFORTH** programs). Or you can use the provided **EDITOR** to write your program.

**\$39.95**  
(tape or disk)

Add \$2.00 per order for postage and handling.

tion. The variable XR is set to FILES plus 2 to allow the largest file number to appear in the leftmost window for modifying. There is no data stored in these two additional files; their presence prevents errors.

Line 20 contains the code for a short machine-language program that reverses the color of every nongraphics character on the screen (light green to dark green). This aids in highlighting the file windows and total areas, and makes for a more pleasing presentation.

Line 30 loads the code into the protected memory area and line 40 defines a two-dimensional string array (A\$(MX,MY)) that holds all data. MX is a variable used throughout the program to define which file is in the leftmost window, and is initialized at one. B\$ is a string used to clear the screen without disturbing the top and bottom lines. This program uses a number of subroutines for common tasks, and sometimes calls other subroutines from them. The first subroutine is called from line 50, and begins at line 860.

Line 860 clears the screen, prints the title, reverses the screen and calls another subroutine at line 930. The Clear Screen subroutine (line 930) clears all data between the first and last screen lines. In this application, this leaves those two lines in reverse color, while restoring the normal light green to the remainder of the screen.

Next, line 870 prints the options available and sets P to 309. P (position) is used in the INKEY subroutine (line 600) to denote where a cursor appears. This routine uses the INKEY\$ function to scan the keyboard and create a rapidly blinking question-mark cursor at position P. In this manner you can have a one-keypress input with a cursor.

Line 880 allows execution to continue only after a valid input (1 or 2) has been keyed in. Line 890 again clears the screen and, in concert with line 900, informs the operator of the option chosen. If the option is 1 (Create New File), PN\$ (Person's Name) is set to NONAME, UD\$ (update date) is set to 99/99/99 and execution returns to line 60. Otherwise, execution jumps from line 910 to the Read Data From Tape subroutine at line 760.

The subroutine at line 760 first calls the subroutine at line 720 to print a tape message. Line 750, in turn, calls the INKEY subroutine to wait for you to press the enter key. Then, execution returns to line 780, which displays the

message "Searching." The program opens the buffer for input in line 780 and the message "Loading File" appears when the file is found.

Line 800 reads the file's header information, consisting of the person's name (PN\$) and last update date (UD\$). Then, line 820 loops to read the eight pieces of data for each record, storing them in the A\$ array. When the file read is complete, the buffer is closed, and the message "Initializing" is printed.

Line 840 right-justifies each entry, padding spaces as necessary to make each entry eight characters long. With this completed, execution returns to the calling subroutine's line 910. Execution is then passed to line 80, skipping over line 70, which pads (initializes) all array elements when the Create New File option is chosen. Line 80 clears the screen (subroutine 930) and prints the owner information obtained either from an existing file or the definition in line 900 (for a new file).

Again the program calls the INKEY routine (line 90, with P' redefined as 212) to request a Y or N response to the "Change" question. An N response branches execution to line 120. A Y response allows the data to be changed. Line 100 limits the name to 15 characters and the date to eight. These are both free-form inputs. Then execution loops back to line 80. In this manner, you can keep changing this data until you are satisfied with it.

Line 120 clears the screen and asks for today's date. This need not be today's date, but will become the new update date if a Modify is performed before the data is saved out to tape. Line 130 also limits the date input to eight characters. Lines 140 and 150 show you the date as it will be used and allow you to correct it.

When you press N to indicate no more changes are necessary, DF (date flag) is set to zero. DF is used later on in the program to determine when the update is to be changed. Lines 160-190 print the display screen. Lines 200-470 form a main loop that allows you to Modify, move the window (Files), or end.

Line 200 prints available options on the command line. Line 210 waits for a single-key input and first checks for a left- (ASCII 8) or right- (ASCII 9) arrow key press. If it senses one, it adjusts a file pointer (N) accordingly. If you pressed the left key, (ASC(A\$)=8) returns a -1 (true). The -1 times 2+1+MX sets N to MX-1. If you pressed the right key, (ASC(A\$)=8)

returns a 0 (false) and N is set to MX+1 (0\*2+1+MX). In either event, execution jumps into the File routine at line 460. Here, it checks the current value of N for an invalid state. If found, no further action is taken, and execution returns to the beginning of the loop (line 200). Otherwise, the current file pointer MX is equated to N, and the files shift accordingly via the subroutine at line 670. When done, execution returns to line 200.

Back at line 210, if you did not press an arrow key, lines 230-250 compare the key press to the available options and branch to the appropriate lines (or return to line 200 if no match is found). The first option, Modify, begins at line 270. Here certain areas on the screen are readjusted (since other options might have disturbed them).

Line 280 prints instructions on the command line and over the totals area. Line 290 displays a right bracket (modify cursor) to the right of the #SHRS legend, while line 300 retrieves a key press. If you press an up arrow (ASCII 94) and the cursor is not on the top-most line (L>1189), L (location) adjusts to allow the cursor to move up one line, the present cursor is erased, and execution returns to line 290 (where the new cursor is drawn).

If you press the down arrow and the cursor is at least one line above the lowest allowable position (i.e., Cost), L adjusts to allow the cursor to move one line down, the present cursor is erased, and execution returns to line 290. If you press either arrow key and L does not allow movement, line 340 returns execution immediately to line 290. If

you press another key (i.e., the C for change), line 340 defines the array pointer MY and allows input. If you press the enter key immediately (LEN(A\$)=0), no modifications are made.

Otherwise, the input is truncated to eight characters in line 360 and right-justified in subroutine 420. Subroutine 420 also transfers the new input to the proper array element. Then, the complete row pointed to by MY (all three windows) is reprinted. This readjusts the presentation if you inadvertently typed past the end of the leftmost window. Finally, execution returns to line 290.

When modifications are complete and you press the clear key (ASCII 12), line 320 sets the date flag to 1, and then jumps to line 380. Here the gain (A) and dividend total (B) are calculated, and rounded off to two significant decimals. Line 390 prints these values on the screen, then PEEKs them into the appropriate string-array elements. This allows the numeric values to be saved as strings in the proper format (right-justified). Then execution returns to line 190.

As stated above, you can move the window one position left or right using the arrow keys. But what if you want to move directly from file 1 to file 18? The F option allows this direct movement. Pressing F passes execution to line 450, which requests a number between 1 and the highest file allowable. It then waits for an input, equating this to the variable N, and clears the command line. As with the arrow keys, line 460 checks for an invalid input and, if

ecution returns to line 200.

When you press E, execution passes to line 500. Here, you are given four options. The first allows a return to the modification screen—handy if you pressed E by mistake or wish to obtain a printout and then want to modify the file further. As a matter of fact, if an error occurs and you break out of the program, you could always type GOTO 500, select option 1, and reenter the program without disturbing any variables.

Line 510 uses the INKEY routine at line 600 to retrieve the option number desired. If it is not an allowable input, the screen is cleared (line 930) and the options are redisplayed. If you choose option 1, line 510 readjusts the DF flag and returns execution to line 160. If you choose option 4, line 510 causes a jump to line 580 where the program ends.

When you choose option 2, execution jumps to line 950. There a message is printed to prepare the printer. The subroutine at line 740 performs the "Press Enter When Ready" prompt and keyscanning. When you press the enter key, execution returns to line 960 where the last record containing data is

found. If there is no data, the message "No Records on File" is printed, and execution returns to line 500.

Otherwise, lines 970 and 980 print the report header. Then lines 1000 and 1010 print the report. For a file size of 50 records or less, the complete report fits on a single page. If the file size is greater than 50 records, use continuous paper or adjust the print routine to allow for a second page. When printing is done, line 1020 returns execution to line 500.

The last option, 3, saves the modified file to tape. When selected, line 520 calls the subroutine at line 720 (tape message). When you have pressed the enter key (indicating the cassette is ready for recording), line 530 opens the buffer for output. Line 540 saves the header information. Then, lines 550 and 560 save each array element whether it contains data or not. Line 570 closes the buffer and returns execution to line 500.

#### Getting Started

Begin by typing in the program and saving it. Each time you run the program after CLOADing it, you get an OK prompt. Simply run it again and it

executes normally. Select the Create New File option and then enter the owner, last update, and today's date. When the Modify screen appears, select M and begin entering your data.

After you have entered each file, press the clear key. After the calculations have been completed, press the right-arrow key to move the window to the next file. Then press M again and continue entering data. When all data has been entered, you can use the F option to get back to file 1. You can then press E to go to the option menu, where you can get a printed report, save the file to tape, return to the modify screen, or end.

A good regimen is to enter price quotations on a regular basis (daily, weekly, or monthly) and then print out the results for easy tracking and periodic comparison. The STT program is flexible enough to allow it to fit your particular method of tracking and analysis, and the printed records should prove very useful around tax time. ■

# ACTIVE NEGOTIATIONS

graphic by Alison Scott

It is important for the marketing/sales department of a company to keep track of the potential clients with whom their salesmen are working. These active negotiations represent a major portion of a company's future dollar volume. But how do you keep track of potential sales when you have hundreds going on at any given moment? How do you assess their actual potential to become a sale? How do you approximate what your sales from active negotiations will be in a given time period? In a given product line? These and similar questions plagued our marketing department until we developed a solution.

If you need to know how your salesmen can use their time most effectively, and estimate your potential sales,

This valuable business program gives your company the edge over your competitors in sales.

this report will be useful, and has become a major tool for our company in tracking negotiations.

Because we used our CoCo only for printer demonstrations, we did not have disk drives for it. Therefore, we've written the entire report for a cassette system. We have used it for a year and had no I/O errors. If you have disks you can modify the software to work with them.

We use a 132-column Tally printer

that requires separate line feeds as well as carriage returns, so you will find these listed individually in the print commands. If your printer does not need the line feeds, make sure there are enough carriage returns for proper formatting, and leave the line feeds out.

### Organizational Assumptions

The software here is general but it makes several assumptions about the arrangement of your products and

### System Requirements

32K RAM  
Extended Color Basic  
132-Column Printer

lines. You can easily modify most of these to conform to your marketing organization.

First, I have assumed that you've broken the country into individual territories, and that you've given each of these a three-digit code, as is common practice. The three digits allow regional and territorial division of the geographic marketplace. For example, the country might be divided into a series of regions, each with a regional sales manager. Each region is further divided into individual territories with one salesman who reports to the regional sales manager.

The first two digits can represent the region (for example, 01), while the last digit represents the territory. 01C would indicate a specific territory in the 01 region. This is a common organization for a national sales force. In the programs to be presented, all three digits of the territory code are alphanumeric and need not be in sequence. For example, four arbitrary territories in region 01 might be 01A, 01D, 01H, and 01Z.

I have assumed that part numbers do not exceed 10 digits and that they are alphanumeric. Further, I have assumed that the five left-most digits represent a series and are of interest in a summary report. For example, the part number A054300102 might represent one version of a series designated A0543. The trends evident from examining activity on a series are of interest.

Product codes and product lines are also important. I have allowed a single-digit alphanumeric product code (PC) for each category. For example, the letter I might represent dot-matrix printers, while N represents thermal printers.

I further distinguish product lines. Three product lines are included in the programs, each consisting of a number of product codes. A printer product line, for example, might consist of not only PC I and PC N, but PC H (for electrosensitive printers) as well.

The programs presented here are quarterly, but can run more or less frequently.

### Reports Generated

This system has three programs: ACTNEG, ACTNEGIN, and EDITACNG. ACTNEG does most of the work and generates reports. ACTNEGIN generates an input form for your salesmen to fill out. The input form contains last quarter's information so no active negotiations are overlooked. EDITACNG allows you to edit data entered, and then it rearranges

Program Listing 2. Active Negotiations Input

the data into alphabetical order by territory. If you use disk drives, you don't need this last feature.

These programs generate five reports: report by territory, three product-line reports, and a report by product code.

The information supplied by the salesman is important in reviewing these reports. You must know the prospect's name and the salesman's three-digit territory code to know who is selling. The territory code is followed by the part number. Sometimes negotiations are not far enough along to have identified an exact part number, and in this case you use a series or a 10-digit description. The point here is to let the factory know what will be required.

Next is the product code for the product being negotiated. Even if you use a description rather than a part number, a valid product code must be inserted here. Following the product code is the total quantity of that part number that will be purchased over a one-year period, followed by the total dollar value for the quantity of parts being negotiated.

The next item to enter is the order probability or the probability of your prospect ordering the type of product being negotiated. It is not the probability that he will purchase the product from your firm, only that he will buy it. For example, a prospect might be trying to sell a system to one of his customers. If he doesn't make the sale he won't need your product or an equivalent. If there is a 75-percent chance that he needs a product like yours, enter 75 as the percentage.

Following the purchase probability is what I call "our probability." (You can replace "our" with your company name.) This is the probability that your prospect will order from your firm and not the competition. In our example above, if the prospect has an equal probability of purchasing from you or your competition, you would enter 50 as the percentage. This is in spite of the fact that there is only a 75-percent chance the prospect will buy anyone's product.

The delivery for each of the next four quarters of your planning cycle is then entered, in units. Suppose that the current planning cycle starts at quarter 1 and runs through quarter 4, and that our prospect needs delivery of 10 pieces of your product in quarter 2. Enter 0 under QTR 1, 3, and 4, and 10 under QTR 2.

The last item to enter is the status.

This gives the user of the reports a brief but accurate status of the account in question on the day of data submission. This is also invaluable in determining who is dragging their feet: factory, salesman, or customer. The status is limited to 128 characters.

The report by territory is generated first; it is a duplicate of the input data with several calculations done for the user. The information is put neatly into territory order. You have for each negotiation the prospect's name, territory, part number, product code, total quantity, total dollars, order probability, our probability, probability multiplier, probable dollars, deliveries for the four planning quarters, and the status of that prospect. The items calculated are the probability multiplier and the probable dollars.

The probability multiplier is the product of the order probability and "our" probability. If your sales force has been realistic, this product is an accurate representation of the probability that your firm will receive this order (.75 times .50, or 37.5 percent). The probability multiplier relates to the second calculation, probable dollars, the product of the probability multiplier and the total dollars being negotiated. Statistically, over a large number of negotiations, the sum of the probable dollars for all the negotiations represents the amount of sales you should derive from negotiations.

A negotiation with a very large total dollars figure might yield a significant probable dollars figure even though the probability is 1 percent. Examine these carefully in your analysis so that they do not distort the probable dollars. You should also call the salesman immediately to determine if there is anything that will improve the probability of your getting that order.

The total dollars and probable dollars for each page are totaled at the bottom of the page.

The reports by product line are exactly the same as the reports by territory, except that they only list the product codes in a given product line. These are primarily for the use of the product-line managers.

The final report is the report by product code, which summarizes all the negotiations and provides a report by product code showing all the major series. Major series are defined as part numbers all having the same five left-most digits. This report consists of the series number (it still appears as part number on the report, but only the five left-most digits show), total quantity

and dollars being negotiated, probability multiplier for the entire series, probable dollars for the entire series, the probable units, and probable dollars for each of the planning quarters. Probable units are the product of the probability multiplier and the total units. At the bottom of each page is a total of probable dollars for each quarter.

With this report you can tell at a glance the activity on any given product series, including quantity being negotiated, probable dollars, and probable quantity to be purchased.

### Program Operation

Program Listing 1 shows the most frequently used program, ACTNEG.

Line 50 assures that headings in the five reports are appropriate for the current planning cycle. If you respond with an N, the program execution ends and you correct the headings in lines 108 and 110. When they are corrected, run the program again and respond to the prompt with a Y.

Line 101 sends program execution to line 6500, which clears all but one of the graphics pages and reserves 1,000 bytes for string variables. This routine must be located at the end of the program, otherwise program execution is interrupted as soon as it encounters PCLEAR1. Line 105 dimensions the arrays in the program, while line 106 sets the baud rate to match your printer. (We used a serial-to-parallel converter and it required a 1,200 baud input.) If you require a baud rate other than the default value of 600 baud, POKE the appropriate values listed in the back of *Getting Started with Color Basic*, in this line.

Lines 107, 108, 110, and 111 define the headings for each of the reports, while lines 109 and 112 represent the PRINT USING statements for each report. Lines 119 and 120 set up the title screen, while 122 contains an added DIM statement. Line 125 solicits the date to appear at the top of each page, while 130 displays the menu, and 140 accepts your selection. Lines 145-160 check that your selection is within limits, execute your selection, and return you to the menu when done. Line 200 is a subroutine used to open tape files for input.

Line 1000 begins the enter-data routine. Lines 1010-1020 open files for output. Lines 1025-1040 solicit data and allow you to reenter that data if you've made a mistake. Line 1025, which inputs the prospect's name, contains an end-of-entry routine. If you

are finished entering data, type @ when PROSPECT? appears. This automatically closes the file. (I opted for no prompt here; you might wish to use one.) Line 1041 outputs the data to tape, while 1999 returns you to the main menu.

Line 2000 begins the report-by-territory routine. Line 2007 sets T\$ to null.

Here's how the output on these reports is generated. On this report, and the product-line reports, each territory appears on a separate page. If a certain territory has too many negotiations to fit on one page, the program automatically subtotals the current page and then continues the same territory on the next page. The program also goes

to a new page each time the territory changes by monitoring the territory for each negotiation. For this reason, it is important that the final data be entered in territory sequence. Since this is impractical, the program EDITACNG is used to put the data in order.

Lines 2010-2020 input data from the previously recorded data tape, while line 2022 calls the subroutine at 2030. This subroutine handles line counting, territory changes, title pages, printing of data, and page totals, and is called by four of the five report programs. Line 2030 increments the line counter and checks to see if the territory has changed or the maximum number of allowable lines per page has been ex-

## PRICKLY-PEAR SOFTWARE

### QUALITY PROGRAMS FOR YOUR COCO & TDP-100

PROGRAMS REQUIRE 16K EXTENDED BASIC FOR TAPE, AND 32K DISK UNLESS OTHERWISE NOTED.

**LEARN TO READ MUSIC**

**THE MUSIC READER** NEW

An ideal package of programs for the complete beginner or the person with some ability in reading music. These seven programs utilize the perfect blend of high resolution graphics and informative text to teach you how to read music easily. You will learn how to identify the notes and their lengths, and how to recognise the rests. Musical terms are covered (120 of them) along with measures, time signatures, and key signatures (sharps and flats). You will learn the piano keyboard, and how to translate notes into rhythm.

Each of the seven programs fills 16K of memory and each covers one aspect of music reading completely. These programs are complete in themselves - a student can use them without reference to an instruction manual. This means that no knowledge of the computer is needed. Also, all staves and notes are shown on the screen just as they appear on the sheet of music. The graphics are fantastic! The rhythm program is a good example. After a few lines of on-screen instructions, the student is shown a staff containing three measures of music. The notes are of different lengths, forming a rhythm, and the student taps the rhythm on the space bar. If you tap it incorrectly, the program not only tells you it was wrong, it actually shows you the staff of notes you played. By comparing this staff to the one you intended to play (both are on the screen together), it is easy to see where you went wrong, and all of this is done in full high resolution graphics.

These programs were written by a professional musician who teaches music and directs the band program at a college, so you can trust them to be educationally correct. That they are also fun to use is certainly a bonus. If you've always wanted to learn to read music, let your computer and the Music Reader join you. You'll be reading music like a pro before you know it!

The tape version of this package consists of seven different programs and requires 16K of memory with extended BASIC. The disk version consists of the same seven programs driven by an interactive menu for ease of use and requires 32K with disk extended BASIC. **Tape - \$34.95; Disk - \$39.95**

Programs are available on AMDEK cartridges - add \$5.00 to the disk price.

Your Personal check is welcome - no delay. Include \$1.50 shipping for each program ordered. (Shipping free on \$50.00 or larger orders). AZ residents add 7% sales tax. Orders shipped within two days.

**Tape Omni Clone** NEW

In the tradition of our famous Omni Clone for disk, we are proud to offer the fantastic Omni Clone for TAPE. As you know, good computer practice requires the making of backup copies of software to prevent loss. In the past that has often been difficult or impossible to do, even using some of the other tape backup programs available. This easy to use backup utility is suitable for any size Coco from 16 to 64K, and it automatically adjusts to the size memory you have. On a 64K system you can load about 62,500 bytes of various programs (about 6 to 8 average programs) before dumping them to a new tape. It easily handles programs with auto loaders, no headers, no EOF markers, unusual size data blocks, and many other unusual situations. As with our disk Omni Clone, we can't guarantee that this will back up any tape, but we haven't found any it won't handle, and we've tried dozens, including the toughest ones we could find. If you have any tapes in your collection you haven't backed up, now is the time to get your software collection protected - against loss. **On tape, but works on disk systems - \$29.95**

**Adventure in Wonderland**

Simply the best adventure ever written for the color computer. This adventure puts you in the character of Alice as you roam through the many puzzles and perils of Wonderland. To win you must become a queen on the chessboard, eliminate the menace of the Snark, and escape from Wonderland. The program uses a full intelligence simulator so you can enter commands and questions as whole sentences, not a stinky word or two. Also, there are at least three ways out of every trap. (You may think there is no way out at all, but there are always three ways!) Some people have so much fun talking to the various inhabitants of wonderland that they forget about solving the adventure completely. With a vocabulary of hundreds and hundreds of words you will never run out of topics of conversation. If you want to try your hand at the best of adventures, this is it. **100% ML Needs 32K of memory. Tape - \$24.95; Disk - \$29.95**

**TeeOff**

This is the only 100% machine language completely high resolution golf game you will find for the color computer. Your golfer is an actual little person you move around on the screen with your joystick, and when you have lined his club up with the ball you hold down the fire button and he will take his backswing. The longer you let him wind up, the farther the ball goes, and when you release the button he swings and hits the ball. You can watch it go right down the middle of the fairway, avoiding all those nasty water holes, sand traps, and cactuses. (Actually, you may not ALWAYS make a perfect shot - after all, this is golf!) When you get on the green, the view zooms in close while you putt. If you like golf, you will like TEEOFF. For 1 to 4 players, **100% ML. You need a joystick. Tape - \$24.95; Disk - \$29.95**

HOT CoCo January 1984 69

ceeded. If not, the program jumps to lines 2050-2060, which print the data, update the page total, and cause a return from subroutine.

If the territory has changed or the maximum number of lines has been exceeded, the program flow continues to line 2033. This resets the line counter to zero. Line 2040 calls line 6410 (which prints the page total), resets the page totals and updates the previous territory variable.

It then causes a form feed, which advances the printer to the top of the next page and prints a new title and heading. Execution continues with line 2050 as previously described. Line 2025 keeps sending the program back to the input statement until an end-of-file marker is found, at which time a RETURN sends the program back to the main menu.

Lines 3000-3030, 4000-4030, and 5000-5030 all work in exactly the same fashion as do lines 2000-2060. They all call the same subroutine. The only difference is in lines 3025, 4025, and 5025. These selectively ignore all product codes not in a given product line, generating the three reports by product line.

Line 6000 begins the report by product code. Lines 6010-6050 input the data to be summarized. Line 6060 resets a flag that determines whether a given record is part of a series previously identified. Line 6070 compares the record currently being examined to those series previously identified. If a match is found, the pertinent data, such as total units, total dollars, and so on, are added to the previous totals for that series. If no match for the current record is found, then the flag, which is not set, fails the test in line 6090 and creates a new series in line 6100. Line 6200 allows the use of more than one data tape in the event that you have too many negotiations to fit on one tape.

Lines 6210-6230 step through the product codes in sequence. Line 6235 sets the variable for the next series to be printed to ZZZZZ so that series appears in alphabetical order. It also sets the line counter to one.

Line 6240 calls a subroutine that prints the title page, while 6250 resets flag F9. Line 6260 steps through all the series found while line 6270 compares their product code to the current product code. Line 6280 places the series in alphabetical order, while line 6300 checks to see if there are more series with the current product code remaining. If not, the next product code is examined. Line 6310 prints the series

Program Listing 3. Active Negotiations Editor

with its data when the sequence is correct. Line 6330 is a line counter and title

page generator, while 6340 eliminates from future examination those series that have already been printed.

Line 6350 returns program execution to continue searching for series in a given product code. Line 6380 prints the page total while 6390 and 6400 issue a form feed and print the report-by-product-code heading. Line 6410 is the subtotal line for the reports by territory and product line. Finally, line 6500 is the initialization line for the computer memory.

Use ACTNEGIN to generate the input forms for your sales force. ACTNEGIN is exactly identical to ACTNEG except that the status for each account is left off, the quarters are shifted to show what the sales force said last quarter, a space is left for entry of data concerning the quarter not forecast last time around, and the output format is expanded (i.e., fewer lines per page) to leave space for alterations to last quarter's data. The differences between ACTNEG and ACTNEGIN are shown in Program Listing 2. Copy ACTNEG, Listing 1, to a separate tape and then make the changes shown in Listing 2. The operation of these new line numbers is as follows.

Line 10 is simply a corrected heading in a REM statement. Line 109 is a modified PRINT USING statement that leaves space for the next quarter to be forecast. Line 119 displays the proper program name, while 2021 checks whether the "our probability", used by the appropriate salesman last time, was zero. If so, this means that the salesman was reporting a lost opportunity and it need not be reported on again.

This is the only way a salesman can eliminate a negotiation; he must report its probability as zero, so you always have a record of what happened to any given negotiation. Line 2030 changes the line counter to allow more space for the salesman to change information, while 2050 changes the appearance of the printed input form, shifting quarters to conform with line 109, and blanking the status.

EDITACNG is the last program. It allows both editing of the input data and reordering it to appear in the desired territory order. Since disk drives are not used, EDITACNG loads the entire data base for the forecast to be edited into memory and manipulates it all there.

Line 15 clears space for the status comments while line 20 dimensions the needed arrays. Line 30 handles the simple menu and makes sure inputs are within allowable limits, while line 40

## COLORPEDE

This truly outstanding engineer designed, 100% machine language game with multi-colored high resolution characters and fast action will challenge the most avid arcade buff. Can be played by 1 or 2 players controlled with joy sticks or key board. Joy stick control is fast, smooth and accurate. As COLORPEDE slithers through the toad stools, you attempt to destroy the COLORPEDE, knock out the menacing Bouncing Bug and eliminate toad stools while accumulating higher and higher scores. Demonstration mode with top 5 scores. Pause feature. For 16K Color Computer and TDP-100.

**Cassette-\$29.95**

**Disk-\$34.95**

## ROBOTTACK

Ultra fast arcade action with colorful high resolution graphics. You are the super human who must fight off the attacking robots and save the remaining humans from destruction. You have super powers, can shoot in any direction and move anywhere on the screen to accomplish your vital mission.

Engineer designed, 100% machine language. Can be played by 1 or 2 players with joy stick control. Top 5 scores displayed. Pause feature. For 16K Color Computer and TDP-100 with joy sticks.

**Cassette-\$24.95**

**Disk-\$27.95**

(517) 351-8537

DEALER INQUIRIES INVITED

QUALITY PROGRAMS SOLICITED

loops back to the menu after returning from a subroutine.

Line 100 opens the data file to be read, while line 110 initializes the counter. Line 120 checks for the end of file and increments the counter, while line 130 displays the current number record being loaded for convenience. Line 140 actually completes the data input loop, while line 150 closes the file when all the data is loaded.

Lines 160-180 list the records entered and allow the operator to pass or reject them as needing alterations. If changes are needed, program execution is routed to the subroutine at line 220. Lines 220-230 perform the actual editing. When editing is complete, lines 190-210 allow the entry of additional new or previously overlooked negotiations. The actual editing is done in lines 220-230.

Line 240 begins the saving routine. In line 250 the file is opened, in 260 the data is actually read out, in 270 the file is closed, and in line 280 execution is returned to the menu display routine.

The "place in territory sequence" routine begins in line 500. Line 530 prompts the operator, line 540 opens the data file, and line 550 initializes a counter. Lines 560-600 read the data in much the same fashion as did lines 120-150.

Line 610 sets up an array storing the territories to be listed, while the data for the array resides in line 620. I use a total of 26 territories; this should be tailored to fit your sales territory organization.

Lines 630-635 set up the recorder to accept output. Lines 640 and 650 set up two nested loops to output the data in order. First, the first territory to be printed is selected. Then, in line 670, the program loops through all its records finding and saving to tape all

those with the appropriate territory. Line 660 acts to show which negotiations are being reviewed and the review speed. This gives you some idea of which territory is currently being processed. Lines 680 and 690 close the loops, line 700 closes the file, and line 710 returns execution to the menu routine.

### Using the Programs

Now that you have the three programs entered and saved, you are ready to use them. First, gather the in-

---

*"Send this form  
to your sales force  
and threaten to cut off  
their expense accounts  
if not returned  
when you specify."*

---

formation needed for your first run. Since you have no previous data, you can't use the ACTNEGIN program. Manually construct a form showing what information is needed.

Send this form to your sales force and threaten to cut off their expense accounts if it is not returned when you specify. I would suggest a letter or some other explanation detailing how to fill out the form; excerpts from this article are acceptable. From this point forward, you need only load the previous quarter's data tape and run it with the ACTNEGIN program to generate your input forms. When using ACTNEGIN, run only the report by territory. I will not be responsible for the accuracy of the other four reports if you

run them from ACTNEGIN.

When you get the forms back, run ACTNEG and select "Enter Data" from the menu. Insert a good quality, reliable tape into the recorder and prepare to record. I cannot say enough about the importance of a quality tape. All your work will be in vain if you get an I/O error. I have always used Radio Shack tapes for this purpose.

Type in the data. When you have entered all the prospects' names, respond to the "Prospect?" prompt with an @. The tape that has been gathering data all this time is now closed. At this point, it's a good idea to run a copy of the report by territory and have your regional sales managers check it out. After you receive their corrections, load the original data tape using the EDITACNG program. Make corrections as necessary, and enter additions at the end of the edit routine.

Now, rewind the tape and call the place-in-territory-sequence routine. Follow the prompts and everything will be fine. I would suggest here that you keep the previous data tape (the one not in sequence) and the one you have just made. This way, if one crashes, you have only the last step to repeat to recover your position. Remember to use a bulk tape eraser when erasing tapes to prevent glitches.

When the reorganized data tape is ready, reload ACTNEG and run the reports you need. Rewind the data tape after each report.

I have set up the report-by-product-code routine of the ACTNEG program to handle multiple data tapes. The other routines and the EDITACNG program handle only one at a time, but allow the use of multiple tapes when the data exceeds what memory can handle. This number varies depending on the length of the status reported, but generally runs around 200 negotiations if your sales force isn't too long winded.

You must enter the data in two parts on two data tapes if your negotiations exceed 200. It is assumed you will keep these in territory sequence; tape 1 will contain regions 01 and 02 while tape 2 contains regions 03 and 04. In this way, the data is considered independent pieces of information until it has to be summarized. When running reports that are in territory sequence, simply run tape 1 first, followed by tape 2, tape 3, and so on. ■

Handle your employee payroll with speed and efficiency. This business feature shows you how.

One of the many uses I've discovered for my Color Computer is this payroll program, originally written for the TRS-80 Model I. In converting the program I added several features missing in the original. It is set up for 30 employees and uses almost all the memory in a 16K computer.

Before loading the program from disk, you must enter PMODE 0,1:PCLEAR 1:VERIFYON to free up all available memory and set the disk to verify each write operation. Load the program and delete line 180. This line branches to the subroutine that reads payroll data from the disk. The first time you run the program there will be no data on the disk so delete the line.

Type "RUN" and the computer presents the main menu. Choose the Add option to enter the employee list. The program must be set up on separate disks if there are employees with different pay periods, such as weekly or monthly. After entering the employee information, the data will be saved to disk automatically. Use the

List option to print out a record for each employee and check the records carefully for errors. If you find any, use the Make Changes option to correct them.

You must reinput the data for each field as you are prompted. The data will be saved to disk automatically when you finish. Use the List option to print a new copy of any record that was changed.

To remove employees from the list, use the Delete option. Again, the data will be automatically saved to disk.

You are now ready to make a payroll run. When you choose the Calculate option, enter the ending date of the pay period in whatever format you want for the payroll record printout.

Each employee record appears on the screen and can be included or excluded from the run. If the computer includes the record, it will perform and print the calculation along with the year-to-date figures for that employee, and repeat the procedure for each employee in the file. After the program returns to the main menu, check the printout for errors. The data was not saved to disk auto-

### System Requirements

16K RAM  
Disk Basic  
80-Column Printer

# EXPAND YOUR COLOR COMPUTER

USER 80C

## USER SELECTABLE EXPANSION REQUIREMENTS

- Activate your disk controller, ROM or RAM cartridge, EPROM board, or any device that normally operates in the Color Computer expansion slot.
- Select any of the 6 slots with push-button keys or programming.
- Menu-driven software simplifies programming and allows the User to operate multiple slots at the same time (e.g., transfers data from one slot to one or more slots).
- Attach additional USER 80C's for more expansion slots.
- Utilize its own reset button, eliminating the need to press the reset button behind the computer.
- Protects the computer from electrical damage caused by experimental boards or by plugging/unplugging ROM cartridges or controller boards with the power on.
- Has its own on/off switch with an LED indicator.
- Gold inlay connector contacts for more reliable operation.
- An external power supply, which is independent from the computer, is supplied. It is a high efficiency, switching regulator type, which uses very little power and generates less heat.
- More to come: Analog/digital converter, parallel ports for printers, cassette recorders and joysticks. Four channel scope works with your computer and displays on your T.V. set or monitor.
- Production of experimental boards upon request (based on your schematics). Experimental boards licensed to you.

**“Designed with the User in Mind” \$249.95**

TERMS: Send certified check or money order for \$249.95, plus shipping, handling and applicable sales tax, C.O.D. accepted. (Personal checks take three weeks to process.) For shipping and handling include \$5.00 U.S., \$8.00 Canadian/Mexican, \$15 Overseas. Illinois residents include 5% Sales Tax. Prompt shipment. Dealer/Club inquiries invited.

# COLOR COMPUTER SOFTWARE

**SPACE RAIDERS**—A sensational rendition of the arcade classic. No collection is complete without this invaders type game. Great sounds and tense action. We think it's the best. **Cassette—\$24.95 / Disc \$27.95.**

**CAVE HUNTER**—Maneuver your way to the bottom of a spooky old cave to retrieve the treasures. It's fun but not easy! Passages lead in all directions and angry cave creatures pursue you relentlessly. A fast paced arcade game. **Cassette—\$24.95 / Disc \$27.95.**

**ASTRO BLAST**—Wave after wave of alien attackers—each one different and unique. A great space "shoot-em-up" with hi-res graphics, lots of color and dramatic sound effects. A continuing best seller. **Cassette—\$24.95 / Disc \$27.95.**

**HAYWIRE**—This challenging combination of angry robots and the evil menace will provide many hours of fun and excitement. Haywire is the best Color Computer version of the Berzerk arcade game you can get. **Cassette—\$24.95 / Disc \$27.95.**

**BLACK SANCTUM**—If you enjoy suspense, you'll love this one. Encounter the forces of black magic as you roam around an old 18th century monastery. Watch out for the black hooded figures! **Cassette—\$19.95.**

**CALIXTO ISLAND**—A challenging puzzle with an occasional twist of humor. You'll visit a secret laboratory, a Mayan pyramid and you'll meet crazy Trader Jack who adds to the fun. **Cassette—\$19.95.**

## Mark Data Products

All Orders: Please add \$2.00 shipping and handling in the continental U.S. All others, add air shipping and \$3.00 handling. California residents add 6% sales tax. Foreign orders please remit U.S. funds. Software authors—contact us for exciting program marketing details.

matically. Therefore, if you find errors in the payroll, end the program, reload the program from disk, and run it again.

If there are no errors in the payroll, save the data to disk. Before ending the session, you can list each employee record to the printer as a back-up. If the payroll disk is destroyed, you can easily recreate it from this back-up.

*“...use this program along with your current manual payroll...until you are confident of it.”*

Figure 1 shows a typical printout from a payroll run for three hourly employees paid weekly. Figure 2 shows the printout of records for the same employees.

You might require the following program changes. The federal tax tables used are the ones in effect through July 1, 1983 (lines 18000-19080). The FICA percentage and

cutoff are good through December 31, 1983. The state tax is for Kentucky and probably will be incorrect for other states.

You must edit lines 20000-20060 for the appropriate state calculation. The calculation for city tax is in line 12090 and is set for 1 percent in the variable CT. The other tax category is a percentage that you can set to the desired level when inputting employee records. For hourly employees, over-

time is paid at 1.5 times regular pay. You can change this in line 12040.

As with any newly computerized system, you should use this program along with your current manual payroll for several pay periods until you are confident of it. ■

*Address correspondence to Mike Charlton, 3936 Yates Drive, Owensboro, KY 42301.*

**COLOR TREK** — Blast Klingons and save the Federation in this game of both skill and strategy. Includes an instructions program and ten levels of difficulty. Requires 16K of memory.  
Cassette \$7.95

**ADVANCED D&D NON-PLAYER CHARACTER MAKER** — Takes into account spells, weapons, hit points, level, class, gender, race, alignment, constitution bonus, racial adjustments, and minimum requirements. Whew! A must for all dice weary DM's. Requires 16K of memory.  
Cassette \$14.95

**ARE YOU BORED WITH YOUR 4K COLOR COMPUTER?**

**COLOR ALEPH PROGRAM PACKAGE** — Includes COLOR CYCLES, COLOR BLACKOUT, and COLOR MAZE. Each is progressively difficult and requires only 4K of memory.  
Cassette \$11.95

**COLOR CYCLES** — Play chicken against motorcycles of light with up to seven enemies at one time. Written in machine language.  
Cassette \$4.95

**COLOR BLACKOUT** — Armed with only a tennis racket and five balls, you must knock out the colored bars piece by piece. Joysticks are required.  
Cassette \$4.95

**COLOR MAZE** — Run for your life through a twisty maze. All the while, an angry ghost is chasing at your heels throwing paralysis rays. Be wary of the meddlesome programming wizard who rearranges the maze around you. Includes machine language subroutines.  
Cassette \$4.95

# SUPER PRO KEYBOARD

- Only \$69.95
- Original key layout.
- No special software required.
- Fast, simple installation—no soldering.
- Individually boxed with full instructions.
- Professional, low profile, finished appearance.
- U.S. made—high quality, quad gold contacts.
- Smooth "Touch Typist" feel—no sagging.

#### **Rainbow, April '83**

A fine piece of hardware from Mark Data Products...It is super and it is professional too...If you are searching for a replacement keyboard, it is an excellent buy...

#### **Hot CoCo, August '83**

Like putting leather upholstery in your Volkswagen...Very impressed with the appearance and performance...Could easily pass as original equipment...Installation is very simple...

#### **Color Computer Magazine, June '83**

The installation procedure is well detailed and quite simple...Has a professional feel, reacts well to the touch...has held up to some purposeful pounding...

#### **Color Computer News, June '83**

Mark Data Products is well known to us "longtimers"... Every bit as finished as if Tandy had done it...The Mark Data Super-Pro is your best buy...The one that is in my CoCo to stay ..

## **Great Computer Software Also**

# SHOW AS YOU GO

In a recent meeting, a coworker, Al, used his TRS-80 to display a line graph while he gave a short presentation. Unfortunately, I found myself thinking about the drop in September while he was talking about the rise in March. Al was upstaged by his graph.

A computer graphic should be dynamic and produce a dramatic effect. The Program Listing allows you to "draw" a graph as you need it during a presentation.

Finding a way to draw the graph point by point was easy. An INKEY command in front of a loop of statements allows you to draw lines by pressing one key. I also wanted to print val-

Don't let your computer upstage you! Use it to complement your business graphics presentations.

ues on the axes of the graph and to center the title, however, which was a more challenging task.

One big deficiency of the Color Computer is having to use the DRAW statement to get letters and numbers on the graphics screen. But I did not want to

recode the program for each new title or set of values.

After several days of playing around, I decided to define a string array A\$(58). Each element contains a set of DRAW instructions. The array produces the ASCII character set of letters, numbers, and special characters. They are in the same order as the ASCII character codes in the *Going Ahead with Extended Color Basic* manual.

All you have to do is put a title line or an axis value into a string variable and pick out each character in the string with a MID\$ function. Set a numeric variable equal to the character's ASCII code value minus 32. The numeric variable then becomes the index for picking the correct array element, which is moved into a DRAW statement.

For example, the command  $N = ASC("A") - 32$  results in  $N = 33$ . Line 470

$A$(33) = "XP$:BD7U6E1R2F1D2L3R3D4"$  is a set of DRAW instructions for the letter A.

The program indexes each array element to the decimal number of its ASCII character. I use the LEN function to center the title and right-justify

Line Numbers	Function
10-120	Subroutine calls
130-730	Dimension arrays and load alphanumerics
750-880	Prompt for graph title
900-1090	Prompt for vertical axis values
1100-1120	Subroutine for too small a value
1130-1150	Subroutine for too large a value
1170-1290	Prompt for time scale of horizontal axis
1330-1520	Prompt for values for each point in time
1530-1610	Coded values if prompts not desired
1630-1850	Draw title on screen
1870-2040	Draw in axes and tics
2060-2250	Compute vertical axis values
2270-2420	Subroutine to draw in vertical axis values
2440-2620	Draw and paint graph
2640-2760	Subroutine to print years for horizontal axis
2780-2830	Subroutine to print months for horizontal axis

Table 1. Line Descriptions

## System Requirements

16K RAM  
Extended Color Basic

# **SUPER SCREEN**

## ***the Color Computer Supercharger***

- A big 51 character by 24 line screen.
- Full upper and lower case characters.
- Easily combine text with hi-res graphics.
- PRINT @ is completely functional on the big screen.
- The powerful ON ERROR GOTO is fully implemented.
- Auto-key repeat for greater keyboard convenience.
- Control codes for additional functions.
- Works with 16K, 32K or 64K computers.
- Available on disc or cassette.

### **51 CHARACTER BY 24 LINE DISPLAY**

Super Screen is a powerful, machine language program that significantly upgrades the performance and usefulness of 16K or greater, Extended and Disc Basic Color Computers. The standard Color Computer display screen is totally inadequate for serious, personal or business applications so Super Screen replaces it with a brand new, 51 character wide by 24 line screen including full upper and lower case characters. Instead of a confusing checkerboard appearance, you now have true lower case letters along with a screen that is capable of displaying 1224 characters. The difference is startling! Your computer takes on new dimensions and can easily handle lines of text that were simply too long and complex to display on the old screen.

### **COMBINE TEXT WITH HI-RES GRAPHICS**

You can now write truly professional looking programs that combine text with hi-res graphics. Super Screen allows you to create graphics displays with the Basic LINE, DRAW and CIRCLE statements and then notate the graphics with descriptive text. You can even use PRINT @ if you wish for greater programming convenience. Super Screen's versatility will amaze you.

### **PRINT @ IS FULLY IMPLEMENTED**

The PRINT @ statement is a valuable asset to the programmer when formatting text on the screen. The standard Color Computer will report an error if you specify a location higher than 511 but Super Screen allows locations all the way to 1223! You get a big screen and a powerful formatting tool as well. Of course, Super Screen also supports the CLS command allowing you to clear the big screen using standard Basic syntax.

### **ON ERROR GOTO**

That's right! Super Screen gives you a full implementation of ON ERROR GOTO including the ERR and ERL functions. Now you can trap errors and take corrective action to prevent crashed programs and lost data using the same standard syntax as other computers. The ON ERROR GOTO capability overcomes a serious deficiency of Color Computer Basic and greatly improves your capability to handle sophisticated tasks. All well written, 'user friendly' programs use error trapping techniques and yours can too! Now that's power!

### **AUTO KEY REPEAT**

No more frustration as you edit a long line in your Basic program; just hold the space bar down and automatically step to the desired position in the line. Need a line of asterisks? Hold the key down and auto repeat will give them to you. Those of you who spend many hours at your keyboard will appreciate this outstanding addition to Super Screen's long list of impressive capabilities.

### **CONTROL CODES FOR ADDITIONAL FUNCTIONS**

Super Screen recognizes several special control code characters that allow selection of block or underline, solid or blinking cursor and other functions. You can 'Home up' the cursor or you may erase from the cursor to the end of a line or to the end of the screen just like many other computers. These special codes give you an extra dimension of versatility and convenience that put Super Screen in a class by itself.

### **AND MORE GOOD NEWS...**

Super Screen comes with complete, well detailed instructions and is available on cassette or disc. It adjusts automatically to any 16K or greater, Extended or Disc Basic Color Computer or TDP-100 and uses only 2K of memory in addition to the screen memory reserved during power up. Guaranteed to be the most frequently used program in your software library...once you use it, you won't be without it! Super Screen's low price will really please you: only \$29.95 on cassette or \$32.95 on disc!

**Mark Data Products**

NOW . . . . . TOGETHER . . . . . the HARDWARE—the \*Micronix Keyboard and the SOFTWARE --- \*Telewriter-64 with keyboard driver software, (has been referred to as the "WORDSTAR" of Color Computer software).

The KEYWORD package is enough to convert your Color Computer to a full business system. If you've been getting tired of flat calculator keys and reverse video-lower case-word-processing. Now is the time to change all of that frustration and switch to the KEYWORD.

The KEYWORD comes in cassette for \$109.90 or disk for \$119.90 for the premium--(low profile keys)--keyboard add \$30.00 to each. Please specify your computer's board type if known. Otherwise, please specify the complete catalog number and serial number.

- \* FHL FLEX DOS (Requires 32/64 K ext. basic)—Enables use of the other 32K. . . . \$69.95 (Plus \$1.50 shipping)

- \* FHL Full Line

- \* Star-Kits SPELL-N-FIX (Spelling checker with 20,000 word dictionary. . . . \$69.25 (Plus \$1.50 shipping)

- \* AMDISK-III (3" Micro Floppy Drive-624K). . . . \$499.00 (Plus \$10.00 shipping)

All software available in amdek III format.

Also available \* FHL DYNA-SPELL-(FLEX Version) also C compiler available.

TERMS: Check or money order shipping charges: \$3.60 U.S. only. Allow 21 days shipping for personal checks. N.Y. residents add sales tax.

vertical axis values. The length of the title and value strings determines margins for the title and the printing start point for the axis values.

### Operating the Program

You should consider several things before running the program. You can use one or two title lines, each with up to 30 characters. The time variable runs along the horizontal axis, indicating either 12 months or 12 years.

The units for the vertical axis can be whatever you want and can range from 0 to 999. No negative numbers, decimals, or numbers of more than three digits are allowed. I recommend that you start the vertical scale with zero

A\$(58)	Draw instructions for numbers and letters
IN\$	INKEY test variable
M\$	Months or years on horizontal axis
MN\$	String of month labels
P\$	Starting column for title lines
SY\$	Starting column for vertical values
TI\$	Title line 1
T2\$	Title line 2
VA\$	Display point in time for value prompt
VR\$	Single character in vertical value string
VV\$	String for vertical value label
C	Index for drawing horizontal labels
C1	Column for start point of graph line
C2	Column for end point of graph line
J	Index for month label
K	Index for horizontal point
L	Length of title line 1
L2	Length of title line 2
LY	Length of vertical value
M	Index for retrieving first letter of month
N	Index to draw vertical values
P	Index for length of title line
P1	Row for start point of graph line
P2	Row for end point of graph line
SY	Starting column for printing axis value
-VA(12)	Values of graph points
VH	High vertical axis value
VL	Low vertical axis value
VV	Vertical value to print on screen
X	Index for title letters
XX	Index for printing years
YE	Year displayed in prompt for value
YR	Starting year of graph
YS	Row to start printing axis value
Z	ASCII value of a single character in title

Table 2. Variables

and because the scale is divided into quartiles, that you use an upper limit that is divisible by four. The value points for the graph must be within the limits set for the vertical axis.

No coding changes are necessary to run the program as it is listed. It includes prompts for the two title lines, low and high values for the vertical axis, horizontal axis units (months or years), and values for each point of the graph. If the horizontal axis is years, the program also asks you for the starting year.

After the prompts, the program draws the axes and prints the titles and values. The program draws and paints the graph section by section each time you press a key.

If you do not want to go through the prompts, you can code the parameters for the graph into the program. Delete lines 20-50 and remove the remark in line 60. Put the necessary values in lines 1530-1600. The program then draws the graph skeleton immediately.

The INPUT statement does not accept the colon and comma keys, so you cannot include them in a title line if you are using the prompts. No problem occurs if you code a colon or comma into lines 1530 or 1540.

The program is set to run in high-resolution PMODE 4,1. You can change line 1640 to PMODE 3,1 or PMODE 2,1 and can change the PAINT statement in line 2580 to use different colors.

You can use this technique for drawing letters and numbers on the graphics screen in other programs, but the array and operating code take up about 2,200 bytes.

This program draws only one graph. You can add another dimension to variables TI\$, T2\$, M\$, VL\$, VH, YR, and VA(12), and you can repeat lines 1630-2830 for multiple graphs. The program uses more than 7,000 bytes (counting all spaces and remarks), so you might need 32K for expansion.

Instead of hitting a key each time you want to add to the graph, you can create a more impressive effect coding in a timer and carefully coordinating your speech with the graph. Set up a numeric array for holding time intervals, then delete the INKEY command in line 2600 and replace it with the TIMER code described in the Extended Basic manual. This requires a carefully rehearsed speech, but you will leave the audience scratching their heads. ■

## DSKMON

Examine and fix sector data, also includes disk read, write, file information display, and selective disk backup. (ML, 16k or 32k) Disk (With Source) .....\$24.95

## UNLOCK

Color Computer Disk Fix Program. Complete disk fix utility. Features included are initialize any track (up to track 255), copy any track (up to track 255), verification of any track, and copy of any track fixing I/O errors. Disk .....\$24.95

## EUCHRE

A Hi-Res version of the card game. Your partner is the computer, the opponent team is played by the computer. Allows any of the four players to "GO" alone. (ECB, 32k) Cassette .....\$19.95

### CCADS

A full 6809 machine language monitor with line assembler and disassembler. All you need to debug machine language programs. (ML, 16k or 32k) Cassette \$19.95 or Disk (With Source) .....\$23.95

### CLOCK

A software real-time clock program for the CoCo. Warning: The clock will stop during tape I/O. (ML, 16k or 32k) Cassette \$9.95 or Disk (With Source) .....\$13.95

### BULLETIN BOARD SOFTWARE

Run a Bulletin Board from your color computer. Includes upload and download of Ascii files. Requires 1 disk drive, 32k of memory and an auto answer modem. Includes schematics to make modem I auto-answer .....\$19.95

### CHROMA-KEYS

Define function keys and save them to disk or cassette. (ML, 16k or 32k) Cassette \$9.95 or Disk (With Source) .....\$13.95

### DARKROOM DATABASE

Throw away your Photo-Lab index. Let CoCo look up the facts. Darkroom Data-Base with timer. (16k or 32k) Disk .....\$19.95

### GRADES

A data base program designed to aid in keeping records of students' test scores. Also calculates final grade, test averages, and other statistics. (32k) Cassette \$19.95 or Disk (With Source) .....\$24.95

### SPOOLER

Print ASCII files from disk without waiting. (ML, 64k only) Disk (With Source) .....\$15.95

### COMMAND

Add machine language programs as commands to BASIC. (ML, 16k or 32k) Cassette \$15.95 or Disk (With Source) .....\$19.95

# Now NRI takes you inside the new TRS-80 Model 4 microcomputer with disk drive to train you at home as the new breed of computer specialist!

**NRI teams up with Radio Shack advanced technology to teach you how to use, program and service state-of-the-art microcomputers...**

It's no longer enough to be just a programmer or a technician. With microcomputers moving into the fabric of our lives (over 1 million of the TRS-80™ alone have been sold), interdisciplinary skills are demanded. And NRI can prepare you with the first course of its kind, covering the complete world of the microcomputer.

## Learn At Home In Your Spare Time

With NRI training, the programmer gains practical knowledge of hardware to design simpler, more effective programs. And, with advanced programming skills, the technician can test and debug systems quickly and easily.

Only NRI gives you both kinds of training with the convenience of learning at home. No classroom pressure, no night school, no gasoline wasted. You learn at your convenience, at your own pace. Yet you're always backed by the NRI staff and your

instructor, answering questions and giving you guidance.

## TRS-80, Model 4 plus Disk Drive to Learn on and Keep

NRI training is hands-on training with practical experiments and demonstrations. You not only learn to program your computer, you learn all about it...how circuits interact...interface with other systems...gain a real insight into its nature. Under NRI's carefully planned training, you even install a disk drive, verifying at each step its operation.

You also work with a professional 4-function, 3½ digit digital multimeter and the NRI Discovery Lab® performing over 60 separate experiments. Both microcomputer and equipment come as part of your training for you to use and keep.

## Same Training Available With Color Computer

NRI offers you the opportunity to train with the TRS-80 Color Computer as an alternative to the Model 4. The same technique for getting inside is enhanced by using the new NRI-developed Computer Access Card. Only NRI offers you a choice to fit your specific training needs.

## The Catalog is Free. The Training is Priceless.

Get all the details on this exciting course in NRI's free, 104 page catalog. It shows all equipment, lesson outlines, and facts on other electronics courses such as Electronic Design, Industrial Electronics, Video/Audio Servicing... 12 different career opportunities in all.

Keep up with the latest technology as you learn on the latest model of the world's most popular computer. If coupon has been used, write to NRI Schools, 3939 Wisconsin Avenue, Washington, D.C. 20016.

Now training includes either the TRS-80 Model 4 Microcomputer with Disk Drive or TRS-80 Color Computer with Computer Access Card; professional LCD multimeter; the NRI Discovery Lab; and hundreds of demonstrations and experiments. (TRS-80 is a trademark of the Radio Shack division of Tandy Corp.)

# COLOR MAIL LIST

From the response I received concerning my cassette-based mailing-list program published in *80 Micro* (January 1983, p. 126) I believe this is a popular application for the CoCo. Therefore, I've decided to upgrade the earlier program and present a second, both of which require a disk drive.

## Revised Program

The revised Program Listing 1 includes new features such as disk data files and the option of printing an individual label for each member of an organization, instead of all names on one label.

Since the program reads the mailing list into memory for processing, you can set up multiple disk files, each containing 60 addresses. If you have the available memory, clear additional string space and increase the value of T in line 10 to provide room for more addresses in each file.

As before, the program allows eight data fields for each label. Fields 1-4 contain names of specific individuals of each organization. Field 5 is the organization name, and field 6 is the street address. The city, state, and zip code are in field 7, and the telephone number is in field 8.

## Menu Options

The main menu allows the following options:

- A adds names to the mailing list. This option provides instructions for data entry. When the file is full, store the file

**Bogged down by organizing and typing those address labels? Here are two neat ways your CoCo can help.**

using the W option and begin a new file by using the R option.

- R reads in a mailing list from a disk file. It then prompts you for a file name. This option also starts a new file.

- L lists the names on the screen. This option also lets you select other data fields for listing on the screen. For example, use of field 5 lists all organization names.

- C changes the mailing list. The program presents a new menu with four options: D (delete a name from the list), C (change one of the eight fields for each address), A (return to find another address), and E (exit this option to the main menu).

The computer assigns a number to each address, and you must enter this number to find a specific address for deletion or change. The screen displays the number during option L.

- P prints address labels. Two options are available: S (prints a separate label with organization name and address for each name in fields 1-4) and C (prints labels showing all entered names). You can use two labels to align the printer before printing the entire list.

At present the program prints two

identical labels for each address. If you only need one label, edit lines 1220-1250, 1270-1290, 1320-1360, 1380-1410, 1520, 1550, 1580, 1610, and 1630-1650 to delete “;TAB(42);M\$(I,X)” from each line.

- D prints an address list with phone numbers.

- W writes the entire address list to a disk data file. It then prompts you for a file name.

- E ends the program.

## Program Structure

In line 10, T controls the total number of addresses in the list, while L controls the length of each address field. Clear additional string space if you increase T.

Lines 20-130 are the main menu. Lines 140-290 are the A option. Lines 300-370 are the L option, lines 380-390 are the W option, line 400 is the R option, lines 410-630 are the C option, lines 640-810 are the P option, lines 820-860 are the D option, and lines 870-1680 are the various subroutines called from the main program.

## System Requirements

**16K RAM**  
**Disk Basic**  
**Line Printer VII**  
**One Disk Drive**

## New Program

Compared to the previous listing, Program Listing 2 only allows one name and no organization name for each label. But it does sort the addresses by last name and zip code so that you can print labels alphabetically or by zip code. Once you've entered the addresses, the program does not move them on the disk, but it uses pointer files for the sorted lists.

Since I've written the sort routine in Basic, it limits the practical number of addresses that should be stored on the disk file. Tests with the program show that it takes three minutes to sort 100 addresses and 16 minutes to sort 200. If

you require only one sort, you could delete the second by eliminating either lines 360-550 or 550-770.

The program allows the following seven data field and corresponding maximum field lengths:

Data Field	Character Length
Last Name	18
First Name	18
Street Address	30
City	20
State	2
Zip Code	10
Telephone	10

Adjust line 10 to clear the string space

you require. You can also change the value of NN to control the number of addresses allowed in the file.

## Menu Options

The main menu allows the following options:

- A adds names to the list. This option gives you instructions for data entry. Before it stores each address, it lets you make corrections. After you've entered all the addresses, the program does both sorts before returning to the main menu.
- C changes the mailing list. Entering the last name locates a specific address to edit. Because there may be multiple addresses with the same last name, the

program will search until you indicate it has found the correct address, or until it has searched all addresses.

● P prints the address labels alphabetically or by zip code. For the last option, you must input a range of zip codes. For either option, you can get a trial run of two labels to align the printer. Note that the program prints the labels two across.

● L lists the entire address list with phone numbers. Note that this list is in the order of original data entry.

● E ends the program.

*“Tests with the program  
show that it takes  
three minutes to sort  
100 addresses and  
16 minutes to sort 200.”*

#### Program Structure

In line 10, variable NN controls the total number of addresses that you can

store in the disk data file. Clear additional string space as required. Lines 20-180 are the main menu. Lines 190-780 are the A option, lines 790-1040 are the C option, lines 1050-1490 are the P option, and lines 1500-1570 are the L option. Lines 1580-2170 are the various subroutines called from the main program. ■

## Micronix Proudly Introduces Our New *Premium Keyboard* for your Color Computer

### All the features of our popular Professional Keyboard:

- \* No gluing, soldering, or cutting—plugs right in
- \* Four function keys complete the matrix
- \* High quality construction assures years of trouble-free operation
- \* Complete documentation included

### PLUS these exciting new features:

- \* Attractive low profile
- \* Extended Radio Shack layout
- \* Silk-smooth feel—  
uses ALPS keyswitches

### Our Versakey software enhances the keyboard's utility

- \* Auto-repeat, n-key rollover and type-ahead
- \* F1 becomes DEFINE,  
F4 becomes CTRL
- \* May define up to 128 keys (including their SHIFT, CTRL, and SHIFT-CTRL combinations) as strings of up to 80 characters each,

- \* Supplied on cassette, may be copied to disk

*"Have Josie ship yours today!"*

The Premium Keyboard . . . . .	\$79.95
The Professional Keyboard . . . . . (including software)	\$59.95
Versakey software . . . . .	\$ 9.95

Both keyboards carry a 90-day limited warranty.

Please specify your computer's PC board type if known. Otherwise, specify the complete catalog number and serial number.

**PLEASE NOTE  
ADDRESS AND  
PHONE NUMBER  
CHANGE**

# CP/M

## FOR YOUR COLOR COMPUTER

- Now have access to the largest library of programs available
- CP/M is the recognized leader in professional and personal software
- Adds the power of a 4 MHz, Z80A
- CP/M 2.2 included
- No modifications are necessary. Simply plug into the cartridge port and plug Radio Shack's disk controller into it.
- Maintains full Radio Shack compatibility
- Requires 64K memory and one or more disks with controller

Don't  
wait  
any longer!

## SOFTWARE SPOOLER™

- The Software Spooler™ will allow you to keep using your CoCo even while printing - no more waiting for slow printers!
- For example, reduce the wait for a 7K LLIST from 11½ minutes to 6 seconds - an 11,500% speed increase (using a LPVII).
- The Software Spooler™ is compatible with all BASIC commands and programs on Ext. BASIC or DISK systems and can use virtually any printer at speeds from 110-4800 BAUD.
- Transparent operation - just load it and forget it. You choose how much RAM to set aside with one simple command. First in - first out buffering with wraparound makes maximum use of that RAM.
- Complete documentation included.
- You've paid for your memory - use it to the fullest!

# COLORFUL CRYPTOLOGY— PART V

*Ed. note—Beginning in our September 1983 issue, Karl Andreassen introduced HOT CoCo readers to the basics of cryptology and looked at the Color Computer as a means of making and breaking secret messages. This month he touches on nonalphabetic symbols and the very secure but unwieldy secret code.*

I received a letter asking about codes—particularly, those that require the use of a book or magazine for encoding and decoding. The introductory blurb is a sample of this kind of cryptic communication.

Barring an episode of pure luck, such codes are virtually impossible to break without knowing what books, which editions, and what procedure to apply. Once a cryptocracker has breached such a system, the originator changes the books or the procedure, and the cracker has to begin from scratch.

I have been intentionally careless in preparing the above line of code. If you look carefully at the first code group, you will note that the letters HCC are remarkably coincidental to the first letters of the title of your favorite magazine.

Following HCC are the digits 1 and 4. You might take these to signify 14, but *HOT CoCo* hasn't seen 14 issues as yet. So look at the table of contents. There you'll find a line expressing the volume and issue number. So get your volume 1, number 4, and see if it decodes.

The next symbol in the code is logically a page number, 91. Look for paragraph 5 on page 91. Write the eighth word in the fifth paragraph as the first word of the message.

```
HCC14 91 5 8 23 4
23 92 4 12 82 6 10
91 4 38-39
```

When you get to the two groups of numerals with a dash between them, write both the 38th and 39th words as the final two words of your message. The message reads, "Yek eht tuohti elbakaerbnu era sedoc" (A mirror reveals all).

So, if codes are virtually unbreakable, why aren't they used instead of less secure ciphergrams? If you took the trouble to look up the code line, you already know the answer. How long did it take you to come up with the complete statement? If you think that was a long time, you should try to encode a fairly long message this way.

Time is the most serious deterrent to using these codes. There's also a problem in that they require both sender and receiver to have the same book.

Contrast such a cumbersome system with a nice, clean substitution cipher and the keyword to encode and decode the message. You can remember both the system and key and never write them down.

Single substitution ciphers are fun to tackle, and can be opened in various ways. But as you must suspect by now, there are more secure ciphers possible, with little increase in enciphering and deciphering complexity.

Suppose, for instance, that you add a number of different alphabets to the system, using each one in turn as you encounter each plaintext letter. Easy to remember, and easy to apply—if you know the system and the key.

Such is the versatility of ciphers, as opposed to codes. The best rule is to use the type of system that affords you the most security, within the bounds of time and effort.

Sometimes cryptographers use non-alphabetic symbols, as you saw last month. The stars were arranged in message form. To solve the message you first must reduce the patterns to letters.

You could use other type symbols, such as !, @, #, \$, %, ^, &, \*, (, ), or +. Moving your fingers up one row on the keyboard (if you are a touch-typist) will produce a rudimentary cipher. There are any number of arbitrary symbol alphabets that you can construct, using only the symbols on your CoCo keyboard.

Numerals alone present a variety of possibilities for communicating in relative secrecy. You need 25 or 26 numeral combinations for direct substitution, so don't overlook the ASCII numeral set that exists within the CoCo. Key in the following to see the ASCII series for capital letters:

```
10 FOR X=1 TO 26
20 PRINT ASC(CHR$(X+64))" = "
CHR$(X+64),
30 NEXT X
```

Writing a cryptogram using ASCII numbers is simply a matter of asking your CoCo to print them as you touch the plaintext letters on the keyboard:

```
10 Z$=INKEY$:IF Z$=""THEN 10
20 IF Z$=" "THEN PRINT " ";:GOTO 10
30 PRINT ASC(Z$):GOTO 10
```

Note that in line 20 the quotation marks have a space between them, while there is no space between them in line 10.

If you discover a cryptogram in ASCII cipher (all numerals between 65-90), change line 30 and add line 40 to decipher:

```
30 A$=A$+Z$ :IF LEN(A$)=2 THEN 40  
ELSE 10  
40 PRINT CHR$(VAL(A$)); A$="" :GOTO 10
```

In case the result is not plaintext, consider the possibility that the sender used two types of encipherment: a cipher alphabet plus ASCII.

In explanation of the decipher program, you must collect two digits per cycle. Line 30 collects them as A\$ until the count is correct (as measured by LEN(A\$)) and then refers the pair of digits to line 40 for execution.

Since the digits are in memory as strings, you must use VAL to change them to numerals before they can become usable ASCII symbols. In this form, CHR\$ will transform them to their letter equivalents, which become your plaintext. Then A\$ is nulled with A\$="" to renew the cycle. Use the break key to end the cycle.

#### Using Graphic Symbols

Among the crypto possibilities open to us through our CoCo is a set of graphics symbols, in both black and white and color. You can type these, like ASCII numbers, directly from the keyboard through use of short, experimental programs, quite similar to the ones I've given.

You can introduce numerous variations for direct typing, but each will have the disadvantage of being common knowledge among CoCo users. For instance, change the numeral 2 in line 30 to 3. You may now print the graphics characters by typing any three-digit number between 125-143 (125-255 in Extended Color Basic).

A quick jump of the imagination and a bit of programming will make it possible for you to touch each letter of the alphabet and see a corresponding graphic symbol appear on screen. Each unique symbol will of course stand for the letter that caused it to appear, and you will be creating a cryptogram. I'll give you such a program soon, and you might try writing one yourself.

In the meantime, here is a 107-word message to work on, using code-book cryptography with the one codebook I am sure is available to all of us:

HCC14 91 7 1-24 92 1 1-29 93 9 1-51

Write to Karl Andreassen at 24750 Chianti Road, Cloverdale, CA 95425.

ONE OF THE WAYS TO MAKE YOUR COMPUTER MORE SECURE IS TO ENCIPHER IMPORTANT DATA BEFORE FILING IT ON TAPE OR DISK

THE COMPUTER IS AN IDEAL CRYPTO MACHINE FOR USE AT THE ORIGINATING POINT OF AN ENCIPHERED MESSAGE BUT UNTIL IT CAN BE PASSED OVER AS A WRISTWATCH YOU MUST USE HUMAN FACULTIES FOR SOME VITAL COMMUNICATIONS

A CLUE TO THE STARS CRYPTOGRAM SPACES ARE EQUALLY AS IMPORTANT AS THE STARS AND THE MESSAGE MAY NOT BE AS LONG AS IT MAY AT FIRST APPEAR

WHILE KEYWORDS ARE VERY IMPORTANT IN CREATING EFFECTIVE ENCIPHERED MESSAGES THE REAL KEY IS PRACTICE IF YOU BREAK AT LEAST ONE CRYPTOGRAM A DAY FOR A YEAR. IT WILL BECOME ALMOST EASY NOTE THE ALMOST

EVERY FIXED STAR IS THE HUB OF A SYSTEM OF PLANETS AND EVERY PLANET HAS THE POTENTIAL OF SUPPORTING SOME KIND OF LIFE HOW LONG BEFORE WE ENGINEER AN ATMOSPHERE FOR MARS AND SEED THE MOONS OF JUPITER

Answer to Last Month's Cryptograms (Except the Star Message)

# YORK 10™ CASSETTES

## COMPUTER GRADE DATA TRAC BLANK CASSETTES

C-05, C-06, C-10, C-12, C-20, C-24, C-30

From the leading supplier of Computer Cassettes, new, longer length C-12's (6 minutes per side) provide the extra few feet needed for some 16K programs.

**BASF-LHD (DPS) world standard tape.**  
Premium 5 screw shell with leader.

**Internationally acclaimed.**  
Thousands of repeat users.

**Error Free • Money back guarantee.**

## PRO-COLOR-SERIES

PRO-COLOR-FILE *Enhanced* \$79.95 D

This high level data base development program offers the ability to track any type of information. From Mailing Lists to Expense Records, to Inventory or Court Trials, PRO-COLOR-FILE has the versatility to handle it.

60 Data fields  
Upto 1020 Bytes per record  
Use 1-4 Disk Drives  
4 Color Data Entry Screens  
28 User defined Equations  
Scan File Alphabetically  
Duplicate records  
Duplicate fields

8 Report formats  
Summary Reports  
Screen Reports  
Page titles, numbering  
Sort on any Field  
Sort 3 Fields at once  
Sort any size file  
Select sub-sets of file

See Reviews in:

*Color Computer News -- June 83*

*Hot CoCo -- August 83*

*Rainbow Magazine -- June 83*

PRO-COLOR-FORMS \*NEW\* \$39.95 D

Generate customized letters by merging PRO-COLOR-FILE data files with a letter. Print a personalized letter to everyone on your list. PRO-COLOR-FORMS will place data anywhere on a full page, even within the text of a letter.

Embedded control codes  
6 User designed forms

32 to 133 characters  
7 to 66 lines

Have your data printed on pre-printed forms or design your own. Requires PRO-COLOR-FILE to use.

PRO-COLOR-DIR \*NEW\* \$24.95 D

Compile a master listing of all your directories in one data file. This utility program will read a diskette's directory and place the information in one master file. PRO-COLOR-FILE is then used to generate reports or search and update. PRO-COLOR-DIR will store:

Diskette ID name  
File name/Extension  
File type (Basic, ML, Data)  
Number of Sectors allocated  
ML Load and Execute address

Date Created  
Date Updated  
Number of Grans allocated  
Number of Sectors used  
ML file length

Store 1000 entries! Requires PRO-COLOR-FILE to use.

# COLOR MANIA

# COLOR MANIA

# COLOR MANIA

# COLOR MANIA

## PART I

# COLOR MANIA

I am a Colormaniac. I was first infected just over two years ago. Fortunately, the incubation period was long enough for me to put personal affairs in order before the advanced stages set in. Early symptoms were successfully treated with liberal doses of Tandy's *Getting Started with Color Basic* and *Going Ahead with Extended Color Basic*, but I quickly developed a tolerance and required stronger and more frequent treatments.

Advanced Colormania is a condition best characterized by heavily callused fingertips, disk-shaped cornea, vague nightmares of open FOR...NEXT loops and type-mismatch errors, and, most significantly, a strong desire to know more than is presented in the two manuals mentioned. You're on your own for treating the first three symptoms, but there's hope for the fourth.

The Radio Shack books are excellent, and a novice can build a firm foundation in Basic programming through them, but having done that, isn't it time to start building the rest of the house?

While the typical Colormaniac continues to seek improved Basic techniques, he eventually asks the 64K question: What is machine language? It's a real mystery to many, and some even begin to learn about it, only to be frightened off by its foreboding complexity. Have you ever asked an advanced computerist what machine language is, and come away knowing that you didn't understand what you thought you heard, but certain that you didn't want to hear any more until you understood the strange vocabulary he

Attention Colormaniacs!  
Your disease is incurable  
but this prescription  
treats it with pleasure.

threw at you?

Don't try to dive into machine language without first defining terms, understanding the number relationships involved, and getting some idea of what happens inside the computer. If you are reluctant, perhaps a demonstration of the power of machine language will provide some incentive. Later in this article I'll present a simple Basic program, then write and explain the operation of an equivalent machine-language subroutine.

The machine-language version runs about 350 times faster, while occupying less memory. This is why all those fancy arcade games with fast graphics and great sound effects are written in machine language. Basic just isn't fast enough to read the joystick, fire the phaser, draw the ray's path, explode the target, update the score, generate sound effects, and make it seem like it's all happening at once.

This is also why the better word processors and text editors; multivoice music programs; and all Radio Shack program packs, CoCo disks, and game cassettes are written in machine language.

Don't misunderstand; Basic continues to be an important programming tool, and you will continue to do bigger

and better things with it, even as you learn machine language. Eventually you'll compare the two and see some applications where Basic is the obvious choice.

An understanding of machine- and Assembly-language programming requires prior study of a few preliminary areas, the first of which is number systems.

Although most of us are accustomed to calculating with the decimal (base 10) system, the computer's circuits deal almost exclusively in binary (base 2) numbers. You frequently, for the sake of convenience, express the computer's operations in the hexadecimal (base 16) number system. Before proceeding, look at number systems in general. There are several rules that hold true no matter which number system you use.

- The base of a number system tells you how many values are possible in any given digit.

- In determining the value of any number, you assign a value to each column, reading from right to left. For now, forget about anything to the right of a decimal point. You are talking strictly about whole numbers. The value of the digit in the far right column is the value of that digit times the base to the zero power. Remember that any number to the zero

### System Requirements

16K RAM

Extended Color or Color Basic  
Editor/Assembler (optional)

power is always one. Moving left one column, the value of the digit in the next column is the value of that digit times the base to the first power. Remember that any number raised to the first power is always that number. For example:

$$1^0 = 1 \quad 5^0 = 1 \quad 99^0 = 1$$

$$1^1 = 1 \quad 5^1 = 5 \quad 99^1 = 99$$

● As you continue to move left one column at a time, the value of the digit in each column is the value of that digit times the base to the second, third, fourth, fifth power, etc.

Now, apply these three rules to an ordinary decimal number, 50,598. You read and work with numbers like this every day, and usually don't think about interpreting them in this manner. Since this is a decimal (base 10) number, there can be any of 10 digit values in each column, namely 0, 1, 2, 3, 4, 5, 6, 7, 8, or 9.

The far right column in our example contains the digit 8, and its value would be 8 times 10 to the zero power, or 8 times 1, or 8. In the second column, it's 9 times 10 to the first power or 9 times 10, or 90. The process is completed in Fig. 1b.

This is simple stuff, but I want to remind you how numbers work before moving on to binary and hex. How would you convert the same number expressed in binary back to decimal? This is base 2, meaning that only two possible digits, 0 or 1, can appear in any column. The aforementioned rules and procedures still apply, and the process appears in Fig. 2b.

Remember that you are reading the binary number from right to left, examining each bit (binary digit), to see whether it will (if the bit is 1) or will not (if the bit is 0) represent the base 2 raised to the power 0, 1, 2, 3, 4, and so on, according to the column being examined.

By using binary values, you can employ digital electronic circuits, where a

value can be represented on a series of wires (a bus) by either the presence (binary 1) or absence (binary 0) of a specific level of electric current on each wire. Compare this to analog circuits, where an infinite number of possible voltage levels can exist in any one wire. We have seen how easily you can convert binary to decimal by simply evaluating the digits, reading right to left, and incrementing the power to which the base (2) is raised in each column.

Converting decimal to binary is the same process in reverse. It's helpful to have a table of powers of two, as shown in Fig. 2a. The conversion is then a simple process of assigning the binary digits. In this conversion, however, you form the binary number working from left to right.

You compare the column value of the first binary digit (32,768 when building a 16-digit binary) to the number; if the decimal number is equal to or greater

than the column value, then that bit becomes a one, and the decimal number is reduced by the value of the column, forming a remainder. If the decimal number is less than the column value, then the bit is zero and the decimal value remains unchanged. In either case, you then move one column to the right and repeat the process as illustrated in Fig. 2c.

You have seen that converting decimal to and from binary is simple enough, and by now you realize that doing it repeatedly is about as exciting as strep throat. But didn't you buy a sophisticated computer to, among other things, handle some of the more mun-

**a. Binary—powers of Two:**

$2^0 = 1$	$2^4 = 16$	$2^8 = 256$	$2^{12} = 4096$
$2^1 = 2$	$2^5 = 32$	$2^9 = 512$	$2^{13} = 8192$
$2^2 = 4$	$2^6 = 64$	$2^{10} = 1024$	$2^{14} = 16384$
$2^3 = 8$	$2^7 = 128$	$2^{11} = 2048$	$2^{15} = 32768$

**b. Example for Converting Binary to Decimal:**

**c. Example for Converting Decimal Number to Binary, Building the Binary from Left to Right:**

NUMBER = 50,598	REM = Remainder
1??? ???? ???? ???? NUM >	32,768 so bit = 1; REM = NUM - 32,768 = 17,830
11?? ???? ???? ???? REM >	16,384 so bit = 1; REM = REM - 16,384 = 1,446
110? ???? ???? ???? REM <	8,192 so bit = 0; REM still = 1,446
1100 ???? ???? ???? REM <	4,096 so bit = 0; REM still = 1,446
1100 0??? ???? ???? REM <	2,048 so bit = 0; REM still = 1,446
1100 01?? ???? ???? REM >	1,024 so bit = 1; REM = REM - 1,024 = 422
1100 010? ???? ???? REM <	512 so bit = 0; REM still = 422
1100 0101 ???? ???? REM >	256 so bit = 1; REM = REM - 256 = 166
1100 0101 1??? ???? REM >	128 so bit = 1; REM = REM - 128 = 38
1100 0101 10?? ???? REM <	64 so bit = 0; REM still = 38
1100 0101 101? ???? REM >	32 so bit = 1; REM = REM - 32 = 6
1100 0101 1010 ???? REM <	16 so bit = 0; REM still = 6
1100 0101 1010 0??? REM <	8 so bit = 0; REM still = 6
1100 0101 1010 01?? REM >	4 so bit = 1; REM = REM - 4 = 2
1100 0101 1010 011? REM =	2 so bit = 1; REM = REM - 2 = 0
1100 0101 1010 0110 REM =	0 so bit = 0; Done.

**a. Decimal—powers of 10:**

$$10^0 = 1 \quad 10^2 = 100 \quad 10^4 = 10,000$$

$$10^1 = 10 \quad 10^3 = 1,000 \quad 10^5 = 100,000$$

**b. Example for Evaluating Decimal Number:**

Fig. 1. Powers of 10 (a) and Evaluation of Decimal Number (b)

Fig. 2. Powers-of-two table (a) is helpful in converting both binary to decimal (b) and back again (c).

dane tasks in life? If you need to manipulate binary and hex numbers to talk to the computer, why not use it to help you convert number systems?

Extended Color Basic includes a feature for converting decimal to hex and back, but neither Extended nor non-Extended Color Basic can handle binary directly. Hex-Bin (Program Listing 1) accepts input in either decimal, binary, or hex; it then computes and prints the equivalent in the other two bases. Analysis of the program shows that it is accomplishing the conversions in the same manner I describe here. It does not require Extended Color Basic, and it handles any decimal number between 0 and 65,535.

You should remember that decimal 65,535 is the largest number that can be represented by 16 binary digits, because:

1111 1111 1111 1111 (binary) = 65,535 (decimal)

Now, try figuring the largest number that can be represented by eight binary digits (1111 1111). It'll come in handy in a little while.

### Why Should I Care About All This?

Sooner or later you'll be interested in the internal workings of the 6809E microprocessor. Technically, it is an LSI 40-pin DIP IC. That means it's a large-scale integration (particularly dense packing of lots of low-current transistor switches) integrated circuit with 40 connecting pins, and that it is a rectangular,

dual in-line package (DIP) with the pins in two parallel rows, 20 per side.

Sixteen of these pins comprise the address bus, and they are connected to the program memory (RAM) and Basic interpreter (ROM), plus any program packs or disk controller connected to the side port. They are also connected, though less directly, to the printer, joystick, and cassette interfaces.

When I say that the 6809 can address 64K, I mean that it can access any of 65,535 addresses by means of binary signals on the 16-bit address bus. In this way it tells the rest of the system the address to which it is about to write, or the address from which it wants to read data.

Much of the data handled is in 8-bit format. In addition to its 16-bit address bus, the 6809 also has an 8-bit data bus, used to send and receive 8 bits (1 byte) of data at a time.

Perhaps you've wondered what the POKE command can be used for. The syntax is POKE address, value, and the limits for address and value are 65535 and 255, respectively. Trying to go higher than POKE 65535,255 brings up an FC (function call) error, because the POKE command references the address and data buses, 16 and 8 pins respectively, and the binary signals carried are therefore limited in value to the largest numbers that can be represented by 16 or 8 bits.

Back in the dark ages of home computers, around 1975 or so, the simpler machines did not have keyboards. In-

stead, they had front panels consisting of rows of toggle switches for control of address or data buses. To enter a program, the user had to set each switch to represent 1 bit of the value desired, in binary, and then press a button to let the computer know to accept that byte. Entering the shortest program took quite a while, and a single bit error halfway through could result in anything from simple migraine to severe paranoid depression. Use of hexadecimal keypads on home computers was, then, a giant step forward.

Since hex means "six" and deca means "ten," the hexadecimal number system is based on 16. Just as in decimal and binary, the base indicates both the number of possible values in any column and the relationship between columns. The first 10 digits used for column values are the same as in decimal, 0-9, then the letters A-F represent the decimal equivalent values 10-15. The value of each hex digit depends on the column in which it appears, just as in the other base systems. Hex 5, for example, when appearing in column 2 equals 5 times the base raised to the column number, or 5 times 16 raised to the second power, or 5 times 256, or 1,280.

Figure 3a shows the 16 hex digits, with decimal and binary equivalents of each. The decimal equivalents are shown in four columns, according to the position in which the hex digit might appear. Reading the table in columns should help reduce the tedious math involved in converting.

Figure 3 shows converting between hex and decimal, which is performed essentially the same as you did with binary. In converting decimal to hex, however, you now have 15 choices for each hex digit, whereas in binary you had only two. Use Fig. 3a to find each value.

Start with decimal 50,598; examination of the table shows that this is greater than hex C000 but less than hex D000. You therefore select hex C for column 3, subtract its value from the decimal number, move right one column, and continue converting the remainder. Remember that column 3 is really the fourth column from the right, as you count right to left starting with zero. Figure 3c shows the rest of the conversion.

After working with hex numbers for a while, you'll notice that you can repre-

sent any 4-bit binary number (a nibble, half a byte) by a single hex digit, and that you can write any 8-bit binary (a byte) as two hex digits, and so on. In this way, attaching a 16-key hexadecimal keyboard to a microcomputer allowed the user to enter programs much more easily than repeatedly setting toggle switches. You will often use hex numbers to represent addresses and data, mostly for the sake of convenience.

Instead of saying that the 16-bit bus can address decimal 65,535 or binary 1111 1111 1111 1111 locations, you can say that there are hex FFFF possible locations. Using the Binary Equiv. column in Fig. 3a permits rapid conversion between binary and hex.

From here on, and to avoid confusing one base with another, adhere strictly to the following rules:

- Binary values will be prefaced by a percent sign (%).
- Hexadecimal numbers will be prefaced by either a dollar sign (\$) or Basic's ampersand H (&H).
- Decimal will be the default, i.e., if no base is specified, use base 10.

### Basic Versus Machine Language

When you program in Basic, the computer must interpret each byte of code in order to run the program. If the program starts with 10 FOR X=1 TO 5, the computer first examines the F, checking to see if that is an instruction. It isn't, so the computer takes the next byte of code, and examines FO. Still not satisfied that it has found an instruction, it fetches the third byte of code, and examines FOR. That's a recognizable keyword, and the CoCo begins to understand what you want it to do.

This is a simplification, as the computer actually "tokenizes" a Basic program, storing it in sort of a shorthand in memory so a keyword like FOR doesn't really occupy 3 bytes. For the time being, however, think of a Basic program as being stored in memory the same as you would see it listed on the screen.

Expecting that FOR will be followed by a variable name and then the equal sign, the CoCo continues to read the program, and, assuming that syntax is correct, does the expected counting.

Most significant here is the fact that the computer doesn't remember what it's doing when running a Basic program; when it encounters the inevitable NEXT X, it returns to the initial FOR X, and reads it again. This example was a loop for counting X from one to five, and the FOR instruction is therefore read six times. On the sixth reading of the FOR instruction the computer says "Well, I'm done now; time to jump to the instruction after NEXT."

This is why Basic is called an interpreter, since each byte of code must be interpreted before the microprocessor knows what to do with it. In fact, the Basic ROMs actually comprise a lookup table where each word of Basic is located and translated into a set of machine-language instructions that the 6809 can understand.

The 6809 speaks only machine language, and each time an instruction is encountered, it must be interpreted before it can be executed. Remember how I said that the data bus was an 8-bit bus? Any of 255 (\$FF or %1111 1111) values can therefore be read as instructions. There are actually more than 255 possible machine-language instructions, as a

Program Listing 2b. Basic Versus Machine Language Demo Program, Extended Color Basic

made up of registers, each of which holds either 8 or 16 bits of information (data). The majority of instructions tell it to manipulate specific registers in a predetermined manner. Those registers that are accessible to the programmer are:

- The A accumulator (8-bit), which is a temporary holding location for a byte of data.

- The B accumulator, which is another 8-bit storage place for data.

- The D accumulator, which is actually the A and B registers strung together (concatenated). You might have heard that the 6809 is an 8-bit microprocessor that thinks it's a 16-bit processor; hence the schizophrenia. The ability to manipulate 16 bits of data in the D accumulator with a single instruction sets the 6809 apart from the popular Z80 (TRS-80 Models I and III, Timex/Sinclair TMS1000, and others) and the 6502 (Apple, VIC-20, et al.) microprocessors, where only 8 bits at a time can be manipulated.

- The PC or program counter (16-bit), which allows the 6809 to keep track of the address in memory from which it is getting instructions.

- The S (hardware) and U (user) stack pointers (16-bit), which are used mainly to store addresses and values while executing subroutines.

- The X and Y index registers (16-bit), used for indexed addressing, allow a program to specify relative rather than fixed addresses, by holding an offset value to be added to or subtracted from the address in the program counter. In other words, use of these registers permits an instruction to command, "Fetch the value xxx bytes away from the present location," instead of specifying an address. It is this feature that allows writing PIC (position-independent code), or machine-language pro-

grams that are relocatable, and can be run anywhere in memory.

- The DP or direct-page register (8-bit) is used as the most-significant byte of an address, allowing the great flexibility in advanced programming.

- The CC or condition-code register (8-bit) is actually eight flag registers rolled into one. Each of the 8 bits in the CC is an individual indication of such things as: "Was the result of the last operation a zero?", "Was that last number negative or positive?", or "Did I have a carry or a borrow in that last addition or subtraction?"

### Putting It to Work

Earlier I threatened to demonstrate the machine-language equivalent of a simple Basic routine; the time has come. See Program Listing 2, and consider the

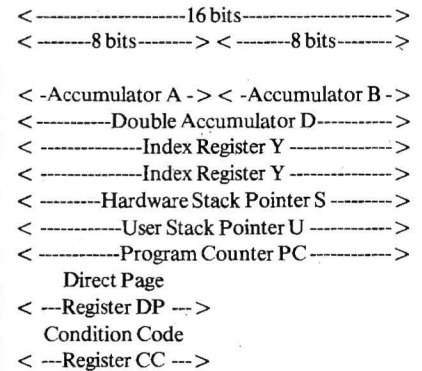

Fig. 4. Programming model of the 6809 microprocessor. Remember that the D accumulator is not a separate register, but is rather the A and B accumulators strung together. When 2 bytes are loaded into D, the most-significant byte will be in A, and the least-significant in B.

# THE DRAGON HAS ARRIVED!

And it's just as remarkable as we promised it would be! Designed in the United Kingdom and manufactured in New Orleans by TANO Corporation, the Dragon is the color computer you've been waiting for.

## WITH POWER, MADE SIMPLE...

With 64K bytes of RAM (48K bytes available to the user) and 32K bytes of ROM, the Dragon is powerful indeed. Yet it's simple to use, thanks to the Dragon's native language, Microsoft™ Extended Color BASIC. This marvelous color computer language offers sophisticated graphics (set, line, draw, circle, paint, print, and print using included) along with full editing features (insert, delete, change) and advanced sound features.

## DAZZLING GRAPHICS...

The Dragon boasts nine brilliant colors, and you can choose any of five different resolutions, from 512 points of text (16X32) to 49,152 points (256X192) at high resolution. If you decide not to invest in a color monitor, the Dragon will work beautifully with your home VHF television set.

## AND FREE SOFTWARE

With an extensive and ever-growing list of software titles, the Dragon can be used for everything from planning a budget to playing chess. Many titles are available right at the point-of-sale. And best of all, the Dragon comes with nine **free** software programs, valued at \$150, to get you started in word processing, financial management, programming, and some great games too!

## IT'S BUILT TO LAST...

In quality of construction, the Dragon's professional keyboard rivals those used with data entry terminals. It is repeatedly tested for performance and durability before we sell it. And the keyboard's layout insures that your fingers will feel at home from the first stroke.

## AND READY TO GROW.

System expansion can be accomplished without further expenditures for special interfaces. The Dragon features a real RS-232 serial port, allowing the Dragon to interface with a modem, printer, or another computer. Joystick and cassette recorder interfaces and a monitor output are also standard. And the Dragon's Centronics parallel interface makes it ready for use with a printer. Options include disk controller and drive, a printer, modem and joysticks.

If all of this sounds exciting to you, just mail the coupon and we'll send you more information on the Dragon. We think you'll find it was worth the wait.

## DRAGON by TANO.

The color computer  
you've been waiting for.

Please send me more information on the Dragon.

# Send Your Child on the Rainbow Quest.

Fiction, Fantasy, and Computer Adventure for the Color Computer

**R**ainbow Quest will take your child on a space adventure of the future. The planet Rainbow is a faraway land of ancient and mysterious cities, mazes, and puzzling events for young readers to discover. **Rainbow Quest** by Richard Ramella is a book-and-cassette adventure for the Radio Shack Color Computer. Children read and play along as Molly and Sam meet pirates, robots, and strange creatures as they make their way across the planet Rainbow. To reach their goal, they must survive on their own and face the challenges they meet along the way. Readers will help Molly and Sam find their way through dark and confusing mazes, solve word and number puzzles, and conquer invaders in arcade-style games.

Each obstacle they meet is a program, on the **Rainbow Quest** cassette, ready to load and run.

**Rainbow Quest** has 25 programs in all. Book and cassette are sold together in a protective storage binder with complete instructions. Each **Rainbow Quest** package for the Color Computer is \$24.97.

To order **Rainbow Quest**, call toll-free for credit card orders, 1-800-258-5473. (In New Hampshire, call 924-9471.) Or mail your order with payment or complete credit card information to: Wayne Green Inc., Attn. Book Sales, Peterborough, NH 03458.

following program line:

```
50 FOR N=0 TO 65535:NEXTN
```

This is simple but experience shows that looping 65536 (0-65535) times takes just over two minutes in Basic. You can accomplish the same thing in machine language if you:

- Set the D accumulator to \$FFFF. Remember that D is actually A and B concatenated.

- Decrement the A accumulator by one, and test to see if it has reached zero; if not, decrement and test again. Since A was initialized with 255 (\$FF), it takes 256 iterations before zero is reached.

- Once the A accumulator reaches zero, move on to the B accumulator and decrement/test it in the same manner. If B has reached zero you are finished; if not, reload A with \$FF and jump back to the second step.

This is essentially the same as nested FOR...NEXT loops in Basic. Every time A completes 256 loops, B completes one loop. Once B has completed its 256 loops, you have looped a total of 256 times 256, or 65,536 times.

To begin writing the machine-language routine, you must tell the 6809 that you are going to load a value into the D accumulator. You accomplish this by feeding the 8-line data bus with the binary coding, 1 1 0 0 1 1 0 0.

At least that's how the Stone Age hobby computerist would have done it with his front-panel switches. The second-generation pioneer used a hex keypad and entered the equivalent, or \$CC. The instruction \$CC tells the 6809 that the 2-byte D accumulator is to load itself with the next 2 bytes of memory following the instruction. Since you want it filled, those bytes will both be \$FF. You then program the CoCo to decrement the A register with the instruction \$4A. So far our program is CC FF FF 4A.

I'm not pulling these instructions from under a rock somewhere, or inventing them for the purpose of illustra-

tion. Although there are several fine books available on the 6809 instruction set and machine/Assembly-language

Program Listing 3. Machine Language Counter Program

Line 0004—DECA simply decrements the A accumulator.  
Line 0005—Says, "Branch if not equal" to the line where LOOP-A appears in the label field. The BNE instruction always refers to the instruction immediately preceding it, and in this case means that the branch takes place if the result of the last operation was not zero. This is similar to Basic's IF statement, and if the test is not met, i.e., if the A accumulator has not been decremented down to zero, control falls through to the next line.  
Line 0006—Decrement the B accumulator.  
Line 0007—BEQ (branch if equal) DONE tells us to branch to line 0010, where DONE appears in the label field, but only if the result of the last operation was zero. Otherwise you proceed to the next instruction.  
Line 0008—Load A with \$FF.  
Line 0009—BRA (branch always) is an unconditional branch, and in this case takes you back to LOOP-A.  
Line 0010—RTS (return from subroutine) transfers control back to the address stacked (stored in the H register) when this machine-language program was called from Basic.

 intracolor COMMUNICATIONS

programming, the ultimate information source is Motorola's own *6809 Microprocessor Programming Manual*, available from Motorola Semiconductor Products Inc., P.O. Box 20924, Phoenix, AZ 85036. Through use of this or another 6809 instruction set reference, you can continue to write the machine-language program.

There is an easier way. Just as you learned to convert between number systems by hand and then put the computer to work to do it for you, here again the computer can perform the drudgery of converting the algorithm to machine-language instructions, through use of an editor/assembler program. See Program Listing 3, which is an output from the editor/assembler. There are seven fields (columns), and from left to right they are:

- The output line numbers, starting with 0001. These aren't necessary, but are a convenience generated automatically by the editor/assembler for our reference only. Some editor/assemblers don't even generate this field. For now, skip lines 0001 and 0002, and look at line 0003.

- The address field indicates locations in memory where the machine code is located. Notice that the program starts at \$0E00, meaning that this is the address in RAM where the first byte of the program is stored.

- The actual machine-language code that comprises the program. Notice that the first few bytes I mentioned before, \$CC FF FF, appear here, followed by the rest of the program.

- The label field. Labels are for branching, and are explained shortly.

- The op-code (operation code) field is the instruction that the programmer writes to tell the editor/assembler what he wants the program to do. Instead of having to remember that \$CC is the instruction for loading the D accumulator, you need only to remember (or look up) the mnemonic memory jogger to represent the instruction. In this case, the op-code is LDD, an abbreviation for "load accumulator D."

- The operand or address field is used with most instructions, telling the editor/assembler what you want it to do. In this case, the op-code LDD is followed by the operand #\$FFFF, specifying that you want the D accumulator loaded with \$FFFF. Had you instructed LDD \$FFFF instead of LDD #\$FFFF, omitting the # symbol, the assembler would interpret this as not to load D with \$FFFF but with whatever value was stored at memory location \$FFFF. In other words you can have either di-

rect or indirect addressing, and the # symbol is one of several syntax rules that the Assembly-language programmer must learn.

- The comment field is similar to remarks in Basic programming, and simply provides the programmer with a place to leave notes for himself.

Fields 4, 5, 6, and 7—the label, op-code, operand/address, and comments fields—are called "source code" and are written by the programmer with the editor portion of the editor/assembler program. The assembler portion then analyzes the source code and generates "object code" (field 3), which is the actual machine-language program. In other words, assembly is the process of translating the op-codes and operands of source code into bytes of machine-language object code.

Examining line 0001 of this program, you see in the op-code and operand fields "NAM counter." NAM is not a real op-code, but is rather a pseudo-op, used simply to give the program a

---

*"You can also walk  
from Chicago to St. Louis,  
but there are certainly  
easier ways to get there..."*

---

name. Notice that no object code is generated in this line. Likewise, line 0002 contains the ORG pseudo-op, and tells the assembler what address to use to originate the program, but generates no code in field 3. It is because I used ORG \$0E00 that the object code beginning in line 0003 is assembled to that address.

Notice that LOOP-A appears in the label field for line 0004 and again in the operand field for line 0005. This is a label chosen by the programmer, and is used for jumps, more properly called branches, similar to Basic's GOTO command.

When used in the label field it simply establishes a reference point. Then, when seen in the operand/address field, it directs a branch (either forward or backward) to the line in which it appears in the label field. You should by now understand enough about the source program to examine the rest of it. See Table 1 for line descriptions.

There are several ways to load and run a machine-language program. It can be loaded from tape to memory

with CLOADM and started with EXEC, or can be POKEd directly into memory by a Basic driver as you do here; see Listing 2. Line 120 holds the object code in a DATA statement, and a loop in line 20 reads the data and POKEs it into the desired locations. Line 10 tells Basic the location at which the machine-language routine begins, and transfers control to the routine in line 90.

In the Extended Basic version, Listing 2a, the DATA statement is in hex, &H in line 20 reads the data before it is POKEd in as object code, DEFUSR0 places the machine-language routine's address in memory, and the actual machine-language code begins at \$0E00, which is the beginning address of graphics page 1.

In the non-Extended version, Listing 2b, the same data is in decimal, the machine-language routine is POKEd to the 14 consecutive bytes of RAM starting at 16001, and this starting address is passed to Basic by two POKE statements in line 10. All these procedures are documented in the Radio Shack manuals.

In this example, the machine-language routine occupies almost as much memory as the equivalent Basic FOR...NEXT loop, but this is not truly representative. Machine-language typically uses a small fraction of the RAM required by Basic for the same application.

I have not intended this to be a thorough coverage of all 6809 machine-language instructions, but rather a cursory introduction to the process of machine- and Assembly-language programming.

An editor/assembler is not an absolute necessity, as you can do a "hand assembly" and enter the object code directly to memory. You can also walk from Chicago to St. Louis, but there are certainly easier ways to get there, and I highly recommend the purchase of an editor/assembler for anyone interested in machine-language programming. There are several on the market; my personal favorite is the Micro Works SDS80C, or, for disk users, their Macro-80C. Likewise, a solid tutorial and reference text is quite helpful, and Lance Leventhal's *6809 Assembly-Language Programming* is probably the most comprehensive work available.

Finally, remember that if your Colormania goes into remission, it's only temporary. ■

BY RICHARD TUCKER

# 4K LOAN ANALYSIS

So, you think there aren't serious programs for 4K Color Basic? Take a look at this loan analyzer.

If you have a 4K Color Computer like mine, there aren't many serious programs available. I decided to fix this problem by writing a loan program that would tell me the monthly payments for a loan at a specified interest.

I dug around in my old high-school notes and found the equation for determining monthly payments:

$$PMT = P \times j(1+j)^{-M} \text{ where } j = (1-i/c)^{c/12} - 1$$

It's not necessary to understand the equation to use the program, but the following information will be helpful as you go through the program line by line:

PMT = the monthly payment

M = the number of monthly payments to pay off the loan

i = the interest rate as a decimal

c = the number of times the interest is compounded yearly

j = the corrected interest based on c compoundings yearly

Program Listing 1 is the loan-analysis program, with REM statements to break up the various sections for easier identification. (Program Listing 2 gives changes for the MC-10.)

• Lines 40-100 print the main program title. This is straightforward, but look at

the screen-centering routine of line 50. By tabbing one-half the width of the screen, minus half the length of the string, you can center the string on the screen. If you change the string, it will still be centered.

• Lines 180-330 are my Color Computer adaptation of William Barden Jr.'s "gee whiz" input routine as described in *Programming Techniques for Level II Basic* (RS#62-2062). Using this as a subroutine, I made a screen that appears like a form to be filled in.

• Before my adapted subroutine begins execution, a subroutine at line 420 creates a dummy string ZAS equal to the maximum number of characters to be input. When the program enters the input subroutine, ZC equals the starting position on the screen for the number to be input.

• Line 180 prints the dummy string on the screen. This shows the maximum space for input characters.

• Line 200 sounds a beep to prompt the operator.

• Line 220 gets a character from the keyboard.

• Line 230 checks to see if this character is a control character or a letter.

• Line 240 checks to see if the character is a backspace.

• Lines 250 and 260 do a backspace.

• Lines 270 and 280 check for the enter

key. If it is pressed, they return to the main program with ZA\$ equal to the characters pressed.

● Lines 290 and 300 check to see if the string length has exceeded the allowable maximum. If it has, the program substitutes a backspace for the character typed.

● Line 310 prints the character typed.

● Line 320 adds that character to the string.

● Line 350 contains a subroutine that prints the main form on the screen.

● Lines 460-650 contain the main routine.

● Lines 670-900 print the amortization schedule, 12 months to a screen.

● Line 1030 contains a subroutine that rounds off each calculated dollar value to two decimal places before that value is printed.

It might be a good idea to look at that subroutine in some detail, because it is an excellent example of the capabilities of the string commands LEFT\$ and MIDS\$:

● Before the calculated dollar value enters the subroutine at 1030, the program must make the number equal to the dummy string ZZ\$. Line 1030 simply initializes the counter variable X and the roundoff variable YX.

● Line 1040 compares each character of the string ZZ\$ with the decimal point.

● Once it finds the decimal point, line 1050 checks the third digit after the decimal to see if it is greater than four. If it is, this line adds .01 to the number by converting ZZ\$ back to a number ZZ, adding .01, and converting back to a string again.

● Lines 1060 and 1070 add the proper number of zeros if the original number was an even number of dollars or dimes.

● Line 1080 then removes the numbers past the second decimal place and returns. ■

# Take Your Pick

## We Have it Your Way

Whether you're using cassette or disk, we have the right systems software for you. Not games, but serious software for putting your computer to work.

### WORD PROCESSING SOFTWARE

**SPELL 'N FIX** finds and fixes your spelling and typographical errors. Cassette or disk versions cost just \$69.29 with a 20,000 word dictionary, FLEX version \$178.58.

75,000 word optional dictionary costs \$50 additional.

**ALL-IN-ONE** editor/word processor/mailling list program costs \$50 (STAR-DOS version) or \$75 (FLEX version).

### DISK OPERATING SYSTEMS

**STAR-DOS** provides the power of a big DOS with the simplicity of standard R/S disk format. \$49.90 for 16K-64K systems.

**STAR-FLEX** is a full implementation of FLEX™ (a trademark of Technical Systems Consultants Inc.) for the Color Computer. \$225 includes text editor, macro assembler, and HUMBUG debugger program.

### SYSTEMS SOFTWARE

**HUMBUG** is the famous 6809 monitor/debugger adapted to the CoCo. \$39.95 for 16K or 32K disk or tape systems; \$59.95 for 64K systems using STAR-DOS or FLEX; \$29.95 for the MC-10.

**REMO TERM** lets a terminal or modem control the CoCo or MC-10 for \$19.95. Disk or cassette.

**COMM TERM** communications terminal program for the MC-10 costs just \$19.95.

**NEWTALK** reads out memory contents in words through the TV speaker. \$20. Disk or cassette.

### HOME FINANCE

**CHECK 'N TAX** lets you check on your bank. Not just a checkbook balancing program, but a help at tax time too. \$50, disk only.

### EDUCATION

Numerical Methods is a college level course on computer mathematics. \$75, disk or cassette.

### GAMES

**SHRINK** is our version of Eliza for \$15. Disk or cassette.

**THREE-D** teaches spatial relationships through three-dimensional tic tac toe. \$25, disk or cassette.

## PREREADER

will help your preschool (age 3-5) child learn to read with this easy to use menu-driven program. Great high resolution graphics, colors and sound effects. Your child will learn to identify capital and small letters, numbers, shapes and colors. After these skills have been mastered, the preschooler will learn to associate individual letters and consonant blends with sounds they make.

Requires 32K Extended Basic and joysticks.

\$19.95  
Disk \$24.95

## STATGRAF

STATGRAF is a linear regression analysis program combined with a powerful but easy to use plotting/line graphing system. Designed for professional, technical, business, and educational use, among its many features are:

- \*type titles & labels on the graph in any of three orientations;
  - \*position titles & labels where they will not interfere with the graph;
  - \*save data and completed graphs on disk or tape; display disk directory;
  - \*transform data: logs, square root inverse, exponential, additive codes;
  - \*calculate, display, & plot residuals;
  - \*powerful data editor: append, delete, insert, change;
  - \*plot multiple data sets; symbols include 5 figures or any text character;
  - \*calculate, display, and print regression statistics and tests of significance;
  - \*superimpose frame, regression line, 95% confidence limits, grid;
  - \*works easily with common machine language screen print programs (not supplied);
  - \*same program works with either tape or disk;
- Requires 32K Extended Basic; supplied on disk or tape.

PURCHASE OUR UNIQUE AND AGGRESSIVE MARKETING APPROACH TO WORK FOR YOU TODAY!

BY MARK D. GOODWIN

# JOURNEY TO THE CENTER OF THE ROM—PART III

I'm devoting this month's article to the 6809 disassembler that appears in the accompanying Program Listing. This single-pass disassembler is written in position-independent code and will run on all versions of the Color Computer.

## Assembling the Program

You can assemble this program with any editor/assembler. Simply type it in as it appears in the listing. I used an SDS 80C Micro editor/assembler. If you use Radio Shack's Editor/Assembler be sure to change the @ characters in the Label field to characters that are acceptable. You must also double check for typos before attempting to assemble it. There are a lot of data items, and one little typo could cause enormous problems.

Readers with a disk-based Color Computer system must change the ORG in line 2 from \$600 to \$1000 before assembling the program; otherwise, the disassembler will overlay the disk communications area and a crash will result.

## Running the Program

Once you've correctly assembled the

Now you can disassemble the Color Basic ROM and make your own source-code listing—even in 4K.

program, you can make your own source-code listing of the Color Basic ROM. If your machine has at least 16K of RAM, you should follow the normal procedures for loading and executing a machine-language program.

Because the disassembler uses almost all of the available memory on a 4K computer, it will overlay the stack area while loading. This will cause the Color Basic CLOADM routine to crash. To avoid this, use the following procedure with 4K machines to correctly load and execute the disassembler:

- Turn on the computer.
- Position the cassette recorder to the disassembler program.
- Press the play button on the cassette recorder.
- Type CLEAR0 and press enter.

- Type CLOADM and press enter.
- The disassembler program should now load.
- If it doesn't, repeat the above six steps until it does.
- Press the stop button on the cassette recorder.
- Type EXEC and press enter.
- Now the disassembler program should be functioning properly.

Once you've loaded and executed the disassembler, a prompt will signal you to enter the starting address. Because the Color Basic ROM begins at memory location \$A000, you should type A000 and press enter. The disassembler will now ask if you want to send the output to a printer. If so, press the Y (yes) key. If not, press the N (no) key.

The disassembler will now disassemble the Color Basic ROM. If you are

### System Requirements

4K RAM  
Editor/Assembler

using a printer, the disassembler will print 60 lines per page and then pause at the end of each page. If you are not using a printer, the disassembler will display 16 lines and then pause.

If you want the disassembly of the Color Basic ROM to continue, press any key except break. If you do not want the disassembly to continue, press break.

### Looking Ahead

Next month I will present explanations for all the locations in the Basic

communications area. After that, I will start the actual line-by-line commenting of the Color Basic ROM.

There will be no accompanying text with next month's installment. I believe that the material in future installments of the series is self-explanatory. However, should you have a specific question about any of the material in this series please feel free to write me. ■

Contact Mark Goodwin at Star Route 79, Box 103, Orland, ME 04472.

**MAKE IT  
EASY TO SAVE  
your copies of  
HOT CoCo**

Your magazine library is your prime reference source—keep it handy and keep it neat with these strong library shelf boxes. They are made of white corrugated cardboard and are dust resistant. Use them to keep all your magazines orderly yet available for constant reference.

Self-sticking labels are available for the following:

80 Micro	73 Magazine	Radio Electronics
Microcomputing	QST	Personal Computing
inCider	CQ	HOT CoCo
Desktop Computing	Ham Radio	Interface Age

One box (BX1000) is \$2.00, 2-7 boxes (BX1001) are \$1.50 each, and 8 or more boxes (BX1002) are \$1.25 each. Be sure to specify which labels we should send.

Call **TOLL-FREE** for credit card orders:

**1-800-258-5473**

Or use the order form in this magazine and mail to:

**HOT CoCo**

Attn: Book Sales, Peterborough, NH 03458

SHIPPING AND HANDLING CHARGES \$2.00 per order, up to and including a quantity of eight. 25¢ for each additional box ordered.

**The Soft Shop**

**FILMASTR**

The Color Computer has a powerful ally in FILMASTR. This is a DATA MANAGEMENT SYSTEM that you can trust. FILMASTR combines the best features of the big systems to provide a combination of speed, power, and ease of operation that can't be beat.

YOU are in complete control of this friendly program with no programming knowledge required. You design the data screen with up to 20 fields by moving the cursor on screen with the arrow keys and typing in the field names. FILMASTR takes care of all of the rest.

Enter data by just filling in the blanks. This form fill-in is easy and natural to use. You can even copy data from the previous record with one key-stroke. Add records, delete records, change records without fuss.

Tell FILMASTR to sort your file on any field that you want or to retrieve a particular record and the job is done with super-human machine language speed. FILMASTR will find a single record or a group of records that meet your request and will save those records as a separate file if you want to.

Controlled printing formats? Of course! Tell FILMASTR which records to use, which fields to print and in what order. You can control the print location to any position on the page. Mailing labels? You bet!

All commands are given to FILMASTR with single key strokes. Press the HELP key (BREAK), and the available commands are displayed. Make your choice from the menu and let FILMASTR do the work.

FILMASTR can store up to 255 characters in each record and up to 24,000 characters in each file. (9000 with 16K).

**FILMASTR 16K or 32K ..... TAPE \$29.95**  
**EXT BASIC ..... DISK \$34.95**  
**AMDISK \$39.95**

Quality Software

# EDUGAMES

Joe the CoCo

INVITES YOU TO LEARN AS YOU PLAY

## BASEBALL MATH

Here's fun for the entire family in an exciting and competitive game that will test & improve skill in mental addition. Flashing color graphics and super sound effects accompany 12 difficulty levels that will challenge young and old alike. Also available in a subtraction version and in Spanish.  
16K Cassette \$24.95

## TAKE 'EM AWAY

Bandits are attacking the King's castles. By giving correct answers to the subtraction problems as they appear on the screen, you shoot down the bad guys and save the kingdom. If you give a wrong answer, one of the castles is destroyed. Look out! Just when you think it's all over, another wave of bandits appears.  
16K Cassette \$19.95

## FROM A TO G

Learn to read music without expensive lessons. Written by a professional music teacher, this program displays the notes of the treble and bass clefs with upper and lower ledger notes. The tone of each note is sounded and the keyboard location is shown. You key in the answer before the time limit is up. The correct answer is then displayed. (Optional workbook...\$5.95)  
16K Extended Cassette \$19.95

## JFD - COCO DISC SYSTEM - \$449

J & M Systems, Ltd. is a leader in the Model III marketplace with our JFD-III Disc Controller. With thousands in operation, we have set new standards in controller performance and reliability. We bring these same high standards to the COCO, resulting in the highest quality disc controller system on the market. Compare these functions before you buy:

- Price. \$449 includes controller, first drive, disc basic in ROM, and manuals. Just plug it in.
- Never needs adjusting. Our exclusive Digital Phase Lock Loop Data Separator and Digital Pre-comp Circuit eliminates the 3 adjustments found on other controllers.
- High quality standard production disc drives. For improved service and reliability. Tandon & Teac drives provide twice the read sensitivity that the drives found in other disc systems do, and hold their alignment far longer.
- Gold-plated card edge connectors throughout.
- Software compatible with Radio Shack Disc Basic, Flex, and OS/9.

J & M Systems, Ltd., 137 Utah NE, Albuquerque, N.M. 87108

### COCOCOPY

This all M/L Program will copy BASIC or M/L programs including most Auto Start Programs. It will supply the beginning, ending and offset addresses and allow you to change the load address for M/L programs. I/O errors are ignored so that bad tapes can be corrected. Programs can be renamed and the motor/audio functions are controlled from the keyboard.

CAT. NO. DMO04 16K Ext \$12.95

### DATAMAIL

The ultimate cassette based mailing list program for home or business use. Fully customized data collection screen allows you to set your own field lengths and field titles. Fast machine language sort by any column in any field. Save all or any block of files for latter reading by DATAMAIL or your own letter program. Merge two or more lists, search by record number or key word in any column. One key commands for Input, Kill, Change. Print single records or any block of files, 1, 2, 3, or 4 across. 32 K holds about 300 files.

# Talk is Cheap!

You want your color computer to talk, but how much will it cost?  
\$50 . . . \$100 . . . \$200 . . . NO!

## HOW ABOUT \$29<sup>95</sup>?

**SPEAK UP!™** is a machine language Voice Synthesizer program for your TRS-80 Color Computer.\* It is 100% software. Nothing else to buy. Best of all, YOU can make basic programs talk!

16K and 32K versions on one cassette. Has text to speech capability.

\*T.M. Tandy Corp.

16k minimum

It's easy to use, and will say virtually anything!

## Talk really is cheap!

Reviewed in the April issue of *Rainbow*.

# Instant CoCo

by Anee Eisenberg

Last month you probably noticed the small symbol  that appeared on the table of contents. This is our way of marking programs I've included on Instant CoCo, the cassette dump of *HOT CoCo*. We're making the best and the longest programs we publish instantly available to you on a monthly cassette, so you don't have to type them in.

Instant CoCo comes with a caveat; before you try to run our programs, you must read the article and the System Requirements box. If you've got a 16K RAM CoCo, and the program needs 32K RAM, it won't run on your computer.

## Errata

Last month, I made a mistake in the Instant CoCo Index that appeared with this column. The program that adds a full character set to your CoCo video display, CHROUT, was incorrectly listed as requiring 32K Basic. In fact, it requires Extended Basic. Also, the command to load this program (as noted in the article) is CLEAR200, 31918: CLOADM:EXEC.

## Dismayed CoCo Can't Cope With Unknown Commands

The CoCo does a funny thing when a Disk Basic program is loaded into

Extended Basic, or an Extended Basic program into Basic. When listed, the program has lots of exclamation marks. "Oh my gosh!" the computer seems to say, "What does this mean?"

The exclamation points appear as default characters when a command the computer doesn't recognize is called. Because the computer can't translate it into a known Basic command it defaults to something it can print, an exclamation point. Don't confuse this with the PRINT USING !

command available in Extended Basic. So, if you see a listing with lots of exclamation points, check the System Requirements box. You've probably loaded it into the wrong Basic.

## Problems?

Most emphatically, we are committed to supporting Instant CoCo. If you have any difficulties with the programs or the cassette, call or write to me at Pine St., Peterborough, NH 03458. ■

*Instant CoCo Directory—January*

## Coming Next Month

Though you might tell your friends that you use your CoCo for practical things such as word processing or data-base management, we know the *real* reason you own a computer—just for the sheer fun of it.

Next month we'll give you programs that all computer hobbyists will enjoy. (You can tell your friends that these programs have serious uses too, but we know better.)

Want to know how you'll feel for that big date next week? Wallace Smock's Biorythm Calendar will tell you your physical, intellectual, and sensitivity highs and lows for any day. Robert Yeater has a Morse-code tutor program, but if you have no need to learn Morse code, you can use this program to improve your memory skills.

What do you get when you cross a CoCo with your stereo system? Pick up the February *HOT CoCo* and find out. Is your computer room overrun with cassettes of useful and not-so-useful programs? Helen LaBonville's Indxcard will help you make sense out of that mess.

Hardware buffs will like Mark Wil-

son's Circuit Drawer program. Design those circuits on the screen and avoid mistakes on the real thing, or use this program to experiment with different component configurations.

No issue devoted to the fun of computing would be complete without games. Peter Holden has written a challenging CoCo version of the old Chinese game Go. It is similar to Othello, and you can play the computer as an opponent.

February's *HOT CoCo* will keep any true computer hobbyist busy for weeks, at least until the March issue arrives. March will be just as interesting. You see, it's the issue with... well, let's wait until next month for that. ■

# DEFT™ Systems, Inc.

## Colour Software Workbench™

The **Colour Software Workbench (CSW)** is a system of **machine language** programs that run on a 32K or 64K TRS-80 Color Computer Extended Disk Basic System. It lets you develop machine language programs in a combination of **Pascal** and **6809 Assembler** source languages. The **240+ page CSW User's Guide** that is included explains the fundamentals of the languages as well as how to use the package.

Part ONE of the CSW User's Guide tells you how to use all of the programs in the Workbench. This first part contains one section for each program.

### TEXT EDITOR

- Screen Mode Editing
- Entering Text
- Finding Strings
- Changing Multiple String Occurrences
- Moving, Copying and Deleting Blocks of Text
- Reading, Writing and Merging Files From Tape and Disk

### PASCAL COMPILER

- Specifying:
  - Source from Tape, Disk or Keyboard
  - Object and Listing to Tape, Disk, Screen or Printer
- Optional Symbol Table in the Object File for use by the Symbolic Debugger
- Explanation of Source Listing Format

### MACRO ASSEMBLER

- Specifying:
  - Source from Tape or Disk
  - Object and Listing to Tape, Disk, Screen or Printer
- Explanation of Source Listing Format

### OBJECT LINKER

- Specifying:
  - The Machine Language ORIGIN
  - Listing to Tape, Disk, Screen or Printer
  - Binary File on Disk
  - Whether to use Pascal Runtime Library
  - Whether to use Symbolic Debugger

### SYMBOLIC DEBUGGER

- Setting and Clearing Breakpoints
- Displaying and Modifying 6809 and Graphics Registers
- Displaying and Modifying Memory
- Using Pascal Symbols
- Tracing Pascal Procedure Activations
- Viewing the User's (Graphic) Screen
- Using Symbols, Registers & Constants in Expressions

**\$150.00**

3% Shipping & Handling, 5% Maryland Sales Tax

To order, send Name and Address and check or money order to:

DEFT Systems, Inc.    313  
**P.O. BOX 359**  
**DAMASCUS, MARYLAND 20872**

or **CALL TOLL FREE: 1-800-368-3238** Operator 8  
 (in Virginia) **1-800-542-2224** Operator 8

Shipped UPS as soon as your check clears, sooner if you charge, MasterCard and VISA accepted.

\*TRS-80\* and \*Color Computer\* are Trademarks of TANDY Corporation

Part TWO of the CSW User's Guide provides you with the background information needed to write programs using the Colour Software Workbench.

### LEARNING EXERCISE

- Complete Pascal and Assembler Language Source
- Uses All Parts Of the Workbench
- Resulting Program is a Text Processor

### PASCAL

- Describes Standard Language Elements Supported
- Constants Include Decimal and Hexadecimal Integers, ASCII characters and strings
- Types Include:
  - Integer, Char, Boolean, Enumerated, Subrange
  - Multi-Dimensioned Arrays
  - Records and Variant Records
  - Sets of Up to 256 Elements
  - Files
- PROCEDURES and FUNCTIONS with FORWARD
- Variables and LABELs
- Arithmetic, Boolean, and Set Expressions
- Statements: IF, WHILE, REPEAT, CASE, GOTO, EXIT, FOR, BEGIN, assignment (: =)
- Input/Output: RESET, REWRITE, READLN, EOF, WRITE, WRITELN, CLOSE, PAGE
- Built-in Functions and Procedures: ABS, CHR, CURSOR, ODD, ORD, PRED, SUCC

### ADVANCED PASCAL

- Strings Support: Assignment, Comparing, Concatenation
- String Procedures and Functions: STRINGCOPY, STRINGDELETE, STRINGINSERT, STRINGPOS, HEX, ENCODE, DECODE
- Type Extensions for Structured Type Breaking
- Absolute Memory Access via Built-in WORD and BYTE Arrays
- ROM Routine Access via CALL Built-in Function
- Static and Public Variable Allocation
- Separate Compilation and Assembler Interface via INTERFACE, EXTERNAL, and PUBLIC
- Listing and Multiple Source File Directives
- Explanation of Error Messages

### 6809 MACRO ASSEMBLER

- Motorola Compatible Source Conventions
- Macro Facility With up to 9 Macro Parameters
- Separate Compilation and Pascal Interface via PUBLIC and EXT Directives
- Listing Control Directives
- Explanation of Error Messages

### TECHNICAL NOTES

- CoCo ROM Compatibility
- Pascal Runtime Library Assembler Interface
- CSW Object File Format

Hi-resolution and 3-dimensional skeletal **graphics** packages included. This includes full Pascal & Assembler source code. Includes:

- HIRESCLEAR,
- HIRESLINE,
- GRAPHDISPLAY,
- MOVESKELETON,
- SHOWSKELETON

DEFT and "Colour Software Workbench" are Trademarks of DEFT Systems, Inc.

# The Educated Guest

This month I want to explore ways of classifying educational software. If you ask why, consider the bewildered parent who spends several hundred (or thousand) dollars to buy a computer so that Johnny will have an educational advantage. This parent, having already taken one step in the wrong direction, looks for the best software so Johnny can do something besides playing games.

He enters the local computer store with high expectations of fascinating learning material tailored to Johnny's needs and asks, "Do you have anything for education?" The answer is usually, "Oh, we have a great selection." The salesman then takes an interminable amount of time searching through every shelf in the store to find five programs that seem to relate to education.

"And what do these programs do?" asks the parent. The salesman, reading from the label, replies, "Well, this program requires 16K RAM, is written in Basic and requires a duo-constabulary adapter." The parent, not understanding a single word, asks to see it. The salesman pauses, mumbles under his breath, looks after five other customers, goes to ask the boss if he can open the software, and with help from everyone in the store manages to get a program started.

Finally, after 73 minutes in the store, the parent sees a program in operation. It whirs, it gurgles, it captivates, and then he buys it on the spot. The parent has just made another mistake.

Now, anyone in the computing field will tell you that the first thing to do when buying a computer is to look for software that will meet your needs. In my opinion, the computer with the best and most in educational software is (oh no)...the Apple. However, the computer with the most potential for education is our own Color Computer. The Color Computer is also a good

## EDUCATIONAL SOFTWARE BUYER— BEWARE!

by Charles H. Santee

buy if you are willing to spend some time either looking for educational software or writing your own programs.

Assuming you have already made a preliminary decision and have a computer, you want to purchase or write educational programs. I suggest you write a specification sheet, outlining exactly what you want the program to

*Said a parent, "I want education"  
And didn't make specification  
Without further thought  
A program was bought  
But the only thing learned was frustration.*

perform. Figure 1 is a form you might use to do this. There are many ways to classify a program, so if you have ideas for improvement, let me know.

First is the hardware required for the program. Make sure the program you buy works on the equipment you have. Next is the age for which the program is appropriate. While this seems straightforward, it can be misleading. Age can refer to the reading level of the text, interest level, instructional level of the content, or the age range of a group that field tested the program.

You need a second criterion that I will call the age reference. Determine how the age reference was obtained. An age reference is usually obtained by testing the program with different age groups, by selecting material from

a graded source, or by computer analysis of content. The most common method used is to rely on the experience or intuition of the author.

The next criterion is to define the specific content of the program in goals and objectives (learner oriented outcomes). For example:

● Goal: The user will demonstrate mastery of material covering the Civil War period of history.

● Objective: When presented with questions about the Civil War, the user will select a correct answer from four alternatives presented on the video screen, with 90-percent accuracy.

Or, you can provide a brief paragraph defining the content. For example:

This program presents information about 200 spelling words selected at random from a list of

"Santee's Commonly Misspelled Words," 1984. Four words are presented on the screen at one time. One word is misspelled. The user zaps the word with the speller ray. The program presents the words at random and repeats the presentation of words until the user demonstrates 90-percent accuracy in zapping 20 of the misspelled words.

You can then assign the program to a content category such as business/finance, foreign language, mathematics, computer science, reading, or home economics.

You can also categorize according to instructional technique using drill and practice (skill practice), tutorial (skill instruction), games (motivational exercises), simulation (computer representation), problem solving (student analysis), or inquiry (supplementary information source). For an explanation of these techniques consult the *Education Software Sourcebook* from Radio Shack (Cat. No. 26-2756), or read the *CAI Sourcebook* by Robert L. Blake (Prentice-Hall Inc., 1982).

**NEW PRODUCT**

**THE INTRONICS EPROM PROGRAMMER NEWLY DESIGNED UNIT ENCLOSED IN MOLDED PLASTIC CASE**

- Plugs into ROM pack slot. Uses tape base software (option of on board ROM)
- No personality modules required
- No switches to fiddle with
- Will program 2500, 2700 and 68700 series EPROM
- High quality zero insertion force EPROM socket
- Gold plated contact (Text Tool™)

Fig. 1. Educational Software Specification Sheet.

Try to determine the following about field testing: Who has used the programs? What evidence is there that the program successfully teaches the content? How was the success of the program measured? Has the software been reviewed or used by an independent source?

You should also know what features are unique to that program. What provisions are made for scoring the user's progress? Does the program keep a record of the correct and incorrect responses? Does it provide a summary of progress? Does the method of scoring provide motivation for improvement?

Finally, find out who has completed the specifications you have requested. What is the person's background and what bias might you expect?

Here is how to use the specification sheet. First, determine your own needs: What kind of program will really help Johnny? If you are a parent, you might want to ask the teacher. Find out the content area that needs improvement, his present level in that area, and the best way to learn that material.

If Johnny needs practice on skills, then the drill-and-practice type of program is for you. If you want new skills, you need a tutorial program that tests your knowledge and presents new material.

Maybe Johnny is a whiz who only learns what interests him. Then you need a motivational activity or a game that makes learning fun.

Perhaps you want to try out your skills in a new area like the stock mar-

## The Educated Guest

ket but are afraid to take the risk or spend the money. A simulation can provide the experience you want on a nonthreatening level.

Maybe Johnny can recite the books ad nauseam but can't apply facts to a problem. Then the problem-solving program might help. On the other hand, if you need just a good source of easily accessible information, the supplemental information source or data base is your answer.

Write down the type of program you want and make out a specification sheet to take with you to your local computer or software store. If you are buying by mail, send the specification sheet, with several blank forms and a return envelope, to the vendor with a request for him to complete a sheet for programs similar to your specifications.

If your vendor cooperates, check out any references provided in the specifications. Look up the review of the product or call a school that has used the product. Finally, if you find a store that has a demonstration copy, take a look at the program and try it

with the person it is for.

One of the instructional techniques on the specification sheet is the tutorial program, commonly used in computer-assisted instruction. This type of program often uses a method called branching where the program begins with information presented one screen at a time. These are called teaching frames or presentation frames. I prefer the word screen for the information presented on one video screen.

After several instruction screens, the user gets a criterion screen that requires some type of response from the user. Depending on the response, the program branches or goes to different parts of the program. For example, the criterion screen might ask a question to see if the user understands the material. If he answers correctly, the program goes on to new material. Incorrect or partially correct responses branch to repetition or review of the material.

Good branching programs are difficult to write. Once a program is written, it is often difficult to adapt for alternative uses. The criterion for

branching is often a single question. Therefore, in certain instances, the decision on mastery is based on a single response. How would you like to be hired or rejected for a job based on how you answered a single question?

You can overcome this by using series of related questions and other more complicated techniques, but the decision on where to branch still often depends on a single question.

Now for Santee's branching method. In this method you develop a pool of questions related to a topic. Divide these questions into levels of difficulty or into content groups. The program first presents questions and perhaps instruction at the first level. When the user demonstrates a certain level of mastery, say 90 percent, the program branches to the next level.

(Next month Charles Santee continues with a program that shows an application of this method.) ■

Write Charles Santee c/o HOT CoCo, Pine St., Peterborough, NH 03458.

# The Original FLEX™ for Color Computers

- Upgrade to 64K
- RS to FLEX, FLEX to RS file transfer ability
- Create your own character set
- Automatic recognition of single or double density and single or doubled sided
- All features available for either single or multiple drive systems
- Settable Disk Drive Seek Rates
- Faster High Resolution Video Display with 5 different formats
- Save RS Basic from RAM to Disk
- Move RS Basic to RAM
- Load and save function on FLEX disk
- 24 Support Commands 12 with Source Text
- External Terminal Program

### Languages Available

Pascal, Fortran, RS Basic, RS Assembler, TSC Basic, TSC Assembler, Relocating Assembler, Macro Assembler, Mumps

If you are tired of playing games on your TRS-80C Color Computer, or find that you are handicapped by the limitations of the RS BASIC in trying to write a Program that will allow you to actually USE the Color Computer as a COMPUTER, YOU ARE READY TO MOVE UP TO THE FLEX9 Operating System. If you want to have REAL PROGRAMMING POWER, using an Extremely Powerful Business BASIC, PASCALS, C Compilers, a full-blown Macro Assembler with a Library capability so you are not continuously reinventing the wheel, YOU ARE READY TO MOVE UP TO THE FLEX9 Operating System. If you would like to see if YOU REALLY COULD USE A COMPUTER IN YOUR BUSINESS, or begin to make your Computer start PAYING IT'S OWN WAY by doing some Computer Work for the millions of small businesses around you, such as Wordprocessing, Payroll, Accounting, Inventory, etc., then YOU ARE READY TO MOVE UP TO THE FLEX9 Operating System. How?? DATA-COMP has the way!

DATA-COMP's FLEX9 Conversion for the TRS-80C Color Computer was designed for the SERIOUS COMPUTER USER, with features like greatly increased Display Screens, WITH Lower Case Letters, so you can put a FULL Menu on ONE Screen, or see SEVERAL Paragraphs at the same time, with features like providing a FULL Keyboard so you have FULL Control of your Computer AND it's Programs NATURALLY, without needing a chart to see what Key Combination will give you what function, with USER ORIENTED functions to make using the Operating System natural, like having the Computer AUTOMATICALLY determine what type of Disk is being used in what type of Disk Drive and working accordingly, rather than you have to specify each and every thing for it, or like having the Computer work with the Printer you have been using all along without you having to tell the new Operating System what is there, etc.

# DYNAMITE+™

**"THE CODE BUSTER"**  
disassembles any 6809 or 6800  
machine code program into beautiful source

- Learn to program like the experts!
- Adapt existing programs to your needs!
- Convert your 6800 programs to 6809!
- Automatic LABEL generation.
- Allows specifying FCB's, FCC's, FDB's, etc.
- Constants input from DISK or CONSOLE.
- Automatically uses system variable NAMES.
- Output to console, printer, or disk file.
- Available for all popular 6809 operating systems.

FLEX™ \$100 per copy; specify 5" or 8" diskette.

OS-9™ \$150 per copy; specify 5" or 8" diskette.

UniFLEX™ \$300 per copy; 8" diskette only.

For a free sample disassembly that'll convince you DYNAMITE+ is the world's best disassembler, send us your name, address, and the name of your operating system.

**Order your DYNAMITE+ today!**

See your local DYNAMITE+ dealer, or order directly from CSC at the address below. We accept telephone orders from 10 am to 6 pm, Monday through Friday. Call us at 314-576-5020. Your VISA or MasterCard is welcome. Orders outside North America add \$5 per copy. Please specify diskette size for FLEX or OS-9 versions.

### Foreign Dealers:

Australia & Southeast Asia: order from Paris Radio Electronics, 161 Bunnerong Road (PO Box 380) Kingsford, 2032 NSW Australia. Telephone: 02-344-9111.

United Kingdom: order from Compusense, Ltd., PO Box 169, London N13 4HT. Telephone: 01-882-0681.

Scandinavia: order from Swedish Electronics hk AB, Murargatan 23-25, Uppsala S-754 37 Sweden. Telephone: 18-25-30-00.

**Computer Systems Center**  
13461 Olive Blvd.  
Chesterfield, MO 63017  
(314) 576-5020

UniFLEX software prices include maintenance for the first year.

# Doctor ASCII

by Richard E. Esposito

Got a problem with your computer? Ask Doctor ASCII to solve it. Write to Doctor ASCII, HOT CoCo, Pine St., Peterborough, NH 03458.

**Q.** I am interested in obtaining new languages for my 64K CoCo with disk drive. I'd like Pascal, Cobol, and Fortran. What would my best bet be: Radio Shack's new OS-9 or FLEX?

Mark Charney  
Denville, NJ

**A.** Microware (the authors of OS-9) offers OS-9 versions of CIS Cobol for \$895 and Pascal for \$400. Technical Systems Consultants (the authors of FLEX) offer FLEX versions of Pascal for \$200 and FORTRAN77 for \$375. These are all contained in the Frank Hogg Labs (The Regency Tower, Suite 215, 770 James St., Syracuse, NY 13203) catalog. It is desirable, and in some cases mandatory, that you have a second drive for this software. Good software does not come cheap.

Currently, most CoCo FLEXes use a high-resolution 51-by-24 display whereas OS-9 uses the standard 32 by 16. Since FLEX has been around longer, there is more software available for it. FLEX software has been priced lower than OS-9 in the past, but Radio Shack currently is offering Basic-09 for \$99 (half the usual \$200 Microware catalog price). If the Shack eventually carries the entire OS-9 line at the same discount, the price differential could swing the other way.

**Q.** I have a CoCo with a D board to which I recently added disk drives. My machine hangs up when I POKE 65495,0 for high speed with the disk plugged in. Is there a fix? Is there a simpler way to copy files from one drive to another without doing all that typing? BACKUP is fine but you cannot combine files from two disks.

Marie Melodia  
Brooklyn, NY

**A.** I had the same problem with my machine. I solved it by removing capacitor C85.

I use Program Listing 1 for myself. It is patterned after the PCOPY command in FLEX. To use it, load and run Listing 1, then put the source disk in drive 0 and the destination disk in drive 1. If the destination disk is a new one, it must be formatted first. The program is self-prompting. It will copy one file (ONE), files with a particular extension (EXT), or files with any extension (ALL). If you choose EXT or ALL, it will ask whether you want to copy all of them. If you say no, it will list the file names one at a time and ask whether you want each of them copied.

```
10 CLEAR1000
20 DIMF$(2)
30 INPUT"[EXT, ALL, OR ONE]";A$
40 IF LEFT$(A$,1)="E" THEN GOTO6
0 ELSEIF LEFT$(A$,1)="A" THEN GO
TO 70 ELSE INPUT"FILENAME";B$
50 COPYB$+" :0" TO B$+" :1":END
60 INPUT"EXTENTION";E$: E=1
70 INPUT"COPY ALL OF THEM";R$: I
F LEFT$(R$,1)="Y" THEN Y=1
80 FORI=1TO9
90 DSKI$0,17,2+I,F$(1),F$(2)
100 FORF=1TO2
110 FORJ=1TO97STEP32
120 IF MID$(F$(F),J,1)=CHR$(255)
THEN END ELSE IF MID$(F$(F),J,1
)=CHR$(32) THEN GOTO200
130 Q$=MID$(F$(F),J+8,3)
140 IF Q$<>E$ AND E=1 THEN 200
150 C$=MID$(F$(F),J,8)+"/"+Q$
160 PRINTC$;
170 IF Y<>1 THEN INPUT" COPY ";H
$: IF LEFT$(H$,1)<>"Y" THEN 200
180 COPY C$+" :0" TO C$+" :1"
190 PRINT" COPIED"
200 NEXTJ
210 NEXTF
220 NEXTI
230 END
```

Program Listing 1. File-Copying Utility

**Q.** I recently purchased a CoCo for word processing. I now have the problem of deciding which printer to purchase. Much of my typing involves cutting stencils for mimeograph on behalf of many volunteer organizations.

My problem is that I am afraid to use a dot-matrix printer to cut a mimeograph stencil because of possible damage to the pins. A daisy wheel would serve the purpose, but they are expensive. The cost of Xeroxing 25-200 copies is prohibitive and retyping the computer output onto a stencil seems awkward.

Shelly Ennis  
Clio, MI

**A.** I have had good success with a Radio Shack LP VIII printing on Spirit duplicator stencils. Of course, you will need access to a Spirit duplicator. Assuming you can surmount that hurdle, look for a printer that has friction feed and test it to see that its impression is hard enough to come through the stencil. You should be able to find a printer that meets your needs for less than \$400.

**Q.** I own a CoCo on which I create many hi-res graphics that I like to send to my printer. I have a hi-res screen-print program of my own, which is very long to type in for each screen print. Is there a way to merge two Basic programs simply?

*Bill McCrea  
Jacksonville, FL*

**A.** I assume that you have a tape setup. With a disk system there is a MERGE command. For cassette users, a program called "Bmerge" by Dick Robinson appeared in *Color Computer News*, June 1983, p. 84, that will do the trick.

**Q.** I have an IDS Micro Prism 480 and a 32K CoCo. Can you please tell me how to do a graphics dump to the printer? Is there a way to change the baud rate in Scripsit?

*Marc Korner  
Metairie, LA*

**A.** Unfortunately, I do not have access to an IDS printer. If one of our readers has a screen-print program for it, please send it in.

The Scripsit ROM pack stores the baud rate constant at address \$CE11, which is in ROM and therefore unchangeable unless you have a 64K machine. If your 32K machine (Radio Shack original, not piggyback) has an F board, you really have 64K. If that is indeed the case, you can put a copy of Scripsit on tape or disk with the appropriate baud rate for your printer in it. Referring to the article "Disk Utilities," *HOT CoCo*, September 1983, p. 134, alter the Romfix program in the following manner: Add a line 355 POKE &H4E11,##, where ## is the desired baud rate constant (180 for 300 baud, 87 for 600 baud, 41 for 1,200 baud, 18 for 2,400 baud, and 1 for 9,600 baud). If you want your revised copy of Scripsit on tape, also change the SAVEM in line 380 to a CSAVEM. Aside from these changes to the Romfix program, follow the instructions in the article.

**Q.** After reading July's "64K Modification," I was wondering why you have to put in a program to get 64K when you have the right chips in it. I would like to know this since Radio Shack gives you 64K without having to put in a program.

*Lance Wuckert  
Winnipeg, Manitoba, Canada*

**A.** An 8-bit microprocessor such as the CoCo's MC6809 has 16 address lines. Each of these address lines can be on or off giving a total of 65,536 combinations. The result is that a total of only 65,536 or 64K bytes of memory can be accessed at one time. When the CoCo is first turned on, no matter who installed the 64K RAM, you have access to only 32K of the RAM from address 0 to address 32767. The rest of the address space is occupied by Extended Basic in ROM from 32768 to 40959, Basic in ROM from 40960 to 49151, and Disk Basic in ROM from 49152 to 57343.

This configuration is known as memory map 0. What the program supplied in the article does is copy the code from the ROMs down into lower memory, remove the ROMs from the upper half of the 64K address space, replace this

upper half with RAM, and finally copy the Extended Basic code, the Basic code, and the Disk Basic code into this upper RAM. This new configuration is known as memory map 1. 64K programs such as FLEX, OS-9, and Telewriter-64 have a program to switch memory maps built in. No matter which 64K CoCo you have, after powering up, typing ?MEM will yield 31015, 24871, or 22823 depending upon whether you have Basic, Extended Basic, or Disk Basic.

**Q.** I would like to transfer graphic games from my friend's Apple II+ to my 32K CoCo with Extended Basic. Your September column said that this could be done with a smart-terminal program running on each. What is a smart-terminal program and what equipment do I need?

*Daniel Sounders  
Glendale, AZ*

**A.** If you are referring to machine-language games, you are out of luck. The two computers use different microprocessors, which have different instruction sets. The CoCo uses a 6809 and the Apple uses a 6502. If you are interested in transferring Basic programs, it is a relatively simple task. You need a smart-terminal program for your CoCo. What I mean by a smart-terminal program is one that has a buffer or a place in memory in which to store incoming text, which can subsequently be saved in ASCII to tape or disk.

This buffer can also be filled with an ASCII file for transmission to another device. The Apple would need a similar program. You would also need a modem and a cable to hook it to your RS-232 port on the back of your CoCo.

The transfer would take place as follows: Your friend with the Apple would telephone you or vice-versa. You would set one modem on originate and the other on receive. An Apple ASCII file would be loaded into the Apple's smart-terminal program's buffer. It would be transmitted to your CoCo's smart-terminal's buffer. You would save it to tape or disk for future editing with an ASCII-capable word processor such as Scripsit, Telewriter-64, or VIP Writer. Once edited to conform with the CoCo's Basic, you could load it in as a regular program.

**Q.** I recently paid Radio Shack \$255 (\$149.95 for the chip set, \$45 to modify my D board to accept 32K, and \$30 to install 32K) to upgrade my CoCo. For this price, I did receive the new Color Basic ROM 1.2. What additional modification and cost is required to run the new OS-9? Should I buy Radio Shack 35-track drives or 40-track drives from other vendors?

*Carolyn J. Testa  
Springfield, VA*

**A.** Assuming the 64K mod is incomplete on your machine, you only need complete the steps starting with step 1 in the center column at the bottom of page 46 of the article "64K Modification," *HOT CoCo*, July 1983. Be aware that Fig. 2 on that page is in error. The pins should be numbered counterclockwise from the notch.

I personally prefer 40-track 5 1/4-inch disk drives as opposed to Radio Shack's 35-track drives. The advantage of

## DAISY WHEEL New Smith Corona TP-2

True letter quality printer for less than the cost of an office typewriter! Priced \$500 less than other popular daisy wheel printers!

## Doctor ASCII

the 35-track CoCo drives is that service is as close as your Radio Shack store.

**Q.** I would like to know if there is a way to use color graphics in the 256-by-192 mode and the price of the book *Assembly-Language Graphics for the Color Computer*.

*Michael Cardillo  
Largo, FL*

**A.** Four-color graphics in 256 by 192 appeared in October's Doctor ASCII column in response to Matthew Edward's question. The book *Assembly-Language Graphics for the TRS-80 Color Computer*, by Don Inman, published by Reston, sells for \$14.95.

**Q.** Could you please tell me how to "lock up" programs I have written? I would like to have my Basic programs unlistable and unbreakable.

*Brian Rupert  
Kittanning, PA*

**A.** Spectrum Projects, 93-15 86th Drive, Woodhaven, NY 11421, markets the program Hidden Basic 1.0, which seems to do what you want. It sells for \$19.95 and works with Basic or Extended Basic.

**Q.** In September's Doctor ASCII column, Bruce Esposito asked about scroll protection and you told him to use

POKE 359,0. It does not work for me but POKE 359,16 does.

In the same issue, I changed the Romfix program from the "Disk Utilities" article to save the programs to tape. I used EDTASM+ to relocate the programs so that they start in RAM at \$0600, but they will not EXEC. Can this be done?

*Timothy Ambrose  
Dunedin, FL*

**A.** The POKE 359,0 works with a disk system, your POKE 359,16 seems to work fine with tape. Sorry for the confusion.

The Romfix program was not designed so that the resulting machine-language programs could be offset loaded. Most ROM packs are not written in position-independent code, so this was not a consideration. If you have 64K and you load your tapes created by Romfix without an offset, they should work fine.

**Q.** I am interested in learning how the sort routine works in the Directory Sort program ("Disk Utilities," September 1983).

*Douglas R. Cook  
West Jordan, UT*

**A.** The Directory Sort program used a bubble sort. I am providing Program Listings 2 and 3 to illustrate how it works. Listing 2 will do a bubble sort for you. Initially, you will be interested in Listing 3. It demonstrates the bubble-sorting algorithm on your TV screen.

To put information into ascending order, scan the data from the bottom up. Each time you encounter two adjacent

```

210 FOR I=1 TO N
220 PRINT A$(I)
230 NEXT I
240 END
```

*Program Listing 2. Bubble Sort*

points that are not in order relative to each other during a scan, interchange their relative positions.

The scans will get shorter as the sort progresses. The length of a scan decreases by one with each new cycle. The top of the list gets filled with values from down below as bubbles would head upward in a fish tank, hence the name. Continue scanning until one of two things occurs: you have completed N-1 scans or you have completed a scan without making an interchange. ■

# Re:FLEX

*Ed. note—This month, Scott Norman takes over this fourth in our bi-monthly series on the FLEX operating system.*

No doubt about it; it seems funny to be welcoming readers to my column when the column itself has been around for a while and I'm the newcomer. In any event, I'm happy to be doing Re:FLEX, and I look forward to reporting my experiences with some interesting software.

If you are familiar with The Color Key, my former *80 Micro* column, you know that my principal interests are applications software, high-level languages, and utilities—more or less in that order. So, I envision Re:FLEX as a forum for discussing these topics as they apply to the advanced Color Computer operating systems. Note the plural.

Therefore, I'll direct this column primarily toward the present or prospective FLEX/OS-9 user who wants to know what's available and how it works. I'll try to communicate some sense of how various pieces of software "feel," and I'll discuss things that may not be obvious from the advertisements and manuals. I'll do some spreadsheeting, dig into a couple of FLEX word processors, and have a look at some of the business software available in CoCo FLEX formats.

And just to indulge myself, I have a copy of TSC's Pascal that's crying for some action. More on this at a later date.

I'm serious about covering OS-9, too, but where is it? At this writing (September), OS-9 isn't available yet. Frustrating, but I expect Basic-09 to be worth the wait.

Meanwhile, I expect to have Frank Hogg's O-Pak running as soon as he gets the file-translation routines finished. That will give me optional FLEX-like high-resolution text screens for OS-9, along with the ability to

## AN INTRODUCTION, AND A COUPLE OF "OTHER" BASICS

*by Scott Norman*

swap files among the various CoCo operating systems.

It's a good thing that O-Pak's high-res screens are optional, though. I understand that OS-9 will leave only 34K or so of RAM free when the screens are in use, and Basic-09 itself takes something like 22K! That extra 6K of screen RAM could come in very handy.

That kind of memory usage might mean that, even with low-res video, you'll see OS-9 software written in small modules, with the attendant need for many disk accesses in the course of normal operation.

I also have to believe that memory limitations will keep multitasking from being much of a factor for CoCos unless someone starts producing add-on RAM cards. Would it be possible to put a couple of boards with, say, 64K apiece into the expansion interface? That would let additional users do something meaningful.

And speaking of being useful, my contribution to the rumor (speculative forecasting) mill for this month is the unconfirmed story that the Shack is working on an inexpensive 80-by-24 video-display card for the Color Computer. If true, that certainly wouldn't hurt business applications. Could this be another candidate for the expansion box?

### Random Basic for FLEX

Because of my own interest in high-level languages, I'm going to review some of the features of Random Basic (RBasic) (Computerware, Box 668, 4403 Manchester Ave., Suite 102, Encinitas, CA 92024) and Extended Basic (XBasic) (Technical Systems Consultants, 111 Providence Road, Chapel Hill, NC 27514). This might be old stuff to some of you; if so, let's agree to meet on the other side. I have to start somewhere.

These are by no means the only Basic dialects supported by FLEX. By themselves, neither of them would be enough to make many people run out and buy the operating system, either. Neither supports high-resolution graphics, and neither has a decent capability for editing source code; you're in the big leagues now, so you need some sort of text editor for preparing long program files.

Random Basic was so named in order to call attention to its ability to deal with random-access disk files in addition to sequential files. The former can be handled in a more flexible fashion than the latter, of course, though it's not a very economical use of disk capacity. (XBasic can use random files, too.)

RBasic has other advantages. It can manipulate numbers with absolute values that lie between  $1.0E-99$  and  $9.99...E+99$ , as opposed to Color Basic's  $1.0E+/-38$ . This can be vital for scientific computation in which you encounter very large and very small numbers all the time—especially as intermediate results in long calculations.

RBasic computations can carry along 11 digits. This feature alone merits serious consideration by programmers who deal with problems in the physical sciences.

The language is a little schizophrenic in its approach to notation. You can abbreviate commands to the minimum required for unique identifica-

# of the hill!

It's a jungle out there, but the latest news on the Color Computer grapevine is that, above the swirling mists of confusion, more and more people are discovering **the Rainbow**®

Now in its third year, **the Rainbow** has become the standard by which all other Color Computer magazines are compared. And no wonder! **The Rainbow** towers above the crowd, now offering more than 300 pages each month, including more than two dozen type-in-and-run program listings, a host of articles and in excess of 30 hardware and software product reviews.

We lead the pack in Color Computer publications and are devoted *exclusively* to the TRS-80® Color, TDP-100 and Dragon-32. We made our climb to the top by continually offering the best and the most by such well-known authors and

innovators as Bob Albrecht and Don Inman, and games from top programmers like Chris Latham, Fred Scerbo and John Fraysse. **The Rainbow** offers the most in entertainment and education, home uses, technical details and hardware projects, tutorials, utilities, graphics and special features like Rainbow Scoreboard and our new CoCo Clubs section.

For only \$22 a year, you get the keys to all the secrets locked in your CoCo!

Are you searching through the jungle of claims and clamor? Climb above it all. Look up. Find **the Rainbow**

 TDP System 100  
 Dragon-32  
 MC-10

tion, while you can give variables names up to 126 characters long (although the interpreter only considers the first six).

This can be quite helpful in making sense out of someone else's code—or even your own old material.

RBasic has several "housekeeping" commands for the control of output format. It is fairly simple to specify print operations that will result in right-justified text, columns of figures aligned on their decimal points, and so on. All in all, it is much easier to set up a good-looking format for printed output in RBasic than in the Color Basics.

There are a full complement of arithmetic and relational operators and Basic functions for manipulating both numerical and string qualities. Novelties include  $IMOD(X,Y)$ , which returns the integer remainder of dividing X by Y.

Besides being able to call machine-language subroutines, the RBasic user can define as many as 26 "personalized" functions for subsequent use within a program, much as in Fortran:

```
DEF FNA(X) = (Defining Expression)
```

There are a few restrictions. Function names must consist of FN plus a single letter, the defining expression must fit in one program statement of 128 characters or less, and there can be only one (nonsubscripted) independent variable. The variable actually in use when the function is called in a program replaces the dummy variable, X.

RBasic has an ON ERROR command for making programs crash-proof. Simply insert a statement like the following:

```
ON ERROR GOTO (line # of routine for continuation)
```

before any potentially critical step in a calculation. It is possible to take corrective action, depending on the nature of an error, using the ERLINE and ERCODE functions that return the line number in which an error occurred and a numerical code for the error itself.

RBasic has a few more commands and functions for dealing with random-access files than Color Disk Basic does. The two languages have to per-

form pretty much the same operations, but there are enough differences in syntax to make careful study of the manuals worthwhile.

For example, there is a useful RBasic function/command named RECNO. This informs you of the current position of the record pointer, and (in conjunction with the SET statement) allows you to move the pointer to any location within a file.

(See my review of RBasic (*80 Micro*, April 1983, p. 198) for a more detailed report.)

## On to XBasic

RBasic's biggest drawback is its speed—or rather the lack thereof. It takes nearly three times longer than Extended Color Basic to perform a Sieve of Eratosthenes benchmark, which is primarily a test of a language's ability to execute loops.

*"...XBasic zips through  
the same program at least  
25 percent faster  
than the Color Basics..."*

On the other hand, XBasic zips through the same program at least 25 percent faster than the Color Basics, even when it is restricted to the use of floating-point variables. Simple loops in which the counting variable is defined as an integer (a nice feature of the TSC product) really wail. They execute about four times faster than with the Radio Shack Basics.

Does this mean that XBasic is the hands-down winner for operating speed? Not exactly—the speed of a high-level language depends on more than FOR...NEXT loops. To test many of the mathematical functions, I use another benchmark that calls for 100 computations of:

$$\text{EXP}(-X) * (\text{SIN}(X)) \wedge 2$$

for values of X between 0-10.

When I tested Color Basic and the two FLEX Basics against this, the standings changed quite a bit:

```
Disk Color Basic: 13 sec.
XBasic: 19 sec.
RBasic: 55 sec.
```

The RBasic times are actually on the low side, because its exponentiation routine failed when  $\text{SIN}(X)$  became negative; therefore, I had to resort to multiplying two SIN functions together.

XBasic is clearly faster than RBasic, but I still think it's interesting to keep the very respectable performance of Microsoft's offspring in mind before making any extravagant claims.

XBasic is big: a 78-sector FLEX file accompanied by a separate two-sector file for its line-renumbering utility. RBasic is only 50 sectors long, leaving 35.8K of RAM available for source code, as opposed to XBasic's 26.5K. But both of these are a healthy increase over Disk Basic—especially when you remember that the two FLEX dialects still use a high-resolution screen for text.

Incidentally, XBasic has a numerical range of 76 orders of magnitude, just like the Radio Shack product. The difference is that XBasic carries a precision of 13-16 digits.

Here are a few of XBasic's unique features:

- You have the option of specifying a line number in the RESTORE command, so that you can reuse portions of a series of DATA statements.

- A SCALE command scales all floating-point numbers by  $10^N$  (Scale factor) and rounds them to an integer before they're used within a program. The result is that roundoff errors become much less of a problem in long calculations; being integers, all of the numbers used in the computation have exact representations in the binary system. Results are reconverted to floating-point representation for output.

- SWAP interchanges the values of two variables. Technical Systems Consultants (TSC) claims that this specialized command can reduce the execution time of a sort (an obvious application) by 20-30 percent.

- PTR is a function that returns the address of the variable named as its argument. I have had to go through contortions with PEEK arithmetic to get the same information out of Extended Color Basic.

- DPOKE stores a double-byte argument in a specified location—just the thing for setting pointers. There is a corresponding DPEEK function,

## Re:FLEX

along with a standard single-byte POKE and PEEK.

XBasic has error-handling and function-definition routines very much like those of RBasic. Functions can have two-letter names, which means that you are unlikely to run out of computing power in any practical application. You can call a function FN-- where -- is anything except a two-letter Basic word like ON or IF.

In the same vein, there are complete facilities for sequential and random disk file I/O. The TSC manual (85 pages with appendices) does a sober, straightforward job of telling you about the syntax required to get on the air with file manipulation. It also goes into some detail about the use of virtual arrays, which use random file I/O techniques to handle much larger data arrays than would actually fit into memory.

When you record an XBasic program on disk with the usual SAVE command, it produces a conventional ASCII file. Naturally, you can list and manipulate this file (which has a default extension of .BAS) with standard FLEX text editors. This is very desirable, in view of the language's lack of a built-in editor.

On the other hand, XBasic offers a COMPILE command that saves a program in binary form, including program and DATA statements together. The resulting disk file defaults to a .BAC extension, and is usually considerably smaller than the ASCII version. It loads faster, although it doesn't run any faster.

You can't edit or even list a COMPILED file after it's loaded. You can't save or compile additional copies, either. This feature provides the commercial programmer with a measure of security against prying eyes.

TSC produces another piece of software, the Extended Basic Precompiler, which also accepts .BAS files and converts them to .BAC format. The Precompiler offers much more, however—like the opportunity to dispense with line numbers and GOTOs in favor of labels for modules of source code, *a la* Basic-09. But that's another story, for another column. ■

## EPROM BURNER/ ROM EMULATOR

The ProtoEPROM-CC from Prototech, Inc. will program and run 2716, 2732, and 2732A EPROMs. With the built-in 4K of RAM you can create and debug your own program pack software, then copy it into EPROM. Plug the disk (or program pack) into the expansion port of the ProtoEPROM-CC to save or load EPROM images on disk. Both RAM and EPROM are programmable directly from BASIC or from assembly language. The ProtoEPROM-CC plugs in to your Color Computer ROM slot and is completely powered by the Color Computer. ✓82

## SOURCE CODE?!

INTRODUCING UNATRON

A new challenge for the CoCo

Venture where atomic fission is a way of life and reactivity control is the key to success.

Special Features:

- 9 screens
- Up to 85 active characters at a time
- Over 100 distinct shapes
- User modifiable
- Solid joystick control
- Extremely powerful, Strategically challenging

Also Included:

- All source listings, fully commented in 132 columns
- Complete documentation on all aspects of software and technique
- Modification information with examples

# PRODUCT NEWS

edited by Cynthia Smith

The information used in the Product News section is supplied through manufacturers' press releases. *HOT CoCo* has not tested or reviewed these products and cannot guarantee any manufacturer's claim.

## New CoCo Word Processor

Master Writer is a new word processor for the Color Computer that runs on 16K, 32K, or 64K machines; has disk or cassette capabilities; and does not require Extended Color Basic.

Master Writer's full screen-oriented editor allows you to move the cursor anywhere in your text using the up, down, right, and left arrows. Do this one character at a time, or by line or page. Insert, delete, or replace text at the cursor watching your changes as you make them. Delete or move blocks of text from one place to another. Merge in text from other files.

It features an automatic carriage return after the last complete word on each line, and it has automatic page feed so you don't have to worry about where a line or page ends.

An easy-to-understand manual has you using Master Writer in minutes. It is a menu-driven system with single-letter commands. Check any command without having to refer to the manual with the help screen. Its 10 programmable function keys allow easy insertion of frequently used words or phrases.

Master Writer works with any printer. Take full advantage of your printer's special functions such as variable character size and emphasized characters with easy embedding of printer control codes. The global-search function lets you quickly locate specific strings for replacement or deletion.

Other features include easy setting of left, right, top, and bottom margins, printer line width, and

lines per page. Also auto repeat keys, auto line centering, auto page numbering, and choice of display color format make operating more efficient.

Master Writer sells for \$14.95 for cassette and \$19.95 for disk from Pyramid Distributors, 527 Hill St., Santa Monica, CA 90405. 213-399-2222.

## Gold Plug-80

The Gold Plug-80 for the Color Computer solves problems of poor contact at the card edge connections of the disk controller module and the disk drive cable at the module and disk drives.

Included in the disk module kit are ground tab extensions that contact the ground clips on the CoCo's female connector. Gold Plug-80 extends this connection 1/2 inch, and ground tab extensions extend ground tabs 1/2 inch to contact ground clips, reducing RFI to the monitor. Extensions are required only on disk module or external module box.

The Gold Plug-80 for the CoCo disk module (both ends), including ground tab extensions is \$16.95; for the external module box or the computer end of the disk module including ground tab extensions, \$8.95. The disk drives or ROM

modules are \$7.95 each. A gold-plated drive cable is recommended and available from E.A.P. Co. for \$29.95 (two drive) and \$39.95 (four drive). A gold-plated female connector for the CoCo is available for \$8.95. Contact E.A.P. Co., P.O. Box 14, Keller, TX 76248. 817-498-4242.

## Display Noise Eliminator

The Display Noise Eliminator will get rid of the annoying jitter and wavy lines that your Color Computer is putting on your TV screen.

Many users find that their CoCos have more of this kind of interference after converting to 64K, or adding disks. This is due to the additional interfering signals from the computer, disk controller, and disk drives. The Display Noise Eliminator is a special type of filter that traps this noise and prevents it from reaching the TV.

The Display Noise Eliminator is supplied as a kit that takes two minutes to install. Installation requires no special tools or soldering. The computer case is not opened, and the warranty is not affected.

It sells for \$14 from Emerald

Systems, 13052 Ferntrails Lane, Creve Coeur, MO 63141.

Reader Service ✓ 570

## New from CoCoPro

The Dual Cassette Copy System for the CoCo lets you load from one cassette recorder and save to another with machine-language software. No longer do you have to change cassettes after loading or saving each program. DCCS starts copying with the first file encountered, or at a specified file name. It automatically adjusts up to 64K and displays remaining memory when loading. Select up to nine copies of each program.

DCCS is a menu-driven copy program. The default modes copy each file encountered on the first cassette one time onto the second cassette. Normally, files with errors are bypassed. As files are read and copied, a directory is generated on the screen showing the length of Basic programs and data files and the start, end, and transfer address of machine-language programs. A blank leader of eight seconds duration is automatically placed between all files recorded.

From the menu, you can change the number of copies to be made, select that the copying begin at a specified file name, and force copying of files with tape read errors. While the copying is underway you can enter a keyboard character that causes the operation to pause at the next possible step without aborting the ongoing procedure.

DCCS includes program on cassette, motor control adapter cable for the second cassette recorder, and complete instructions. It sells for \$42 from CoCoPro, P.O. Box 37022, St. Louis, MO 63141.

## MagiGraph

MagiGraph is a graphics development utility for the Radio Shack Color Computer, designed for experienced Basic and Assembly-lan-

The Gold Plug-80

## PRODUCT NEWS

guage programmers. The program simplifies the task of drawing highly detailed graphics characters, up to and including an entire high-resolution graphics screen.

MagiGraph has a full set of logical operation and pixel manipulation functions that simplify the development of a character in all possible color and position combinations.

The program offers nine animation buffers that allow positions of an animated character to be tested and revised so that animation blends together smoothly. You can list the pixel codes of a graphics character in hexadecimal numbers to a printer, and save the graphics screen on cassette tape or floppy disks to be used later by another program, or revised with MagiGraph.

MagiGraph is available on cassette for \$34.95 (16K required); disk for \$34.95 (32K Extended Color Basic required); Amdisk cartridge for \$44.95. Documentation and sample programs are included in the package. Contact The Micro Works, P.O. Box 1110, Del Mar, CA 92014. 619-924-2400.

### Business Sense From The Source

The Source, a communication and information service for personal computer owners, has recently announced these services.

- Bizdate is an electronic business magazine updated 55 times during the working day. The user signs onto The Source and types Bizdate to receive a menu of activities in all major financial markets, plus the latest financial and business news stories, analyses, and editorials.

Its first edition is available at 8:30 a.m. and in it you will find items such as the Board Room (reports from The Business Roundtable, The American Enterprise Institute, and other business leaders), U.S. News Washington Letter (details on investment opportunities, tax issues, and real-estate trends), and a Commodities Index (includes opening and closing charts, analyses and commentary on precious metals, treasury reports, grains, cotton, sugar, coffee, cocoa, lumber, and livestock).

- Stockcheck lets you monitor the stock market and retrieve information by typing in a symbol. At your access are current quotations, price/earning ratio, sales volume and net change. With Stockcheck you can create portfolio files for stocks or bonds and call up the latest quotes on them.

Data originates from UPI, and N.Y. and American bond market reports. Single command services include information on gold prices, Dow indexes, NYSE indexes, currency reports and information, Standard & Poor's indexes, and metals market prices.

All services are accessible for personal computers or communicating word processors. It is a local telephone call in many major metropolitan areas. Registration for The Source is \$100, and basic use is billed at \$20.75 per hour weekdays, and \$7.75 per hour evenings and weekends. Contact The Source, 1616 Anderson Road, McLean, VA 22102. 703-734-7500.

### Hi-Resolution Screen Package

The Hi-Resolution Screen Package is designed to improve the standard 32-by-16 text-mode display of the Color Computer through the use of Cer Comp's Hi Resolution Graphics Display. The program is fully integrated into the existing Basic ROM software and can be used with standard Basic programs as well as others. The format of the display when the program is first executed defaults to 51 characters by 24 lines.

This display can be changed to 64, 42, 36, 32, or 28 characters per line from the keyboard, and the various screen sizes are displayed on the screen simultaneously.

The package also includes other control-code functions that allow various screen functions comparable to other video terminals. They include reverse screen, reverse character, underline character, and double-size characters. Other control codes allow erase-to-end-of-line, erase-to-end-of-screen, clear screen, home cursor, and bell tone. All these features are controlled through control codes sent via the Basic CHR\$(n) statement, or through machine-language routines.

It sells for \$19.95 plus \$2.50 postage from Cer Comp, 5566 Ricochet Ave., Las Vegas, NV. 702-452-0632.

### Battery Back-Up for CoCo Memory

Sav-A-Byte Battery Back-Up (BBU) now allows you to use your full complement of 32K/64K resident CoCo memory for word processing or program development applications without worry-

ing about common power-line glitches. Frustrating and time-consuming intermediate SAVE routines are a thing of the past with BBU. Just complete your job and save only once.

Immunize your CoCo against memory loss by plugging the BBU cartridge into the ROM port and connecting its external rechargeable battery. The battery is constantly being charged by the CoCo power supply and stands ready to maintain all memory content for up to three hours during prolonged power loss. An on/off switch and LED indicator on the cartridge allow for control and monitoring of the BBU function.

You are still able to use the ROM-port bus because the BBU features a ribbon cable bus-extender that allows you to maintain interface with a disk controller or other standard ROM port interfaces.

The BBU is compatible with CoCos that use 64K RAM devices and is available now for \$99 (including battery) from Sav-A-Byte, 2857 Emanuel Church Road, W. Columbia, SC 29169. 803-356-2398.

### Disk Loader

Disk Loader for the TRS-80 Color Computer loads most 16K machine-language programs from tape to disk. This new program takes tape-based machine-language programs, stores them on disk, and allows them to run automatically.

Disk Loader is especially designed to load programs that interfere with normal disk operation. It saves multiple copies, allows renaming the program, and automatically gives program load and execute addresses. Supplied on tape with easy-to-operate instructions, Disk Loader works with any 32K or 64K Color Computer disk system. \$13.95 ppd from Stuart Hawkinson, 6695 S.W. 203rd Court, Aloha, OR 97007. 503-642-9146.

### Take Charge Of Your Money

Money Manager is a complete home money-management system with small-business applications, containing optional, automatic budgeting of specified accounts.

Menu driven, the program allows up to 26 accounts and up to 300 transactions before deleting the transactions, retaining the account balances. You can list all ac-

count balances and all transactions, or only those in a specified account, plus save and load data from tape or disk. Printer is optional.

Supplied on tape only, with complete documentation for a minimum 32K Color Computer, Money Manager sells for \$24.95 from Reitz Electronics Inc., 3170 W. Central Ave., Toledo, OH 43606.

### Math Invasion

First it was the Klingons, then the Body Snatchers, and now we are invaded by savage math problems. Crystal Software has released a new educational game for the TRS-80 Color Computer entitled Math Invasion.

This game combines arcade-style action with sound educational principles. A group of alien math problems is descending upon the planet and the only defense is to solve the equations. You use a laser cannon with the correct answer, and you can instruct CADS (Computer-Aided Defense System) to assist you in making the proper calculation.

Invaders come from one of four distant galaxies: Addition, Subtraction, Multiplication, or Division. Each galaxy has three classes of aliens that require a different level of mathematical expertise to defend against.

You use a menu to select the type and difficulty of the invading math problems. Math Invasion is recommended for ages 7 and older, requires 16K Extended Basic, and is available on cassette for \$19.95 plus \$1.50 shipping. Contact Crystal Software, 6591 Dawsey Road, Rock Creek, OH 44084. 216-474-7626.

### A Pack Of Business Solutions

Bizpack is a business-planning and record-storing program for the FLEX-based Color Computer and other 6809 FLEX systems.

It features simplified spreadsheet entry, statistics, plotting, moving averages, forecasting, arithmetic operations between columns, automatic formatting, time-series analysis, automatic inflation adjustment, ability to rename commands, and array size limited only by the amount of disk storage.

The forecast function predicts the amount of money available for investment, the amount needed to

borrow, repayment schedule, the amount of cash on hand, and inventory, among other key items.

For special flexibility, Bizpack lets you perform any data manipulation possible in TSC XBasic, using an ancillary program format. Bizpack emphasizes an easy-to-use command structure that provides solutions to the challenges facing business people when they plan and control profitable operations, and a Bizpack license is \$120.

For further information contact Ike Jeanes, The Virginia Company, 303 Park St., P.O. Box 2167, Christianburg, VA 24073. 703-382-4135.

## Mark Data Shenanigans And Super Screen

For the game enthusiast and the serious computer user these two products for the Radio Shack Color Computer and TDP-100 are now available.

Shenanigans, a machine-language, hi-res adventure game, takes you from the heart of the city to remote wilderness in search of an elusive pot of gold at the end of the rainbow. For novice or experienced adventurer, Shenanigans is available on 32K cassette for \$24.95 and 32K disk for \$27.95.

Upgrade the performance and usefulness of your CoCo with Super Screen, a powerful machine-language program.

Replace your 32-character-by-16-line display with a 51-character-by-24-line display screen including a full upper- and lower-case character set. Super Screen fully supports the CLS and

PRINT@ Basic commands making it easy to format business and personal programs.

Super Screen gives a full implementation of the ON ERROR GOTO statement including the ERL and ERR functions. Now you can trap errors and take corrective action to prevent crashed programs and lost data using the same syntax as many other computers. This addition to the Basic instruction set lets you write user-friendly programs.

Another important feature is the Key Press Auto-Repeat. Hold the space bar down and automatically step to the desired position in the line.

Super Screen is usable with, and automatically adjusts to 16K, 32K or 64K Extended or Disk Basic Color Computers and is available on cassette (\$29.95) or disk (\$32.95). Both Shenanigans and Super Screen are available from your favorite dealer, or direct from Mark Data Products, 24001 Alicia Parkway, #207, Mission Viejo, CA 92691. 714-768-1551.

## RS-232 Checker

The Model 700 EIA RS-232 Interface Analyzer is a diagnostic tool designed for use at the standard EIA RS-232 or CCITT V.24 data interface of modems, multiplexers, terminals, and computers. It is inserted in series between the data terminal equipment and the data communications equipment (DCE) to provide access to and monitoring of all data, timing, and control signals.

The Model 700 uses state-of-the-art tristate LEDs to display polarity, activity, and validity of all key

interface signals, simultaneously, in red, green, and red-green mixtures. Out-of-spec signals and open circuits are spotted instantly.

A complete table of EIA/CCITT standard interface signal description is provided in a reference chart. A compartment holds a folded EIA cable and mini-patchcords. The unit is compact, and battery powered for portability.

The Model 700 sells for \$275. Contact Sales Dept., Electro Standards Laboratory Inc., P.O. Box 9144, Providence, RI 02940.

## Hurricane Plotter/Predictor

New from The Software Connection, a Hurricane Plotter/Predictor Program distinguishes between a tropical storm and a hurricane, and determines whether the storm is a danger to the area.

If the storm presents a danger, the program gives an alert and calculates the time until the storm hits the area. The map is available at the press of a key, and once the storm has been plotted it shows its exact location in relation to the United States.

It has a relocatable city symbol, is designed for 16K tape or 32K disk systems, and requires Extended Basic. The Software Connection offers this program for \$19.95. Contact them at 5460 N. State Road 7, Suite 108, Ft. Lauderdale, FL 33319. 305-484-7547.

## New for the Dragon 32

Elkan Electronics announces three new products for the Drag-

on-32 home computer.

● Nanos Quick-Reference card for the Dragon-32 is a 20-page card containing some hitherto unpublished information about the Dragon-32. Intended as easier-to-handle and easier-to-use than the reference manuals, the card is pocket size, and costs £2.95.

● The Dragon Cruncher conversion program is the first cassette-based, menu-driven program that converts most Dragon-32 programs for use on the Tandy Color Computer, and most Tandy Color Computer programs for use on the Dragon-32. This program also enables program listings from magazines such as *HOT CoCo* to be easily converted, without programming, for use on the Dragon-32. Dragon cruncher sells for £7.95.

● Quick-Shot deluxe self-centering joystick controller has a positive-response fire button and contour grip, and helps you improve your scores on arcade type games that require quick reactions. It sells for £14.95 (£1 shipping), or £28.95 for 2 (£1.50 shipping).

All three products are available from Elkan Electronics, FREEPOST, 11 Bury New Road, Prestwich, Manchester M25 8JZ. Phone 061-798-7613.

## Morse Code Teacher

Cynwyn now offers TRS-80 Color Computer and TDP-100 owners Morse Code Teacher, a program aid for learning International Morse Code. The program is designed for the beginner to International Morse Code and features three different practice routines that promote familiarity with the code and can increase copying or auditory recognition speed up to five words per minute.

In the introductory routine, whenever any letter or number on the computer keyboard is pressed, the program responds with the equivalent character in Morse code. The second routine generates and sends characters one at a time from predetermined letter/number groups and displays them on the screen for checking. In the final routine, random characters are sent either three or five words per minute for copying sessions of one minute, and are then displayed on the screen at the end of the session.

Morse Code Teacher requires 16K RAM and Extended Color Basic, and is available on cassette for \$15 postpaid from Cynwyn, 4791 Broadway, Suite 2F, New York, NY 10034. 212-567-8493.

From the Creators of Rainbow Writer . . .

## RAINBOW SCREEN MACHINE SUPER SCREEN MACHINE

The Rolls Royce of graphics/text screen enhancers — more features than all others combined!

Revolutionary — heralded as the most useful, powerful and versatile state-of-the-art utility ever developed for the Color Computer!

- Add these features to your computer/program: ML extension of Basic loads on top of 16, 32, or 64K machines to enable easy mixture of hi-res graphics and text in your programs. Dense text or large lettering for children, visually impaired or VCR title screens with no programming!
- User definable 224 character set featuring lower case descenders, Greek, cars, tanks, planets, etc., completely interfaced with all keys, commands, and P.MODES. 12 sizes (most colored) from 16x8 to 64x24.
- 2 distinct character sets automatically switch for sharpest lettering featuring underline, subscript, superscript, reverse video, top and bottom scroll protect, double width, colored characters in P.MODE 4, and help screen.
- Simple 2-letter abbreviated commands inside your program or control key entry from keyboard, even during program execution!
- Includes demo program, character generator program and manual. 16K Ext. Basic required - 32K recommended, \$29.95 Tape, \$32.95 Disk.
- All of the features of Screen Machine and more:
- Variable SMOOTH Scroll for professional displays, listings, business use.
- Variable volume Key Click (tactile feedback).
- EDTASM\* command for instant compatibility with R.S. editor-assembler cartridge, providing 64x24 display.
- Superpatch\* command for instant compatibility with disk EDTASM.
- True Break key disable and recognition.
- 10 User Definable commands used to activate your special drivers or subroutine.
- Dynamic Screen Dump command for use with Custom Software, Engineering's Graphic Screen Print program for simple printer "Snapshots" of your screen even during program execution!
- The new standard — Upgradeable at any time from previous Rainbow-Writer or Screen Machine purchase. Return old program, manual, plus cost difference and \$7.00 shipping and handling.
- Super Screen Machine \$44.95 Cass - \$47.95 Disk

YES, I want to easily create dazzling displays with the best SCREEN Enhancer for my Color Computer. Please RUSH me the incredible SCREEN MACHINE at the affordable price of:

Rainbow S.M. \$29.95 Tape - \$32.95 Disk

### Rainbow Quest for the Color Computer

A computer fantasy for young Color Computer users. Rainbow Quest is an adventure that combines fiction and programs. Readers must cross the planet Rainbow and master a series of challenges to succeed on the Quest. Each challenge is a program on cassette. Included are arcade games, puzzles, and mazes. Book and cassette sold together. \$24.97 BK7391 128 pp.

### Computer Carnival

For the TRS-80 Models I and III. These sixty programs for beginners will entertain and educate. Children will find mazes, word games, graphics, puzzles, and quizzes. Card games, logic tests, word and number quizzes, and letter guesses make Computer Carnival a learning experience. The Carnival Companion cassette of all sixty programs is also available. Computer Carnival and Carnival Companion \$24.97 CC7389 Computer Carnival \$16.97 BK7389 218 pp. Carnival Companion \$9.97 TP7389

### Inside Your Computer

Find out what goes on inside your Color Computer. Inside Your Computer explains microcomputer circuits and how they work. Topics include chips, interpreters, circuits, machine language, binary numbers, algorithms, ASCII code, software, and what they all mean to the computer. Includes many photographs and schematics. \$12.97 BK7390 108 pp.

### Annotated BASIC, vol. 1 and 2

This two-volume set teaches you the hows and whys of BASIC programming. TRS-80 Level II programs are taken apart and described in detail. Each program is accompanied by documentation, program annotation, BASIC concepts and definitions, and a flowchart. Volume 1 \$10.95 BK7384 160 pp. Volume 2 \$10.95 BK7385 125 pp.

### The Selectric™ Interface

You can turn an IBM Selectric I/O writer into a letter-quality printer for your computer. The Selectric Interface gives you the programs and step-by-step instructions you need for Selectric models 2740, 2980, and Dura 1041. With slight modifications, the instructions will work for various chips. \$12.97 BK7386 124 pp.

### Kilobaud Classroom

Learn electronics with this hands-on course. This collection of electronics projects starts with simple concepts and takes you on to building your own small computer. You'll learn electronics theory and get the practice you need to master digital electronics. \$14.95 BK7386 393 pp.

For credit card orders, call toll-free, 1-800-258-5473. Or send your order on a separate piece of paper to: Wayne Green Books, Retail Sales, Peterborough, NH 03458. Be sure to include the book title, order number, and price. Postage and handling is \$1.50 for the first book, \$1.00 for each additional book. Foreign air mail is \$10.00 per book. Check, money order, or complete credit card information must accompany your order. If you have questions about your order, write customer service at the above address.

# GIMIX STATE OF THE ART 6809 SYSTEMS FOR THE SERIOUS USER.

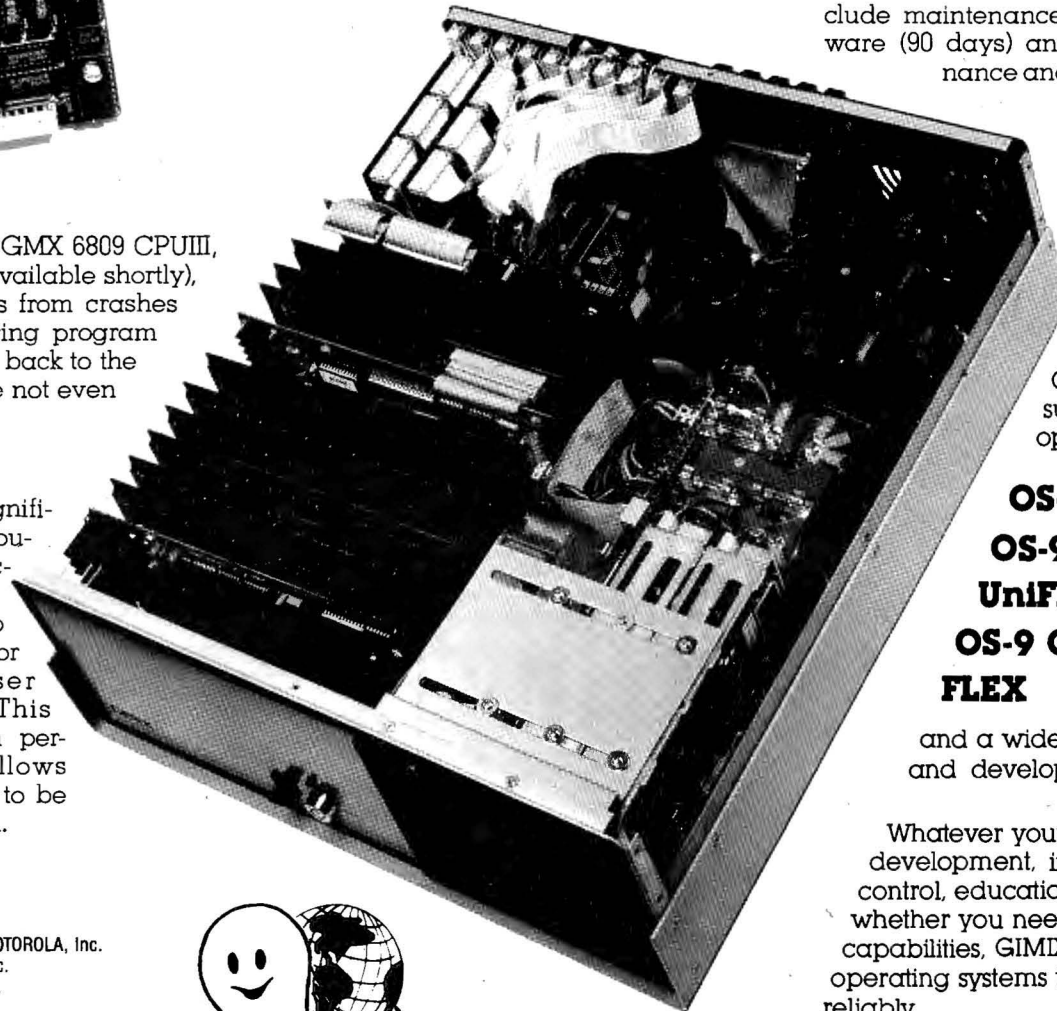

**GIMIX has 19MB or high performance  
47MB Winchester Drive Systems and/or  
Floppy Disk Drive Systems.**

For the ultimate in performance, the Unique GMX 6809 CPU III, using either OS-9-GMX III or UniFLEX GMX III (available shortly), gives protection to the system and other users from crashes caused by defective user programs. e.g. During program development, a programmer who crashes goes back to the shell or the debugger, while the other users are not even aware anything occurred.

The intelligent serial I/O processor boards significantly reduce system overhead by handling routine I/O functions, thereby freeing up the host CPU for running user programs. This speeds up system performance and allows multiple terminals to be used at 19.2K baud.

BASIC-09 and OS-9 are trademarks of Microware Systems Corp. and MOTOROLA, Inc.  
FLEX and UniFLEX are trademarks of Technical Systems Consultants, Inc.  
GIMIX, GHOST, GMX, CLASSY CHASSIS, are trademarks of GIMIX, Inc.

For the user who appreciates the need for a bus structured system using STATIC RAM and powered by a ferro resonant constant voltage transformer.

GIMIX has single user systems that can run both FLEX and OS-9 or Multi user systems for use with UniFLEX or OS-9.

GIMIX versions of OS9 and UniFLEX include maintenance and support by Micro-ware (90 days) and TSC (1 year). Maintenance and support after this period are available at extra cost.

(NOTE: this support and maintenance is only for use with approved GIMIX hardware)

GIMIX 6809 systems support five predominant operating systems:

**OS-9 GMX III,  
OS-9 GMX II,  
UniFLEX,  
OS-9 GMX I,  
FLEX**

and a wide variety of languages and development software.

Whatever your application: software development, instrumentation, process control, educational, scientific or business; whether you need single or multi-user capabilities, GIMIX has hardware and the operating systems to get the job done reliably.

Please phone or write if you need further information.

You've invested a lot of time and money into your computer . . . . .  
It's time that investment paid off!

## THE COLOR ACCOUNTANT

Introducing The Color Accountant (from The Programmer's Institute), the only complete personal financial package specifically designed for the TRS-80 Color Computer. This unique package includes:

- |                                   |  |
|-----------------------------------|--|
| 1. Complete Checkbook Maintenance | 6. Color Graph Design Package (graphs any files) |
| 2. Chart of Accounts Maintenance  | 7. Check Search                                  |
| 3. Income/Expense Accounts        | 8. Home Budget Analysis                          |
| 4. Net Worth Statement            | 9. Decision Maker                                |
| 5. Payments/Appointments Calendar | 10. Mailing List                                 |

After the initial setup, **THE COLOR ACCOUNTANT** requires less than an hour of data input each month.

The checkbook maintenance program is the key to the entire package. Once your checkbook is balanced, the checkbook summary file will automatically update the home budget analysis, net worth, and income/expense statements. You can then graph any file, record bills and appointments, make decisions, print a mailing list, analyze various accounts or stocks, and even calculate taxes.

All programs are menu-driven and allow add/change/delete. Each file and statement can be listed to screen or printer, and saved to cassette or diskette. **THE COLOR ACCOUNTANT** also comes with 40 pages of documentation that leads you step-by-step through the entire package. The TRS-80 COLOR Ext. Basic requires 16K for this package.
