Feature Program

Forms the Easy

ave you ever needed to create a custom form for personal or business use? If so, you probably pulled out paper, a pencil and a ruler, then got busy drawing all sorts of lines and boxes. Then when you got ready to add the text, you likely discovered it would have been much easier had you started with the text and added the graphics to that - especially if you planned to use the CoCo to add the text. Forms takes most of the tedium out of creating good-looking forms.

Forms, a program designed for the CoCo 3, is a sort of word processor for forms that allows you to easily mix text with graphics; it gives you full-screen control over placement of text and graphic elements. The program does not require an RGB monitor, but it is important that the monitor you use be capable of showing all the columns on a 40-column screen. To get started, enter the program as shown in the listing and save it to tape or disk. If you have an RGB monitor, enter RGB before running the program.

When you run Forms, you'll first be asked if you want to read the onscreen instructions. If so, press Y. Otherwise press any other key, and you'll be prompted to adjust the paper in your printer. Knowing just where to position the paper will take a little trial and error the first few times

practice with a few "dummy" forms before setting out to build your masterpiece.

Use the arrow keys to move the cursor around the design screen. Rather than displaying a block cursor, Forms uses dashes at the top and left side of the screen to show you where the cursor is positioned — it is at the intersection of these short lines. Hold the SHIFT key and press any arrow key to move to the corresponding edge of the screen.

Forms gives you a working area 52 columns wide by 101 lines deep for creating your form. (The vertical area is broken into four parts - in other words, the pro-

gram gives you four full screens on which to work.) Each character position on the screen is unique - when the cursor is where you want it, press the key for the appropriate graphic element (see Figure 1). The elements supported allow you to create a wide variety of lines and boxes for your form. As you add characters, the cursor position is not automatically changed; you'll need to move the cursor for each character you add. The actual cursor position, however, is always available at the bottom of the screen.

To add text at the current cursor position, press the CTRL key and enter the text

you want. You can backspace over mistakes by using the left arrow - in the text mode, the left arrow does not update the graphics-screen cursor position. The text is represented on the screen by triangles (the CoCo 3 does not support a 52-column video mode). However, what you type appears at the bottom of the screen as you enter it. As you type, the cursor dashes are updated, making it easier to correctly position the text. When your text is complete, press CTRL again, or press ENTER. You are automatically returned to the graphics mode.

For printing purposes, Forms sets the printer linefeed to half its normal distance. For this reason, always skip a line between successive lines of text. However, graphics lines may be added between these lines with no problem.

To erase the graphic element or character at the current position, just press E. To minimize screen clutter, it is important that you never place a new character over an existing one - always erase the old character or element first.

As I mentioned earlier, Forms supports four screens for a total of 101 lines. When you have completed the top fourth of your form (Screen 1), press S to move to the next

See Forms on Page 8

Key Frame Transformations

ne of the earliest techniques used for computer animation is key-frame interpolation, a process for creating the intermediate visual frames between the critical positions (key frames) in an animated sequence. Key-frame interpolation was intended to replace the "in-betweening" ('tweening) used by countless animators for hand animation. As you might guess, 'tweening is a means of smoothing the movement of an animated figure from one key position to the next.

For many reasons, two-dimensional computer 'tweening was not very successful. The result is that such simplistic techniques gave computers a bad name in the

character-animation industry. (Three-dimensional key-frame interpolation helped to restore the computer's reputation. A quick look at some of today's television commercials shows computer animation can be quite impressive.) Still, two-dimensional key-frame interpolation is a fascinating computer animation technique in its own right. While not particularly useful for traditional character animation, it works well for less well-defined objects and abstract shapes. It is particularly effective for transforming one graphics object into another (say, Africa into a Coke bottle).

See Key Frames on Page 12

A Trip to Yesteryear

Our anniversary has come and gone, and this time of the year for THE RAINBOW always gets me thinking about the past. This is probably as good a time as any to talk about a couple of the things which have been sort of secrets regarding our little magazine. These are not big-time secrets—neither Oprah nor Sallie Jessie would care a whit about them — but every year at this time I tell myself I should mention them, then something more important comes up and they get shoved aside.

Our biggest secret involves our name. It was a subject of much debate in the earlier years when Jim Reed was the managing editor. He called the magazine RAINBOW, while I insisted the name was THE RAINBOW. Reed would write columns, letters and make announcements at RAINBOWfests about RAINBOW; and I would write my column, answer my letters and make my announcements about THE RAINBOW.

I asked Jim (who by the way is one of the founding members of the Louisville palindrome society) to come into my office one day, handed him the latest copy of the magazine, and asked him what its name was.

"RAINBOW," he replied.

"THE RAINBOW," I said.

"But, Lonnie, I've been calling it just RAINBOW for years."

"But, Jim, I've been calling it THE RAIN-BOW longer."

Anyone who can think up YADDAY (which Reed claims to have done) and similar palindromes doesn't give up on words easily.

"But just RAINBOW sounds better," he told me.

"But THE RAINBOW is its name."

"Well, I really think we should consider changing it, then. Especially since that is what I've been calling it."

"Except, Reed," I said, "all of our forms and all of our magazines and all of our bills are printed with a *the*. If we had to reprint them, it would cost a bunch of money."

"That's the trouble with you. Since you became a publisher, you worry about money instead of how things *sound*. Just RAINBOW sounds better."

"Well, Jim, I suppose we *could*. That is, if you don't mind waiting for your paycheck until we reprint all our materials."

The discussion seemed to end right there.

Speaking of ends, look at the little thingie ("thingie" is a word coined by my daughter, Laurie) right above this paragraph. It is called a *star-dash*. It is five asterisks centered in a column and is a generally accepted term in the world of typesetting. But not here, it would seem.

Our first graphic artist, Sally Nichols, once came to me and asked how I wanted to set off several subjects in an article I wrote.

"Just star-dash them," I told her.

"Who-what?"

"Star-dash them."

And she walked away. Back an hour later, she had drawn a dash in the shape of an enlongated star.

"Is this what you want?"

A better story about Sally is the time we got our first stat camera, a pretty heavy piece of equipment about 5 feet high and 3 feet deep with a sort of portable darkroom built in. The salesman who sold it to us had to have three men deliver it and said he would be by later in the day to teach us, particularly Sally, how it worked.

He showed up, talked to Sally and me for a minute or two, and then turned to her and said something like "Come on, Little Girl, and I'll show you how this works."

A full-fledged graduate of the University of Louisville's design program, Sally was not to happy to be a "Little Girl." But she and the salesman went off to the corner we had assigned to the camera.

When I came by, the salesman was "Little Girl"-ing Sally all over the place, and I could tell she was not pleased. An almost interminible hour passed and the salesman was finishing up when he said the last thing he needed to do was level the camera.

"OK, Little Girl," he told her, "you get down here and turn the little screw-in feet while I hold the camera up." Sally laid down on the floor, and he groaned and picked up the heavy camera. While he held the camera in the air, Sally said: "Oh, Wally, now where are those feet? This Little Girl is so confused."

Sally was never "Little Girl" again.

It is true that long ago we ran a questionand-answer column by one of our technical people, Ed Ellers.

"What'll we call it?" Jim Reed asked

Ed's technical thoughts were sometimes somewhere in the stratosphere. On one occasion, I had hooked a new monitor to my CoCo and was having problems with RFI. I called Ed in to ask him why, only to be regaled by a lecture on everything from bandwidths to NTSB scan rates.

All I wanted was an answer. So, after about five minutes of this, I became impatient and finally said, "Earth to Ed, can you just fix it."

The column, thus, was named "Earth To Ed," somewhat over Ed's objection; but around Falsoft, the nickname "Earth" has stuck to this day.

I hope you've enjoyed my little trip down memory lane.

- Lonnie Falk

The Bottom Line

Editor:

Thank you for your continued support of our beloved CoCos. At first I was disappointed with your new format. After thinking it over, however, I realized THE RAINBOW could be printed on toilet paper and I would be happy. Just keep on publishing our only source of news.

Carla Sheridan 147 Lake Street Bellingham, MA 02019

OS-9 and Multi-Vue

Editor:

I would like information about OS-9 Level II and Multi-Vue — our nearest Radio Shack doesn't have these products anymore. Also, where can I purchase these products?

Terence Holmes 211 Long Street Leland, MS 38756

OS-9 is an operating system, a group of programs that controls how your computer operates. It offers more features and more control than is normally available through Disk BASIC. Multi-Vue is a graphical user interface (GUI) intended to make OS-9

Level II a bit more user-friendly. Both products should be available through Tandy's Express Order system—you can call (800) 321-3133 for more information.

Wants to Add EARS

Editor:

While reading through my back issues of THE RAINBOW, I saw numerous advertisements for a product called EARS. Is this product (or an equivalent) still available and, if so, where?

S. Remin 14 Wellington Road Clayton, Victoria 3168 Australia

EARS, a hardware/software product designed to allow the CoCo to accept verbal input from a user, was originally marketed by Speech Systems. We know of no company currently marketing EARS. Perhaps another reader may be able to offer more assistance.

Music Program for the CoCo 3

To all CoCo musicians and/or music programmers: help! For months I have been searching (so far in vain) for a CoCo 3 music program that supports onscreen music staves, chord input and note transposition as well as editing, playback and printing of music. It would be even better if it supported adding text to music (e.g., lyrics, guitar chords, etc.)

and MIDI connection facilities. I have seen these features for PCs, and all the kids at our local Primary School have access to such features on their Apples. Why can't we get them on our illustrious CoCo? Any comments, advice or offers are most welcome. I think I've picked all the brains down here!

Keva Lloyd 8-12 Gallagher Street Sea Lake 3533 Australia

We published a program by George Quellhorst in the April 1991 issue (Page 10) that supports onscreen staves. If using 0S-9 Level II is not a problem, consider UltiMusE III from Kala Software (3801 Brown Bark Drive, Greensboro, NC 27410)—it offers most of the features you mention and more. In the Disk BASIC market is Lyra. However, we are uncertain as to the current availability of this product.

Make OS-9 Easy to Use

Editor:

I want to shout a super-hearty hallelujah in response to John Perry's comments in the April 1992 issue. I went to one of the Atlanta CoCofests and spent several hours talking to folks offering the new computers, begging them to make OS-9 easy to use. All I got were blank stares.

There is a severe dearth of CoCo hackers who remember when they weren't

omniscient. There is no doubt that OS-9 and OSK are very powerful systems, but they will always be hidden in a corner if they can't be used very easily be someone other than hackers.

> Jim LaLone 9835 Standifer Gap Road Ooltewah, TN 37363

User-Friendly Software

Editor:

Why are so many software producers letting programers cut them out of five to eight percent of their potential market? I don't know how many times I have read ads for programs that seem to be just what I want, but four little words tell me I can't use then: mouse or joystick required.

Some years ago I was involved in an automobile accident. I have recovered well, but my fine control of my hands and fingers is not all that great. Through 30 months of hard practice, I have gotten my typing speed back to about 2/3 of what it once was. The mouse and joystick, however, are still useless to me.

Have programmers forgotten about the arrow keys? I doubt it. In fact, I'll bet the vast majority give those arrows a real workout while they are writing their programs!

There are thousands of us out here (many in far worse condition than I). Can you who market these programs really afford to ignore this potential expansion of your customer base?

I have written a number of game and graphics programs for my grandsons enough so that I can tell you it is not that hard to give users a choice of which control to use. Some of my programs have both a "text cursor" and a "mouse cursor." In these programs, when the keyboard is selected, pressing F1 puts the arrow keys into the Text mode and F2 puts them into the mouse mode; the CLEAR key is the "button."

And, please, don't forget diagonals. When both a vertical arrow and a horizontal arrow are pressed, the cursor should travel the diagonal path between the two.

Fred Rickards P.O. Box 794 Trinity, NC 27370

Desperate for Help with Hyper I/O Editor.

I have enjoyed THE RAINBOW for many years, and have found it to be a very helpful addition to my library of computer books and magazines. I want to thank all the people who have replied to my distress calls (through your great publication) for help and also THE RAINBOW staff, which has offered me help with software and hardware problems. It is rare to find such customer service these days, and I just thought you should know there are a lot of people out here who think you're doing a great job.

I would appreciate any help from anyone who uses (or has used in the past) a Burke & Burke hard-drive system with Hyper I/O. I picked up the system from a former CoCo owner. I am looking for any patches or programs that have been written to work with this hardware/software combination and would allow me to run several of my software packages with Hyper I/O.

Mychel Holtry 695 Park Avenue, Apt. 216 Idaho Falls, ID 83402 (208) 524-9027

Printing Pictures

I hope you can help me. I have a 64K Color Computer 2 with a black-and-white TV, an FD-502 disk drive and a DMP-132. I can get the printer to print words on paper. but it won't print pictures, even though I can view the graphics onscreen. I have tried to get the people at Radio Shack to help, but they don't know how to do this either.

Daniel Miller Route 1, Box 147 Church Hill, TN 37642

Printing PMODE graphics images with a printer requires a special program called a screen dump. See "Speedy PMODE Screen Dump" (THE RAINBOW, May 1992, Page 1) by Cray Augsburg for an in-depth look at printing these images.

Looking to Switch to OS-9

Editor:

We have a cassette-based CoCo 3 with 128K. We want to get a disk drive and use the OS-9 operating system, but we are very unsure as to where to go or what would be best for us.

When it comes to computers, we are all but lost. We've had ours for some time and also have Telewriter-64 (with which we are not very happy). We use the CoCo for ministry records and mailing lists, auto-repair records and parts inventory, and myriad other personal and small-business uses. Can you give us some direction and sound advice?

> Tiny and Wanda Brown #13B Mystery Place P.O. Box 2172 Alma, AR 72921

The OS-9 operating system, as we explained in our response to Terence Holmes above, is a group of related programs that manages the way the computer operates and the way we communicate with it. In the past, this operating system has been touted as not too user-friendly. The simple truth is, OS-9 is different than Disk BASIC and requires a little relearning. Since you have not yet experienced Disk BASIC, this relearning should not greatly affect you.

OS-9 has often been considered a hacker's operating system (as opposed to a user's system) since there are so many utilities and relatively few applications. But the necessary applications - word processors, filing programs and a spreadsheet - are available. In addition, a great deal of shareware and freeware is available through Delphi and other telecommunications services. Perhaps other readers will write you with their suggestions.

THE RAINBOW welcomes letters to the editor. Mail should be addressed to: Letters to Rainbow, The Falsoft Building, 9509 U.S. Hwy 42, P.O. Box 385, Prospect, KY 40059. Letters should include the writer's full name and address. Letters may be edited for clarity or to conserve

Letters to the editor may also be sent to us through our Delphi CoCo SIG. From the CoCoSIG> prompt, enter RAI to get to the Rainbow Magazine Services area of the SIG. At the RAINBOW> prompt, enter LET to reach the LETTERS> prompt, then select Letters for Publication. Be sure to include your complete name and

Faster Throughput for the CoCo 3

Originally developed as a low-power (CMOS) alternative to the Motorola 6809, the Hitachi 6309 microprocessor has been around for some time. Until recently, however, few people knew of its hidden enhancements (undocumented features) and the benefit they might offer to users of the CoCo 3.

The 6309 is pin-for-pin compatible with the 6809. In addition to extra registers and support for high-speed block moves (four times as fast as the 6809), the 6309 sports two modes of operation. In the Emulation mode, the 6309 acts as if it were a 6809 but includes new instructions for access to the extra registers. In the Native mode, however, the 6309 executes instructions in up to 35 percent fewer instruction cycles.

Chris Burke (of Burke & Burke) learned of these hidden features earlier this year, and at the Chicago CoCofest (May 1992) introduced PowerBoost. This product includes a 63B09E and socket with which you replace the 68B09E in the CoCo 3, and software for Disk BASIC and OS-9 Level II that allows you to take advantage of the 6309's Emulation mode.

Early reports on PowerBoost indicate processor throughput increases of 10 to 50 percent, depending on the operation being performed — an average of 15 to 20 percent is expected. Because OS-9 is a modular operating system (in contrast to Disk BASIC) throughput increases are more visible with OS-9.

BONUS OFFER: Soft Sector Binders \$3 Each

Go Grocery Shopping With the Coco FRUITS

B eans, oranges, tofu, toilet tissue, pork chops . . . whew! This shopping list is horribly disorganized. If only there was a quick and easy way to alleviate some of the burden of weekly grocery shopping.

Your CoCo 3, along with a disk drive and printer, can do just this. Grocery Helper is a menu-driven program that lets you select from an alphabetical list the items you want to purchase and print them in an

After you enter the program listing, save Grocery Helper to a fresh disk and run it. Make sure to keep the disk in the drive, though, so the CoCo can use it to store your data. The program stores your data in a file named LIST. DAT. If it can't find this file on the disk in Drive 0, the program assumes you haven't set up the master product list yet and takes you immediately to Option 1 (discussed below). However, if Grocery Helper does find a file with this name, a title screen appears and you see a menu of the programs six options.

Option 1, Add Items to Master File, allows you to add, delete, or change items in LIST. DAT. This master file holds up to 360 items of up to 18 characters each.

Grocery Helper supports nine product categories (see Figure 1). The category currently selected is shown on the third screen line. To move to the next category, hold the SHIFT key and press the up arrow. Similarly, use SHIFT-down arrow to move back one category.

The first item in the current category (or the first slot if there are no items in the category) is highlighted. The four arrow keys allow you to move the highlight bar over each listed item. To enter a new item or add to an existing one, position the bar and type the desired characters. In a slot that lists an item, Grocery Helper automatically positions the text cursor at the end of the existing characters. When you have finished entering an item, press ENTER (to move to the next slot) or any arrow key. Since the left arrow is used for cursor control, I wrote the program to interpret the CLEAR key as a backspace. To clear all the characters in the highlighted slot, press SHIFT-CLEAR.

While you are getting used to the program, it's not hard to forget one or more of the function keys. Press CTRL-H to call up a help window that outlines the most important functions. Press CTRL-X to return to the Main menu.

Option 2, Alphabetize Items, sorts the data in the master file in alphabetic order. Always use this option immediately after you create or modify the master file. Otherwise, the program will not correctly interpret the file, rendering the data useless.

Option 3. Select Items, is where you'll spend most of your time with Grocery Helper; use this option to select the items you want printed on your current shopping list. After you select this option, a list containing all the items in the file is displayed. The items are organized in alphabetic order, regardless of the category under which they fall. Use the up and down arrows to

move the cursor through the list, and press ENTER to select an item. (Selected items are indicated by inverted text.) Pressing ENTER while the cursor is on a previously selected item cancels that selection.

To move to the top of the list, use SHIFTup arrow. To go to the bottom, use SHIFTdown arrow. You can also press a single letter to move the cursor to the first item that begins with that letter in the list. As with Option 1, CTRL-H calls a help screen, and CTRL-X takes you back to the Main menu.

Option 4, Print List, is self-explanatory. To achieve a compact printout, I've inserted a control code to print the list in Tandy's microfont. If your printer (or eyes) don't support this small print, simply delete everything up to the RESTORE command in Line 4002 of the program, and change Line 4022 to 4022 GOTO 30.

Figure 1: Product Categories

Use Option 5, Exit, to stop Grocery Helper. Before ending, the program saves any modifications you made to the master file - make sure you have used Option 2 to alphabetize the list first.

Option 6, Clear Master File, is useful but dangerous. Selecting it erases the entire master file from the disk. Though I have made a reasonable effort to render this option goofproof, an unintentional

erasure can still result — please be careful. One final piece of advice: When you are entering items (Option 1) with similar names, enter them "last name first," placing a comma between the words. For example, enter green beans as BEANS, GREEN. (The space is not required after the comma.) Then when the list is alphabetized, the item will appear in an ordered section of the master file - the various types of beans are listed together, making selection easier. When you print the list, Grocery Helper interprets the comma as a delimiter and rearranges the item name (e.g., to GREEN

BEANS). When using this handy feature, be particular with your use of the comma.

BREADS

David LeBlanc is a certified engineer who plans to attend the Technical University of Nova Scotia for a degree in electrical engineering. In addition to working with computers, David enjoys participating in various sports, and his hobbies include reading and listening to music.

SURDOG SYSTEMS

Energy is everything; your home world depends on it. However, someone or something is slowly siphoning it away. As your world's champlon, you must climb into the experimental Power Tank to challenge this nemesis and his minions. Your key lies with the ability to teleport solid mass. Use this to manipulate and explore the endless stronghold of the enemy, and to exploit the free-floating DUPES (Dense Units of Photon Energy) to destroy the menacing Plasma Droids. Be cautious, though; those DUPES can be deadly, too! Photon, a fantastic new arcade game for your Coco3, contains spectacular 320x200 resolution, 16 color graphics, ultra-smooth 60 Hz animation, and loads of real-time music and sound effects. It will send your mind racing over endless possibilities, requiring quick decisions and reactions. Quite simply, Photon is incredibly addictive; it will deliver hours of excitement. Will you become your world's greatest hero, or just another energy slave? Req. 128K CoCo 3 and disk drive

GRAE

2.0 EXPRESS

Gratispress 2.0 is a complete graphics and music programming enrionment. From the beginner to the accomplished professional, you
can use Grafexpress to create lightning fast arcade games, graphic
applications and utilities, and windowing multimedia demonstrations! The Grafexpress package includes two incredible systems.
Grafexpress 16 works on all monitor types and offers support in 12
graphic resolutions (from 128x192 to 320x225). Grafexpress 256 ofters 6 resolutions (from 128x192 to 160x225) on a composite monitor)
in an astounding 256 colors! Ever see a CoCo do that before? Both
systems include standard graphics commands (CIRCLE, FILL, etc.)
that blow away the competition. For example, the BOX command
peaks out at over 2 MegaPixels/second; that's 300 times faster than
ASIC! 255 separate sprites of up to 100x100 pixels each are supported with window clipping and high-res pixel level collision checking. The 8-octave/4-voice music synthesizer has independent
envelope, waveform, and volume controls, a 7 + KHz sampling rate,
and much more. Other features include text/graphics mixing, different font sizes, fast window copying and scrolling, picture
save/load, easy implementation from both BASIC and assembly
language, multiple screen animation, and support for 128X/512K,
double speed, and the high-res joystick interface. The package also
contains support programs that are worth the purchase price of
GrafExpress alone! These include an introductory demo, a picture
editor, a weveform editor, and an art program that supports 256 colors! GrafExpress also comes with a 50 page manual that fully explains all of its incredible features. If you do any graphics programming or simply want to see what
your little CoCo is capable of,

\$34.95

War Monger

The world is in unrest. Power-hungry villains and evil warlords are readying their forces. It falls to you to lead your people against these armies, and only your best strategic plans can save the day. Fight the good fight in any era or locale. Play a simple game of capture the flag armed with water balloons, or climb into the cockpit of a 100 foot high armored warrier. Explore the deepest dungeons, defend your galaxy, or create your own scenarios with this incredible war game construction set/simulator. Your imagination is your only limit. You will deploy your forces with total control over hostile terrain while you scroll a graphic bird's-eye window over an immense world. War Monger has terrific 320x200 resolution, 16 color graphics and includes a title editor to create or edit your own. Play against the computer, battle with another player, or simply watch the computer plot against itself. The enemy is everywhere. Are you ready to take on the challenge as the War Monger? Req.

128K CoCo 3 and disk drive.

KwikGen: Edit OS-9 Boot Files on the Fly

Have you ever tried to make a new boot disk with a single-drive system? Yeah, right! You'd probably rather have a tooth pulled with a pipe wrench. Or how many times have you wanted to make one small change to a boot file but found the only way to do it was to create a completely new boot disk from scratch?

Needless to say, creating or modifying a boot disk isn't the easiest job in the world. Of course, those who've used EZGen from Burke & Burke might say it isn't all that difficult. The only problem with EZGen is that inserting, moving and deleting modules can be slow, especially if you are using a floppy-only system. KwikGen from Gale Force Enterprises (licensed from Sardis Technologies) provides most if not all of the functionality of EZGen but works entirely in memory. This makes the process of adding, moving and deleting modules lightning fast. Included on the disk are versions for OS-9 Level I and II, the CoCo 1, 2 and 3, and terminals.

You begin by running KwikGen with an optional memory modifier. (The more memory you give to KwikGen, the larger the boot file it will let you edit.) A modpatch script is included in the manual for increasing the default to 40K; and up to 48K can be allocated on OS-9 Level II systems. With KwikGen running, you can either load an existing boot file from disk or use the boot file currently in memory. Once the boot file is loaded, KwikGen verifies all modules contained in it. All modules with an invalid header parity or module CRC are purged from the buffer.

KwikGen allows you to delete, insert, move and even rename modules in the buffer. If you rename a module, the new name can be longer than the original name—up to 26 characters in length. If the new name is longer than the original name, the

new name is added to the end of the module. Two of *KwikGen*'s handiest options allow you to "dump" a module from the buffer or patch it in memory. The module-dump listing is similar to that provided by the OS-9 dump command, with the contents shown in both hexadecimal and ASCII formats. Patching a module works a little differently than when using modpatch, but the technique is similar. With *KwikGen* you

enter the offset within the module to the byte you want to change. You are then shown the current byte at that offset and are prompted for the new byte. If you want, you can even enter the data in ASCII format by preceeding the ASCII character with a single or double quote. If the ASCII value is preceeded by a double quote, the most-significant bit of the character is set.

KwikGen allows you to copy the OS-9 Kernel to Track 34. This is especially useful for creating new boot disks or attempting to recover damaged boot disks. And if this isn't enough, the package includes extensive on-line help for all commands — and it's easily accessible.

KwikGen is an especially useful utility that greatly speeds the process of creating and altering boot disks. The only thing I would add to the package is the ability to work with non-boot files — perhaps an alternate write function that doesn't alter LSN 0. This could prove useful for creating customized shells and other files containing merged modules. (Gale Force Enterprises, P.O. Box 66036, Station F, Vancouver, BC V5N 5L4, Canada; \$19.95 U.S. plus \$4 \$/H.)

There are times when it could be important to disable the CoCo 3's keyboard so keystrokes have no effect. For instance, demonstration programs are often designed to run without intervention. Or perhaps you want to temporarily turn off the keyboard from within a program so no data is entered at a crucial time.

To disable the CoCo 3 keyboard, use POKE &HFF01,0. Warning: Make sure you save any programs first! Any keys pressed after this poke are ignored. To turn the keyboard on again, use POKE &HFF01,4,

screen. You'll then see a new screen, all of which is blank — except for the top line, which is a reprint of the last line on the previous screen. To get back to the original screen, press S three times — Forms cycles the screens from 1 through 4, then back again. The current screen is always indicated at the bottom. The ability to use four different screens is also handy for creating multiple forms on one sheet of paper.

All the key commands supported by Forms are shown in Figure 2, and we've covered the use of most of them. The Auto mode, however, also deserves some attention. It can be quite tiring to build a long line from individual graphic elements, and most forms include quite a few such lines. The

	Figure :	3: Graphic-Element	Codes

Auto mode makes this job much easier. To use it, first position the cursor on a blank space, then press A followed by the right arrow. The program will automatically draw a horizontal line from the current position to the next non-space character or the next to last screen column, whichever comes first. The Auto mode works in a similar fashion for vertical lines — just press A followed by the down arrow.

Forms is designed for use with a Radio Shack printer that supports the Tandy printer codes. The graphics elements and their corresponding CHR\$ values are shown in Figure 3. By correlating these elements with the IBM Extended Character Set, it is possible to modify Forms for use with Epson/IBM-compatible printers. Line 910 sets the serial-port speed to 4800 bps. Change or omit this poke as necessary for your printer. Forms runs in the high-speed mode except when printing - pressing BREAK to exit the program also returns the CoCo to normal speed - so you do not need to cut the baud setting in half for printing purposes. The Tandy printer codes in lines 940 and 960 set the printer for halfforward and full-forward linefeed.

Feel free to experiment with Forms, and modify the program to meet your individual needs—I have not yet included a Save/Load feature, though it should be fairly easy to implement. The text and graphics elements are stored in simple string arrays.

Forms is handy program for just about anyone. I know it has helped me a great deal.

John Musumeci is a retired TV repairman whose sole hobby for the past eight years has been working with and programming the Color Computer. He may be contacted at 103-57 104 Street, Ozone Park, NY 11417, (718) 738-0212. Please include an SASE when requesting a reply.

Thinking of buying a printer stand or monitor pedestal? Why not save a few bucks and make one instead? And when you look for materials, consider PVC pipe for the foundation.

PVC pipe is lightweight, easy to work with and relatively inexpensive at most chain hardware stores. It comes in long pieces (which you can easily cut with a hacksaw) and many joints (elbows, Tfittings, etc.) are available. You'll also need a bit of cleaner and adhesive to connect

To make a stand, construct two end frames using elbows, building each with four T fittings for connecting the frames together. Finally, connect the frames it can be just about as wide as you need. To finish, you can put a piece of plywood across the top and paint the whole kit and

lug 'n' Go for Your CoCo!

This CoCo compatible NX-1020 system sets new standards in color printer performance... 225 cps, 4 NLQ fonts including Script, plus a high speed draft font; but the enhancements don't stop there. Add a 16k buffer, a special quiet mode, top feed, bottom and rear tractor, and the list goes on. Seven on-demand colors, 8 color graphic modes, Epson and IBM emulation for maximum software compatibility Virtually everything desired in a printer is here - speed, color and versatility at an affordable price with a 2 year warranty.

Our Plug'n'Go for the Coco system includes:

- NX-1020 Multi Font Color Printer
- Blue Streak Ultima
- Software Support Disk
- Color Graphics Utilities

239⁹⁵

This CoCo compatible NX-1001 system is fully featured with 4 NLQ plus a draft font, 10 character sizes from subscript to quadruple size, 4k buffer, 180 cps, friction and tractor feed, and much much more Backed by a 2 Year warranty. Epson and IBM emulation modes for maximum software compatibility. A performer so versatile you may never exhaust it's creative possibilities!

Our Plug'n'Go for the Coco system includes:

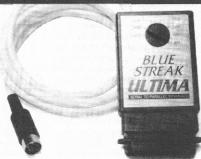

- Software Support Disk

THE RAINBOW 10 August 1992

OS-9 SIG Database Primary Keywords

Last month I promised to describe what kinds of files are stored in each database in the OS-9 SIG, now that the database reorganization is completed. Most of the database names are self-descriptive, but there are always some files that defy classification. In figures 1 through 4, I've listed the

Announcements Archives Humor News Reviews Update

Figure 1: Primary Keywords for General Information

primary keywords for several of the databases. The remaining databases dards, Games & Graphics, Music & Sound, Programmers Den, OSK Applications, OSK Telecom, OSK System Modules, and Tutorials & Education - don't have primary keywords set up yet. I will report the rest as they are finalized.

The primary keywords should give you a general flavor of what kinds of files belong in each database topic. I'll add some prose to describe the contents of each topic:

New Uploads: Do not upload files to this topic! This database is a temporary staging area where all new database groups appear for about a month (a little bit longer if I'm unusually busy at work, a little bit less when I catch up at the end of the month, but always long enough so that people who check in at least once a month have to check only one database). Submit your group to the database you want it moved to after it has spent a month in New Uploads.

General Information: This is the database to check for product information, as product announcements and reviews belong here. General Information is also the "everything else" database, containing random news, humor, politics, and other stuff that doesn't quite fit in any other database.

Applications (6809) and OSK Applications: These are the "meat-and-potatos" database topics for 6809- and 68000-based OS-9 users, respectively. This is where you will find file archivers, calculators, calendar programs, disk utilities, analysis tools. editors, spreadsheets, and other applications and utilities. Note that some applications and utilities are located in other database topics. A graphics digitizer should be placed in Games & Graphics; terminal programs belong in the Telecom databases. Patches for any program that belongs in this topic should also be placed here. For example, a patch for DynaCalc, which is an application, belongs here. A group containing executables for both OS-9/6809 and

Archivers Database Patches Productivity Text Processing Utilities

Figure 2: Primary Keywords for Applications (6809)

OS-9/68000 should be placed in the Applications (6809) database, at least for now. The same rule applies to the following two topic pairs.

Telecom (6809) and OSK Telecom: These topics are self-descriptive. Any file, programs, or data related to telecommunicating belongs here. This includes Bulletin Board Systems (BBSs), file-transfer protocols such as Kermit, terminal programs, and any utilities that are telecommunications oriented

System Modules (6809) and OSK System Modules: Patches and updates to the operating system reside here. A patch for AciaPak belongs here - even though it is used for telecommunications - because AciaPak is a system module. Custom driv-

BBS Doors Patches Protocols Terminal Programs **UUCP**

Figure 3: Primary Keywords for Telecom (6809)

Disk I/O Parallel Communications Serial Communications Screen Drivers Speciality (other)

Figure 4: Primary Keywords for System Modules (6809)

ers and enhancements to OS-9 are stored

Games & Graphics: Graphics files such as VEF and GIF images belong here, as do the programs that allow you to view them. You must have the right to upload any picture files, however. Do not upload a digitized news photo or a picture from a magazine or cartoon: these pictures are copyrighted. Games also belong in this database. If you upload a picture file, please put the type of picture file at the end of the group name. Here is an example:

MARINE CORPS EMBLEM (VEF) DATA JAN-92 BRWOOLSTRUM

The above example broaches another topic: meaningful group names. Brian Woolstrum could have named his group USMC. VEF. The name he gave above is much more meaningful; it describes exactly what is drawn. If you upload a data file for a game, such as Rick Adams' OAI, then follow the group name with (OAI), as above.

You may notice that there is only one Games & Graphics database topic. Uploads for both OS-9/6809 and OS-9/68000 belong here. If your program or data is useful only on a 68000-based system or on any single computer, mention this in the group description and add an appropriate keyword. If your program runs on any 68000based computer, then the keyword OSK is sufficient. The same rules apply to all of the

Music & Sound: Any program or data that creates, plays, digitizes or reproduces sound or music belongs here, just as the topic name suggests. In this topic, you find scores of UltiMusE files and many digitized sounds, as well as the programs to play them. Any MIDI-related programs belong here, such as MIDI patch editors for synthesizers. Also, any documentation related to music, sound, MIDI, or programs belonging here should be placed in this database topic. The same rule applying to Games &

Graphics applies here: Do not upload copyrighted digitized sounds

Programmers Den: This database topic is where budding programmers can find new libraries, programming tools such as make and lex, disassemblers, program skeletons, compilers and interpreters, programming demos designed to give programming tips, and documentation to any of the above. Basically, anything designed to make a programmer's life easier should be uploaded here.

Tutorials & Education: Beginners and people trying to do something for the first time (such as install Multi-Vue or program in C) should look here to find help. You can find articles describing disk fragmentation (and how to avoid it), an introduction to OS-9, help configuring your floppy drives, a tutorial explaining how to upload to the databases, a new OS-9 help utility and many more useful groups.

Standards: This is the emptiest database in the OS-9 SIG. If you are uploading information about an existing or proposed standard, this is where it belongs. Thus, information about the Ymodem protocol should be uploaded here, but information about a program inplementing Ymodem belongs in one of the Telecom topics.

You will notice files in the databases that do not follow the rules as stated above. Deciding which topic a group belongs to can be confusing at times. As Greg Law and I find files that belong in a different topic, we will move them. If you have trouble deciding which topic to upload your group to, you may want to see what is already in the database topics you are trying to decide between. Greg Law uploaded ALPHA DI-RECTORY, which contains a full directory of each database topic with descriptions of each group in each topic. Be warned that this file is about 340K after it is decompressed!

March 1992 Uploads

In the General Information database, James Jones (JEJONES) and Marty Goodman (MARTYGOODMAN) uploaded some very exciting information about the Hitachi 6309 chip - a drop in replacement for the 6809. The 6309 has some hidden features that could prove very useful. Rick Adams (RICKADAMS) released some utilities that manipulate a disk's granule allocation table. While these utilities can be very useful, use them with extreme caution! As with any disk editor, you can easily corrupt your disk

Charles West (SANDRIDER) released the OS-9 SIG

latest version of Ron Bihler's RiBBS, Version 2.02S. RiBBS is a Fidonet-compatible CoCo BBS. In the System Modules (6809) topic, Eugene Anderson (01GEN40) uploaded a patch to Init that allows you to place the CC3Go module in your CMDS directory rather than in your 0S9Boot file; you recover about a page (256 bytes) of OS-9 system space by doing this, because you make your 0S9Boot file smaller. Matthew Thompson (MATHOMPSON) announced the new SCSI hard disk drivers that he is working on. These drivers support 512-byte sectors

Richard Kottke (RICHKOTTKE) uploaded a public domain Motorola floating-point math subroutine library module for OS-9/6809, Richard also submitted a cross assembler written in BASIC09 for the Intel 8051 microcontroller. In the OSK Applications topic, Mike Haaland (MIKEHAALAND) released fstat, similiar to the Multi-Vue version of fstat, that shows a file's file-descriptor information. Bryan Clingman (BRYANC) uploaded MicroEmacs 3.11C — the latest version available. John Donaldson (VAXELF) submitted a description of the OS-9/68000 F\$Rename Set Status call that was released onto USENet by Microware.

In the Standards topic, Ed Gresick (EDELMAR) submitted a proposed printer standard for OS-9/68000 - PrintCap, similiar to TermCap.

The CoCo SIG databases were unusually slow during March. Marty Goodman published the 6309 secrets article in the Source for 6809 Assemblers topic. This is the same article he posted to the OS-9 SIG General Information database. In the Utilities & Applications topic, Denver Page (DENPAG) released an updated version of DISKUTILITIES. This program allows you to copy, move, delete, and rename files, or just erase an entire disk. You can also use the program to scramble a directory, making the disk unusable until you unscramble the directory. Richard McNabb (RICKMAC) uploaded PRINTOUT - a program that dumps 32-, 40- or 80-column text screens to your printer.

Eddie Kuns is pursuing a doctorate in physics at Rutgers University. He lives in Aurora, Illinois, and works as a programmer and researcher at Fermilab. Eddie is the OS9 Online database mamnager; his username is EDDIEKUNS

Feature Program

CoCo Makes a Quick Note Taker

d is a "quickie" 32-column screen editor—it allows you to type text on a 32-by-16 screen and save that text to disk. The program is great for "jotting down" quick notes. (Since the program uses the 32-column screen, it is also ideally suited for use with the TP-10 printer; I use PRT from the February 1990 issue of THERAIN-BOW.)

The idea behind Ed is simple: The Color Computer (any model) stores its 32-column screen text in memory locations 1024 through 1535 (\$400 through \$5FF). Line 70 saves these locations in binary format. Once you've saved the text, all you need to do is load the file as a machine-language program and the text reappears onscreen — the text is placed directly into screen

memory.

Ed was written for the CoCo 3 and is designed for use with a disk drive.

But the program is easy to modify for tape-based CoCos — simply change SAVEM to CSAVEM and LOADM to CLOADM. CoCo 1 and 2 users can make use of the general idea presented, but you must delete Line 10 and insert a check for a save-and-quit key other than BREAK. You can use pretty much any key — just make sure you won't need it for the text you want to enter.

I hope you enjoy this simple screen editor. I find it easier and less bothersome at times than loading a word processor. Since it loads in a flash and is so easy to use, Ed is ideal for writing quick notes and shopping

Reminder: Resubscribe to Rainbow on Disk

lists. I'm sure you'll find other uses for it as well.

Trevor Boehm is a tenth grade student whose greatest passion is challenging computers with new programs. He has participated in several science fairs and has received numerous awards for his work. He can be contacted at 77 Inwood Cres., Winnipeg, MB R2Y 1A2, Canada. Please include an SASE when requesting a reply.

Coco Tools is a comprehensive set of disk utilities, providing the most complete set of functions available for the standard R.S. DOS disk system. Comparable in scope and functionality to that of the famous utility available for MS-DOS computers "PC-TOOLS"!

Coco Tools provides fast and easy operation of standard DOS commands like Copy, Rename, Kill, Disk Initialize and Directory thru a consistent and easy to use interface. It provides easy visual selection of files, so multiple file operations can be carried out with very few keystrokes. Coco Tools is also the most Comprehensive Disk Repair program available, it Automatically diagnosis and repairs file allocation errors, locates corrupt directory information and cross linked files. It provides fast and easy recovery of deleted files without the drudgery normally associated with killed file recovery. It also does lightning fast disk I/O for fast Backup and Copying at speeds you thought only higher priced computers could perform. Coco Tools has multi-file Arciving, Un-Arciving and Test Arciving functions plus the ability to extract any selected group or individual files from a compressed file with easy visual file selection. And allows customizing of display colors, printer/Serial baud rate, Drive step rates and Directory sorting preference. Coco Tools requires a 128K CoCo III, 1 Disk drive and an 80 column display \$49.95

Key Frames continued from Page 1

Going Ahead With the Computer

Computer animation is simply a process by which a set of graphics lines and/or points are made to move from one location to another. In computerized key-frame animation, the animator defines the points in two critical frames and the computer is used to compute the point locations between pairs of points in the starting and ending frames.

In a conventional animated story there are many sets of key frames, requiring hours of tedious hand drawings. Given the resources, the challenge when using a computer is to create interesting animation in spite of the computer's artifacts resulting

from linear interpolation. Both approaches require several 'tweens for smooth animation, but a hand-drawn line is always smoother than a curve as seen on a computer monitor.

Let's look at an application of key-frame interpolation. We'll use the technique to transform a simple square into a diamond shape. Figure 1 shows the two key frames along with one in-between frame. One "rule" of key-frame animation is that there must be the same number of points in the starting and ending frames. The secret is to choose the positions of these vertices carefully. The illusion shown in Figure 1 is deceptive. The eye sees only the four vertices in the starting and ending frames. However, the object in each frame really contains six points.

Figure 2 shows two techniques for hiding the extra vertices necessary for this animation example. Point 4 does not show in the bottom line of the square object (starting frame) because it is in line (colinear) with points 3 and 5. In the end frame, showing the diamond, points 1 and 2 have converged into the same spot, so they appear to be one point in the last frame.

Also illustrated by figures 1 and 2 is the importance of placing the points and shapes in such a way that the changes between shapes flow in an interesting pattern. This takes time to design, and it is a necessary part of the art of computer animation that is not handled the same way for traditional animation.

Were we actually animating the transformation from a square to a diamond, we would use more than one in-between frame. The number of frames used affects how slowly and smoothly the change appears to take place.

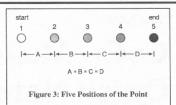

Linear vs. Non-linear Movement

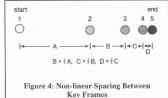

To better understand the application of key-frame interpolation, let's look at how we can smoothly move an object from one place to another. A single point will do nicely and suffers no loss of generality. To move the point from a starting position to an end position, we might divide the distance between the two positions into four equal parts. This means the point will appear in five different positions, each at a different time (see Figure 3).

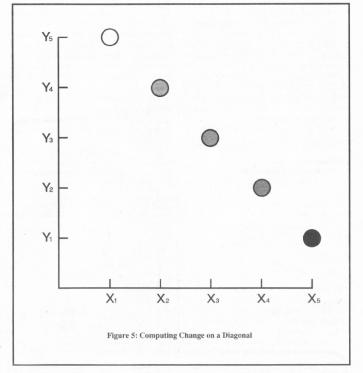

Dividing the distance from the starting to end positions into equal parts results in smooth even movement. Not only that but it is easy to program. However, the results of this approach are not always desirable. Smooth movement is the reason "flying" logos on television are not very exciting. Indeed, cartoons often rely on irregular speeds for humorous effect.

The human visual system detects fine differences in acceleration and deceleration, and the brain uses these distinctions as clues for understanding what we see. Very regular movement is more mechanical than natural, so simple computer animation is often more successful with subjects that don't need to move naturally or follow the laws of physics (e.g., bouncing balls). Simple non-linear timing differences (in this case, deceleration) can be achieved with our moving-point example by halving the distance moved at each frame (see Figure 4). From a programming viewpoint, one way this can be accomplished is by using a two-dimensional array.

Of course most animated objects are not limited to either horizontal or vertical movement. (It would be quite boring if they were.) To achieve diagonal movement we can divide both the x (horizontal) and y (vertical) distances into the same number of even divisions (see Figure 5). Notice, however, the divisions don't have to be the same

size—the requirement is that the *number* of divisions be equal.

Keep in mind the foregoing discussion applies to time as well as distance. For example, we can make the moving point appear to slow

down by decreasing the distance between successive frames and/or by increasing the amount of time it takes to reach each frame in the series. It takes a little experience to play the trade-offs and obtain smooth results; and the best way to get experience is to experiment.

Variations and Other Considerations

In addition to using non-linear distances/ timing, consider moving the entire object across the screen while it transforms. Especially effective on the CoCo 3 might be to change palettes between frames. Finally, having several shapes appear to change and recombine is more work, but it looks very impressive.

To a certain extent, it is possible to animate stick figures. Sooner or later, though, you will discover why linear interpolation did not solve the 'tweening problem for character animation — body parts are of a fixed length and move in an arc, not in a line. You can hide some of the problem by making more key frames and computing only a few 'tweens. But this does not cut down very much on the programming work required to achieve smooth animation.

Program Operation

Listings I and 2 show two programs that illustrate the concepts introduced in this article. The program in Listing 1, KEYF.BAS,

iniz w4
merge /dd/sys/stdfonts >/w4
display 1b 20 08 00 00 28 18 07 0a 0a >/w4
shell i=/w4&

Figure 6: Procedure to Create Window 4

is a BASIC program that runs on any CoCo with at least 16K and Extended BASIC. Enter the program and save it to tape or disk. If you don't have a CoCo 3, however, remove lines 10 and 20 before running the program. Further, if your CoCo 1 or 2 does not work well with the high-speed poke, remove Line 30 as well. Note that Line 240 creates a delay to reduce screen flicker—if you run the program without the high-speed poke, you should remove this line,

When you run KEYF.BAS, you are prompted for the number of divisions. Enter a number from between 0 and 40; smaller numbers decrease the number of frames, increasing the speed with which the end frame is reached. After you enter a valid value, you'll see five shape sets:

- a moving dot
- a triangle folding over itself
- a square transforming into a diamond
- a D changing to an S
- a leg kicking upward

The data for the shape sets is found in lines 660 through 860. Each set consists of three parts:

• a single number indicating the number of points in the shape

August 1992 THE RAINBOW

- . x,y pairs for the starting shape • x,y pairs for the ending shape
- Use this format to add your own shapes at the beginning of the shape data. Then change Line 370 to limit the number of shapes the computer draws before it starts over.

The program in Listing 2 is written in C and works with OS-9 Level II. This program is similar to that in Listing 1 except that it performs only the square-to-diamond transformation.

All the necessary graphics calls are built into keyf.c using #define and printf statements. For this reason you don't need to have or use the cgfx. 1 library to compile the program. However, keyf is designed to be run on a Type 8 graphics window. Before running the compiled program, use build to create the OS-9 procedure (script) file shown in Figure 6 and run this procedure to open Window 4 (use another window number if you are already using Window 4). Use the CLEAR key to select the new window, then execute keyf.

Summary

This article has introduced several aspects of computer animation and focused on the key-frame interpolation technique. Granted, the examples we have looked at are very simple in nature. However, the concept remains the same regardless of the number of points used.

Dawn Smith has been programming personal computers since 1977. She began using the Color Computer because of the relatively inexpensive X-Pad. Dawn completed a masters program with emphasis on graphics, CAD and computer imaging. Her hobbies include archaeology, geology and dance. She may be contacted at 4 Eagle Street, Apt. B. Rochester, NY 14608, Please include an SASE when requesting a reply.

THE RAINBOW is the only publication that offers peace of mind to CoCo users. Members of the CoCo Community have always looked to THE RAIN-BOW for comfort - hints, tips, the latest news and communication with others - for their Tandy Color Computers.

THE RAINBOW continues to serve and support CoCo users, from beginners to the advanced, by covering the wide variety of topics affecting the CoCo Community. Looking for games? Telecommunications packages? Finance programs? Interested in helpful utilities? Hands-on hardware projects? Want to take the guesswork out of buying software and hardware? From Disk BASIC to OS-9, THE RAINBOW has the answers to all your CoCo questions.

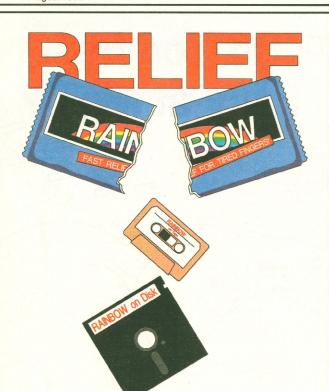

Get rid of your nightmares by renewing your subscription today. THE RAINBOW — the best security blanket for a good night's rest.

Use our 800 number!

For credit card orders, you may phone in your subscription. Our credit card order number is (800) 847-0309, 9 a.m. to 5 p.m. EST. We accept VISA, MasterCard and American Express.All other inquiries call (502) 228-4492.

Feature Program

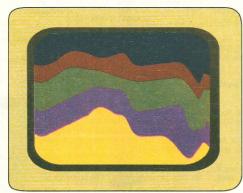

ARTIFACTING MEETS THE COCO 3

When the Color Computer 3 was first introduced, many people believed the age of artifacting colors for graphics had come to an end. After all, the CoCo 3 supports 16 colors (selectable from a palette of 64) on a 320-by-192-pixel graphics screen. This goes way beyond the CoCo 1 and 2 with their two-color limit. Still, I say we can use artifacting to get even more.

In terms of working with the Color Computer, artifacting colors (creating the false impression of colors) relies on an inherent characteristic of color composite

monitors and televisions. The PMODE4 graphics mode supports only two colors, and most programs use black and white. However, if you draw a single vertical line on the PMODE4 screen, it appears either blue or red (depending on the internal timing of the CoCo). If you erase that line and draw a similar vertical line, but one space to the right or left of the first, it appears in the other color - the false "primary" colors alternate vertically. If you put two vertical lines side-by-side, you get a line that appears in the selected foreground color (black or white). By setting different pixels in a defined grid, this "defect" can be used to create the appearance of many different hues. Now imagine the possibilities with 16 selectable colors rather than two.

Color 256 is a simple BASIC program that combines color artifacting with the

CoCo 3's 16-color graphics screen (HSCREEN2) to effectively produce 256 different colors on one screen. The program contains two sections, the first of which sets the palettes and draws the individual lines used for artifacting. Color 256 works much like artifacting on the CoCo 1 and 2 where alternating, adjacent vertical lines are used to create the effect of more colors. It takes some time for the program to draw the lines, so be patient. The high-speed poke is used (Line 20) to speed up the process.

The second section of *Color 256* rapidly cycles the screen through the entire palette of 64 colors. This is accomplished using very simple palette switching. If you press BREAK before the program reaches this color cycling, you'll end up with an odd palette setting and the computer will still be in the high-speed mode (normal speed is

enabled in Line 220). Make sure you slow it down before performing any tape or disk I/O. The best way to set things right is with a full reset of the Color Computer (CTRL-ALT-Reset).

It is important to note that artifacting colors with the CoCo 3's HSCREENs is generally much more effective with a color composite monitor or television. RGB monitors more accurately display the correct information, and it is easy to distinguish between the vertical lines that make up the artifacted colors.

Feel free to study the techniques used by Color 256 and introduce color artifacting into your BASIC programming efforts. Experienced programmers might consider using the interrupts to enable the full 64-color palette onscreen at one time (see "Color Chart for the CoCo 3" on Page 20 of the January 1987 issue of THE RAINBOW). Then it should possible to produce 4096 colors at the same time . . .

Adam Breindel plans to attend the University of Chicago in the fall of 1992, where he will study economics. Currently, he can be contacted at 328 Abbey Lane, Lansdale, PA 19446. Please include an SASE when requesting a reply.

Product Review

VED/68000 for High-Performance Editing

One of the most important tools for any computer system is a powerful but easy-to-use text editor. VED (short for Visual EDitor) is just such an offering from Bob van der Poel Software. VED's origins lie with the CoCo and OS-9, and the program is now offered for OS-9/68000-based machines—the MM/1, TomCat and System IV. The software is supplied on a 3½-inch, high-density disk that contains five directories holding the program modules, documentation files, environment files, help files and source files.

Although the on-line documentation files fully describe the functions of the files on the distribution disk, setting up VED is quite easy. The VED executable module must be copied from the CMDS directory of the disk to the CMDS directory of your hard drive or any floppy disk. In addition, a help file and an environment file must be copied into the SYS directory. Supplied are a few different versions of the help file, including one with documentation for all the standard C library routines; this is extremely helpful for programmers. The environment file describes to VED the specific computer you are using; environment files are supplied for the MM/1, the System IV, VT100 terminals and the Color Computer

Also included on the distribution disk is a program named VSPLIT, which allows you to break extremely large text files into smaller files that VED can more easily accept. Still, I tested VED with some large, unsplit text files (about 250K in length).

Even with this large amount of text, copying a large block of text is almost instantaneous. The source code for VSPLIT is also supplied and can be found in the SRC directory of the distribution disk.

VED's basic editing screen does not include any status bars or symbols, so you can use the entire screen for viewing and editing a file. Any carriage returns in the file are represented onscreen by the tilde (~) character, making it easy to see where paragraphs actually end. A special end-of-buffer character is visible at all times immediately to the right of the last character in the file.

VED features many movement, insertion, and deletion functions, each of which is mapped to a particular control-key combination. These key combinations can be modified through the environment file, and some commonly used functions are mapped to arrow and movement keys on the IBMstyle keyboard most OS-9/68000 systems use. Two of the more unusual features are a Jump function (which lets you move to a position in the file by line number, percentage position, or test label) and Case Toggle (which cycles a word between all upper- or lowercase characters, and normal capitalization. In addition, VED sports an Undo function that operates on the line currently being edited as well as for word, line and block deletions.

The Search and Replace functions offer the usual search (in both directions) as well as Find Next and Find Last. You can use the wildcard character (?) when replacing text—a feature many programs do not offer. Block-editing commands are provided, giving you the ability to cut, copy and paste text. You can also save a block to disk, sort the lines within a block, print a block to the printer or a disk, and display word- and

line-count information about a block.

VED supports a full complement of macro capabilities; up to 26 user-defined macros may be defined and saved to disk at any time while you are editing a file. In addition, there are eight predefined macros, some of which allow you to list the current input and output files or extensions, automatically generate increasing numbers for auto-numbering applications. Two user-definable Time macros give you the ability to easily insert the current time/date string in the format you choose.

Printing is supported by VED, and the output can be sent to either a printer or a disk file. Options such as margin settings, new page, effect sequences (such as underline on/off) and headers may be defined using "dot" commands in the document. For more complex formatting needs, Bob van der Poel Software also offers VPrint, a separate product that can be used in conjunction with VED.

There are a few miscellaneous and very useful functions in VED. An OS-9 shell can be called at any time through a simple command sequence. Memory and file information can be displayed at any time, and commands can be easily repeated a number of times. Cursor blinking can be turned on and off, and the auto-numbering mode can be engaged at will to insert line numbers after each carriage return.

VED's on-line help is completely menudriven and generally easy to use. The manual also describes the format of the help and environment files for those users who may be interested in modifying them for their own use. Getting help for any command requires only that you remember that ESCAPE-H is used to bring up the Help display. VED appears to be a well-designed product that is surprisingly intuitive, setting it apart from other line editors, which often send users running for a sledge hammer. Movement commands are very easy to remember, especially since most are mapped to the and movement keys on the keyboard. Many of the commands are grouped into two-letter sequences. For example, to use one of the Options commands, press ES-CAPE-O followed by the letter specifying the subcommand you want to use. If you hesitate after initiating the first command, VED automatically lists the available letters at the top of the screen.

Bob van der Poel's attention to speed is very noticeable from the performance of VED. For example, VED checks for any keystrokes entered while the screen is being updated and does not redraw the complete screen if the next update will fill the screen with new information. For this reason, using OS-9's key-repeat feature with Page Up and Page Down is extremely fast.

If you are looking for a quality editor for your OS-9/68000 system, VED is a sure winner. The price is reasonable, and VED may be the most often used piece of software on your system, especially for writers or programmers. With the addition of VPrint, you can count on the most advanced text tools for the OS-9/68000 system to deliver the performance you need. (Bob van der Poel Software, P.O. Box 57, Wynndel, BC V0B 2NO, Canada, 604-866-5772; or P.O. Box 355, Porthill, 1D 83853-0355; \$39.95 plus \$3 S/H.)

Submitting Material To Rainbow

Contributions to THE RAINBOW are welcome from everyone. We like to run a variety of programs that are useful, helpful and fun for other CoCo owners

WHAT TO WRITE: We are interested in what you want to tell our readers. We accept for consideration anything that is well-written and has a practical application for the Tandy Color Computer. If it interests you, it will probably interest lots of others. However, we vastly prefer articles with accompanying programs that can be entered and run. The more unique the idea, the more the appeal. We have a continuing need for short articles with short listings. These are especially appealing to our many beginners.

FORMAT: Program submissions must be on tape or disk, and it is best to make several saves, at least one of them in ASCII format. We're sorry, but we do not have time to key in programs and debug our typing errors. All programs should be supported by some editorial commentary explaining how the program works. We also prefer that editorial copy be included in ASCII format on the tape or disk, using any of the word processors currently available for the Color Computer. Also, please include a doublespaced printout of your editorial material and program listing. Do not send text in all capital letters; use upper- and lowercase.

COMPENSATION: We do pay for submissions, based on a number of criteria. Those wishing remuneration should so state when making submissions.

For the benefit of those wanting more detailed information on making submissions, please send a self-addressed, stamped envelope (SASE) to: Submission Guidelines, THE RAINBOW, The Falsoft Building, P.O. Box 385, Prospect, KY 40059. We will send you comprehensive guidelines.

Please do not submit material currently submitted to another publication.

MIDI Hints

Those who have downloaded Lyra and UltiMusE files from Delphi might be interested in the following recommendations for MIDI keyboards that can be used to play these files. Although Lyra can play its files via the speaker in your monitor or TV, the result often sounds quite poor because the files were composed for a MIDI keyboard. The following is a list of MIDI keyboards in the price range of \$200 to \$1000: Casio models CPS720, CT636, CT656, CT670, and CT680: Kawai FS690. K1II, K4, M8000, and PH50; Yamaha PSR300, PSR400, PSR500, PSS795, and YPR20.

Do not buy the older Yamaha models PSR-48 or PSR-38 because they lack the capability to play enough notes at once. My own favorites in this group are the Casio CT680 and the Yamaha PSS795. I will at times chain these two keyboards by running a cable from the MIDI Thru connector of one into the MIDI In connector of the other so they both are playing at the direction of my CoCo. In this way the weaknesses of one are balanced by the strengths of the other. The built-in speakers in such keyboards are generally of poor quality. You should send the output to a stereo amplifier and decent high-fidelity speakers. I personally find UltiMusE 3 superior to Lyra. UltiMusE 3 requires OS-9 and a 512K CoCo 3. Call Kala Software and/or Rulaford Research for more details on these two programs.

Danny Faye (DFYE) Independence, Missouri

Disk Drives and the CoCo

Can you refresh my memory about which models of Color Computer floppy-drive systems were made by Radio Shack? I'm specifically interested in knowing what models of Radio Shack disk controllers work with a CoCo 3 without a Multi-Pak. Also, please tell us how to identify these controllers?

Dave Myers (DAVEMYERS) Ypsilanti, Michigan

Radio Shack made, as best I can recall, five revisions of its disk controller. The very first drive system (I mean disk controller with drives, case and power supply) was Catalog No. 26-3022. This disk controller is unique in that all of its chips were socketted. It used a 40-pin WD1793 Floppy Disk Controller (FDC) chip and required both +5 and +12 volts. This controller cannot be used with a CoCo 2 without a Multi-Pak Interface or a Slot Pak because the CoCo 2 does not supply 12 volts. This controller cannot be reliably used with a CoCo 3 at all (even with a Multi-Pak or Slot Pak) because its data separator was a tad on the sloppy side, and so most versions of the 26-3022 controller won't work properly with a CoCo 3 when the CoCo 3 is running at high speed. I have received occasional reports from users who succeeded in using this ancient controller with a CoCo 3, but you cannot count on such success (even with a Multi-Pak) and I strongly recommend you don't even bother to try it. This disk controller was usually packaged with a gray-case full-height TEC drive. The drive itself was a single-sided, 35-track unit that was incapable of stepping faster than 20ms per track. This full-height TEC drive also had a notoriously poor camdrive head-step mechanism and tended to go out of allignment quite easily.

The second CoCo disk system Tandy offered (it first appeared in the 1984 catalog) was Catalog No. 26-3029. The disk controller of this system used a 40-pin FDC chip, which was a clone of the WD1793 chip made by either Fujitsu (MB8877A) or Mitsubishi (M5W1793-02P). These two chips represented an improvement over the original Western Digital 1793 in that they did not require a source of +12 volts but ran happily off a single +5-volt supply. In the 1984 catalog this system was referred to as "Color 2 Disk #0 Kit." The FDC chip was socketted, as was the 8-pin data-separator chip (FDC 9216), but other chips were soldered to the circuit board. This was - in the opinion of many assembly-language hackers who wrote copy-protection systems or programs to break or clone copyprotected disks - the best, the most reliable and the most stable of CoCo disk controllers ever made, though the three units that came after this one were almost as good. This controller and all that followed work quite happily with all models of Color Computer, including the CoCo 3.

The 26-3029 system was usually packaged in a white case with a full-height, 40track, single-sided drive capable of stepping at 6ms. The drive was usually one whose mechanism was made by Tandon (for its Tandon TM 100-1 drives), but whose logic board was manufactured by Texas Peripherals Inc. for Tandy. This was a most rugged and reliable drive, one of the best of the full-height, single-sided drives ever made.

Around 1985 Tandy began to offer a completely redesigned Color Computer disk system. This used a disk controller that still was full-size like its two predecessors, but which employed a single 28-pin WD1773 FDC chip that did the work of the 40-pin 1793 and the 8-pin 9216 data-separator chip. I'm not too sure about the details of this intermediate offering, but it may have been called the FD-500 drive system. The controller was accompanied by a white case that sat horizontally on the desk with a half-height, 40-track, single-sided drive capable of stepping at 6ms. The case had space for a second half-height drive.

By 1986 Tandy was offering in its catalog the FD-501 (Catalog No. 26-3131) drive system. This was fundamentally similar to the FD-500, but was offered with a redesigned disk controller that was physically smaller (shorter) than the older disk controllers and came in a correspondingly smaller plastic case. Like the FD-500, it used a 28-pin WD1773 FDC chip and worked happily with all models of Color Computer. The half-height drive that usually was supplied with this system was a TEC 501 drive, an especially rugged and reliable single-sided, 40-track drive that was capable of stepping at 6ms.

The last drive system offered by Tandy (which appeared first in the 1988 Radio Shack catalog) was the FD-502 system, Catalog No. 26-3133. This featured a circuit board with a design relatively similar to that of the FD-500 and FD-501 but physically smaller. The FD-502 was unique among all systems offered by Tandy in that it was supplied with a half-height, 40-track, double-sided drive that was capable of stepping at 6ms. This drive was, I believe, made by Tandon and enjoyed a reasonably good track record in the field. This system works happily with all models of the CoCo.

The bottom line is that all Tandy disk controllers except the ancient 26-3022 work with all models of the Color Computer, and the controllers from these systems can be used with double-sided drives of your choice.

Single- vs. Double-Sided

I have on occasion formatted the back side of a single-sided disk, and it appears to format and work just fine. Am I letting myself in for any problems when I do

> Edward Stroh Thornton, Illinois

In the early days of floppy disks, there may have been some significance to labeling a disk single-sided versus doublesided. In those days the technology for laying down the media on the disk was likely poorer than it has been for the last half decade or so, and so boxes of disks that were not certified and tested as working on both sides might actually contain a small but significant percentage of disks that actually had bad media on the other side. This almost certainly is no longer true. I suspect almost all disks that have been sold as single-sided in the last five years are perfectly good on both sides. Indeed, it is hard to find any disks labeled single-sided these days. What makes all of this a moot point is that certified 51/4-inch, double-sided disks are commonly available for under 25 cents each . . . often for as little as 10 cents each. At this price, it hardly pays to bother with ancient, single-sided disks.

Viewing GIF Files in Disk BASIC Is there a simple way to view GIF files on a CoCo 3 (without having to first convert them) using a program running under Disk BASIC?

John Burke (JBURKE) Fremont, California

According to Brian Flahive (BFLAHIVE), there is. The Projector, a program available in the Graphics database on Delphi's CoCo SIG, gives users the ability to directly view GIF files.

Disk-Drive Terminators

I've heard about the need to remove terminator resistors from disk drives when adding a second drive, and the requirement that there must be one and only one terminator resistor in a given drive system. Can you explain to me just what a terminator resistor is, what it does, why there must be only one, and what it looks

> Daniel Holley (MRINTENSITY) Frankfort, Kentucky

Electrically, a terminator resistor is a package that contains several (usually seven or eight) individual resistors. These packages often look like DIP ICs with 14 or 16 pins. These types of terminator resistors have each internal resistor hooked across each facing pair of pins. Such terminators are usually composed of 150-ohm resistors and indicated as such by a designation "151" printed on them. The "151" translates to "15 X 10 to the 1st power." However, some disk drives can take other forms of terminator resistors. Some older Tandy drives used terminator resistors in the form of single in-line pin packages. Such packages appear as a small rectangular blob of epoxy resin with five, six, seven or eight pins in a row coming out of the blob. These are typically internally wired so that one lead of all the internal

NEW HARDWARE!

PRS-232 Port - Supports flow controll Seven lines instead of four. Jumpers for port address, DSR/DCD swap. Requires MPI, SlotPak, or Y-Cable (add \$9.95 for ext. power, required w/ Y-cable) - \$44.95

resistors goes to one (marked) pin, and the other leads go individually to the other pins. Usually the terminator resistor is socketted. With such drives, be sure there is one and only one terminator resistor in the drive system.

18

On a very few 51/4-inch disk drives (such as the Tandy FD-502) and on all newer 31/2inch third-height drives, the terminator resistors are 1000 ohms and are permanantly soldered on the drive logic board. If you are adding another drive with a 1000ohm resistor pack, just add it and don't worry about the terminators. If you want to add a drive that takes a 150-ohm terminator, try adding the drive with a terminator resistor installed. Better yet, find a 300ohm terminator (instead of the usual 150ohm terminator) that fits the socket on the

BAINBOW

Within the OS-9 Shell

drive, and use that if you want to use such a drive with a soldered 1000-ohm terminator.

The reason terminator resistors are required is that many of the control lines coming out of a disk controller originate in open-collector driver chips (usually 7416 or 7406 chips in a CoCo controller, or a 7438 on many IBM-PC type controllers). Open collector gates have the ability to pull a signal down to Ground, but lack the ability to push a signal High on their own. They must be used with pull-up resistors if they are to function properly. These pull-up resistors in the case of the system are located on the drive itself and called the terminator resistor. The reason for this arrangement is that open-collector gates with pull-ups at the other end of the controlling line make for especially reliable, noise-free

Yes! They're still available!

RAINBOW

communications along the cable between the controller and the drive

If there is too small a terminator resistor (as is the case if there are several 150-ohm terminators in the system, effectively putting those resistors in parallel with each other), the open collector-gate is pulled too strongly toward +5 volts (Logic 1), and finds itself unable to pull the signal to Ground (Low) when told to do so. This is the reason too many terminator resistors in a drive system result in total failure or in unreliable operation.

In more modern drive arrangements, such as the newer 31/2-inch third-height drives, it was learned that a 1000-ohm terminator is adequate for pulling up the open-collector gates, and yet even if four such terminators are paralleled, the effective terminator resistance on each line is still only 250 ohms still more than the 150-ohms used in older systems. I hope this gives you some more insight on what is going on with these mysterious terminator resistors.

Tying up the Keyboard

Several folks have asked me recently A how much time the CoCo spends scanning the keyboard under BASIC. My own guess was that the figure is around five percent, but I asked Art Flexser (ARTFLEXSER) to suggest a straight-forward way to empirically measure this? Here is his answer:

If you enter POKE &HADEB, &H39 on a CoCo 3, you will knock out the check for BREAK and SHIFT-@ that is done between every BASIC statement when a BASIC program is run and replace the start of that subroutine with an RTS. Using this you should be able to construct a simple test to see how much time a BASIC program takes to run with and without that part of the keyboard scan knocked out. I agree with your guess of five percent of the total running time, but I await your report on the results of the experiment.

I've not had time to do this experiment. Interested readers are invited to try it in various forms and write THE RAIN-BOW with what they find.

Martin H. Goodman, M.D., a physician trained in anesthesiology, is a longtime electronics tinkerer and outspoken commentator - sort of the Howard Cosell of the CoCo world. On Delphi, Marty is the SIGOP OF THE RAINBOW'S CoCo SIG. His non-computer passions include running, mountaineering and outdoor photography. Marty lives in San Pablo, California.

BAINBOW Birthday Party Bit-to-Bit **Back Issues**

BACK ISSUES STILL AVAILABLE Have you explored the wealth of information in our past issues? From our very first, fourpage issue to many with more than 300 pages of material, it's all just for CoCo users - a

AT A BARGAIN PRICE

great way to expand your library!

All back issues sell for the single issue cover price. In addition, there is a \$3.50 charge for the first issue, plus 50 cents for each additional issue for postage and handling if sent by United Parcel Service. There is a \$5 charge for the first issue, plus a \$1 charge for each additional issue on orders sent by U.S.Mail. UPS will not deliver to a post office box or to another country

MOST ISSUES STILL AVAILABLE Available issues through June 1982 are provided on white paper in a reprint form. All others are in regular magazine form. VISA. MasterCard and American Express accepted. Kentucky residents please add 6 percent sales tax: Canadian residents, 7 percent GST. In

order to hold down costs, we do not bill, and no C.O.D. orders are accepted.

Due to heavy demand, we suggest you order the back issues you want now while supplies last.

To order, review and fill out the form below and mail it with your payment

For greater convenience, order through the Rainbow Magazine Services area of our Delphi CoCo SIG.

A complete index for, July 1981 through June 1984, is printed in the July 1984 issue. Separate copies are available for \$2.50 plus 50¢ handling. Indexes for subsequent years are published annually in the July issues of THE RAINBOW.

About Your Subscription

Your copy of the rainbow is sent second class mail. You must notify us of a new address when you move. Notification should reach us no later than the 15th of the month prior to the month in which you change your address. Sorry, we cannot be responsible for sending another copy when you fail to notify us.

Your mailing label also shows an account number and the subscription expiration date. Please indicate this account number when renewing or corresponding with us. It will help us help you better and faster.

For Canadian and other non-U.S. subscribers, there may be a mailing address shown that is different from our editorial office address. Send your corre-

spondence to our editorial offices at Falsoft, Inc., The Falsoft Building, P.O. 385, Box

Prospect, KY 40059.

is the smallest unit of disk storage available with Disk BA-SIC. In other words, even a one-line program that is only 40 bytes in length is allocated a whole

granule (2304 bytes).

The FAT is a map of

the disk granules oc-

cupied by each file

stored on the disk.

entry on Track 17

requires 32 bytes,

so eight directory

entries (8 entries x

32 bytes equals 256

bytes) fit into one of

the nine sectors (3

through 11) set aside for

this purpose. Again, since a

granule is the smallest supported

can hold a maximum of 68 files.

Each directory

tors — and there are two granules per track, 68 user granules per disk. A granule

Feature Program

Get Your Disks in Order

ew would disagree that having your disk files in alphabetical order makes it much easier to find a specific file quickly. I wrote Disk Sorter for just this purpose - it reads a disk's directory, sorts the information contained there, then writes it back to the disk.

Disk Sorter is a CoCo 3 program designed to work with standard 35-track disks. However, it is easy to modify for use with earlier versions of the Color Computer, (I'll show you how in just a minute.) First, enter the program as shown in the listing. Be especially careful and check for possible syntax errors since a stray character could cause the program to crash a disk during the sorting process. When you are sure the program is "clean," save it to disk.

To sort a disk, run Disk Sorter; the program prompts you to enter a drive number. Enter the number (from 0 to 3) of the drive that holds the disk you want the program to sort. Drive 0 is assumed if you simply press ENTER at this prompt. Depending on the number of files on the disk, it may take a little while for Disk Sorter to do its thing. After the sort is complete, the program executes a DIR command to show you a listing of the sorted directory.

Those of you with CoCo 1's and 2's cannot use Disk Sorter as printed because it contains pokes and statements applicable only to the CoCo 3. To modify the program for use with earlier CoCos, you must delete or edit a few program lines. First delete

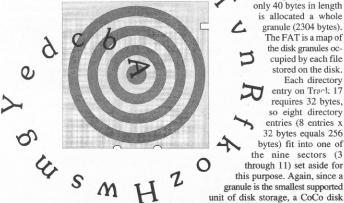

Line 160, which is used to set the screen width. Then delete Line 210, which disables the BREAK key on the CoCo 3. Also delete Line 220, the error trap, and lines 710 through 740. Delete Line 360, which enables the high-speed mode, or edit it for the CoCo 1 and 2 by changing &HFFD9 to &HFFD7. Similarly; delete Line 560 (disables the high-speed mode) or change &HFFD8 to &HFFD6 in that line.

Whenever you are using or modifying Disk Sorter, make sure the computer is not in the high-speed mode. Otherwise an I/O error may result, or the CoCo may trash the disk. Disk Sorter enables the high-speed mode only to increase the speed of the sort routine (a simple bubble sort). It is also important that you never press BREAK or the Reset button while the program is running to avoid the possibility of trashing the disk. (CoCo 3 users need not worry about pressing BREAK since that key is trapped.)

CoCo Disk Structure

A standard Color Computer disk contains 35 tracks (numbered 0 through 34) for data storage. These tracks are arranged as concentric circles on the disk, with Track 0 being the outermost. Each track is divided into 18 sectors (numbered 1 through 18). One sector on a CoCo disk contains 338 bytes of which 256 are used for data storage (the remaining bytes are used for system

Track 17 is a special track that holds the

directory for the disk. The actual directory entries are stored in sectors 3 through 11, and the fileallocation table (FAT) is located in Sector 2. To increase performance, sectors on a disk are grouped in granules - one granule is comprised of nine contiguous sec-

0

The first eight bytes of a directory entry hold the filename proper, and the extension is stored in the next three bytes. If the first byte of a specific directory entry (filename) is \$00, the file orginally pointed to by that directory entry has been deleted and the entry is available. If the first byte is \$FF (decimal 255), this and all subsequent entries have never been used and are free.

Disk Sorter helps speed the system a little by pushing all deleted (previously used) directory entries to the front of the directory when it sorts. When you use DIR to get a listing, you won't see these empty entries. However, since they are in front, Disk BASIC won't require as much time to find a free entry when storing a file as it does when the free entries are spaced throughout the directory.

Disk Sorter is a great tool for sorting the directory information on your CoCo disks. I hope you enjoy using the program and that it relieves some of the headaches of trying to find files in the disk haystack. If you have any questions or comments about Disk Sorter, please feel free to contact me. Make

sure to send an SASE (with Canadian postage) if you need a reply.

Geoff Friesen has a bachelor of science degree in computer science and mathematics. He is the author of several published articles about computers. He may be contacted at General Delivery, Dauphin, MB R7N 2T3, Canada, (204) 638-7302. Please include an SASE when requesting a reply.

Switching Slots

Here is the answer you requested for Kent Holcomb in the October 1991 issue

First, it should be mentioned that OS-9 Level II (at least on my disks) has t3.dd and m1.dd incorrectly set up on the Config disk. The manual and help messages on the disk say that /t3 is for the RS-232 Pak in Slot 2 of the Multi-Pak Interface and that /ml is for the Direct Connect Modem Pak in Slot 1. If you inspect the actual descriptors, you will see that they are backwards: /t3 is set to work with modpak instead of aciapak while /ml is set to work with aciapak instead of modpak. Worse still, aciapak does not get its slot information from the descriptors but (as you said) has the slot hard coded. There is, however, a simple answer to Kent's problem using the following modpatch script.

- 1 aciapak * replace 03 with x3 where x=slo t (0=1, 1=2, 2=3, 3=4) * this patch set for slot 2
- c 68 03 13

At this point, you should use cobbler to create a new boot disk so that the change is made permanent.

> Robert Gault Grosse Pointe Woods, Michigan

Multiple Windows Onscreen

The cover of the October 1991 issue of THE RAINBOW looked really sharp! THE RAINBOW LOOKed ready What are the parameters you used for setting up the three windows as shown on the monitor in the bottom-left corner of the

Ernest Bazzinotti, Jr. Dorchester, Massachussetts

To create the windows as shown on the cover, use build or an editor to create a shell script with the commands

wcreate -z /w1 -s=2 00 00 39 24 02 03 02 /w2 40 00 40 12 00 04 /w3 40 13 40 11 00 01

and run the script. (Note that you must use a shell script because wcreate switches windows after it creates the first window. If you don't, OS-9 will create the windows on separate screens.) Once the windows have been created, enter

shell i=/w1& shell i=/w2& shell i=/w3&

to start shells on the windows. You can then use CLEAR to move to each window and start your applications. (Bear in mind you'll need 512K to get this fancy with windows.)

If you so desire, you can change the color of each window by modifying the last three numbers (02 03 02) for window /w1, and the last two numbers (00 04 and 00 01) for windows /w2 and /w3. The parameters represent, in order from left to right:

starting x (horiz.) position starting y (vert.) position x size in characters v size in rows foreground color background color border color

The border color is specified for the first window only - all other windows on the same screen use the border color of the first window.

You may notice that we used rather odd dimensions for the windows. For example, the first window is 39 columns wide (x size=39) and the other two windows start at column 40. Also the second window is 40 columns by 12 rows, while the third window is 40 columns by 11 rows starting at row 13. This gives a 1-character margin between each window. If you prefer to have 40-column by 24-row and 40-column by 12-row windows without the margin, change the script as follows:

wcreate -z /w1 -s=2 00 00 40 24 02 03 02 /w2 40 00 40 12 00 04 /w3 40 12 40 12 00 01

Alternatively, you may want to totally change the locations and sizes of the windows or add more windows to better suit your needs.

OS-9 vs. OS-9

The first time I saw the OS9: prompt, I was trying to dump a DL Logo picture file to the printer and discovered I needed more "tools." I'm still trying to get the picture printed, but in the meantime I have a few questions coming from an absolute beginner who taught himself BASIC and is trying to start all over with OS-9 which, so far, is a lot like Latin I studied in school: totally great stuff you never use anywhere.

A while ago a Logo product was produced for the CoCo called DL Logo, which ran under OS-9 Level I. This, like a lot of Level I programs, won't boot on the CoCo 3. But some Level I Version 2 programs, such as DeskMate, do boot and run on the CoCo 3.

Conceptually, I understand OS-9 as a vanilla operating system with all these possibilities out there somewhere. So I have OS-9 Level I (I always manage to buy something just about the time it is worthless), and I have OS-9 Level II. What I don't understand is the difference between OS-9 Level I files and OS-9 Level II files. Or is there a difference? If OS-9 is just an operating system, shouldn't it be possible to move DL Logo to an OS-9 Level II system?

I don't mind venturing off into the future. I might even buy one of the new Tomcats. It would just be nice if, as technology jumps another parsec into the future, someone would leave behind a little packet of clues for those of us who follow at a distance but who must move through the same hoops and learning curves. This constant change and assumption that customers are continually thrilled about new stuff and are always ready to plunk down money puts off many people who assume that if they don't have the latest in point-and-click MacBurgers, they can't compete or compute. I work with these types every day. They laugh at my CoCo and then run off in search of cheap memory chips. It's a strange

Michael Franich Milton, Washington

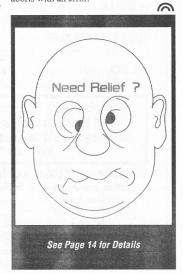

OS-9 Level I versions 01.00.00 and 01.01.00 are virtually identical in all respects, and neither version will boot on the CoCo 3. This is because they both use the memory area between \$FE00 and \$FEFF. On the CoCo 3, this memory area is used by the GIME chip to store interrupt vectors and other goodies. OS-9 Level I Version 02.00.00 was written specifically in preparation for OS-9 Level II and the CoCo 3. This version is different in that the screen driver was split into three modules: C032. io handles the I/O for the CoCo's 32column screen, CO80. io handles the I/O for

the PBJ WordPak-RS 80-column video board, and the module that handles I/O for the keyboard. As you can probably tell, this was done in preparation for Level II's

OS-9 Level II splits the video handlers into three classifications: VDGInt handles OS-9 Level I compatible video, GrfInt is the standard windows driver, and WindInt replaces GrfInt to add pull-down menu support for Multi-Vue.

If you boot the system using Term_VDG (the 32-column green screen), most OS-9 Level I software will run with OS-9 Level II. For example, DL Logo should work fine when run from the VDG screen. To do so, boot OS-9 Level II and insert the DL Logo disk into the drive. Use the chd and chx commands to change the current directories to the DLLogo disk. (For example, chd /d0 and chx /d0/cmds.) Try running the program to see if it works.

As you are alluding, OS-9 is just an operating system. Software written for OS-9 Level I should run with OS-9 Level II without any problems. Keep in mind that if a particular program uses any tricks, it may not work properly with OS-9 Level II. An example of this is Profile distributed by Computerware. Profile would have worked fine with OS-9 Level II, but it attempts to link to the CCGo module to search for the string TANDY to make sure the program is running on a CoCo. Of course, since the CoCo 3 uses the CC3Go module, Profile aborts with an error.

DELPHI — The \$1 per hour online solution!

DELPHI's 20/20 Advantage Plan sets the standard for online value: 20 hours for only \$20, for all the services you want!

· Thousands of files to download.

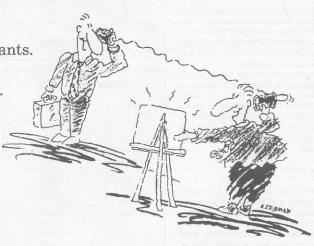

· Chat lines with hundreds of participants.

Animation Creation ... Through Machine Lar

ince the first time I saw an 8mm cartoon, I've thought animation was something special; but it isn't restricted to those people pushing paper and pencil for Walt Disney. No, graphics animation is a natural use for the Color Computer especially when combined with the speed of machine language. In this article, we'll look at how machine language can help the CoCo strut its stuff.

Traditional character animation involves rapidly "flipping" through a "deck" of pictures in which each successive image is slightly different from the last. Needless to say, the number of images required for a smooth animation sequence can be quite high. This is also true when using a computer for animating objects. Through Animator I'll show you how to use the CoCo to draw and save eight graphics pages, each containing twelve 64-by-64-pixel frames for animation, producing an animated sequence with a total of 96 frames.

To rapidly show 96 successive frames, we need to keep them in the computer's memory while flipping through them. After all, loading each page from disk when it is needed would use up valuable time and cause the sequence to appear jumpy. A standard PMODE4 graphics page occupies 6144 bytes, and there are eight pages, so we need to find 48K of free memory. We'll simply have the computer store them starting at a very low location in memory and going all the way up to \$F800. Since memory above \$8000 contains the CoCo's ROM routines, we'll poke a value into Location \$FFDF so we can use the corresponding high-RAM area.

The workhorse of Animator is shown in Listing 1. The short assembly-language routine between lines 210 and 340 is used to place each graphics page in an appropriate memory area as it is loaded. (This routine works in conjunction with the BASIC program in Listing 3, which loads the actual graphics images from disk.) A standard PMODE4 graphics page starts at Address \$0E00 and ends at \$25FF. The assembly routine stores the first page at Location \$3800 and the second page \$2600 bytes above this. Each successive graphics page is stored \$2600 bytes above the last as it is loaded by the BASIC program; memory storage ends at Address \$F800. Lines 240 and 330 disable and enable the interrupts, while lines 250 and 320 set the high- and low-RAM flags as needed.

When all eight pictures have been loaded and stored, the assembly-language routine starting at Line 360 can be used to show the frames. As I mentioned earlier, each frame is 64 pixels high and 64 pixels wide. However, I want to double this size before displaying the frames, so each bit must be repeated in a line and each line shown twice. The FRAME macro takes care of this: it starts with the first frame in memory (Line 390) and uses SHOWIT (Line 670) to display a 64-by-64 area as a 128-by-128 pixel image. Let's look at how SHOWIT works.

Memory Location \$1208 represents the top-left corner of a centered 128-by-128pixel screen area. The graphics area we are using is eight bytes (64 bits) long and 64 bits wide, and the values for the image in this area are stored in ACROSS and DOWN. Register U is always used to hold the location of the current frame in memory. Store the first byte of the frame in Register B and use shifts to check each bit. An arithmetic shift left (ASLB) will remove the left-most bit and save it in the "carry register" (the carry bit in the condition-codes register). If that bit is 0, the register is clear and you can branch (BCC) to the next bit check.

If the carry bit is High (a logic one), however, you must set two bits in Register A (remember, we're doubling the frame size). The first time through, we are dealing with Bit 7, so we'll need to set bits 7 and 6 of Register A. Do this either by ORing the contents with 192 (128+64) or ADDing 192 to Register A. The same procedure is carried out for Bit 6; if it is High, set the next two bits (5 and 4) in Register A using 48 (32+16). If Bit 5 of the graphics byte is set, set bits 3 and 2 in Register A by increasing it by 12 (8+4). Finally, if Bit 4 is High, set bits 1 and 0 of Register A by increasing it by 3 (2+1). Notice at this point we're only halfway through the number, and Register A is full; save Register A as N1, clear Register A, and repeat the process for bits 3 through 0 of the graphics byte. When you are finished, save Register A as N2.

When all of the first graphics byte has been checked, you have two numbers (N1 and N2) that "double" this byte. The program loads Register D with these values and stores them (as two bytes) 32 bytes away (one line) from the current screen location, and then again at the current screen location. The horizontal screen location is then increased by two (, X++) and the program is ready for the next byte.

When the first row is complete, the program jumps 24 bytes in the array (LEAU 24, U) to the start of Row 2 of that frame. It also jumps half a line plus another entire line on the screen (LEAX 48, X). Now it's just a matter of repeating everything until we've gone down all 64 rows of the frame. I've included a delay in Line 1100 that you can adjust in the BASIC program (Listing 3); a higher value increases the delay between frames. Once the first frame is shown, the FRAME macro increases the current graphics location by eight bytes (64 bits - the width of a frame) to get the next frame. When all four frames in the first row have been shown, the macro is recalled using the start of the next four frames. Altogether, the macro is called 24 times, displaying four frames each time. This certainly cuts down on the length of the source code, saving a lot of writing. Enter the source code in Listing 1 and check it for errors with A/NO/NS/WE. When it's error-free, save the source code using W ANIM, ASM and assemble it using A ANIM. BIN /NS/WE.

Now that we have a machine-language program to display successive frames of graphics, we need to find some graphics images to animate. Listing 2 shows a BASIC program that draws a series of images that simulate three planets revolving around a

sun (or, perhaps three moons revolving around a planet). When you run this program, it will draw and save to disk eight full PMODE4 graphics pages.

Once the eight images are saved on disk, you can run the program shown in Listing 3, ANIMSHOW. This short BASIC driver loads the machine-language program (if necessary). It then loads the eight separate graphics pages and displays all 96 frames in succession. ANIMDRAW loops until you press the BREAK key. Line 250 contains the name of the ANIM file to be shown and the speed at which the animation will be displayed. You can experiment with different speeds by poking values into \$37C4; After stopping the program using BREAK, you can resume the animation with the new speed by

entering GOTO 220. You can use these routines to animate just about any sequence by altering AN-IMDRAW (Listing 2). Follow the same general format shown in the listing. The heart of the program is in lines 80 through 140 and Line 290. Once the twelve frames for one PMODE4 screen are drawn, the full image must be saved. Be sure the titles in Line 270 are different from any that you've already saved unless you want to erase the originals. Line 230 was necessary in my planetary sequence since everything revolves around the center of each frame. Depending on how you're drawing your animation, you may want to start HH and VV at (0,0) or at (0,63). Increase HH by 64 for each frame, and increase VV by 64 for each row, looping back to their original values at the end of each 12 frames. [Editor's Note: Included on the August RAINBOW ON TAPE/DISK is different set of eight files that, when run through Animator, depict a 3D cube rotating in space. To view the sequence, remove the REM marker from Line 260 of ANIMSHOW and place a REM marker at the beginning of

Another alteration you may want to make is to convert Animator to generate color animations, but you'll probably have to

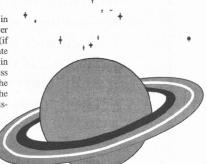

frame width resulting in the ability to use only half as many frames. CoCo 3 users may be able to use a lot more memory and increase the number of frames. A quick animation sequence like my drawing in

double the

Listing 2 could be saved directly into RAM instead of saving it to disk and reloading it. If you're zooming in on a Mandelbrot Set, however, image drawing takes so long that you'll need to save each page as you go and reload it later.

That's all for this month. If you have any suggestions or ideas for future articles, or questions about any of my articles, please let me know.

Bill Nee bucked the snowbird trend by retiring to Wisconsin from a banking career in Florida. The success of his 13-part series, "Machine Language Made BASIC" (July 1988 to July 1989), prompted him to continue writing articles about Color Computer machine-language programming. You may contact Bill at Route 2, Box 216C, Mason, WI 54856-9302, (715) 746-2952. Please include an SASE when re-

ammations, or	it you ii		questing a reply.

CBASIC Editor/Compiler The ULTIMATE Color Computer Basic Compiler!!!

If you want to write fast machine language programs but you don't want to spend the next few years trying to write them in Assembly Language, then CBASIC is the answer!!!

CBASIC is the only fully integrated Basic Compiler and program editing system available for the Color Computer. It will allow you to take full advantage of all the capabilities available in your color computer without having to spend years trying to learn assembly language programming. CBASIC allows you to create, edit and convert programs from a language you are already familiar with Extended Disk Color Basic, into fast efficient machine language programs easily and quickly.

"The most complete Editor/Compiler I have seen for the CoCo... "-The RAINBOW March 1986

CBASIC is a powerful tool for the Beginner as well as the Advanced Basic or M.L. programmer. CBASIC features well over 150 compiled Basic Commands and Functions that fully support Disk Sequential and Direct access files, Tape, Printer and Screen I/O. CBASIC supports ALL the High and Low Resolution Graphics, Sound, Play and String Operations available in Enhanced Color Basic, including Graphics H/GET, H/PUT, PLAY and H/DRAW, all with 99% syntax compatibility.

Specify Coco 1, 2 or 3 Disk \$149.00

DataPack III Plus V1.1

AUTOPILOT and AUTO-LOG Processors X-MODEM DIRECT DISK FILE TRANSFER VT-100 & VT-52 TERMINAL EMULATION

- · No lost data even at 2400 Baud on the Serial I/O port.
- 8 Selectable Display Formats, 32/40/64/80 columns
- · ASCII & BINARY disk file transfer via XMODEM.
- Directly record receive data (Data Logging).
- VT-100 emulation for VAX, UNIX and other systems.
- VT-100/52 cursor keys, position, PF & Alt. Kbd. keys.
- · Programmable Word Length, Parity, Stop Bits
- Complete Full and Half Duplex operation,
- Send full 128 character set from Keyboard .
- Complete Editor, Insert, Delete, Change or Add .
- 9 Variable length, Programmable Macro Key buffers.
 Programmable Printer rates from 110 to 9600 Baud.
- Send Files from the Buffer, Macro Key Buffers or Disk.
- Display on Screen or Print the contents of the Buffer.
- Freeze Display & Review information On line .
- Built in Command Menu (Help) Display.
- Supports: Modem-Pak & Deluxe Pak or Serial Port. Specify Coco 1, 2, 3 Disk \$49.95

EDT/ASM III

EDT/ASM III is a Disk based co-resident Text Editor & Assembler. It is designed to take advantage of the new features of the COCO 3. It has 8 Display formats from 32/40/64/80 columns. The disk also contains a free standing ML Debug Monitor.

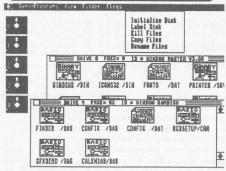

EDT/ASM III has the most powerful, easy to use Text Editor available in and Editor/Assembler package for the Color Computer.

- * Local and Global string search and/or replace.
- * Full Screen line editing.
- * Load and Save standard ASCII formatted files.
- * Block Moce & Copy, Insert, Delete, Overtype. * Create and Edit files larger than memory.
- The Assembler features include:
- * Conditional If/Then/Else assembly.
- * Disk Library files up to 9 levels deep.
- * Supports standard Motorola directives.
- Allows multiple values in FCB/FDB directives.
- 'Allows assembly from Buffer, Disk or both.

 Specify Coco 1, 2 or 3 Disk \$59.95

Window Master V3.0

The Ultimate User Friendly Point & Click operating System for your Coco 3. Simple enough even for children to use, just point and click to run programs, select files, do disk or file maintenance or almost any

task you currently do by typing commands. You also get things like a print spooler, Programmable Function Keys, a Buffered Keyboard.

Ramdisk, Serial I/O port and Deluxe Pak support along with Windows, Icons, Buttons, Pull Down Menus, Edit Fields and Mouse functions all in one program. It has multiple fonts in 54 possible sizes and styles, Enhanced Basic Editing and much much more. It add over 50 commands and Functions to Basic to fully support the Point & Click System without OS9.

"...it offers so many features that it is probably underpriced. I recommend this software to all CoCo3 owners." -The Rainbow Feburary 1989

It is completely compatible with existing Basic programs and takes absolutely no memory away from basic. It requires 1 Disk Drive, R.S. hires interface & Joystick or Mouse.

Includes 128 & 512K Versions Only \$69.95

"The Source"

The SOURCE will allow you to easily and quickly Disassemble machine language programs directly from disk and generate beautiful, Assembler Source Code. And " The Source" has all the features and functions you are looking for in a Disassembler.

- * Automatic Label generation.
- * Allows specifying FCB, FCC and FDB areas.
- * Disassembles programs directly from Disk.
- * Automatically locates addresses.
- * Output listing to the Printer, Screen or both.
- * Generates Assembler source directly to disk.
- * Built in Hex/ASCII dump/display.
- * 8 Selectable Display formats 32/40/60/80.
- * Built in Disk Directory and Kill file commands.
- * Menu display with single key commands.
- * Written in Ultra fast machine language. Specify Coco 1, 2 or 3 Disk \$49.95

Window - Ware

Deluxe Terminal

A Completely New and Easy to use Terminal Program designed specifically for the Coco III.

With advanced features you would expect to find only in a Hi-Priced MS-Dos program. It has a 26 Entry Phone Directory with complete Configuration information for Communications and Automatic logon. Supports the Serial I/O Port up to 2400 baud, Deluxe & Modem Pak and the Disto Serial I/O board up to 9600 baud. It has a Full Screen Text Editor, X/Y Modem File transfer support, Split Screen Conference Mode, Macro Keys. Full Disk Support including Multifile Copy, Kill, Rename, Arc/Un-Arc and Disk Initialize and it is Completely Compatible with ADOS.

Requires 128K, Disk & 80 Col. Display \$44.95

CoCo III Tool Kit

Games

Feature Program

CoCo Finds the Right Location

entering a phrase or title onscreen while writing programs can be a real chore. It isn't all that difficult but involves enough trial and error that it becomes a laborious task. That's why I wrote Print At.

Print At is a simple BASIC program that helps you place a short line of text just about anywhere on the screen. After running the program, you are prompted to enter the phrase; type up to 17 characters (to allow longer lines, change IFL>17 in Line 90 to a greater value) and press ENTER. Then use the arrow keys to move the text line around the screen. As you move the text, the actual PRINT@ location is displayed at the bottom of the screen. You can move the phrase anywhere from the top line down to two rows from the bottom.

When the text is positioned to your satisfaction and you have noted the proper location, press BREAK. Then you can use the location with the PRINT@ statement in your BASIC program. It's amazing how such a simple program can be so handy.

John Musumeci is a retired TV repairman whose sole hobby for the past eight years has been working with and programming the Color Computer. He may be contacted at 103-57 104 Street, Ozone Park, NY 11417. (718) 738-0212. Please include an SASE when requesting a reply.

Feature Program

Protect Your Parcels With Care Labels

hen you send a tape or disk through the mail, good packing techniques are essential. It can also help to let postal employees know that what you are sending is somewhat delicate. You can do this by putting warning labels on your packages.

Post Care is designed for use with a CoCo and a DMP-130 printer, and prints warning labels for you. The program supports one-up labels that are 4 inches wide by 11/2 inches tall and prints two copies of the warning on each label. Enter POSTCARE from the listing and save it to tape or disk. Line 10 sets the computer's sending speed to 2400 bps. Alter this poke to match your setup. The control codes used are supported by most Tandy printers, though you may need to change them if your printer doesn't support the same features the DMP-130 (or if

your printer is not a Tandy). The control codes are commented in the listing.

When you run the program, you are prompted for whether you want a label for a disk (press D) or a tape (press T). To end the program, press E. The label is then printed and the prompt returns, allowing you to print a bunch of labels at one time.

Only once did I forget to attach a label to a tape I sent from Australia to the U.S. That package went through an electronic sorting machine in San Francisco and was thoroughly destroyed (I don't know how the machine fared). Since labels aren't the endall for protection, also exercise care when packing your tapes or disks - place stiff cardboard on both sides of a disk, and pack tapes in sponge rubber or corrugated cardboard. [Editor's Note: We've noticed some people also wrap aluminum foil around disks and tapes before packing them. Based on the number of disks and tapes we receive daily, our experience shows this has little effect on whether or not the materials ar-

rive intact. Consider saving your pennies, folks.]

Keiran Kenny's interests lie mainly with the Color Computer's graphics and math capabilities. But in his own words, "I like to try everything." He may be contacted at 11/ 5 Milson Road, Cremorne, NSW, Australia

AWESOME FILE EDITOR FOR YOUR CoCo III

26 August 1992 THE RAINBOW

The critics will be raving about this strategy game! Based on an original concept by author Jeff Steidel,
Photon is an addictive time-muncher in the spirit of Lemmings⁷⁸ and Tetris⁷⁸. Match wits with
Ludevide, the evil power droid, as you reason yourway through over 60 devious levels. The numerous
original music scores, digitized speech and sound effects, and pleasing animation and graphic senrich
Photon to make it an unparalleled gaming experience. Soon to be released on a variety of computer
platforms, the CoCo Community is lucky enough to be given first glance at this fantatic game! Req.
128k CoCo-3, disk drive, and joystick.

\$34.95

Announcing Announcing Icon Basic09

Icon Basic09 is a graphical user interface (GUI) to Basic09, which will make programming easier than ever! Icon Basic09 takes an innovative approach by using graphic representations, or icons, to represent statements and keywords for writing Basic09 programs and procedures. Instead of constantly typing while writing a program, the user can simply point & click to choose the desired statement!

The next programming language for OS-9!

Icon Basic09 can also be very useful in studying procedures and programs written by others to learn how they operate. The package contains a full set of icons...or, you may edit or create icons using the included icon editor. Icon Basic09 requires a CoCo-3 with at least 256k, mouse or joystick, and OS-9 Iv 2.

Dual hi-res joystick adapter (RS/Colorware) \$40
Hi & Lo-res joystick adapter \$27
HAWKsoft keyboard extension cable \$25
Domination ("Risk"-like wargame!) \$18
MyDOS full-featured DOS extension \$15

US and CDN S&H always included. Terms: MO, check, or COD.
