FeatureProgram

A Reminder A Day

by Richard J. Ries

Things To Do is a personal notebook for OS-9 Level II. Once the program is set up, you'll have much less reason to worry about forgetting important dates and upcoming events. This short utility reads a standard text file containing dates and activities, and compares the current system date to the dated entries in the file. If the dates match, Things To Do prints the associated activity.

To get started, boot OS-9 and start BASIC9. Then enter the two procedures (ttd and LInput) listed here. Save the source code to the current data directory by entering save* ttd, then pack the procedures in the current execution directory by entering pack* ttd.

Before you execute Things To Do, you must create the text file with dated entries. Things To Do looks for these entries in a file named calendar.dat. Create this file using OS-9's build and edit commands or any other OS-9 text editor.

When searching for dates in the calendar.dat file, Things To Do expects the entries to be in the following format:

```
mm/dd activity
```

That is, the month appears in the first two digits, followed by a slash and the day as two digits. Leading zeroes are required for both the month and day. After the day is a space followed by the activity. The date must be the first five characters in the line — any other format will cause ttd to ignore that line.

The calendar.dat file may contain as many entries as you need (and have space for), but it is not necessary that you group all the entries for each day. However, since you'll probably want to edit the file occasionally to add new entries and erase old items, you'll find it far easier to keep things clean if you do group items on a date basis.

To use Things To Do, make sure the packed version of ttd is in the CMDS direc-

tory along with RUNB, Syscall

and Inkey, and make sure calendar.dat is in the current data directory. When all is set, simply enter ttd to see the entries for the current date. If you want to see what's happening on another date, enter ttd followed by the date you want to see. For example, were I to enter ttd ('02/13') on my system, Things To Do would respond by printing

```
Things to do on 02/13:
Get wife flowers for tomorrow.
Press any key to continue...
```

(If you have Shell+, which I do, you could alternatively enter ttd 02/13.)

I run the packed version of ttd from my startup file right after I set the system date. This way, I am reminded of the day's events when I boot the system. To do this, make the last two lines of your startup file read:

```
setime </term
ttd
```

(Actually, I use setdate in place of setime. This is a short utility I wrote that also appears on Page 142 of the February 1989 issue of THE RAINBOW.)

Program Notes

If you supply a date to ttd on the command line, it is stored in CheckDate and later transferred to Today. If no date is given, however, when the program attempts to transfer it, a parameter error occurs and the error handler causes the program to jump down and load the system date. The file calendar.dat is opened and read one

See ReminderonPage4

FeatureProgram

Flying Aces

by George Quellhorst

Aces Up is an easy-to-play (but hard-to-beat) solitaire game for the CoCo 3. When you run the program, four cards from the standard deck are dealt and displayed at the top of the screen. The game is suit-based, so if you find two (or more) cards of the same suit, discard the lower-valued card(s). For purposes of this game, Aces are considered the highest cards in the deck, ranking above Kings. To discard, use the right and left arrows to position the blinking cursor box over the desired card, then press the down arrow. Make sure you check all suits for possible discards.

When you have finished discarding all lower-valued cards, there may be empty spaces. You may fill these locations by moving other cards to them. To move a card, position the cursor on it and press ENTER. Then move the cursor to the new location and press ENTER again. Make sure to check again for possible discards.

When there are no empty spaces and

no possible discards, deal four new cards by pressing the up arrow. Since these cards stack on top of the existing piles, remember that the four cards with no other cards on them are the only active cards on the screen. Continue through the deck in this fashion until there are no cards left in the deck. The number of cards remaining in the deck is displayed in the bottom-right corner of the screen. Oh, yes... the goal of the game is to discard all the cards in the deck, leaving only the four aces. It may sound easy, but accomplishing this will take some work.

To start a new game at any time, press N. Alternatively, to replay the current game, press S. Because it is so easy to press BREAK while trying to press the up arrow, the program disables BREAK. To return to BASIC, hold the SHIFT key and press BREAK.

Printer Questions

Editor:

I am fairly new to the CoCo, and I have a few questions. First, why is there no ink-jet printer available for the CoCo 3? Second, is it possible to interface a word processor to the CoCo 3 and use it as a printer? I have in mind the Xerox 645S Memorywriter, which stores its text on a disk. Can a program be written to make the CoCo 3 read the 645S disk and print what is on the disk? How about using the CoCo 3 to create a disk for the 645S Memorywriter?

William Randall
8343 Centre Street NW
Calgary, AB T3K 1J6
Canada

Some years ago, Radio Shack offered a color ink-jet printer for the Color Computer. The CGP-220 is no longer available commercially. With a parallel interface, however, it is possible to use just about any printer with the CoCo; the biggest disadvantage is that no vendors are marketing software to allow printing of graphics with these printers.

Many typewriters/word-processing machines can be used as printers for computer systems. Doing this usually requires that you purchase an optional interface from the manufacturer. Most such machines use disk formats that are foreign to the Color Computer.

Needs Packet Software

Editor:

I am an amateur radio operator who is interested in Packet radio. I also own a CoCo 2 with 64K of memory. Is there any software available for the CoCo 2 that allows it to operate with Packet?

John Gunson
305 Oak Road
Seaford, DE 19973

How 'bout it, hams? Can anyone lend John a helping hand?

ROM Pak Transfer Needs Help

Editor:

I would like to transfer some ROM Paks to tape and eventually to disk. I have the Microcom books and the ROM Pak-transfer programs and, while transfers to tape seem to go without a hitch, the transferred programs won't execute. Microcom's program simply hangs up when I try to perform a transfer to disk. I understand Microcom is no longer supporting the CoCo.

The ROM Paks I'm trying to transfer are *Finance II* and *EDTASM+*. I am wondering if there are special patches for these two ROM Paks. If so, could you provide me with the information?

Charles Latrobe
211 Edgevale Road
Baltimore, MD 21210

Pokes and patches for transferring ROM Paks to disk are available on Delphi for

many of the ROM Paks sold by Tandy. For information on using EDTASM+ without the hardware, see Roger Schrag's articles in the following issues:

December 1982, Page 29
April 1983, Page 194
September 1983, Page 66
March 1984, Pages 156 and 160

CoCo 3 Shifted Display

Editor:

I am having a problem with my nephew's CoCo 3. Every time I turn the power on, the display is not normal. The display shows the version number properly, but it's shifted over to the left by half a character. Can you tell me what the problem is and how to correct it?

James Ferrett
1806 Jefferson Street S.
Gettysburg, PA 15601

The shifted display reflects a problem inherent in older versions of the Color Computer 3. This effect usually disappears when the computer is upgraded from 128K to 512K. In the meantime, pressing the Reset button a few times will return the display to normal.

Wants CoCo to See the Stars

Editor:

Are there any programs that pertain to astronomy? I am an amateur astronomer and would like to get some software that deals with planet orbits, star charts and astronomical calculations. I have a CoCo 3, a CM-8 monitor, one disk drive and a DMP-132 printer.

Ken Thomason
706 East 200 South
Jerome, ID 83338

See the next letter for some direction.

Help for CoCo Astronomers

Editor:

Please pass on to Bud Helck (whose letter appeared in the October 1992 issue) that one of the best sources for astronomy software is Willmann-Bell, Inc., P.O. Box 35025, Richmond, VA 23235. They do offer a newspaper-type catalog.

But, Bud, don't be put off by the fact that the programs are written for BASIC on a PC-compatible. They are easily converted for the CoCo's BASIC. A lot of the books offered provide only algorithms, which you can insert into your own programs.

John A. Coldwell
McInnes Island Lighthouse
clo Bag 3670
Prince Rupert, BC V8J 3R1
Canada

Disk BASIC Dynacalc and the CoCo 3

Editor:

I have a 64K CoCo 2 with Disk BASIC 1.1 and a 512K CoCo 3 with Disk BASIC 2.1. I can load and run *Dynacalc, Version 5.1:1* on the CoCo 2, but it won't work on my CoCo 3. Any suggestions?

Larry Giacobbo
208-16 Street
Cold Lake, AB T0A 0V2
Canada

If we're not mistaken, the *Disk BASIC* version of *Dynacalc* uses the top block in the 64K memory map — an area that is also used by the CoCo 3 for system control. When you load *Dynacalc* on the CoCo 3, it overwrites the computer's control area, causing the system to crash. We are unaware of any patches to correct this.

DMP-120 Blues and the 6309

Editor:

I own an old DMP-120 on which the ribbon cable connected to the printer head has been torn. Unfortunately Tandy doesn't have any more. Do you know where I can find one?

I was considering purchasing a 6309 PowerBoost kit from Burke & Burke, but I noticed that it runs in the 6809 Emulation mode. NitrOS-9 runs in the Native mode, which is even faster. Which of these packages do you recommend?

Christian Miller
6079 Buerman Road
Sodus, NY 14551-9555

Sorry, but we don't know of any vendors offering a replacement ribbon cable for the DMP-120 printhead.

We have not yet seen NitrOS-9, so we have no basis for comparing it with Burke & Burke's PowerBoost. On the other hand, Chris Burke continues to update PowerBoost, taking advantage of more and more features of the 6309. You might give him a call to get a more timely update on that product.

In Our Defense . . .

Editor:

Since THE RAINBOW changed its format, I have seen many letters of criticism. There are a lot of things for which I use my CoCo 3, and I consider THE RAINBOW an important source of information.

My point is this: Commodore users recently lost *Run* magazine, which ceased publication with the November/December 1992 issue. Apple II users have lost two magazines: *Nibble* ceased publication just a few months ago; and *A+/Incider* has decided to support only the Macintosh as of February. At least we still have our magazine. So instead of complaining, support THE RAINBOW. Otherwise, we may lose it.

Robert Newhart
131 North 32nd Street
Camden, NJ 08105

THE RAINBOW welcomes letters to the editor. Mail should be addressed to: Letters to Rainbow, The Falsoft Building, 9509 U.S. Hwy 42, P.O. Box 385, Prospect, KY 40059. Letters should include the writer's full name and address. Letters may be edited for clarity or to conserve space.

Letters to the editor may also be sent to us through our Delphi CoCo SIG. From the CoCo SIG> prompt, enter RA1 to get to the Rainbow Magazine Services area of the SIG. At the RAINBOW> prompt, enter LET to reach the LETTERS> prompt, then select Letters for Publication. Be sure to include your complete name and address.

THE RAINBOW is published every month of the year by FALSOFT, Inc., The Falsoft Building, 9509 U.S. Highway 42, P.O. Box 385, Prospect, KY 40059, phone (502) 228-4492. OWL WARE Software Bundle

Disk Tutorial/Utilities/Games
DISK TUTOR Ver 1.1
 Learn how to use your disk drive from this multi-lesson, machine language program. This tutor takes you through your lessons and corrects your mistakes for a quick, painless disk drive introduction. (This professionally written tutor is easily worth the bundle's total price.)

3 UTILITIES
 A copy verify, copy, and DOS utility.

2 GAMES
 We will select 2 games from our stock. These are sold for more than \$20 each.

Do not mistake this software with cheap "Public Domain" software which others offer. All of this software is copyrighted and professional in quality. The tutor is unique with us and has helped thousands of new users learn their disk drive.

only \$27.95
 (or even better)
 only \$6.95 with
 any Disk Drive Purchase!!

512K Upgrade
 Again at a popular price. Fully assembled and tested before shipping. Easy to install. Uses last 120 ns chips.
SALE \$79.

Now includes memory test, Ram Disk Lighting, Printer Lighting, and Back-up Lighting. All with an upgraded manual exclusive with OWL!

Our prices include a discount for cash but do not include shipping.
 OWL-WARE has a liberal warranty policy. During the warranty period we will replace or refund at our option at no cost to the buyer except for shipping costs. Call our tech number for return. Return of non-defective or unauthorized returns are subject to a service charge.

Reminder from cover

line at a time using the procedure LInput. LInput is used because BASIC09's INPUT command stops at the first comma it sees, and I like to use commas in my messages.

If the line is longer than five characters (so LEFT\$ has something to work with), the first five characters are copied into Dat, which is then compared to Today. If the strings are the same, a test is made using Wait to see if the header was printed. Wait starts in the FALSE state and remains that way until a matching date is found. Then because it is FALSE, the header is printed and Wait is set to TRUE. The rest of the line that was read (the actual activity) is then printed on the screen, and the program loops back to read another line. On the next match of dates, the header is not printed since Wait is TRUE. This process continues until the end of calendar.dat, at which point the program closes the file. If any entries were printed, Wait is TRUE and the prompt Press any key to continue... is displayed. At this point, the program waits for a keypress. If on the other hand no date matches are found, the program does not wait but ends immediately.

Enhancements

Things To Do could be made a little more fancy by building in an overlay window and by using differently colored words for messages and activities. I decided against this since I have my system boot with the standard VDG display. (It helps me to appreciate just how far we've come.) Another modification would be to rework the program to eliminate the requirement for Syscall, thus allowing it to be used on OS-9 Level I systems.

I hope you find Things To Do to be of use to you. It sure helps me remember important dates and events.

Richard Ries is an embedded-systems programmer who works with many different processors. He currently works for an alarm manufacturer on Long Island, and he is the president of the Long Island Color Computer Club. Richard may be contacted at 32 Halycon Rd., Lindenhurst, NY 11757. Please include an SASE when requesting a reply.

Feature Program

KEEP TRACK OF REFUNDS
by TREVOR BOEHM

Collecting universal product codes (UPCs) from grocery packages and mailing them back for refunds is a great way to save money. If you become serious about refunding, however, and start a large collection of UPCs, you may find yourself losing track of exactly what you have. This is precisely why I wrote Refunder.

Refunder is a BASIC program designed to keep track of the UPCs in your collection. The program requires at least 16K and a disk drive. To use Refunder, first enter the program as shown in the listing, then save it to disk as REFUNDER.BAS. Now type RUN"REFUNDER" at the OK prompt to start

the program. Onscreen, you see the Main menu, from which you can add and edit the data, view it, print it, see the disk directory or quit.

Refunder allows you to track up to 500 products. You can increase this value if necessary by altering the DIM statements in Line 10. Also, when you save or load data, enter the full filename if you don't want to use the default extension of .DAT. Finally, when you look up a product by name (Option 3), you can enter the full product name or just a portion of it. This is handy if you forget exactly how you originally entered the product.

I hope Refunder helps you organize your

collection of UPCs. If you have comments about or problems with the program, please feel free to write to me.

Trevor Boehm is a high-school student who attends Silver Heights Collegiate in Winnipeg. His interests include computer programming, applied science and reading science-fiction novels. He may be contacted at 77 Inwood Cres., Winnipeg, MB R2Y 1A2, Canada. Please include an SASE when requesting a reply.

TIM KIENTZLE

How to Manage Strings, Part I

Among the nicest features of BASIC are its built-in string operations. When programming in C, you lose much of this power; so you must decide whether the C-library string functions are sufficient or whether you should use a more-sophisticated approach. With assembly language, you lose pre-fab string functions altogether, in which case you must decide how to create the functions you need. This month and next, we'll discuss some different approaches to the problem.

The Problem with Malloc

Many C programmers use the library routine `malloc` to allocate space for each string, then manipulate the strings by using the `str` functions and release the space with the library routine `free` when the space is no longer needed. This approach works fine when there are only a few strings, and you're not performing extensive operations on them. Unfortunately `malloc` and `free` can be slow, especially when there are a lot of strings or the heap is badly fragmented by the frequent creation and destruction of strings. So even though C programmers do have some "built-in" string-handling capability, it's a good idea to consider other approaches in situations where you need to handle a lot of strings.

How Will You Use It?

Before developing a strategy for handling any sort of object, you need to carefully consider how you'll be using that kind of object. Some of the questions you should consider are:

☞ How many strings will I need? If you need only a few, you can probably get by using a much simpler approach.

☞ How "long-lived" will the strings be? If you need to create a lot of strings but need each one for only a short time (i.e., the strings are "short-lived"), you should consider an approach that re-uses the same areas of memory. Ideally the method you choose will not take too long to create new strings or recycle the space no longer needed by an old one.

☞ Do the strings need to be handled individually? Sometimes what you really need is a method that can handle a lot of strings together. A good example would be a symbol table, where new strings are added one at a time, but the only way you'll be freeing them is by destroying the entire symbol table at once.

☞ Will the strings be changing very much? In the symbol table example, once a new string is added, it is never changed. In other cases, strings may need to be changed frequently.

☞ Is there a convenient maximum size? If you can reasonably limit *all* the strings in your routine to, say, 32 characters, handling them will be much simpler than if you allow strings of any size.

The answers to these questions help you determine the best approach for your particular situation. For instance, if your answer to the last question indicates that all you'll need are a specific number of strings of the same size, you can develop a much faster and simpler approach than if your program requires an unknown number of strings of any size.

Handling One String

How you store a single string also depends on your needs. There are two widely-used approaches; which is best depends on your particular situation. One approach is to use some special marker to indicate the end of the string. C programmers have pretty much standardized by using null-terminated strings, where the last byte of the string is always a zero. OS-9 stores many names by setting the high-order bit on the last character. Copying strings stored in this format is usually very fast, since there's no need to keep track of the size. On the other hand, it takes a long time to find the size of such a string, and you are prevented from putting certain characters in the string.

Another approach is to use what are sometimes called "dimensioned" strings, where the length is stored as part of the string. This is the standard method in Fortran and is also used in many Pascal implementations. As suggested above, it is often less efficient to copy these strings, but there is no restriction on what characters you can include in such a string. Clearly, finding the size of such a string is very fast. As always, you should think about the operations your routine will be performing most often before you decide which implementation is most suited to your application.

Fixed-Length Strings Are Often Enough

If you can reasonably limit the size of the strings you plan to use, life will be much simpler. For a few strings, just set aside enough space for each string, then use either pointers to the strings or simply the number of the string (i.e., treat the block of memory as an array of strings).

In some situations you don't know exactly how many such strings you'll need, in which case you'll need to set up some sort of dynamic allocation, creating new strings from a block of free memory as they are needed. In C this is accomplished with the `malloc` function.

An important thing to consider is how to release unneeded space when you are done with the strings. If you are likely to be allocating strings as often as you free them, it might make sense to free a string by storing a pointer in a list of "available" strings — recycling a string from such a list is much faster than freeing the string storage and calling `malloc` to reclaim it. This takes advantage of our assumption that all strings are the same length. For strings of different length, recycling is usually not reasonable.

Variable Length Strings

If your application requires that you use variable-length strings, consider using a "string pool." If the strings will never be destroyed, it is quite easy to set aside a block of memory and store strings in it, one after the other. The only requirement is that you keep a pointer to the next available byte in the storage pool. (See Figure 1 for an illustration of how this approach works.)

Sometimes a combination of the previous two approaches is the best. By allocating most strings as fixed length, you gain the speed and simplicity of that approach for short strings. Then use a string pool to store the few longer strings.

RELIEF

Save Money Too!

Subscribe to these convenient services and receive each month's programs in a ready-to-run form. No more long tedious hours wasted typing! No more red eyes and sore fingers! All you do is load and run, using the current issue of THE RAINBOW as documentation.

OS-9 programs are available too! One side of the RAINBOW ON DISK is formatted for the OS-9 operating system (OS-9 programs cannot be put on tape) so you can get all the great programs in the magazine.

A one-year subscription to THE RAINBOW and RAINBOW ON TAPE is only \$91 in the U.S., \$108 in Canada, \$153 foreign surface rate and \$188 foreign airmail.

A one-year subscription to THE RAINBOW and RAINBOW ON DISK is only \$115 in the U.S., \$138 in Canada, \$183 foreign surface rate and \$218 foreign airmail. U.S. currency only. Back issues of both RAINBOW ON TAPE and RAINBOW ON DISK are also available! (see our back issue ad in this issue)

RAINBOW ON TAPE back issues are available beginning with the April 1982 issue. A single copy of RAINBOW ON TAPE is \$10 within the U.S., \$12 in all other countries. The annual subscription for RAINBOW ON TAPE is \$80 within the U.S.; \$90 in Canada; and \$105 for all other countries. U.S. currency only.

RAINBOW ON DISK back issues are available beginning with the October 1986 issue. A single copy of RAINBOW ON DISK is \$12 within the U.S., \$14 in Canada, \$16 in all other countries. The annual subscription for RAINBOW ON DISK is \$99 within the U.S.; \$115 in Canada; and \$130 for all other countries. U.S. currency only.

Figure 1: The String Pool

Compacting String Manager

There are situations where none of these simpler approaches will work. In these cases, you need a method that allows you to work with any size string but avoids the overhead of malloc and free. An approach that works well is to augment the string pool described above with a *compaction* routine (sometimes referred to as "garbage-collection"), which reclaims unused space from strings that have been freed. The way this is usually accomplished is by moving the strings that are still allocated down to the bottom of the string pool, thus collecting all the free space in one large block at the top of the pool. There are a few hurdles, though. The first is that if the strings are going to move, we can't have pointers to them. We can get around this by setting up a special set of pointers and letting other parts of the program have pointers to those pointers. (Such devices are often called "handles.") Since other parts of the program have pointers

only to handles (which never move), the pointers to the actual strings can be changed whenever we perform compaction. The other hurdles involve figuring out just what information we need in order to achieve efficient compaction.

Next month I'll show you how to implement a string manager in assembly language. In the meantime, remember that although a string manager is the most general solution, it's not always the best. The methods discussed earlier in this article are faster and work quite well for most of the situations where you need to work with strings.

Tim Kientzle is currently pursuing a doctorate in mathematics at the University of California at Berkeley. He is the author of V-Term and has worked with the Color Computer since 1982.

Chart Your Monthly Bills

by Charles A. Kiedaisch

People may joke about older persons losing their memories, but it really happens. As I have grown older, I find that I sometimes forget which bills I have paid and which ones I haven't. Rather than go through the checkbook comparing entries with bill stubs, I wrote *Bill Chart* to help me keep track of my bills.

Bill Chart is a short BASIC program that prints a chart of the bills I must pay each month. To the right of each bill on the chart are 12 blocks, one for each month of the year. When I pay a bill, I simply put the date in the appropriate block next to the name of the bill. When the column for a given month is filled, I know for sure I have paid all of that month's bills.

Bill Chart should work with any Color Computer and uses printer codes for the Tandy DMP-130 and DMP-133 printers. To use the program, enter the listing as

shown, save it to tape or disk, then enter RUN. After printing the header, *Bill Chart* prompts you to enter the account. Enter the name of the first bill at this prompt. The program then prints this entry on the chart and asks you for the next account. To put a blank line between bills, press ENTER by itself at the prompt. When you have entered all the names of your monthly bills, type END and press ENTER.

Bill Chart works well and certainly helps me keep things straight (but you don't have to be older for it to be useful.)

Charles A. Kiedaisch is a retired tool-and-die designer who still does some independent work and uses his CoCo 3 to create master drawings. He enjoys building useful programs for the Color Computer.

Product Review

KwikZap: High-Performance Editing

It seems there are more than enough OS-9 utilities to go around — I think I've looked at four or five disk-zap utilities in the past year alone. Out of this multitude of choices, it's sometimes difficult to decide which product you want or need. I hope this review answers your questions about *KwikZap* from Gale Force Enterprises.

KwikZap was written for OS-9 Level II and requires at least 128K of memory. Besides a disk drive or two, you will also need an 80-column monitor (color or monochrome).

Let's get to the bottom line first. Of all the disk zappers I've seen, this has to be the best — in all respects. Let's take a look.

The program status is displayed onscreen at all times, and the different function settings are shown clearly. The sector information appears in two side-by-side windows — one with Hex values, the other with ASCII data — for easy comparison. Also, entire sectors are displayed at once, reducing the amount of searching necessary to find just the location you want. All this goes a long way toward helping you prevent mistakes, as do the program's on-line Help features.

KwikZap supports single-keystroke help for its various functions, and you can set the program so an abbreviated Help message appears onscreen at all times. This abbreviated help is also intelligent — only the information that applies to the current setup or mode is shown.

Zapping options include the ability to modify the Hex data in byte or nibble mode (yes, you can work with individual Hex digits if you want), or in the ASCII mode. If you want to work with a memory module that has been merged into a larger disk file, the program allows you to "link" to that module alone, limiting your working space to just that module; in other words you won't have to wade through a full sector of data just to modify a small module (very handy for working with device descriptors). When working with a memory module, you can also verify the module's CRC automatically without having to change the CRC manually. Searching for a specific byte pattern or ASCII data is quick and easy since you are allowed to search for just the first occurrence of the pattern; or you tell the program to search repeatedly from one occurrence to the next until you find the sector you're looking for. You can move from sector to sector by using the up and down arrow keys, or you can jump to a specific sector. You can also modify a file's length, which is helpful for such things as stripping the padding from an Xmodem file transfer and extending the length of a file to accommodate inserted bytes.

A dynamic sector stack allows you to change the order of the sectors in the file or on the disk. The stack holds sectors in memory until you are ready to write them to disk, and you can pull sectors from the top or the bottom of the stack, making it easy to rearrange them before writing them. (All sectors put onto the stack go on top, but you can still pull sectors from either the top or bottom.)

KwikZap also features an Undo function, which makes operations in the Modify mode far safer than with some other programs. When selected, the Undo function restores the sector to its original state.

The *KwikZap* documentation is a well-written booklet that clearly explains all of the program's functions. The sector stack is described in its own section, and another section explains how to modify *KwikZap* to suit your individual preferences (the program uses an environment file in your /dd/SYS directory to keep track of these preferences). Telephone support is available if necessary, but I don't think experienced OS-9 users will need more than the included documentation. As I said before, *KwikZap* is in my opinion the best disk zapper available for OS-9. (Gale Force Enterprises, P.O. Box 66036, Station 'F', Vancouver, BC V5N 5L4, Canada; 604-589-1660; \$24.95 U.S.)

— Bill Budenholzer

Reviewer Information

In order to continue to bring Tandy Color Computer users all the best information about new hardware and software products each month, we are constantly looking for new people to join our independent review staff. Therefore, we invite you to join THE RAINBOW's elite fleet of reviewers.

You read THE RAINBOW because you love your Color Computer, so if you want a creative outlet and a chance to examine quality hardware and software, with your observations published nationwide, we want to hear from you.

Send us a cover letter with your name, address, occupation, list of equipment, areas of general interests, and a sample review of a CoCo product you are currently using. We look forward to your response. After all, we already see you have the best taste in computers.

Write a Personal Diary

by Mark Rivera

Diary is a simple CoCo program I wrote to allow me to keep a daily record. However, while it was originally designed as a personal diary, there is no reason the program can't be used to log any series of important events or information.

Each entry in the diary can be up to 249 characters in length and is saved to disk as a separate file. The program is also password-protected to some extent, and the password file is saved to disk. For these reasons, I recommend that you save Diary on a freshly formatted disk and use the disk only for recording entries in the diary.

When you run Diary, you are greeted with a menu offering the following options: start a new diary, make an entry in the diary, view entries and quit. To start your diary, save Diary on its own disk and enter RUN. When the menu appears, press 1 and follow the prompts. You are first asked to enter a password, which may be from one to eight characters in length. After Diary saves the password to disk, you are returned to the menu from which you can select Option 2, where you make new entries in the diary. You will be prompted for the password and date after you select this option. You may enter the date in any format (e.g., 25DEC92 or 122592) as long as the string you enter is no more than eight characters in length. — Diary uses this date string as the filename for each entry. Obviously, then, you cannot use a slash or a period in the date string; otherwise Diary will interpret it as an extension. The main point is that you use the same format for each entry. This helps you avoid confusion later on.

After you enter the date (or other string), you see a blank screen. Just enter the text for your diary entry, making sure you don't press ENTER until you are done. (When you press ENTER, Diary thinks you're finished and saves the entry to disk.) If you don't like the words breaking at the right edge of the screen, format the text by using the space bar. And remember, you are limited to 249 characters, including spaces.

To view entries, press 3 at the Diary menu. Before you are allowed to see any entries, you must correctly enter the password. When prompted, enter the date and that day's entry is displayed. After the entry is displayed, press any key to enter the date for another. If you type the word PASSWORD and press ENTER at this prompt, the program ends.

The password protection offered by Diary is fairly limited. Both the password and the daily entries are saved as data files that can be read using a standard word processor — so it won't stand up to the clever (and very inquisitive) user. However, it does give some protection and may help keep younger siblings from digging where they don't belong.

As I said earlier, Diary can be used to store any type of information. Since there is no checking for the date format, you don't have to enter a date at all — any eight-character string will do.

There are a couple of modifications you

might want to make to Diary. First, the program is not designed to print daily entries. It should not be too difficult to add such a feature. Also, there is currently no way to get from the view-entries prompt back to the menu. To change this, replace Line 350 with something like

```
350 IF D$='MENU' THEN 30
```

and enter MENU at the prompt to return there. Finally, Diary gives you no way to edit entries. Actually, to do so would be against the idea that a diary is for quick impressions and editing an entry may spoil the feelings you are trying to record. However, perfectionists may choose to add this feature.

Mark Rivera is 15 years old and is a sophomore in high school. He owns an MC-10 and a CoCo 3, and he has written several BASIC programs for personal use. Mark may be contacted at 10839 Cropper Rd., Pleasureville, KY 40057, (502) 461-7519. Please include a SASE when requesting a reply.

FeatureProgram

Shopping List Generator

by Trevor Boehm

Do you want a neat, sorted shopping list when you take a trip to the store? Shopping List is a short BASIC program that helps you create just such a list; it works on any CoCo with at least 32K of memory.

To use Shopping List, first enter the program listing and save it to tape or disk as SHOPPING.BAS. Then set your printer to the online mode and run the program. Once Shopping List is running, simply enter the items you want, one at a time, in any order. When you are finished, press ENTER by itself to send the list to the built-in sort routine. After it is sorted, the list is displayed and you are asked whether or not you want a printout; enter Y or N accordingly. Building a list couldn't be easier!

Shopping List is limited to 50 items per list. To increase this, just change the value assigned to Variable N in Line 20.

With a few minor modifications, you

can use Shopping List to sort just about any list of items. Simply change all references to "groceries." I have used this program to help me pack for vacations, organize lists of people for my local cadet corps, and prepare for our computer swap meet.

Whether you choose to use the program as is, or modify it to suit your own needs, I hope Shopping List finds a happy home in your software collection.

Trevor Boehm is a high-school student who attends Silver Heights Collegiate in Winnipeg. His interests include computer programming, applied science and reading science-fiction novels. He may be contacted at 77 Inwood Cres., Winnipeg, MB R2Y 1A2, Canada. Please include a SASE when requesting a reply.

ACES from cover

Your chances of winning a game of Aces Up are about one in 25, depending on your skills. If you have any questions about the game, please feel free to call or write to me. Good luck!

George Quellhorst has owned and used Color Computers since their introduction, and he enjoys writing software for his CoCo 3. George may be contacted at 203B Meadows Drive, Painesville, OH 44077-5361. (216) 354-3812. Please include an SASE when requesting a reply.

Announcing
Icon Basic09
 The next programming language for OS-9!

Icon Basic09 is a graphical user interface (GUI) to Basic09, which will make programming easier than ever! Icon Basic09 takes an innovative approach by using graphic representations, or icons, to represent statements and keywords for writing Basic09 programs and procedures. Instead of constantly typing while writing a program, the user can simply **point & click** to choose the desired statement!

Icon Basic09 can also be very useful in studying procedures and programs written by others to learn how they operate. The package contains a full set of icons...or, you may edit or create icons using the included icon editor. Icon Basic09 requires a CoCo-3 with at least 256k, mouse or joystick, and OS-9 lv 2.

MARTY GOODMAN

Switchable Operating Systems
How can I use a 27256 EPROM to hold one 16K DOS (Extended ADOS) and two 8K DOSs (Disk BASIC and RGB DOS)?

*Jim Houtakker
 Galena, Illinois*

The key to "bank switching" within a large EPROM is control over the high-order address lines — in this case, address lines A13 and A14 (pins 26 and 27 of the EPROM). You must also of course properly burn the DOS information into the EPROM. Let's say the EPROM internally has addresses \$0000 through \$7FFF. Burn the 16K DOS into locations \$0000 through \$3FFF in the EPROM, then put the first 8K DOS into locations \$4000 through \$5FFF and the second 8K DOS into locations \$6000 through \$7FFF. Note that these addresses are absolute EPROM addresses — you'll have to interpret them to get the proper memory-buffer locations for your particular EPROM burner.

Put the EPROM into your disk controller in the same fashion you would a 27128 (16K) EPROM, but bend up pins 26 (A13) and 27 (A14). Now connect A14 and A13 to two poles of a DPDT switch. In one position, the switch should connect A14 to ground and connect A13 to Pin 26 of the 28-pin EPROM socket in the disk controller. In this position, the lower bank is selected, activating the 16K DOS.

Now for the tricky part: when the DPDT switch is in the other position, A14 from the EPROM must be connected through a 4.7K resistor to a source of +5 volts (such as Pin 28 of the chip). With the switch in this position, A13 of the EPROM should be connected to the center pole of an SPDT switch. One side of this second switch should be grounded and the other side connected to +5 volts via a second 4.7K resistor. Thus, when the DPDT switch is in this second position, the upper half (16K) of the 27256 EPROM is selected, and you use the second switch to select which of the two 8K banks is seen by the CoCo. A schematic for this circuit appears in Figure 1.

Variations of this approach can be used for putting four 8K DOSs or two 16K DOSs into one 32K EPROM. One tip here: if you want to switch between one 16K DOS and only one 8K DOS, you can dispense with the entire circuit on the A13 line — just connect Pin 26 (A13) of the EPROM to Pin 26 of its socket — provided you put two copies of the 8K DOS back-to-back in the appropriate 16K bank of the EPROM. This allows you to use a single SPDT switch to select between the DOSs.

Keyboards and Power Indicators
How can I attach an IBM keyboard to my CoCo? Is there a way to add power-on indicators to my CoCo and disk drive so I'll know they're on?

*James Ruth
 Newark, New York*

A CoCo PRO! in Ypsilanti, MI still sells the Bob Puppo keyboard adapter that allows you to connect an IBM-style keyboard to the CoCo. This accessory is rather expensive (\$80 or more) but works quite well.

Adding a power-on LED to the CoCo and a disk drive system is not that difficult, though you must be comfortable with use of several tools and techniques. You will need a LED with appropriate mounting hardware. From Radio shack, try a red (Cat. No. 276-041) or green (Cat. No. 276-022) T-1 1/4-size LED and a panel mount (Cat. No. 276-080). Or you can buy the panel mount with the LED already installed (Cat. No. 276-068 or 276-069). You'll also need to put a resistor in series with these LEDs. Use a 330Ω, 470Ω, or 1KΩ resistor (all 1/4-watt)

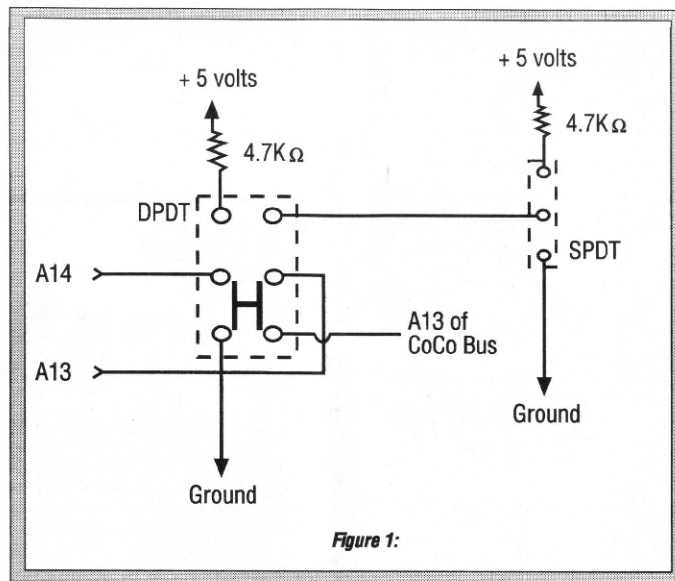

Figure 1:

depending on how bright you want the LED.

Now wire the cathode (the short lead) of the LED to ground. In the CoCo 3, one ground point is the metal case of the RF modulator (the box that has the jack for the TV set on it). A good ground point in a disk-drive case is on either of the two center wires (usually black) of the four-conductor power connector.

Wire the anode (the longer lead) of the LED to the resistor, and connect the other side of the resistor to a source of +5, +10 or +12 volts. Inside the CoCo, a good source of +10 volts is at the junction of the cathodes of D1 and D2. Look for the biggest electrolytic capacitor in the CoCo 3, a cylindrical 4700-μFd, 16-WVDC capacitor (labeled C29) located near the power-regulator transistor. Facing the keyboard, look just to the right of and just a hair back from C29 to find D1 and D2, two black cylindrical devices. On one end of each of those

diodes is a band, indicating the lead on that end is the cathode. Connect the wire from the other side of the resistor to the cathode of either D1 or D2.

Inside a disk drive case and power supply, a good source of +12 volts is again on the power connector. The 12-volt line is usually yellow, though sometimes it is blue. It will be one of the two outer wires on the four-wire cable. If you accidentally hook into the 5-volt power wire (usually the red wire), don't worry — the light will work fine, too.

It is up to you exactly where to mount the LED you install. Make sure you use either heat-shrink tubing or electrical tape to keep your connections from shorting together.

Disabling the Clear Key

Those wanting to disable the Clear key from BASIC on a CoCo 3 might try the following pokes:

For the 32-column screen, enter

```
POKE &HA928,&H39
```

For a 40- or 80-column screen, enter

```
POKE &HF6E0,&H39
```

A better approach would be to use POKE &HA38D,&H8C. This single poke disables the Clear key in all screen widths yet leaves the

memory map of the CoCo 3. One note: horizontal scrolling can cause a computer crash if your CoCo 3 has an older (1986-version) GIME chip.

RGB, Fast Disk and Surplus Equipment

Is there a way to connect an RGB monitor to a Commodore-64 RF output? I saved some files to disk while my CoCo was in the high-speed mode, and now all I get is an I/O error when I enter DIR with that disk in the drive. Is there a way I can recover the data on the disk? Where can I get a 512K CoCo upgrade, a 1-meg upgrade, an FD-502 disk drive and extra color computers?

*Brandon Broyles
 The Colony, Texas*

While it is theoretically possible to convert an RF signal to an NTSC composite-video signal, then finally to separate R,G, and B signals, such a project would be expensive and elaborate. In this case it would probably also be pointless because such a widget would take a great deal of time to design and build, and end up costing more than a used color TV.

How much you can recover of your files depends on just how much of the disk's information was destroyed when it was written to with the 6809 running at 1.87 MHz. To recover the data, you'll need a good understanding of Disk BASIC's file structure (read Chapter 11 of the disk manual), a disk editor (there are some good ones on Delphi), a fair amount of luck, and a lot of time and patience before proceeding. Cer-Comp sells an outstanding set of utilities, called *CoCo Tools*, that are specifically geared to helping you recover files from a crashed disk. However, even with a full understanding of the disk file structure and a good disk editor, you may still be unable to recover any data from the files. For future reference, consider buying *ADOS 3* and having it burned into an EPROM. This modified operating system permits reliable disk operation even when the CoCo is operating at high speed.

Sadly, there are very few remaining sources from which to buy accessories for the Color Computer. Computer Plus may still have some 512K memory boards for the CoCo, but I hear CoCo PRO! is indefinitely out of them. The CoCo SIG on Delphi has a Classified Ads section where Color Computers and accessories are constantly being offered for sale. That is probably your best bet when looking for these items.

Martin H. Goodman, M.D., a physician trained in anesthesiology, is a longtime electronics tinkerer and outspoken commentator — sort of the Howard Cosell of the CoCo world. On Delphi, Marty is the SIGop of THE RAINBOW's CoCo SIG. His non-computer passions include running, mountaineering and outdoor photography. Marty lives in San Pablo, California.

CLS command operational in addition to leaving the Clear key available for other uses.

 Miami, Florida*

Changing Widths in ML
How can I execute a WIDTH 40 or WIDTH 80 from within an assembly-language program?

*Robert Allen Turner
 Double Springs, Alabama*

The CoCo 3 technical manual, available from Tandy via National Parts, supplies the specifications for the GIME chip. Part of this information details the video modes of the GIME chip and which registers affect them. After studying this information, you should be able to "talk" directly to the GIME chip, putting it into different video modes and pointing video memory wherever you like within the

Feature Program

Grab a Shape

by Keiran Kenny

Grabbit could be seen as an easy game or as an exercise to help children learn to distinguish different between shapes. When you run the program, you are asked to choose a speed; press 1 (fast), 2 or 3 (slow) accordingly. After this, *Grabbit* sets itself up by drawing several shapes. The program then displays a single shape in the left-middle portion of the screen, at the same time "flashing" all the drawn shapes one at a time on the right side. When the shape on the right is the same as the shape on the left, press the space bar. You'll see how well you did, and you'll have the option to try again. *Grabbit* requires at least 32K of memory and Extended BASIC.

The speed setting you select determines how fast the shapes are flashed. By adult standards, fast is not very fast and slow could be a bit too slow. To speed things up a bit for quicker children, reduce the value 1000 in the delay loops in lines 440 and 490 (Variable SF is used to store whatever number the user selects).

Lines 630 to 720 draw the 10 easily distinguishable shapes in a square at the top center of the screen to set up the program. The GET statements store each square and figure in dimensioned arrays B through K.

The shapes are randomly displayed in 48-by-48 squares — an area of 2304 total pixels. The program uses "speed" GET/PUT statements — the values at the upper-left corner in the LINE statement in Line 260 are multiples of eight, and the values at the lower-right corner are one less than multiples of eight. All subsequent GET/PUT statements use the same protocol, and a PSET option is not required.

The values (72) in the DIM statements in Line 40 were arrived at by dividing the total area (2304) by 32, not by 4 as my programs usually do. DIMA(72) uses a lot less memory than my original DIMA(576). Using this approach, it is possible to dimension enough space for a whole PMODE4 screen (an area of 49152 pixels). This area divided by 32 is actually 1536, but I was able to reduce it further still to 1228. For an example, enter and run the short listing shown in Figure 1.

This approach seems to work with all areas where the speed GET/PUT protocols

Product Review

CoCo Friends Disk Magazine

One of the things I've always enjoyed about reading THE RAINBOW is the exchange of information between CoCo users. Now that Tandy is no longer supporting the CoCo, it seems more important than ever to build connections with other users. *CoCo Friends Disk Magazine* from Rick's Computer Enterprise looks like a great way to do just this. *CoCo Friends Disk Magazine (CFDM)* is unlike any other disk magazine I've ever seen. Sure, it includes good advice and interesting programs (some of them are great examples of the CoCo 3's capabilities); but more importantly, you get those connections that help us keep our CoCos alive.

CFDM is distributed on double-sided "flippy" disks (you don't have to have double-sided drives) and can be used on any CoCo 3 with a disk drive. In fact, one of the requirements Rick Cooper has for submissions is that they work with 128K machines. Accompanying the disk is a booklet that explains all the features of *CFDM* as well as how to "turn the pages."

The "magazine" starts from a Disk BASIC program, and the "cover" includes some beautiful CoCo 3 artwork. After starting the magazine, you are presented with a menu that shows all the sections in the issue. The material in *CFDM* is organized into logical sections, and you can easily move from section to section using the CoCo 3 keyboard. Once you move into a section, a sub menu shows the contents of that section. Selecting an item from this menu tells the system to display a specific article or topic.

Side 1 of the *CFDM* disk includes editorial comments, articles, advertising, letters, etc. The articles discuss just about everything that has anything to do with the CoCo and CoCo users. Most of the articles are short, well-written and easy to read. Although graphics aren't supported in the actual articles (there's plenty of room for graphics on Side 2), you can change the screen colors for easier reading. One of my favorite columns allows readers to introduce themselves to the other readers. A want-ad section gives readers a way to request things they want for their CoCos and offer things they are willing to sell to other users.

CFDM also includes sections for reviews, programs, suggestions for new ways of using your CoCo 3, news about the CoCo, letters from CoCo clubs and more. But the really unique thing about *CFDM* is that each section includes an easy-to-use text editor. This allows you not only to make notes about the articles but also to add your two cents to make the magazine better. Readers are encouraged to add their comments and contribute to the magazine using this method; once you make your comments, you save them to disk and send them back to Rick's Computer Enterprise.

The flip side of *CFDM* contains more artwork as well as programs, including games, graphics demonstrations and utilities. The graphics are in a standardized format, and programs are included that allow you to view the images on your computer. I've always enjoyed the graphics capabilities of my CoCo 3, and this is a great way to share your talents with others.

All of the functions of the *CFDM* program performed flawlessly. For instance, included is a program for printing the magazine on paper. It works really well.

Even though information for OS-9 users is a bit limited, I believe all CoCo users can benefit from *CFDM*'s method of communication. Each issue is crammed full of helpful hints, interesting programs, beautiful artwork and friendly information. Besides, the programs and techniques discussed in the review copies I received could be adapted for OS-9. But the free exchange of opinions and contributions can only help those who use a CoCo 3. (Rick's Computer Enterprise, P.O. Box 276, Liberty, KY 42539; \$6 per issue, \$16 for 3 issues or \$30 for 6 issues; published monthly)

Figure 1: Dimensioning Example

are observed, but it appears to be unreliable in experiments where they did not apply. I began reducing my DIM values step-by-step because I was working with ADOS 3 and that system tends to freeze when you get near the maximum area you can dimension. In any case, it is good practice to try reducing the values used in DIM and CLEAR statements — you might need the extra memory as your program grows.

Line 20 of *Grabbit* establishes the variables SP and SL according to whether you are using a CoCo 3 or an earlier model. If you press N at the ANOTHER? prompt (Line 590), the program returns the computer's operating speed to normal.

Keiran Kenny's interests lie mainly with the Color Computer's graphics and math capabilities. But in his own words, "I like to try everything." He may be contacted at van Montfoortlaan 31, 2596 SP The Hague, Holland. Please include an SASE when requesting a reply.

Feature Program

A Matter of Principal

by Ralph D. Miller

While in the process of purchasing a home, I had various financing schemes to consider. In order to evaluate each approach properly, I needed an amortization program. As always, the CoCo came to the rescue.

Amortize is a short BASIC program that prints complete amortization schedules for the loan configurations you enter. The printer speed is set to 2400 in Line 2. If you use the default speed of 600 baud, just delete Line 2. Otherwise edit the line to reflect the speed you use.

When you run *Amortize*, you are asked for the annual interest rate in percent (e.g., enter 8.5 instead of .085), the number of interest periods annually (if the interest rate is compounded daily, you would enter 365; for interest compounded monthly, enter 12, etc.), the number of payments per year, the amount of the loan in dollars and the term of the loan in years. When answering these questions, you need only enter the digits; no %, \$, etc., are needed.

The program then checks to be sure your printer is online and notifies you if it is not. After determining that the printer is online, *Amortize* prints a header describing the loan and the computed installment amount, then details each payment by the amount of the payment applied to interest, the amount applied to principal and the amount of debt outstanding. These tables really come in handy when you decide to prepay principal

payments in order to save interest. After printing the last payment, *Amortize* returns to allow you to run another table.

The installment amount is printed in Line 19, and the table is started at Line 20. If you don't need the complete table but want to see what your "monthly" payment would be for a given loan configuration, add

STOP

to the beginning of Line 20.

A word of caution, which I learned through experience: If you let it be known among your friends that you can run amortization tables, you'd better shop around for a good price on extra printer paper.

The Contras

2 years in the making.
A cast of 3 all-star programmers.
THE game. Here at last...

Once upon a time, Sundog Systems announced a new 512k game called *The Contras*. It took two years and three programmers to complete this, the most ambitious game ever created for the CoCo-3. Jeff Steidl, accomplished author of *Photon* and *GrafExpress 2.0*, led the effort to produce this technological marvel. In doing so, he proved that the CoCo can match—or surpass—any home game system.

The Contras features a two-player cooperative mode, 512k filled with incredible graphics, super-smooth animation and scrolling, an outstanding background music score, sizzling sound effects, and lightning-fast arcade action.

This is paramilitary combat at its best. Play alone or with a friend as you take on the evil alien invaders. Blow away the enemy while travelling thru multiple levels and powering up with ever more destructive weapons. *The Contras* will keep you playing for hours; it is quite possibly the best CoCo game ever! Requires 512k CoCo-3, disk drive, & joystick.

\$34.95

WHAT THEY'RE SAYING ABOUT COCO FRIENDS DISK MAGAZINE

...I received the CFDM the other day, and all I can say is that it is the best thing since sliced bread...Rick I am impressed.
—Colin North, Australia

...I was impressed by the STARTUP disk and then really impressed by the first month's issue of CFDM.
—Clarence Bower, OH

...I like it! I like it!...
—John Pendleton, MO

...I am...years old and just a beginner with CoCo 3...You have so much on one little floppy disk—I won't believe all the wonderful things you have on it! I spend hours going over and over...
—Harold Moenich, PA

...Looks great...have made many new CoCo Friends, thanks to your mag. Am currently corresponding with 4 NEW CoCo Friends... Thanks.
—George Quellhorst, OH

...Material & Format: In a word—FUN. It is interesting to find out about other CoCo users and what they do with their machines.
—Daniel M., MD

...Congratulations, Rick, on your first issue of CFDM!! You deserve an A+. It has been a long time since I derived so much pleasure from reading a computer magazine. Your first issue bodes well for the SURVIVAL and REVIVAL of interest in the CoCo 3.
—H. Allen Curtis, VA

...I wrote the driver and have edited the "Mid Iowa & Country CoCo's UPGRADE newsletter on disk since 1990. While each of our disk letters have their own style, let me say "YOURS REALLY LOOKS GREAT!"
—Terry Simons, IA

...You put together an interesting variety of programs each month, and I enjoy them all. I'm glad to see a variety of new contributors in each issue.
—Norm Barson, NJ

...Last night I sat down at my CoCo and read Issue #2 from "cover to cover," and realized what a terrific idea the CFDM really is, and much too good to pass up. So, I am enclosing a money order...to cover issues #2-#7.
—Gordon C. Matthews, Canada

...Let me know if I miscalculated on my subscription, the LAST thing I want to do is miss a copy of CFDM!!
—Denn "Mac" McConnell, ID

EDDIE KUNS

Using Workspace

Several times in the past couple of years, I've mentioned your Delphi Workspace as a place to store files. But we've never really looked at what Workspace is. How do you get there, and what does it cost you?

Simply put, your Workspace is a special storage space on Delphi where you can keep *private* files only you can access — your Workspace is your "own" disk area. Each user is assigned his own Workspace when he joins Delphi; although you may belong to many different SIGs on Delphi, you have only one Workspace.

To get to your private Workspace, enter `W0` at any SIG's main menu. (`W0` is a Delphi abbreviation for `WORKSPACE`.) You should soon after see the `WS>` prompt, indicating you are now in your Workspace area. When you press `CTRL-Z` or enter the `EXIT` command, you are returned to the menu from which you entered Workspace.

As I mentioned before, your Workspace is an area in which you can store files you don't want others to see. It is also the area on Delphi to which you first upload files you want to later submit to the public databases. In addition, all your Mail messages and folders are stored (automatically by the system) in your Workspace. Sounds a little like a great big mass-storage device in the sky, doesn't it? But watch out — the files you keep in Workspace could cost you money. Every Delphi user has 50 free (no-cost) disk blocks for file storage. Each block is 512 bytes, so you have about 25K of free storage space (about 11 disk granules for Disk BASIC users). Any disk usage beyond these 50 blocks may be charged to your Delphi account, depending on how long you use that extra storage space. Make sure you keep track of any files you place in your Workspace, and remember to delete the files you don't need.

Since Delphi runs on VAX/VMS, it uses the VAX/VMS file system. Each filename includes three parts: a name, an extension and a version number. A typical filename might be `SEND_TO_TIM.LZH;2`. In this case, `SEND_TO_TIM` is the actual filename, `.LZH` is the file extension, and `;2` is the version number. VAX/VMS filenames are case-insensitive and will appear in uppercase no matter whether you use uppercase or lowercase when naming them. Filenames and extensions can each be 40 characters in length, though most people rarely use filenames that long!

The concept of version numbers might be new to most CoCo users, especially those who use mostly Disk BASIC. The version number is one more part of a filename that helps it stay unique. You can have two or more files with the same filename and extension as long as each filename has a different version number. This is great when you repeatedly edit a file but want to keep the older versions. You do not normally need to specify the version number when working with files; the latest version of a file is the one with the highest version number, and this is the default ver-

sion number used by the system. Version numbers can range from 1 to 32767.

If you create or upload a file using a filename that is already used by another file in your Workspace, the current version of the file is not overwritten. Delphi automatically creates a "new version" of the file, using the next-highest available version number. Thus, if you do a directory of your Workspace, you will see two versions of this file; the filename and extension will be the same, but the version number will be different. Of course, both versions of the file count toward your overall Workspace disk usage.

Workspace Commands

The commands available to you in the Workspace area are shown in Figure 1. Many of these commands, such as `COPY`, `DELETE`, `EXIT` and `LIST`, have obvious functions. Some operating notes are in order, however.

| | |
|----------------|--------------------|
| APPEND to File | LIST File |
| CATALOG Files | PUBLISH File |
| COPY File | PURGE Old Versions |
| COUNT Words | RENAME File |
| CREATE File | SETTINGS |
| DELETE File | SUBMIT File |
| DOWNLOAD File | UNPROTECT File |
| EDIT File | UPLOAD File |
| EXIT | KERMIT-Server |
| HELP | Other Commands |

Figure 1: The Workspace Menu

When you use `LIST` to list a file in your Workspace, you can use `XOFF` (`CTRL-S`) and `XON` (`CTRL-Q`) to pause the listing and restart it, respectively. You can use wildcards with the `DELETE` command; for example, to delete all the files in your Workspace that have a `.TXT` extension, you would enter `DELETE *.TXT`. The `DELETE` command prompts you to make sure you want to delete the file(s) you specified on the command line. A separate prompt appears for each file. If you don't want to be prompted, add `/NOCONFIRM` to the end of the command line.

If you have several versions of different files in your Workspace and you want to keep only the highest (latest) version, use the `PURGE` command. This command causes all lower-numbered versions of all files to be deleted. You can also purge old versions of a specific file by entering the filename after the `PURGE` command.

Another useful command is `CATALOG`, or `DIRECTORY`. If you enter `DIRECTORY` (or `DIR` for short), Delphi shows you a listing of the files in your Workspace, including each filename, the file size in blocks, and the date and time the file was created. The `DIRECTORY` command supports several options, which I'll cover next month.

If you receive and store a lot of mail, you'll see many files with the extension `.MAI` when you enter `DIR` in Workspace. These files are mail files and, under ordinary circumstances, you *should not delete them*. To keep from confusing the Mail system, any mail messages should be deleted only from within Mail. The safety rule to remember is that, if you want to work with mail messages, do it from within Mail. As far as disk usage is concerned, Delphi counts only the part of your `MAIL.MAI` file that is currently used to hold mail messages.

For safety's sake, all mail files are *protected*. That is, they are automatically created in such a way that you cannot delete them. If you decide to delete all mail files from your Workspace, you need to first unprotect them. Not surprisingly, you use the `UNPROTECT` command to do this. If you enter `UNPROTECT MAIL.MAI`, you will be

able to delete the file `MAIL.MAI`. (Again, you would do this only if you wanted to delete *all* of your mail without entering Mail and deleting all the messages.) Similarly, if you want to protect a file against being accidentally deleted, you can enter `PROTECT MYFILE.TXT`. If you later decide you want to delete this file, you must first unprotect it.

The `PUBLISH` and `SUBMIT` commands both perform the same function. Either of these commands can be used to submit a file or group of files to the databases of the SIG from which you entered your Workspace. However, using `SUBMIT` from within your Workspace is the old Delphi method of uploading files and is discouraged. A better way to submit a file to the databases is to enter the database to which you want to submit the file(s), then enter `SUBMIT` at that prompt. Remember that you are not charged for uploading files when you are inside the `SUBMIT` menus.

As a last tidbit before we end this month, if you want to find out how long a text file in Workspace is, use the `COUNT` command. An example, using the text file for last month's "Delphi Bureau," is shown in Figure 2.

Next month we'll look at the rest of the Workspace commands. We'll also see how to upload and download files using your Workspace area.

Eddie Kuns is pursuing a doctorate in physics at Rutgers University. He lives in Aurora, Illinois, and works as a programmer and researcher at Fermilab. Eddie is the database manager of the OS9 Online SIG and can be reached online as `EDDIEKUNS`.

```
WS> count report.txt
File REPORT.TXT: 10016 characters, 95 lines, 1688 words, longest word
"low-number:high-number" (23), longest hyphenated word
"low-number:high-number" (23).
```

Figure 2: Sample Output of `COUNT` Command

Uploads At A Glance

In the OS9 Online Applications (6809) database, Steve Mylonas (`SAM35`) released `WDD`, a program which allows you to change the default disk drive (`/DD`) to another device on the fly. He also contributed two programs that repeatedly unlink a module until the module is no longer in memory or `deiniz` a device until it is completely deinitialized. These utilities can often save a lot of typing. Ken Scales (`KENSCALES`) uploaded a demo program by Alan DeKok that shows off an OS-9 Level II C graphics-sprite library Alan is developing. Darren Kindberg (`DKINDBERG`) released the latest version of `gcal`, a calendar and appointment-keeping program for use with `Mulivue` and `gshe11`.

In the Telecom (6809) database, John Eng (`JENG`) uploaded the latest version of an `ADQ` offline reader. Some BBSs allow you to download all of your BBS mail to your local system in a particular format; this program allows you to read this mail.

Shawn Driscoll (`EARTHER`) released into the Games & Graphics database a new version of *Stranded and Out of Gas*, an adventure game. In the Programmers Den database, Shawn also released the latest version of `gui.b`, a GUI (Graphics User Interface) toolkit for the CoCo 3. Tim Kientzle (`TIMKIENTZLE`) ported his popular version of `make` for the OS-9/68000 machines. In my opinion, Tim's version is superior to the Microwave version. Jim McDowell (`JMLSOFT`) uploaded two utilities for C-source programs. One program, `xtncln`, allows you to use the backslash (`\`) to extend source lines across several lines. The second program, `trigraph`, performs tri-graph substitutions according to the ANSI standard.

In the OSK System Modules database, Tim Kientzle uploaded a new version of

`SysGo`; Kevin Darling and Scott Griepentrog have worked on earlier versions of this module. This version of `SysGo` is customizable and includes assembly source. This allows you to turn definitions on and off in the source, recompile the module, and have `SysGo` boot your system the way you want. Jim Lalone (`TERMITE`) contributed a tutorial for OS-9 beginners to the Tutorials & Education database.

In the CoCo SIG CoCo 3 Graphics database, Eric Crichlow (`HYPERTech`) released a clipboard file for *Image Master* that contains several 16-color icons. Don Joyce (`REDCOAT`) updated the setup file for *Bowling Stats, Version 5.3*. This setup file is necessary only for people using unmodified Disk BASIC; if you use `ADOS`, you don't need this update. Mike Nelson (`MICHAELJN`) uploaded a cassette-labeling program for printing the contents of your music tapes.

In the Hardware Hacking database, Marty Goodman (`MARTYGOODMAN`) provided data initially posted by Francis Swygert (`DSRTFOX`) about the Super NES RGB and audio connectors. This file also describes how to interface the Super NES to various monitors. Marty also posted a Forum message originally written by Art Flexser (`ARTFLEXSER`) that describes the unexpected way in which the GIME memory mapping handles ROM mapping.

In the Games database, Johnny Williams (`DRILLMASTER`) released a game database for chess. He also released a puzzle program that takes a graphics image, rearranges it, and gives you five minutes to piece it back together. In the Telecommunications database, Andrew Jackson (`AJACK`) uploaded a program that creates macros for *DelphiTerm 4.1*. Art Flexser contributed in the Soapbox (chitchat) database a description of his experiences during hurricane Andrew in the Miami area.

Submitting Material To Rainbow

Contributions to THE RAINBOW are welcome from everyone. We like to run a variety of programs that are useful, helpful and fun for other CoCo owners.

WHAT TO WRITE: We are interested in what you want to tell our readers. We accept for consideration anything that is well-written and has a practical application for the Tandy Color Computer. If it interests you, it will probably interest lots of others. However, we vastly prefer articles with accompanying programs that can be entered and run. The more unique the idea, the more the appeal. We have a continuing need for short articles with short listings. These are especially appealing to our many beginners.

FORMAT: Program submissions must be on tape or disk, and it is best to make several saves, at least one of them in ASCII format. We're sorry, but we do not have time to key in programs and debug our typing errors. All programs should be supported by some editorial commentary explaining how the program works. We also prefer that editorial copy be included in ASCII format on the tape or disk, using any of the word processors currently available for the Color Computer. Also, please include a double-spaced printout of your editorial material and program listing. Do not send text in all capital letters; use upper- and lowercase.

COMPENSATION: We do pay for submissions, based on a number of criteria. Those wishing remuneration should *so state* when making submissions.

For the benefit of those wanting more detailed information on making submissions, please send a self-addressed, stamped envelope (SASE) to: Submission Guidelines, THE RAINBOW, The Falsoff Building, P.O. Box 385, Prospect, KY 40059. We will send you comprehensive guidelines.

Please do not submit material currently submitted to another publication.

SUNDOG SYSTEMS

Energy is everything; your home world depends on it. However, someone or something is slowly siphoning it away. As your world's champion, you must climb into the experimental Power Tank to challenge this nemesis and his minions. Your key lies with the ability to teleport solid mass. Use this to manipulate and explore the endless stronghold of the enemy, and to exploit the free-floating DUPES (Dense Units of Photon Energy) to destroy the menacing Plasma Droids. Be cautious, though; those DUPES can be deadly, too! Photon, a fantastic new arcade game for your CoCo3, contains spectacular 320x200 resolution, 16 color graphics, ultra-smooth 60 Hz animation, and loads of real-time music and sound effects. It will send your mind racing over endless possibilities, requiring quick decisions and reactions. Quite simply, Photon is incredibly addictive; it will deliver hours of excitement. Will you become your world's greatest hero, or just another energy slave? Req. 128K CoCo 3 and disk drive.

\$34.95

GRAF 2.0 EXPRESS

GrafExpress 2.0 is a complete graphics and music programming environment. From the beginner to the accomplished professional, you can use GrafExpress to create lightning fast arcade games, graphic applications and utilities, and windowing multimedia demonstrations! The GrafExpress package includes two incredible systems. GrafExpress 16 works on all monitor types and offers support in 12 graphic resolutions (from 128x192 to 320x225). GrafExpress 256 offers 6 resolutions (from 128x192 to 160x225 on a composite monitor) in an astounding 256 colors! Ever see a CoCo do that before? Both systems include standard graphics commands (CIRCLE, FILL, etc.) that blow away the competition. For example, the BOX command peaks out at over 2 MegaPixels/second; that's 300 times faster than BASIC! 255 separate sprites of up to 100x100 pixels each are supported with window clipping and high-res pixel level collision checking. The 8-octave/4-voice music synthesizer has independent envelope, waveform, and volume controls, a 7 + KHz sampling rate, and much more. Other features include text/graphics mixing, different font sizes, fast window copying and scrolling, picture save/load, easy implementation from both BASIC and assembly language, multiple screen animation, and support for 128K/512K, double speed, and the high-res joystick interface. The package also contains support programs that are worth the purchase price of GrafExpress alone! These include an introductory demo, a picture editor, a waveform editor, and an art program that supports 256 colors! GrafExpress also comes with a 50 page manual that fully explains all of its incredible features. If you do any graphics programming or simply want to see what your little CoCo is capable of, GrafExpress is a must! Req. 128K CoCo 3 and disk drive.

\$34.95

War Monger

The world is in unrest. Power-hungry villains and evil warlords are readying their forces. It falls to you to lead your people against these armies, and only your best strategic plans can save the day. Fight the good fight in any era or locale. Play a simple game of capture the flag armed with water balloons, or climb into the cockpit of a 100 foot high armored warrier. Explore the deepest dungeons, defend your galaxy, or create your own scenarios with this incredible war game construction set/simulator. Your imagination is your only limit. You will deploy your forces with total control over hostile terrain while you scroll a graphic bird's-eye window over an immense world. War Monger has terrific 320x200 resolution, 16 color graphics and includes a tile editor to create or edit your own. Play against the computer, battle with another player, or simply watch the computer plot against itself. The enemy is everywhere. Are you ready to take on the challenge as the War Monger? Req. 128K CoCo 3 and disk drive.

\$29.95

The Quest for THELDA

An immensely popular 128K CoCo 3 arcade/adventure. Over 500 screens of fast fantasy action and puzzle solving. Great graphics and sound effects. **\$34.95.** Hint book only \$4.95.

★ THE ★ CONTRAS

A 512K two player futuristic combat arcade game. Full screen 320x225 hardware scrolling and smooth animation. Back-ground music score and sound effects! 512K CoCo3 only. **34.95.** Shipping soon!

Crystal City

This was THE game of '91! Ultra-fast space action with hardware scrolling on a 128K CoCo 3. Wild sound effects and over 30 MegaBytes of amazing graphics! **34.95.**

ZENIX

Lightning fast arcade game for the 128K CoCo 3. Terrific 320x225 graphics, back-ground music score and sound effects, and out-of-sight game play. **\$29.95.**

ALSO AVAILABLE

| | |

| Hall of the King 1, 2 or 3 CoCo 1 - 3 | \$29.95 ea. |
| Hall of the King Trilogy | \$74.95 |
| White Fire of Eternity CoCo 1 - 3 | \$19.95 |
| Dragon Blade CoCo 1 - 3 | \$19.95 |
| Champion CoCo 1 - 3 | \$19.95 |
| Paladin's Legacy CoCo 1 - 3 | \$24.95 |

Visa, Mastercard, Check, Money Order, and CDD (USA only, please) accepted. All foreign orders must be sent in US currency Money Orders. Include \$2.50 for shipping in USA and Canada. \$5.00 Foreign. \$3.00 extra for CDD orders. PA residents add 6% sales tax. Dealer inquiries welcome. Authors, we're looking for new software!

Sinistaar

Everyone loves this 512K arcade game. 3 disks packed with spectacular graphics and eerie background digital sound effects. 512K CoCo 3 only. **\$34.95.**

KYUJIN-SAI TO BE NINJA

The best selling 128K CoCo 3 martial arts arcade game. Now available in both RS-DOS and OS-9 versions. Play the incredible combat experience you've been missing under the operating system of your choice! **\$29.95.**

SOUNDTRAX

A polyphonic digital sound sequencing system for your 128K/512K CoCo 3 with a user-friendly point-and-click graphic editor. Create music scores with your own sounds or from the many we provide. **\$34.95.** Sample instrument disks: 6 sides of sampled sounds/instruments. Only \$12.95 each or \$29.95 for all three.
